SHEET TITLE: APPROACH RETAINING WALL DETAILS NO. 6

PROJECT: SIXTH STREET VIADUCT REPLACEMENT

ADDRESS: SIXTH STREET VIADUCT (WHITTIER BLVD) LOS ANGELES, CA

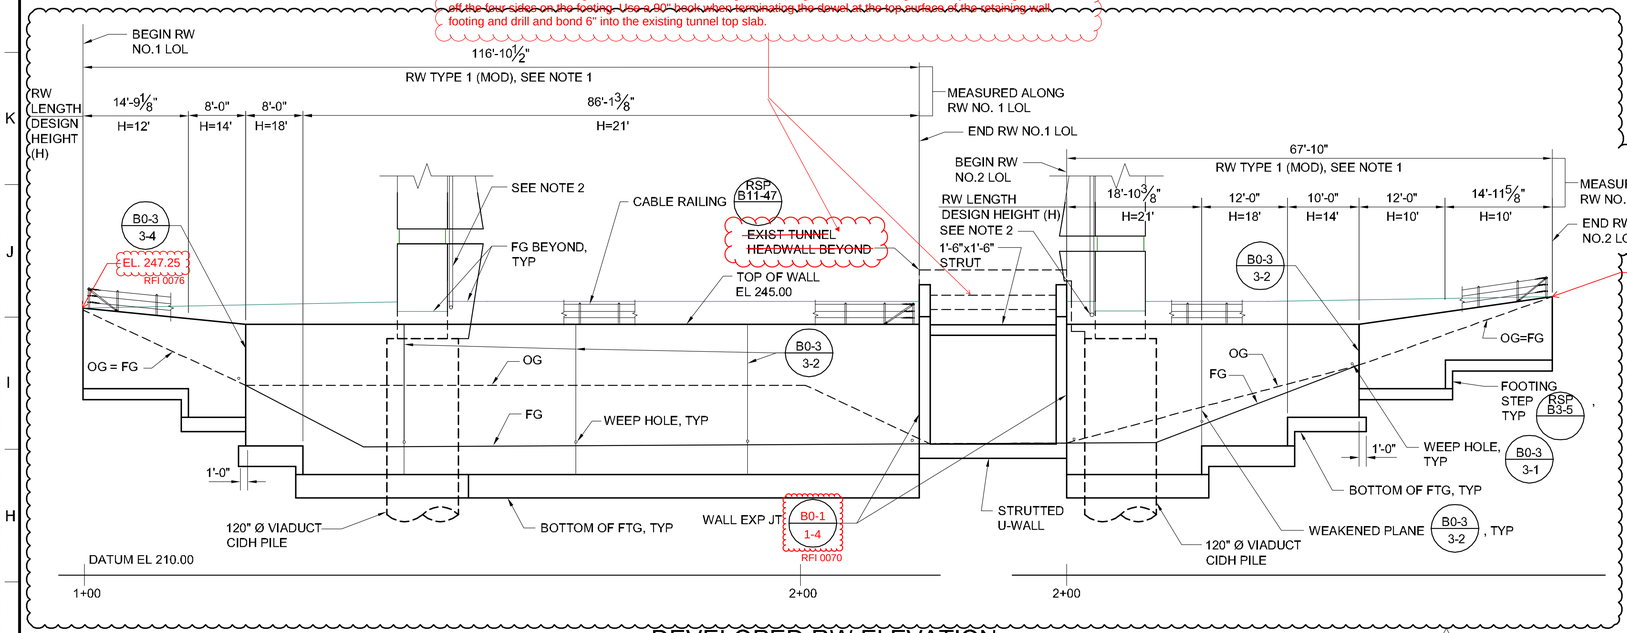
WORK ORDER NO. E700224F

DRAWING NO. S2-13

SHEET 206 OF 560 SHEETS

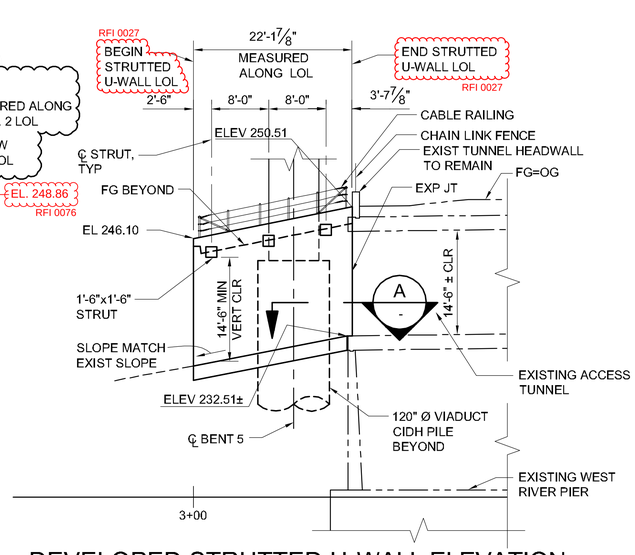
ADDENDUM 5

Per RFI 646 construct headwall per Type 5 (Modified) retaining wall on sheet S2-33 with the following exceptions:
-Match top of wall elevations and alignment with north and south sides.
-Remove the retaining wall footing shear key.
-Place retaining wall footing directly on existing tunnel top slab.
-Add #5 dowels on a 12" grid each direction connecting the retaining wall to the existing tunnel top slab. Begin dowels 6" off the toe/ edge of the footing. Use a 90° bend when terminating the dowel at the top surface of the retaining wall footing and drill and bond 6" into the existing tunnel top slab.



DEVELOPED RW ELEVATION

SCALE: 1" =10'

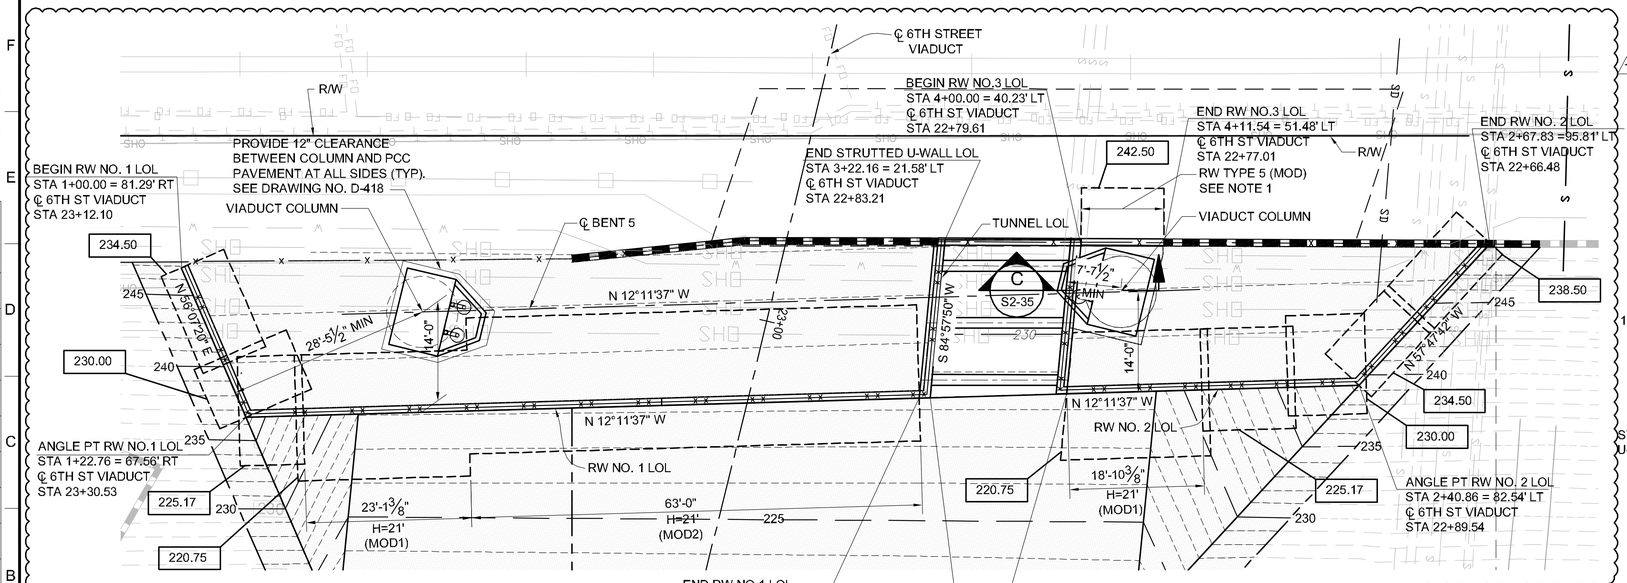


DEVELOPED STRUTTED U-WALL ELEVATION

SCALE: 1" =10'

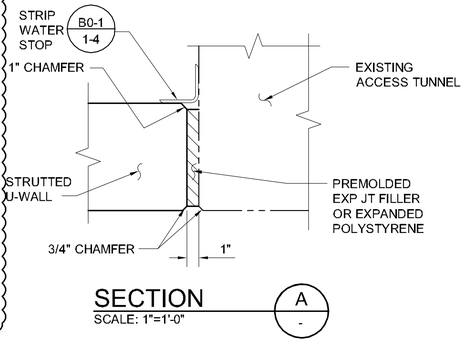
LEGEND

- 100.00 — INDICATES BOTTOM FOOTING ELEVATION
- CONCRETE CHANNEL LINING REPLACEMENT. SEE NOTE 3
- EXIST RW TO BE REMOVED AND/OR RECONSTRUCT. SEE NOTE 3
- EXISTING STRUCTURE
- PROPOSED CONSTRUCTION
- CHAIN LINK FENCE
- CABLE RAILING FENCE



RW LAYOUT PLAN

SCALE: 1" =10'



SECTION A

SCALE: 1"=1'-0"

NOTES:

1. FOR DETAILS OF MODIFIED RW TYPE 1 OR TYPE 5, SEE DRAWING NO. S2-33.
2. VIADUCT COLUMN DRAIN OUTLET SHALL DRAIN ONTO THE PAVED SLOPE.
3. FOR CONCRETE CHANNEL LINING REPLACEMENT AND RETAINING WALLS NOT SHOWN, SEE DRAINAGE DRAWING NOS. D-411 THRU D-419.
4. FOR ADDITIONAL DETAILS SEE SUBMITTAL 023r4. RFI 0067

Sheet Version 3.0

TYPICAL Y-BENT AND JUMP-SPAN NOMENCLATURES

SCALE: 1" =10'

NOTES:

1. THE ORIENTATION OF Y-BENT, INCLUDING THE 11'-0" DIMENSION OF THE LOWER COLUMN, SHALL BE PARALLEL TO THE CHORD BETWEEN THE WEST AND EAST Y-BENT TOP CONTROL POINTS.
2. BCW AND BCE ARE FINISHED CONCRETE ELEVATIONS AT THE TOP OF BEARINGS. WHEN BCW AND BCE ARE NOT THE SAME ELEVATION, THE LOWER ELEVATION OF THE TWO SHALL BE USED TO ESTABLISH THE FINISHED CONCRETE ELEVATION AT THE TOP OF THE BEARING. THE 11'-0" COLUMN DIMENSION SHALL BE MAINTAINED AT THE TOP OF BEARINGS WHEN BCW & BCE ARE AT DIFFERENT ELEVATIONS.
3. FOR THE LAYOUT OF THE X AND Y COORDINATE SYSTEM AND THE BENT PLAN LAYOUT, SEE DRAWING NO. S3-12.
4. THE ARCH RIB CANT IS OBTAINED BY ROTATING THE ARCH RIB ABOUT THE LEVEL LAYOUT LINE. A TRANSITION IS REQUIRED BETWEEN THE Y-BENT TOP CONTROL POINT AND THE ARCH RIB CONTROL POINT. THE SECTION ON THE Y-BENT TOP CONTROL POINT CONSISTS OF A SECTION CUT THROUGH THE 6.0' X 7.0' Y-BENT STRUCTURAL SECTION ALONG THE LEVEL LAYOUT LINE. THE UPPER SECTION IS THEN A PARALLEL SECTION CUT THROUGH THE ARCH RIB CONTROL POINT.

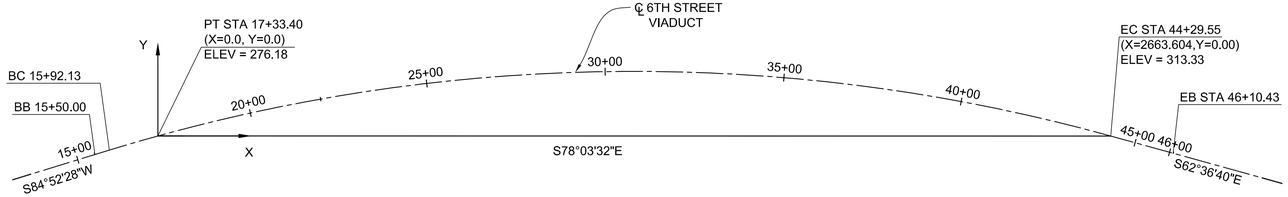
SHEET 221 OF 560 SHEETS



GEOMETRIC CONTROL - X AND Y COORDINATE LAYOUT

SCALE: 1" = 200'

LEGEND:

ZNT = ELEVATION OF NORTH Y-BENT TOP CONTROL POINT

ZNB = ELEVATION OF NORTH Y-BENT BOTTOM CONTROL POINT

ZST = ELEVATION OF SOUTH Y-BENT TOP CONTROL POINT

ZSB = ELEVATION OF SOUTH Y-BENT BOTTOM CONTROL POINT

NOTES:

1. Z AXIS IS VERTICAL, ELEVATIONS ARE RELATIVE TO DATUM SHOWN ON GENERAL PLAN.
2. SEE "TABLE OF DIMENSION" ON DRAWING NO. S3-11 FOR REFERENCED COORDINATES.

BENT LAYOUT PROCEDURE:

1. ESTABLISH ARCH RIB CONTROL POINTS EAST AND WEST AT NORTH AND SOUTH ARCH RIBS. SEE DRAWING NO. S5-01.
2. SET THE ELEVATION OF THE Y-BENT TOP CONTROL POINT AS THE AVERAGE OF THE ARCH RIB CONTROL POINT EAST AND WEST ELEVATIONS MINUS 2'-6". THIS ESTABLISHES THE ELEVATION OF THE LEVEL LAYOUT LINE SHOWN ON THE "TYPICAL Y-BENT AND JUMP-SPAN NOMENCLATURES" ELEVATION ON DRAWING NO. S3-11.
3. ESTABLISH Y-BENT TOP CONTROL POINTS AND THE LOCATION OF THE LEVEL LAYOUT LINE DESCRIBED IN STEP 2 BY PROJECTING THE CANTED TANGENTS OF THE ARCH RIB THROUGH THE ARCH RIB CONTROL POINTS TO THE ELEVATION OF THE LEVEL LINE DESCRIBED IN STEP 2.
4. ESTABLISH Y-BENT BOTTOM CONTROL POINT BY PROJECTING LINES ALONG ANGLES αW AND αE TO THEIR INTERSECTION IN THE PLANE ESTABLISHED WITH THE LEVEL LINE DESCRIBED IN STEP 3. SEE DRAWING NO. S3-11 FOR αW AND αE.
5. SEE "PLAN - BENT LAYOUT" HEREON FOR ℄ BENT LAYOUT.

LEGEND:

- STRUCTURAL CONCRETE
- 9° TAPERED ARCHITECTURAL FLARE CONCRETE
- CURVED PLANE ARCHITECTURAL FLARE CONCRETE

NOTES:

1. THE BC ELEVATION AT Y-BENT ARCHITECTURAL FLARES AT THE INTERIOR ELEVATION SHALL BE THE SAME AT THE EAST AND WEST SIDE AND SHALL BE THE LOWER OF BCW OR BCE.
2. TO PERMIT THE REUSE OF THE BENT 7 COLUMN FORM AT BENT 4, THE UPPER PORTION OF THE BENT 7 COLUMN FORM CAN BE REMOVED TO ACCOMMODATE THE SHORTER LENGTH Y-BENT 4 ARMS. AT BENT 4, THIS WILL REQUIRE EXTENDING STRUCTURAL CONCRETE INTO ARCHITECTURAL CONCRETE AT THE INSIDE OF THE Y-BENT AND ADDING A SIMILAR THICKNESS OF ARCHITECTURAL CONCRETE AT THE EXTERIOR OF THE Y-BENT. BELOW THE EC AT CURVE R2W AND R3E SHOWN ON DRAWING S3-11 WHERE INTERIOR ARCHITECTURAL CONCRETE BEGINS TO ANGLE AWAY FROM STRUCTURAL CONCRETE AS SHOWN IN SECTION A ON DRAWING S3-14, THE CORNER OF STRUCTURAL CONCRETE WILL BE REMOVED AS THE STRUCTURAL CONCRETE EXTENDS INTO THE ARCHITECTURAL CONCRETE. INCREASE THE RADIUS OF TIES TO MAINTAIN REQUIRED COVER AND ADJUST THE LOCATION OF LONGITUDINAL REINFORCEMENT. AT GRILLAGE REINFORCEMENT SHOWN IN SECTION A ON DRAWING S3-31, BEND THE #9 CROSS-BAR AS REQUIRED WHERE THE CORNER OF STRUCTURAL CONCRETE IS REMOVED. 1

NOTES:

1. PRIOR TO CONTINUING CONCRETE PLACEMENT AT EXISTING CONSTRUCTION JOINTS IN Y-BENT ARMS, THE EXISTING CONCRETE SURFACE AT THE CONSTRUCTION JOINT INTERFACE SHALL BE PREPARED BY REMOVING ALL LAITANCE AND INTENTIONALLY ROUGHING THE SURFACE TO AN AMPLITUDE OF 1/4".
2. FOR CLARITY, ARCH RIB FLOOR BEAM PT DUCTS ARE ONLY SHOWN ON LEFT ARM.

Y-BENT REINFORCEMENT NOTES:

1. ALL Y-BENT LONGITUDINAL REINFORCEMENT ARE #14 ASTM A706 GRADE 80 BARS.
2. WHERE B, C, D AND CORNER F BARS CROSS AT Y-BENT STEM, OFFSET BARS AT ONE Y-BENT ARM TO AVOID INTERFERENCE AS SHOWN ON "BAR OFFSET DETAIL".
3. FOR Y-BENT GEOMETRY AND DIMENSIONS, SEE DRAWING S3-11.
4. AFTER TERMINATION OF A BARS, PLACE #7 Y-BENT ARM TIES TIGHT AGAINST CONTINUOUS B BARS. THESE #7 TIES ARE PLACED ON THE INSIDE OF THE BUNDLE #7 VERTICAL Y-BENT STEM BARS.
5. SEE Y-BENT REINFORCEMENT TABLE ON DRAWING NO. S3-17.
6. WHERE #7 SECTION C/S3-17 CLOSED TIES OVERLAP #7 Y-BENT ARM CLOSED TIES, USE 90-DEGREE HOOKS AT TERMINATION OF #7 SECTION C/S3-17 CLOSED TIES. WITHIN THIS SAME REGION, CHANGE #6 ⟵ TOT 6 @ 6 TO #6 ⟷ TOT 4 @ 6 SHOWN ON SECTION C/S3-17.

U-STIRRUP DETAIL WHEN SPACING ≥ 16"
NO SCALE

LEGEND:

- ARCH RIB FLOOR BEAM 5 1/8" Ø PT DUCT
- BUNDLED BARS
- HEADED REBAR

T.O. 5 - Change Order Serial Sketch No. 65 - Page 1 of 5

NOTES:

1. BUNDLE #8 OR TIES AS REQUIRED TO PROVIDE CLEARANCE FOR 5¼"Ø ARCH RIB FLOOR BEAM PT DUCTS. SPACING OF SINGLE OR BUNDLED U-STIRRUPS SHALL NOT EXCEED 24". SEE "U-STIRRUP DETAIL WHEN SPACING > 16" ". ADJUST LONGITUDINAL AND LATERAL POSITION OF VERTICAL #8 CROSS-TIES AS REQUIRED TO PROVIDE PT DUCT CLEARANCE. WHEN BUNDLING OR PLACING TWO TIES AT A MINIMUM SPACING OF 2.5 TIES THE TIE DIAMETER, ONE OF THE CAP TIES MAY BE PLACED WITHIN THE DEPTH OF THE EDGE GIRDER AS A HORIZONTAL CROSS TIE.
2. ALL END BAR TERMINATIONS MAY BE 90° HOOKS, 135° HOOKS OR HEADED REBAR WITHIN LIMITS OF NOTE 2 APPLICATIONS. BEND #8 CROSS-TIES TO MATCH ARCH RIB SLOPE AT LEVEL LAYOUT LINE WHERE INTERFERENCE WITH Y-BENT ARM F BARS OR INSIDE A, B, C AND D BARS OCCURS. SEE DRAWING NO. S3-13 FOR LOCATION AND DEFINITION OF LEVEL LAYOUT LINE.
3. AT HEADED REBAR TIES AND CROSS TIES, USE REDUCED SIZE HEADS (4 x NET REBAR AREA)

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

ADDENDUM 5

SECTION A-

SCALE: 1/2"=1'-0"

RFI 446

1. Two-pieces ties are limited to the crown region of each arch rib only, defined as the length of the arch rib between the X= 60' long arch rib intrados transitions defined on Contract drawings S5-02 S5-03. At all arch ribs, this crown region exceeds the length of 60' to 80' requested by RFI 0446.

2. At both the "U" and cap element used to form the two-piece closed tie, all bars shall terminate with 135-degree hooks having a six-bar diameter extension at each end. The 180-degree hooks shown by RFI 0446 are not permitted.

3. At one-piece closed ties, all bars shall terminate with 135-degree hooks having a six-bar diameter extension at each end. The 180-degree hooks shown by RFI 0446 are not permitted.

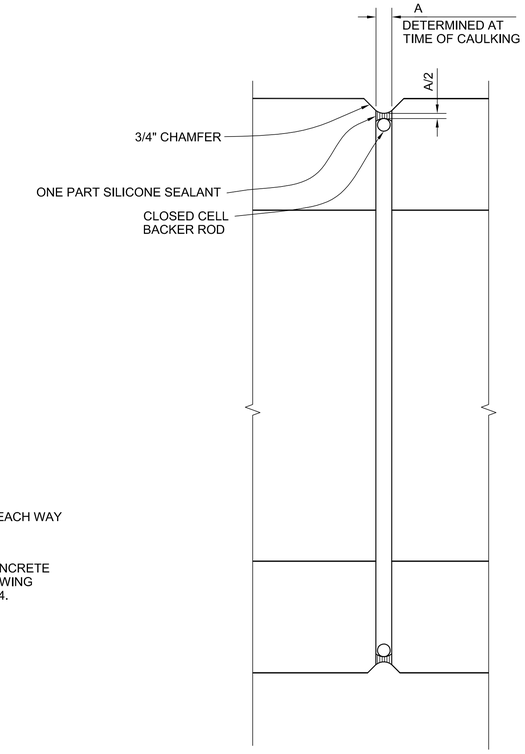
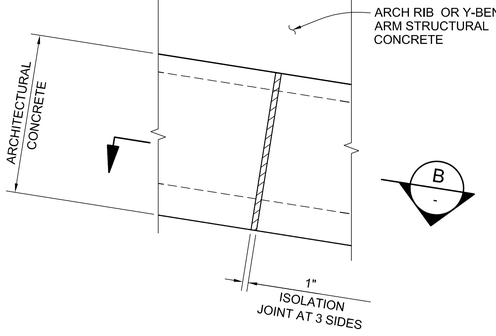
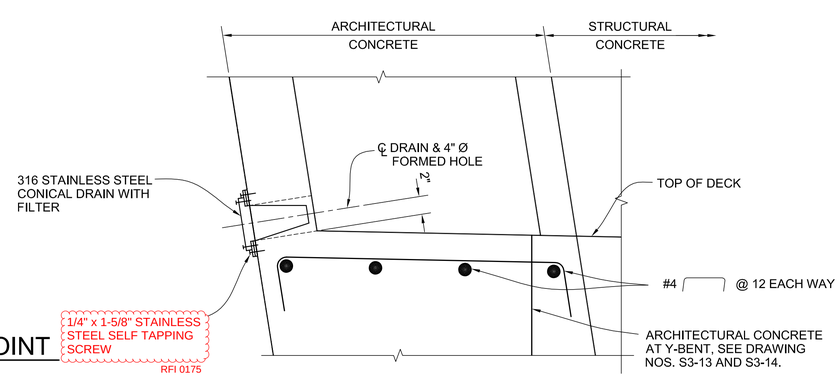
ARCH RIB ISOLATION JOINT LOCATION

NO SCALE







PLAN - ARCH RIB AND Y-BENT ARM ISOLATION JOINT

SCALE: 3/4" =1'-0"

RFI No.266

In 2 locations (SW corners of bents 5 and 7) the concrete wedge behind the PT anchor plates for the TARFB post tensioning interferes with the isolation joint shown on S5-11 and S5-12. See attached emails with renderings. SSW proposes to shift the isolation joints down the y-arm 5 1/16" at 7 SW and 6 1/16" at 5 SW to eliminate the conflict and accommodate our block out forming.

Response: No exception is taken to the Contractor's request to adjust the position of the Y-Bent arm/arch rib architectural concrete isolation joint located below the edge girder as proposed in RFI 0266 to avoid interference with the Contractor's block-out forming system. When relocating the joint, it is suggested to ensure the relocation is sufficient to avoid interference between the architectural concrete end reinforcement shown on Contract Drawing S5-12 and the Contractor's block-out form.

SCALE 6"=1'-0"

NOTES:

1. FOR HANGER GEOMETRY, SEE DWGS. S5-49 TO S5-66.
2. PENDANT PLATE AND HANGER SLEEVE BRACKET SHALL BE ULTRA HIGH MOLECULAR WEIGHT POLYETHYLENE (UHMW-PE). UHMW-PE COMPONENTS SHALL MEET FEDERAL STANDARD 595B, NO. 363.7 GRAY. BOLTS, NUTS, AND WASHERS SHALL BE GALVANIZED IN CONFORMANCE WITH ASTM A153.
3. HANGER SPACER DETAILS SHOWN ARE FOR NOMINAL HANGER DIAMETER. ACTUAL FIT-UP SHALL BE VERIFIED BY CONTRACTOR AND REQUIRED CHANGES SHALL BE SUBMITTED WITH SHOP DRAWINGS FOR APPROVAL. AFTER BOTH HANGERS HAVE BEEN FULLY TENSIONED PER THE SPECIAL PROVISION, THE HANGER SPACER BOLTS SHALL BE FULLY TIGHTENED.
4. DISTANCE BETWEEN HANGERS VARY. VARY THICKNESS OF PENDANT PLATE SO THAT HANGER OFFSET DISTANCE IS NOT INCREASED OR DECREASED BY MORE THAN 3/16" DURING INSTALLING OF HANGER SPACERS. MULTIPLE PENDANT PLATES MAY BE USED WITH A MINIMUM THICKNESS OF 3/8" PER PLATE.

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

ADDENDUM 5

4-BAR BUNDLE TRANSITION AT BENT 3

SCALE: 1/2" =1'-0"

NOTE: SEE LOWER ARCH RIB REINFORCEMENT FOR ALL DETAILS NOT SHOWN

REBAR TERMINATION DETAIL

SCALE: N.T.S.

1
-

S5-23
S5-29
S5-32

NOTES:

1. AT BOTTOM OF ARCH RIBS NEAR BENT 3 WHERE THERE IS NO Y-BENT ARM, OMIT "C" BARS SHOWN ON SECTIONS. SEE SECTION A / S3-06 FOR ADDITIONAL REBAR LAYOUT AND DETAILS.
2. CONSTRUCTION JOINT OCCURS AT INTERSECTION OF ARCH RIB INTRADOS AND TOP OF DECK AT OUTER TOP EDGE OF THE EDGE GIRDER, AND ARE NORMAL TO ARCH RIB SECTIONS.
3. PRIOR TO CONTINUING CONCRETE PLACEMENT AT EXISTING CONSTRUCTION JOINTS IN ARCH RIBS, THE EXISTING CONCRETE SURFACE AT THE CONSTRUCTION JOINT INTERFACE SHALL BE PREPARED BY REMOVING ALL LAITANCE AND INTENTIONALLY ROUGHENING THE SURFACE TO AN AMPLITUDE OF ¼".
4. THE CONTRACTOR SHALL DETERMINE ALL DEFLECTION AND REQUIRED CAMBER VALUES BASED ON THE SELECTED ERECTION SEQUENCE. SEE DRAWING NO. S9-05 FOR CONSTRUCTION SEQUENCE AND GEOMETRY CONTROL SUBMITTAL REQUIREMENTS.
5. AT THE COMPLETION OF CONSTRUCTION, THE ARCH RIB SHALL HAVE BEEN CONSTRUCTED WITHIN A OUT-OF-PLANE TOLERANCE OF ¼" PER 10' VERTICALLY RELATIVE TO THE TRUE ARCH RIB GEOMETRY SPECIFIED ON DRAWING NOS. S5-01 AND S5-50 THRU S5-66. THE OUT-OF-PLANE TOLERANCE IS MEASURED NORMAL AND HORIZONTAL TO THE ARCH RIB LOL.
6. LOCATIONS OF HANGERS AND HANGER BRACKETS SHOWN ARE FOR "TYPICAL KEY ELEVATION". FOR SPAN 3 LOCATIONS OF HANGERS AND HANGER BRACKETS REFER TO "SPAN 3 KEY ELEVATION" AND DRAWING NOS. S5-51 AND S5-52.
7. SEE DRAWING NO. S5-72 FOR HANGER BRACKET. HANGER BRACKETS ARE INSTALLED ECCENTRIC TO THE CENTER LINE OF THE ARCH RIB AND ECCENTRICITY IS VARIED TO AVOID INTERFERENCE BETWEEN HANGER SOCKETS. SEE "PLAN VIEW OF HANGER ECCENTRICITY" ON DRAWING NO. S5-71 AND NOTE 14 ON DRAWING NO. S5-72.
8. THE ALTERNATE HANGER BRACKET SHOWN ON S5-73 MAY BE USED EXCEPT AT THE FIRST TWO HANGERS ABOVE THE ARCH RIB KNUCKLE AND WHERE INSUFFICIENT CLEARANCE EXIST BETWEEN BRACKET AT THE ARCH EXTRADOS. THE ALTERNATE DETAIL CANNOT ALSO BE USED AT THE NORTH ARCH RIB OF SPAN 8 AND THE SOUTH ARCH RIB OF SPAN 9 TO ACCOMMODATE POSSIBLE FUTURE STAIRS.

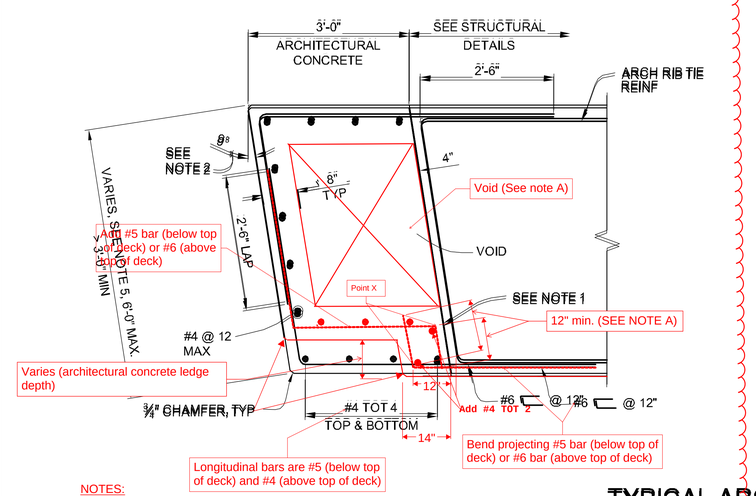
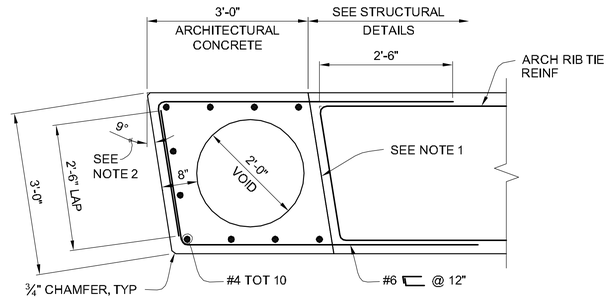
ARCHITECTURAL REBAR DETAIL 1



NOTES:
A. Architectural concrete ledge depth varies. To maintain cover, and achieve 12" rebar tail length, bend #5 or #6 bars at 'Point X' about the horizontal axis (i.e. into or out of page) as necessary. Bend all #5 or #6 bars in same direction to avoid interference.

TYPICAL ARCH RIB SECTION

SCALE: 3/4"=1'-0"



NOTES:

1. ALL ARCHITECTURAL CONCRETE IS CAST MONOLITHICALLY WITH STRUCTURAL CONCRETE.
2. CANT OF ARCH RIB FACE IS 9° MEASURED FROM A VERTICAL PLANE TO A PLANE ROTATED ABOUT THE ARCH RIB CHORD, DEFINED ON DRAWING NO. S5-01. SEE "ARCH RIB ROTATION LAYOUT" ON DRAWING NO. S5-50. TO MAINTAIN A LEVEL ARCH RIB EXTRADOS AND INTRADOS, THE ARCH RIB CROSS SECTION CORNER ANGLE IS 9° AT THE ARCH RIB CROWN AND VARIES AT OTHER LOCATIONS.
3. INTERNAL FORMS USED TO FORM ARCHITECTURAL CONCRETE MAY BE LEFT IN PLACE.
4. ALL # 4, 5 AND 6 REINFORCING BARS AT ARCHITECTURAL CONCRETE SHALL BE EPOXY COATED.
5. AT ARCHITECTURAL CONCRETE REINFORCEMENT, USE COUPLERS AS REQUIRED TO PROVIDE CLEARANCE FOR POST TENSIONING JACKS.
6. SEE DRAWING NO. S5-11 FOR DRAINS/VENTS AND ISOLATION JOINTS FOR ARCH RIB ARCHITECTURAL CONCRETE.
7. ALL ARCHITECTURAL CONCRETE BELOW TOP OF DECK CONSTRUCTION JOINT OVER POST TENSIONING ANCHORAGE SHALL BE PLACED AT ONE TIME.

ADDENDUM 5

HANGER WP LAYOUT PLAN

NO SCALE

NOTES:

1. ALL ARCH RIB FLOOR BEAMS AND INTERIOR FLOOR BEAMS HAVE A 15° SKEW WITH RADIAL & NORMAL LINES TO THE ℄ OF 6TH STREET VIADUCT.
2. ALL HANGER LOWER WORK POINTS T(N) ARE SET AT EQUAL DIVISIONS "S" MEASURED CONCENTRIC OR PARALLEL TO THE EDGE OF DECK BETWEEN INITIAL EDGE GIRDER WP T(N). THE NUMBER OF DIVISIONS EQUALS THE NUMBER FLOOR BEAM SPACES.
3. ALL ARCH RIB INITIAL WP USED TO ESTABLISH ARCH RIB WP A(N) ARE SET MID-WAY BETWEEN EQUAL DIVISIONS "S" MEASURED ALONG THE NORTH AND SOUTH CHORD LAYOUT LINE. THE NUMBER OF DIVISIONS EQUALS THE NUMBER FLOOR BEAM SPACES.
4. COORDINATES FOR HANGER WORK POINTS A(N) AND T(N) ARE PROVIDED ON DRAWINGS S5-51 THROUGH S5-66. BOTH THE NORTH AND SOUTH ARCH RIB CONTROL POINT WEST ARE USE TO ESTABLISH THE LOCAL COORDINATE SYSTEM FOR THE HANGER WORK POINTS A(N) AND T(N) AND HAVE COORDINATES OF (X=0, Y=0, Z). COORDINATES "Z" ARE SET EQUAL TO ACTUAL ELEVATIONS.

LEGEND:

- HANGER LOWER WORK POINTS T(N) (SEE NOTE 2)
- ARCH RIB INITIAL WP (SEE NOTE 2)
- ARCH RIB CONTROL POINT
- EDGE GIRDER INITIAL WP T(N) (SEE NOTE 2)

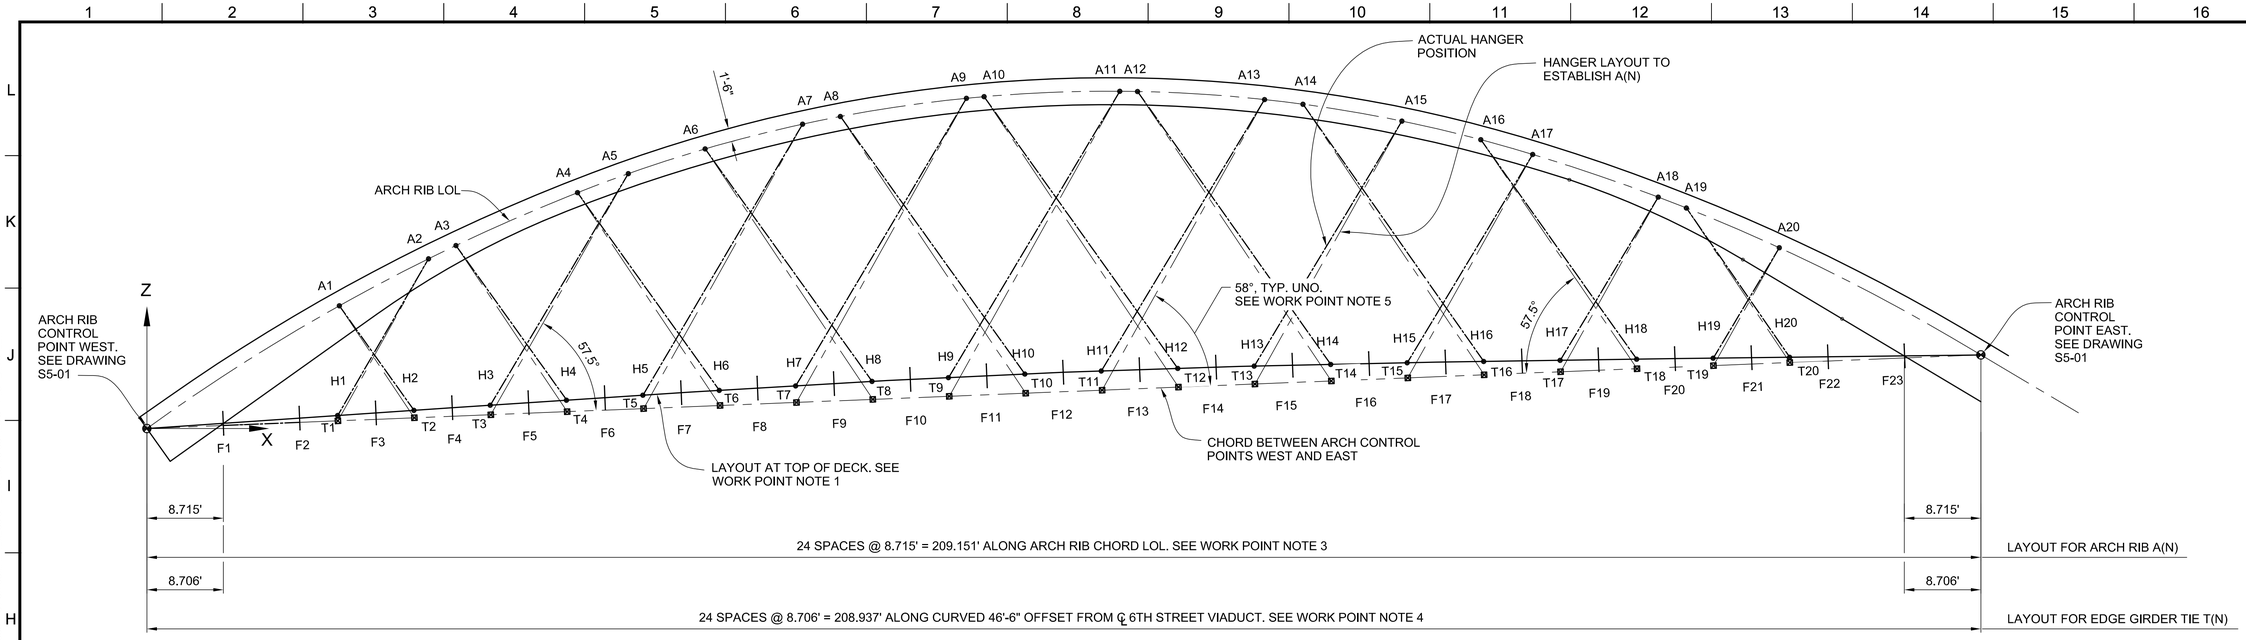
Sheet Version 3.0

ADDENDUM 5



ARCH RIB ELEVATION - SPAN 3 NORTH

NO SCALE

LEGEND:

T(N)	INDICATES HANGER WORK POINT AT TOP OF DECK
A(N)	INDICATES HANGER WORK POINT ALONG ARCH RIB LAYOUT LINE
H(N)	INDICATES HANGER MEMBER
F(N)	INDICATES FLOOR BEAM CENTER LINE WITH RESPECT TO ℄ 6TH STREET VIADUCT
LL+ I	HL93 LIVE LOAD
PL	PEDESTRIAN LIVE LOAD
FULL PL	PEDESTRIAN LOAD ACROSS ENTIRE VIADUCT
•	T(N) AND A(N) WORK POINTS
⊠	ARCH RIB A(N) WP

WORK POINT NOTES:

1. SEE DRAWING S5-50 FOR LAYOUT OF A(N) AND T(N) WORK POINTS.
2. HANGER LENGTH SHOWN IS BASED ON THE THEORETICAL STRAIGHT LINE DIMENSIONS. WORK POINT TO WORK POINT, AND DOES NOT INCLUDE HANGER SAG. WORK POINTS ARE FINAL THEORETICAL COORDINATES REPRESENTING THE VERTICAL AND HORIZONTAL ALIGNMENT.
3. WORK POINT A(N) IS ALONG ARCH RIB LOL AT ℄ ARCH RIB.
4. WORK POINTS T(N) ARE STATIONS OFFSET 46'-6" RELATIVE TO ℄ 6TH STREET VIADUCT.
5. THE HANGER ANGLE SHOWN IS APPROXIMATE AND IS MEASURED FROM THE CHORD BETWEEN ARCH CONTROL POINTS WEST AND EAST AND IS USED TO ESTABLISH ARCH RIB WORK POINTS A(N). THE ACTUAL HANGER INSTALLATION ANGLE WILL BE ESTABLISHED BETWEEN WORK POINTS A(N) AND T(N).

HANGER FORCE NOTES:

1. FOR HANGER ANCHORAGE DETAILS, SEE DRAWING S5-70 TO S5-74.
2. LOAD "DEAD LOAD W/O FWS" INCLUDES ALL DEAD LOAD (EXCEPT FUTURE WEARING SURFACE), ERECTION STRESSES, HANGER PRESTRESS, AND DECK POST-TENSION FOR THE COMPLETED BRIDGE CONDITION. LOAD "FWS" INCLUDES MASS OF FUTURE WEARING SURFACE ONLY. ALL FORCES ARE UNFACTORED.
3. DEAD LOAD HANGER FORCES PROVIDED ARE VALUES DEVELOPED IN DESIGN. CONTRACTOR SHALL INSTALL AND TENSION HANGERS ACCORDING TO APPROVED ERECTION MANUAL. SEE DRAWING NOS. S9-05 THROUGH S9-07 FOR CONSTRUCTION SEQUENCE.

CAMBER NOTES:

1. THE CONTRACTOR SHALL DETERMINE ALL DEFLECTION AND CAMBER VALUES BASED ON THE SELECTED ERECTION SEQUENCE.
2. SEE DRAWING NO. S9-05 FOR CONSTRUCTION SEQUENCE AND GEOMETRY CONTROL SUBMITTAL REQUIREMENTS.
3. SEE NOTE NO. 5 ON DRAWING NO. S5-23 FOR CONSTRUCTION TOLERANCE REQUIREMENTS AT ARCH RIB.

ADDENDUM 5

ELEVATION

SCALE: 1"=1'-0"

OUTSIDE ECCENTRICITY

NOTES:

1. STRUCTURAL STEEL SHALL BE ASTM A709 GRADE 50, Fy = 50 KSI. ALL STRUCTURAL STEEL SHALL BE HOT DIPPED GALVANIZED.
2. ANCHOR RODS SHALL BE ASTM F1554 GRADE 105, Fy=105 KSI WITH WASHER. RODS, NUTS AND WASHERS SHALL BE GALVANIZED IN ACCORDANCE WITH ASTM A153. S5 CHARPY V-NOTCH TESTING REQUIRED.
3. CONTRACTOR SHALL SEAL THE PIPE SLEEVE IN A MANNER THAT WILL NOT ALLOW COMPRESSION OF THE PIPE SLEEVE DURING ROD TENSIONING. CONTRACTOR SHALL KEEP ROD OPENINGS AND PIPE SLEEVES FREE OF GROUT DURING INSTALLATION OF GROUT PAD.
4. THE ANCHOR AND TRAP PLATE, RODS AND PIPE SLEEVE SHALL BE CAST IN CONCRETE. THE GROUT PAD AND UPPER HANGER BRACKET WILL BE INSTALLED AT A LATER DATE. RODS SHALL BE PERPENDICULAR TO THE LOCAL PROFILE OF THE ARCH RIB OR EDGE GIRDER. GROUT PAD WILL FOLLOW THE LOCAL GRADE AND WILL BE TAPERED TO ACCOUNT FOR CROSS SLOPE. GROUT PAD HEIGHT SHOWN ON THE PLANS IS THE MINIMUM DIMENSION AT THE ℄ OF HANGER BRACKET.
5. HANGER BRACKETS AT ARCH RIBS SHALL BE PLACED PARALLEL TO THE LOCAL TANGENT OF THE ARCH RIB INTRADOS. PROVIDE 1" THICK GROUT PAD & VARY THICKNESS.
6. PIN AND COTTER PIN SHALL BE STAINLESS STEEL WITH A MINIMUM YIELD STRENGTH OF 50 KSI, NITRONIC 60 OR APPROVED EQUAL.
7. ANCHOR RODS SHALL BE INSTALLED WITH A TENSILE FORCE EQUAL TO 90 KIPS AFTER SEATING.
8. HANGER BRACKETS ARE DETAILED BASED ON THE DIMENSIONAL REQUIREMENTS OF PROLITE SOCKETS AS MANUFACTURED BY CLODFELTER BRIDGE AND STRUCTURES INTERNATIONAL, INC. IF A DIFFERENT HANGER TYPE OR MANUFACTURER IS SELECTED, THE CONTRACTOR'S ENGINEER SHALL VERIFY FIT UP AND CAPACITY OF THE HANGER FORK, PIN, AND FIN PLATES, AND ADJUST DIMENSIONS AND PLATE THICKNESS IF REQUIRED. DESIGN CALCULATIONS SHALL BE SUBMITTED WITH SHOP DRAWINGS.
9. FOR HANGER WORK POINT A(N) AND T(N) LOCATIONS, SEE DRAWING S5-50.
10. AFTER PLACING NON-SHRINK EPOXY GROUT, REPLACE 3/4" Ø SET SCREW WITH HS BOLT AND TIGHTEN TO SEAL.
11. OUT-OF-PLANE ANGLE OF PIN PLATE SHALL BE ESTABLISHED FROM HANGER WORK POINTS SHOWN ON DRAWINGS NOS. S5-51 THROUGH S5-66.
12. THE INSTALLED OUT-OF-PLANE ANGLE DEVIATION BETWEEN THE HANGER AND BOTH THE ARCH RIB AND EDGE GIRDER FIN PLATES SHALL NOT EXCEED 0.75°. IF ANY ANGLE EXCEEDS THESE LIMITS, THE FIN PLATE AND BASE PLATE WHERE THE ANGLE IS EXCEEDED SHALL BE REPLACED.
13. WHERE INTERFERENCE WITH EDGE GIRDER POST TENSIONING DUCTS OCCURS, INCREASE ANCHOR BOLT SPACING AS SHOWN, INCREASE BASE PLATE THICKNESS TO 3" AND SPLIT TRAP PLATE INTO TWO 6" x 3'-5" PLATES. SEE DRAWING NO. S6-87 FOR LOCATIONS.
14. AT ARCH RIB INTRADOS, INCREASE HANGER ECCENTRICITY WHERE HANGER SOCKETS CROSS. CONTRACTOR SHALL DETERMINE THE REQUIRED ECCENTRICITY BASED ON THE DIMENSIONS OF HANGER SOCKETS FURNISHED. SEE "PLAN VIEW OF HANGER ECCENTRICITY" ON DRAWING NO. S5-71.
15. UNLESS SHOWN OTHER WISE ON DRAWING NOS. S5-21 THROUGH S5-32, DIMENSIONS PROVIDED FOR FIN PLATE MUST BE MAINTAINED. IN ALL CASES, THE SHAPE OF FIN PLATES SHALL BE ADJUSTED TO CONFORM TO THE INSTALLATION ANGLE BETWEEN THE HANGER AND ARCH RIB INTRADOS.
16. THE DISTANCE BETWEEN THE CENTER OF THE PIN AND TOP OF THE BASE PLATE MAY BE INCREASE TO 15" TO ACCOMMODATE HANGER SOCKET MOUNTED JACKS USE FOR HANGER STRESSING DURING HANGER INSTALLATION.
17. PLACE HANGER VERTICAL REINFORCEMENT UNSYMMETRICAL ABOUT THE HANGER BRACKET ANCHOR RODS AS SHOWN. THE LARGER REINFORCEMENT SPACING IS ALWAYS IN THE DIRECTION OF THE HANGER BRACKET ECCENTRICITY. THIS PLACEMENT WILL ALIGN TWO VERTICAL BARS EITHER SIDE OF THE HANGER BRACKET WHEN THE TYPICAL NOMINAL HANGER ECCENTRICITY IS 2". ADJUST REINFORCEMENT AS REQUIRED WHEN HANGER ECCENTRICITY EXCEEDS 2" NOMINAL. SEE NOTE 14.

CONSTRUCTION SEQUENCE FOR HANGER BRACKET:

1. FILL PIPE SLEEVES WITH GREASE. TAPE BOTH THREADED ENDS OF THE ANCHOR ROD THREADS THAT WILL RECEIVE NUTS, THEN GREASE THE ANCHOR RODS AND INSERT THEM INTO THE PIPE SLEEVES WHICH ARE SEAL-WELDED TO THE ANCHOR PLATE.
2. ATTACH THE SINGLE HEAVY HEX NUTS TO THE EMBEDDED END OF THE ANCHOR ROD, FILL THE TRAP PLATE HEX NUT HOLE WITH GREASE, INSTALL THE TRAP PLATE, THEN INSTALL AND SECURE THE COVER PLATE WITH THE 3/4" Ø BOLTS.
3. INSTALL THE ANCHOR ROD ASSEMBLY IN THE EDGE GIRDER/ARCH RIB FORMS AND USE A TEMPORARY TEMPLATE TO SECURE THE ANCHOR RODS AND ENSURE THEIR CORRECT ALIGNMENT AT THE FINISHED CONCRETE SURFACE. AT EDGE GIRDERS, SEAL THE ANNULAR SPACE BETWEEN THE PIPE SLEEVE AND ANCHOR ROD AT THE CONCRETE SURFACE TO PREVENT WATER INTRUSION INTO THE SLEEVE.
4. CAST THE EDGE GIRDER/ARCH RIB CONCRETE.
5. REMOVE THE TEMPORARY TEMPLATE AND INSTALL THE HANGER BRACKET. SECURE THE HANGER BRACKET WITH THE FIRST SET OF TEN SINGLE HEAVY HEX NUTS USING THE SET SCREWS TO POSITION THE ANCHOR ASSEMBLY AS SPECIFIED IN THE DETAILS.
6. TIGHTEN THE FIRST SET OF HEAVY HEX NUTS TO SNUG-TIGHT AND PLACE THE NON-SHRINK GROUT PAD.
7. PRE-TENSION EACH ANCHOR ROD IN THE STRESSING SEQUENCE DESCRIBED BELOW. THEN INSTALL AND TIGHTEN THE SECOND SET OF HEAVY HEX NUTS AS SPECIFIED FOR STANDARD DOUBLE NUT INSTALLATION.

SCALE: 1"=1'-0"

A / S5-72

ANCHOR ROD STRESSING SEQUENCE:

1. PRIOR TO STRESSING ANCHOR RODS, ANCHOR RODS SHALL BE VERIFIED TO FULLY ENGAGE HEAVY HEX NUTS IN TRAP PLATE EITHER BY VISUAL INSPECTION AT THE TIME OF INSTALLATION OR BY TIGHTENING THE ANCHOR ROD UNTIL THE END IS IN FLUSH CONTACT WITH THE BOTTOM COVER PLATE AND THE HEAVY HEX NUT IS IN CONTACT WITH THE ANCHOR PLATE.
2. ANCHOR RODS SHALL BE STRESSED IN THE NUMERICAL SEQUENCE SHOWN ON THE "ANCHOR AND TRAP PLATE DETAIL".
3. ALL ANCHOR RODS SHALL FIRST BE BROUGHT TO THE SNUG TIGHT CONDITION IN THE SAME SEQUENCE NOTED IN STEP 1.
4. SEE NOTE 7 FOR REQUIRED ANCHOR ROD TENSION.

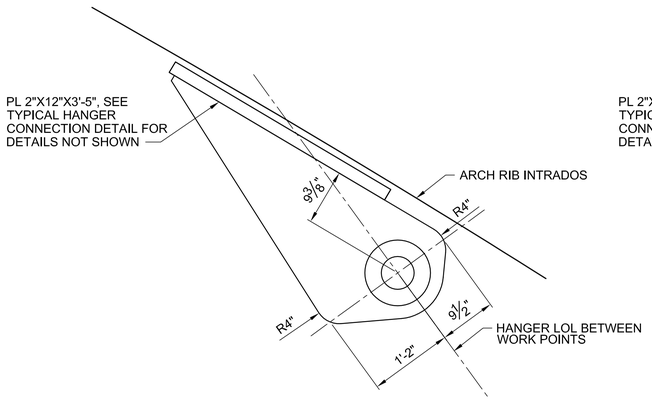
NOTES:

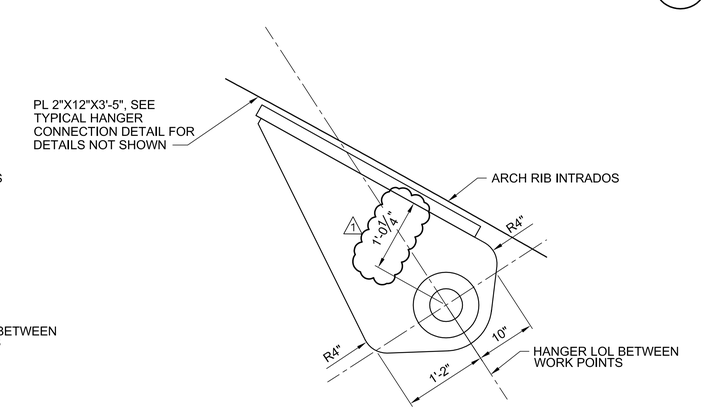
1. FOR UPPER HANGER BRACKET DETAILS, ANCHOR REINFORCEMENT AND NOTES NOT SHOWN HERE SEE SHEET S5-72.
2. ANCHOR BOLTS SHALL BE ASTM F1554 GRADE 105, Fy=105 KSI WITH WASHER. RODS, NUTS AND WASHERS SHALL BE GALVANIZED IN ACCORDANCE WITH ASTM A153. S5 CHARPY V-NOTCH TESTING REQUIRED.

CONSTRUCTION SEQUENCE:

1. PLACE PIPE SLEEVES IN CORRECT LOCATIONS AND HOLD IN PLACE WITH TEMPLATE.
2. CAST THE ARCH RIB CONCRETE.
3. PLACE ARCH RIB EXTRADOS ANCHOR PLATE. FILL PIPE SLEEVES WITH GREASE. TAPE THREADED ENDS OF THE ANCHOR BOLTS THREADS THAT WILL RECEIVE NUTS, THEN GREASE THE ANCHOR RODS AND INSERT THEM INTO THE PIPE SLEEVES. PLACE NON-SHRINK GROUT BELOW ARCH RIB EXTRADOS ANCHOR PLATE.
4. REMOVE THE TEMPORARY TEMPLATE AND INSTALL THE HANGER BRACKET. SECURE THE HANGER BRACKET WITH THE FIRST SET OF TEN SINGLE HEAVY HEX NUTS USING THE SET SCREWS TO POSITION THE ANCHOR ASSEMBLY AS SPECIFIED IN THE DETAILS.
5. TIGHTEN THE FIRST SET OF HEAVY HEX NUTS TO SNUG-TIGHT AND PLACE THE INTRADOS NON-SHRINK GROUT PAD.
6. PRE-TENSION EACH ANCHOR BOLTS IN THE STRESSING SEQUENCE DESCRIBED ON DRAWING NO. S5-72. THEN INSTALL AND TIGHTEN THE SECOND SET OF HEAVY HEX NUTS AS SPECIFIED FOR STANDARD DOUBLE NUT INSTALLATION.



SPAN 12 - HANGERS H1 AND H18



SPANS 4 AND 6 - HANGERS H2 AND H23

REQUIRED ARCH RIB FIN PLATE DIMENSION ADJUSTMENTS

NOTES:

1. FOR HANGER GEOMETRY, SEE DWGS. S5-49 TO S5-66.
2. PENDANT PLATE AND HANGER SLEEVE BRACKET SHALL BE ULTRA HIGH MOLECULAR WEIGHT POLYETHYLENE (UHMW-PE). UHMW-PE COMPONENTS SHALL MEET FEDERAL STANDARD 595B, NO. 363.7 GRAY. BOLTS, NUTS, AND WASHERS SHALL BE GALVANIZED IN CONFORMANCE WITH ASTM A153.
3. HANGER SPACER DETAILS SHOWN ARE FOR NOMINAL HANGER DIAMETER. ACTUAL FIT-UP SHALL BE VERIFIED BY CONTRACTOR AND REQUIRED CHANGES SHALL BE SUBMITTED WITH SHOP DRAWINGS FOR APPROVAL. AFTER BOTH HANGERS HAVE BEEN FULLY TENSIONED PER THE SPECIAL PROVISION, THE HANGER SPACER BOLTS SHALL BE FULLY TIGHTENED.
4. DISTANCE BETWEEN HANGERS VARY. VARY THICKNESS OF PENDANT PLATE SO THAT HANGER OFFSET DISTANCE IS NOT INCREASED OR DECREASED BY MORE THAN 3/16" DURING INSTALLING OF HANGER SPACERS. MULTIPLE PENDANT PLATES MAY BE USED WITH A MINIMUM THICKNESS OF 3/8" PER PLATE.

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

ADDENDUM 5

SECTION
SCALE: 3/4"=1'-0"
C S6-06

NOTES:

1. PROVIDE ADEQUATE SPACE BETWEEN #14 ARCH RIB FLOOR BEAM (ARFB) BARS TO PROVIDE CLEARANCE FOR #14 ARCH RIB TOP #14 BARS. WHERE #14 ARFB SPACING EXCEEDS 18" DUE TO INTERFERENCE WITH #14 ARCH RIB TOP BARS, ADD #10 ACROSS THE FULL LENGTH OF THE ARFB AND CUT AND REMOVE PORTIONS OF THE ADDED #10 BAR WHERE INTERFERENCE OCCURS WITH THE #14 ARCH RIB TOP BARS.
2. POST TENSIONING DUCTS FOR ABUT 13 ARCH RIB FLOOR BEAM CAN BE MOVED HORIZONTALLY ±3" AND ±2" VERTICALLY.
3. SEE DRAWING NO. SL-406 FOR 10" x 16" x 8" ELECTRICAL PULLBOX. ADJUST FLOOR BEAM REINFORCEMENT AS REQUIRED AND ORIENTATE PULLBOX AS SHOWN.

* DISTANCE IS MEASURED ALONG ℄ OF 6TH STREET VIADUCT FOR "D" TENDONS 2

NOTES:

1. ALL INTERIOR FLOOR BEAMS ARE PLACED ON A 15° SKEW TO RADIAL LINES AT CURVED ALIGNMENT AND TO NORMAL LINES AT TANGENT ALIGNMENT TO THE ℄ OF 6TH STREET VIADUCT, UON.
2. THE ARCH RIB FLOOR BEAM LOL IS THE PLAN VIEW PROJECTION OF THE LINE THAT CONNECTS THE WEST AND EAST ARCH RIB CONTROLS POINTS AND IS USED TO LAYOUT BENT GEOMETRY AS SHOWN ON DRAWING NO. S3-12 AND TO ESTABLISH TYPICAL FLOOR BEAM SPACING AS SHOWN ON THIS DRAWING. THE ACTUAL LAYOUT OF THE ARCH RIB FLOOR BEAMS USES THE PROJECTED ARCH FLOOR BEAM LOL SHOWN ON DRAWING NOS. S3-15 AND S3-21.
3. THE ℄ OF INTERIOR FLOOR BEAMS SHALL BE PLACED AT EQUAL SPACING ALONG THE ℄ OF 6TH STREET VIADUCT, BETWEEN STATIONS OF ARCH RIB FLOOR BEAMS. FLOOR BEAM SPACING SHOWN IS APPROXIMATE. SEE NOTES 4 & 10 FOR EXCEPTIONS TO THE EQUAL SPACING LAYOUT.
4. WITHIN THE JUMP SPANS, MODIFY THE 'EQUAL SPACING' LOCATION OF THE INTERIOR FLOOR BEAMS THAT ARE IMMEDIATELY ADJACENT TO ARCH RIB FLOOR BEAMS. THE LOCATION OF THESE FLOOR BEAMS ARE MODIFIED BY RELOCATING THEM AN ADDITIONAL 2'-6" OFFSET AWAY FROM THE ARCH RIB FLOOR BEAM, EXCEPT USE THE SMALLER OFFSET SHOWN IN THE TABLE BELOW AT THE LOCATIONS ALSO SHOWN IN THE TABLE.

ARCH RIB FLOOR BEAM LOCATION	ADDITIONAL FLOOR BEAM OFFSET
BENT 4, EAST	1'-0"
BENT 5, WEST	1'-0"
BENT 6, EAST	1'-0"
BENT 7, WEST	1'-0"

5. THE CONTRACTOR SHALL DETERMINE ALL DEFLECTION AND CAMBER VALUES BASED ON THE SELECTED ERECTION SEQUENCE. SEE DRAWING NO. S9-05 FOR CONSTRUCTION SEQUENCE AND GEOMETRY CONTROL SUBMITTAL REQUIREMENTS.
6. ARCH RIBS AND Y-BENT ARMS NOT SHOWN FOR CLARITY.
7. WHERE INDICATED IN THE TABLE BELOW, OMIT THE FLOOR BEAM ADJACENT TO THE ARCH RIB FLOOR BEAM. THE NUMBER OF FLOOR BEAMS SHOWN IN THE "FLOOR BEAM LAYOUT TABLE" INCLUDES THE OMITTED FLOOR BEAMS.

ARCH SPAN	LOCATION
3	WEST
5	EAST
7	EAST
9	EAST
12	EAST

8. FOR TENDON LAYOUT NOMENCLATURE, AND ADDITIONAL POST TENSIONING DATA, SEE DRAWING NO. S6-80. FOR "J" TENDON DATA, SEE DRAWING S6-18.
9. DISTANCE ARE MEASURED ALONG EDGE GIRDER LOL FROM THE FACE OF THE ANCHORAGE OR COUPLER PLATE. A POSITIVE NUMBER IS AHEAD STATION, A NEGATIVE NUMBER IS BACK STATION.
10. WITHIN THE ARCH SPANS, MODIFY THE 'EQUAL SPACING' LOCATION OF THE INDICATED INTERIOR FLOOR BEAMS THAT ARE IMMEDIATELY ADJACENT TO ARCH RIB FLOOR BEAMS. THE LOCATION OF THESE FLOOR BEAMS ARE MODIFIED BY RELOCATING THEM AN ADDITIONAL OFFSET DISTANCE AS INDICATED IN THE TABLE BELOW AWAY FROM THE ARCH RIB FLOOR BEAM. 3

ARCH RIB FLOOR BEAM LOCATION	FLOOR BEAM	ADDITIONAL FLOOR BEAM OFFSET
BENT 4, WEST	E1	2'-10"
	E2	1'-0"

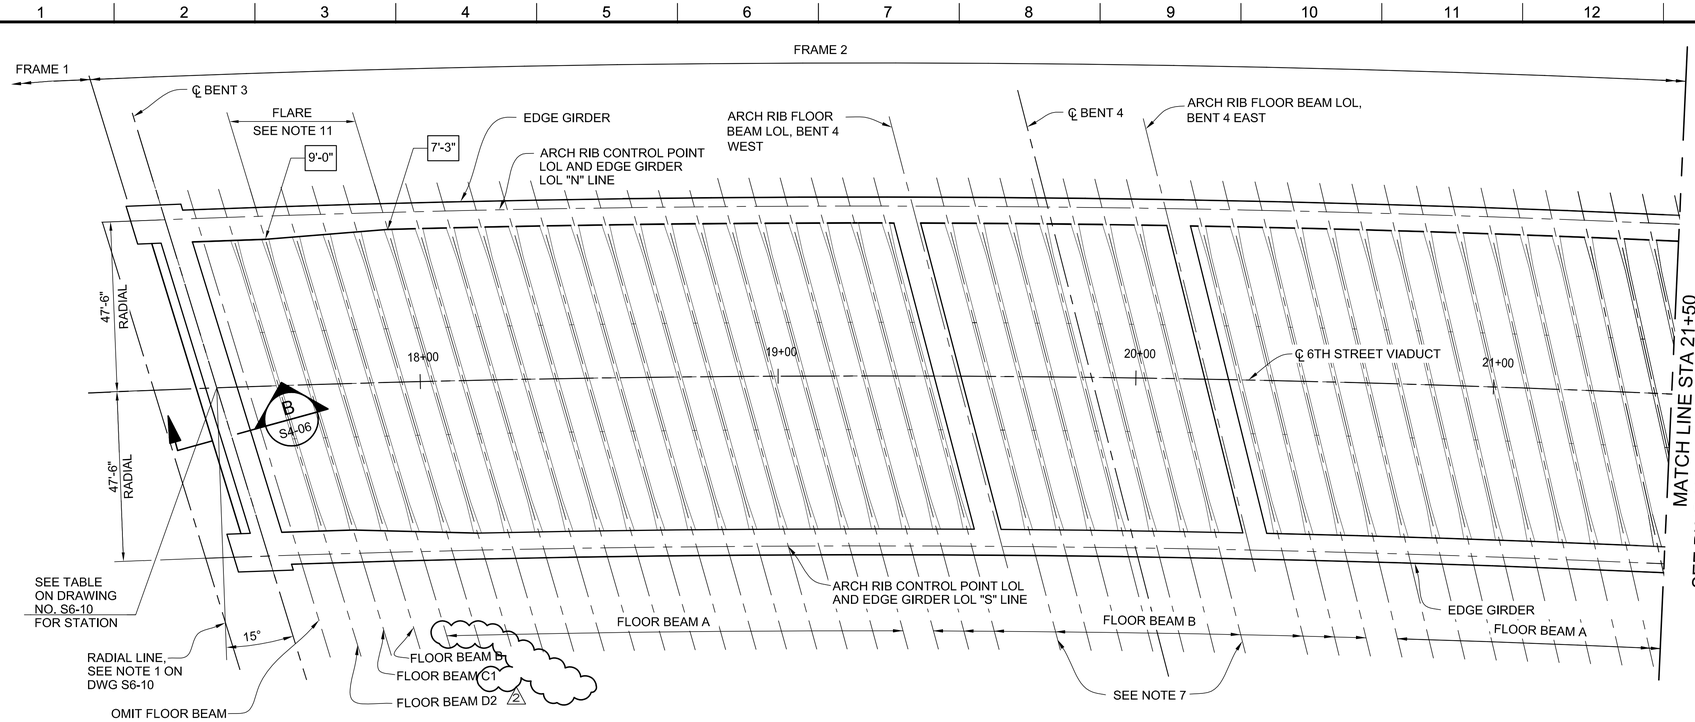
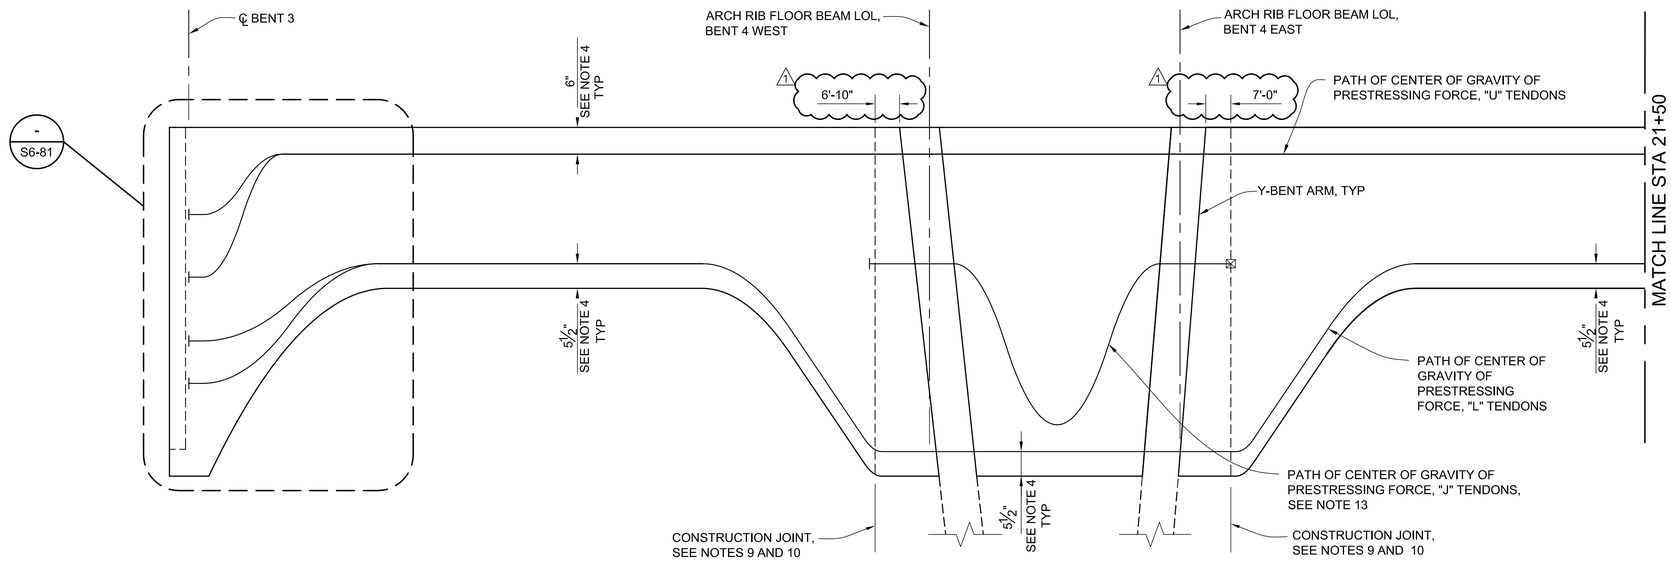
ADDENDUM 5



DECK FRAMING PLAN

SCALE: 1" =20'



LONGITUDINAL SECTION

SCALE: HORIZ: 1" =20'
VERT: 3/4" =1'-0"

NOTES:

1. FOR INTERIOR FLOOR BEAM DETAILS, SEE DRAWING NOS. S7-01 THRU S7-05.
2. FOR ARCH RIB FLOOR BEAM DETAILS, SEE DRAWING NOS. S3-15 AND S3-20 THRU S3-25.
3. FOR TYPICAL FLOOR BEAM LAYOUT, SEE DRAWING NO. S6-10.
4. DISTANCE TO CENTER OF GRAVITY OF PRESTRESSING IS MEASURED NORMAL TO SURFACE.
5. FOR EDGE GIRDER AND DECK SLAB LONGITUDINAL POST TENSIONING NOTES AND ANCHORAGE DETAILS, SEE DRAWINGS S6-80 THROUGH S6-93.
6. ARCH RIBS AND Y-BENT ARMS NOT SHOWN FOR CLARITY.
7. SEE NOTE 4 ON DRAWING NO. S6-10.
8. FOR DISTANCE TO THEORETICAL POINT OF NO MOVEMENT, SEE POST TENSIONING DATA TABLE ON DRAWING NO. S6-10. DISTANCES TO THEORETICAL POINTS OF NO MOVEMENT ARE MEASURED ALONG EDGE GIRDER LOL'S TO THE INTERSECTION OF VERTICAL PLANES PASSING THROUGH THE INTERSECTING TRANSVERSE ELEMENT LOL'S. NEGATIVE VALUES ARE MEASURED BACK STATION, POSITIVE VALUES ARE MEASURED AHEAD STATION.
9. FOR CONSTRUCTION JOINT LOCATIONS, SEE DRAWING NOS. S6-85 & S9-08. (1)
10. PRIOR TO CONTINUING CONCRETE PLACEMENT AT CONSTRUCTION JOINTS IN EDGE GIRDERS, THE EXISTING CONCRETE SURFACE AT THE CONSTRUCTION JOINT INTERFACE SHALL BE PREPARED BY REMOVING ALL LAITANCE AND INTENTIONALLY ROUGHENING THE SURFACE TO AN AMPLITUDE OF ¼". AT DECK CONSTRUCTION JOINTS, SEE B0-5 / 5-2
11. EDGE GIRDER FLARE WIDTHS ARE MEASURED AT FLOOR BEAM CENTERLINE AND AT TOP OF DECK LEVEL. EDGE GIRDER WIDTHS AT FLARE ARE TYPICAL FOR NORTH AND SOUTH EDGE GIRDER. WHERE LONGITUDINAL REBAR INTERFERES WITH POST TENSIONING TRANSITION LAYOUT, ADJUST POST TENSIONING UPWARD OR DOWNWARD VERTICALLY TO CLEAR, SEE NOTE 1 ON DRAWING NO. S6-90.
12. CLOSURE POUR LENGTH WITHIN EDGE GIRDER TO BE AS REQUIRED FOR INSTALLATION OF POST TENSIONING COUPLER DEVICES. CONSTRUCTION JOINT IN DECK BETWEEN EDGE GIRDERS TO BE LOCATED AT MID-BAY OF FLOOR BEAMS. DECK POST TENSIONING DUCTS AT CONSTRUCTION JOINT TO BE COUPLED PRIOR TO CLOSURE POUR. DECK POST TENSIONING TENDONS TO BE INSTALLED AND STRESSED AFTER ADJOINING FRAMES ARE COMPLETE.
13. FOR "J" TENDON PROFILE GEOMETRY AND POST TENSIONING DATA, SEE DRAWING NO. S6-18.
14. FOR EDGE GIRDER AND DECK PRESTRESSING SUMMARY LAYOUT, SEE DRAWING NO. S6-20.
15. LAYOUT OF ARCH RIB FLOOR BEAMS BETWEEN FACES OF Y-BENT ARMS USES THE PROJECTED ARCH RIB FLOOR BEAM LOL. SEE DRAWING NO. S3-21

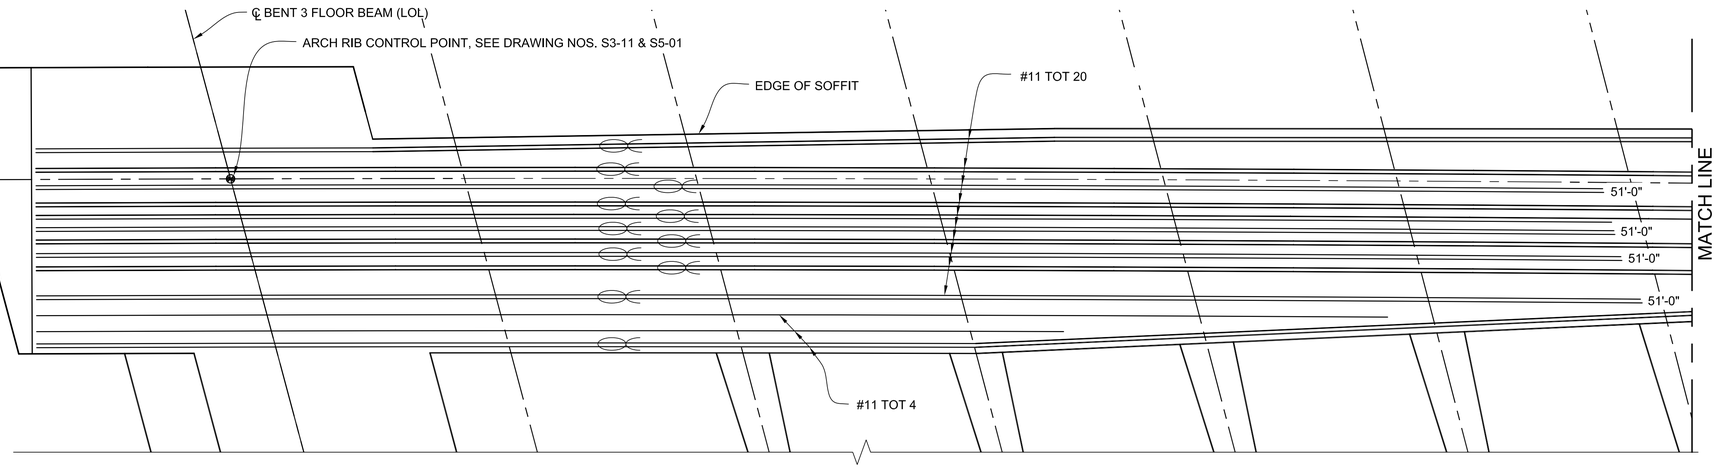
EDGE GIRDER TOP REINFORCEMENT

SCALE: 3/8" =1'-0"



EDGE GIRDER BOTTOM REINFORCEMENT

SCALE: 3/8" =1'-0"

NOTES:

1. TRANSVERSE REINFORCEMENT SHALL BE PLACED RADIALLY OR NORMAL TO ℄ 6TH STREET VIADUCT.
2. FOR TRANSVERSE REINFORCEMENT LAYOUT MODIFICATION AT FLOOR BEAM POST TENSIONING ANCHORAGE LOCATIONS, SEE DRAWING S7-04.
3. FOR HANGER BRACKET AND EMBED DEPICTION, SEE DRAWING S6-72.
4. FOR EDGE GIRDER POST TENSIONING DETAILS, SEE DRAWINGS S6-20 AND S6-80 THROUGH S6-94.
5. NORTH EDGE GIRDER SHOWN, SOUTH EDGE GIRDER SIMILAR AND SYMMETRIC ABOUT ℄ 6TH ST VIADUCT.
6. DIMENSION AT END OF BARS INDICATES LENGTH FROM NEAREST BENT, ARCH RIB OR ABUTMENT FLOOR BEAM LOL.
7. FOR ADDITIONAL REINFORCEMENT TERMINATION DETAIL, SEE DETAIL 1, DRAWING S5-23.
8. FOR EDGE GIRDER STIRRUP DETAILS AT Y-BENT JOINT, SEE DRAWING S3-24.
9. FOR STIRRUP TYPES AND BUNDLE DETAILS, SEE TIE DETAIL ON DRAWING NO. S6-76.

LEGEND:

- BUNDLED BARS
- EMBEDDED PULL BOX (SEE DRAWING NO. SL-404)
- SURFACE MOUNTED JUNCTION BOX (SEE DRAWING NO. SL-404)
- HANGER BASE PLATE WITH WORK POINT

KEY ELEVATION

1. The rectangular shaped box with a circle does represent hanger brackets. Drawing S6-87 represents the typical transition of the widened edge girder at construction joints at Bents 6, 8 and 10 in arch spans to the typical edge girder width of 7'-3". See Note 3 on Drawing S6-87. All hanger work point locations are provided in Drawings S5-49 through S5-74. Provided dimensions and stations should always be used and drawings should never be scaled. The PT profile is provided in the Prestress Elevation. This elevation is applicable at all frame construction joints. See Note 6 on Drawing S6-87 for further information.

2. At the "Inside Eccentricity" and "Outside Eccentricity", all details below the baseplate are identical. Therefore, details below the baseplate at the Outside Eccentricity have not been repeated. Standard bridge detailing practice dictates that dimensions and details are only shown once to avoid confusion. This practice differs from shop drawings where details are repeated often to assist with fabrication. Details should not be scaled. Typical locations of PT ducts are provided on Drawing S6-72.

3. At the first, second, and third lower hanger bracket, note 13 on Drawing S5-72 provides requirements when preparing shop drawings for hanger brackets at these locations.

4. Deck drain required locations at Arch Spans are depicted on Drawing S8-30. These locations should be used in conjunction with Drawing S8-32 to further establish the location of the deck inlets. Any location between the arch rib floor beam and the first typical floor beam that complies with the framing requirements of Drawing S8-32 is acceptable.

5. During previous discussions with SSW, it was determined that deck drainage piping should remain outside of the edge girder to avoid conflict with edge girder reinforcement. This slight adjustment will be recorded on the as-built drawings.

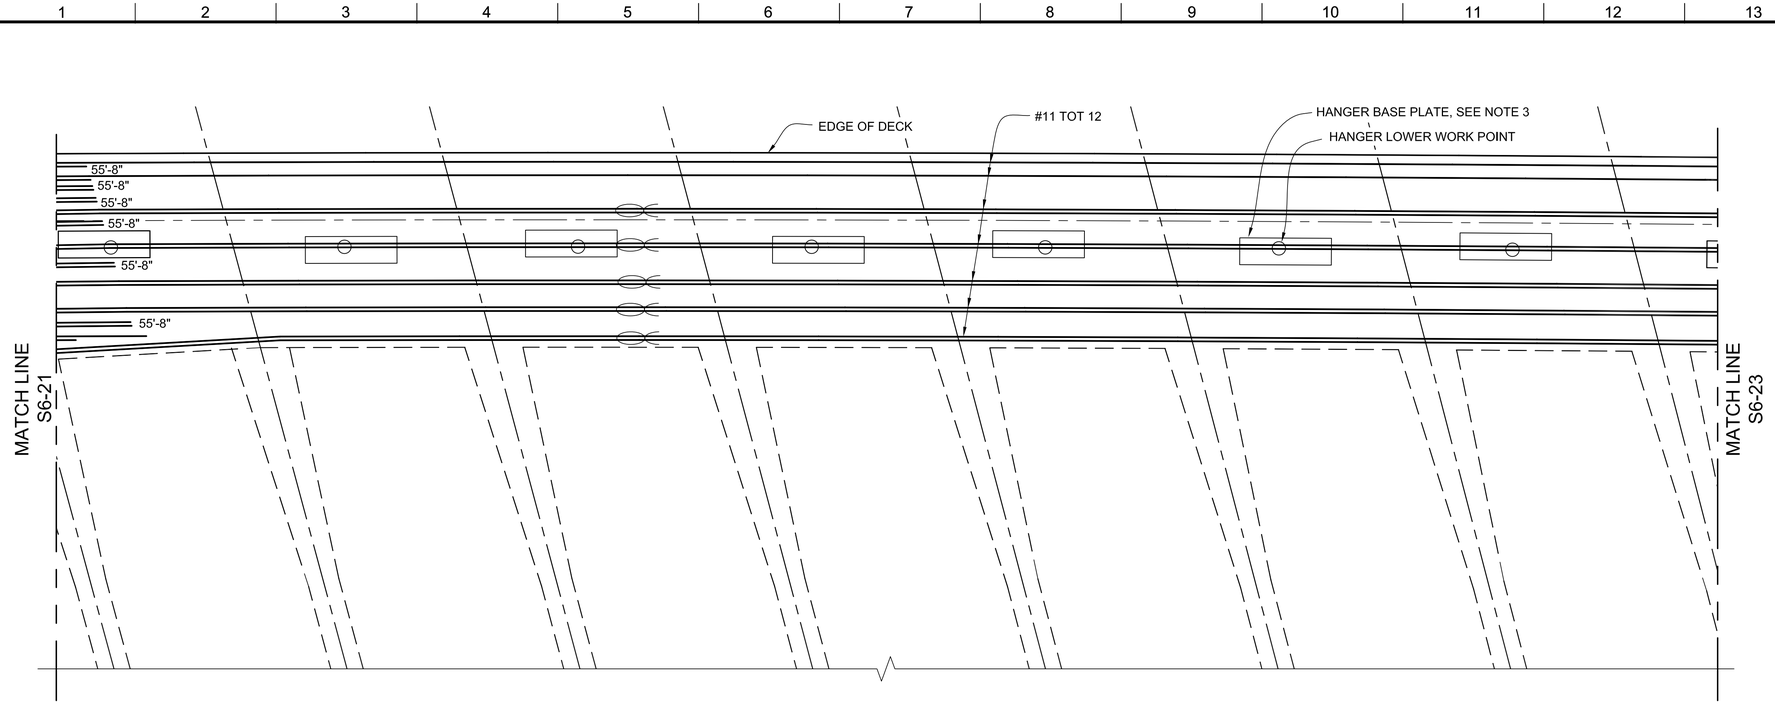
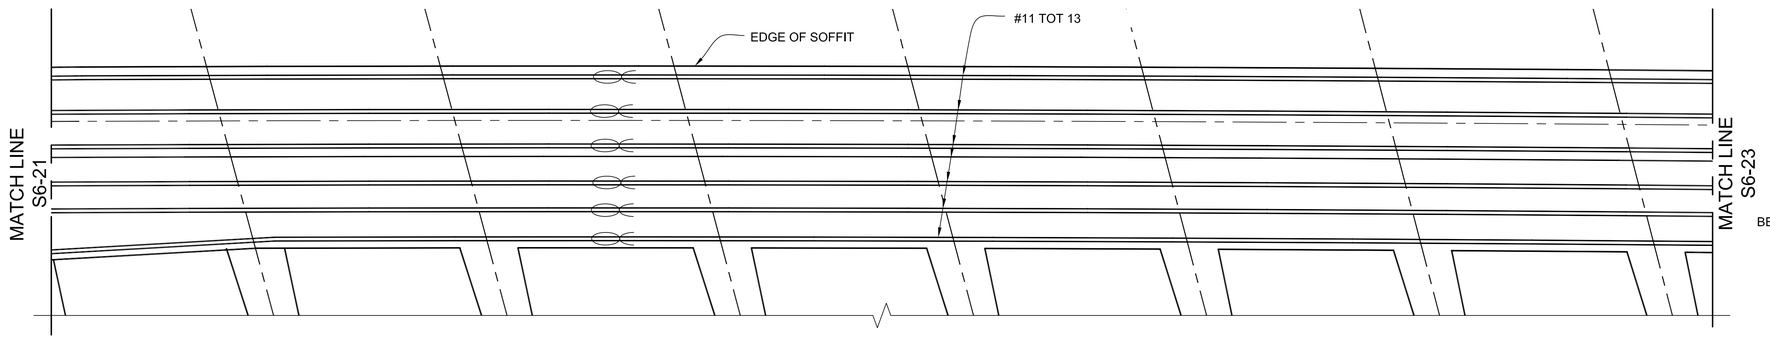
ADDENDUM 5



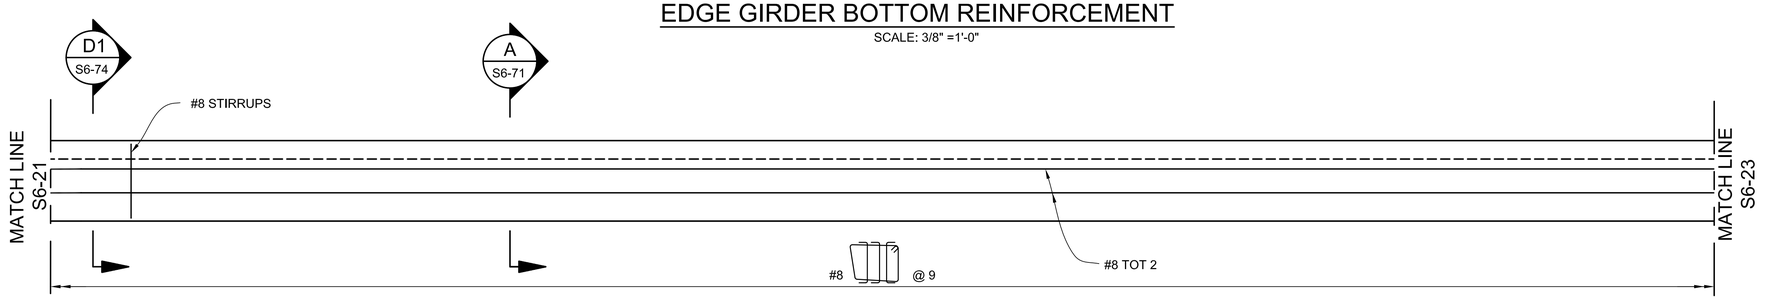
EDGE GIRDER TOP REINFORCEMENT

SCALE: 3/8" =1'-0"



EDGE GIRDER BOTTOM REINFORCEMENT

SCALE: 3/8" =1'-0"



LONGITUDINAL SECTION

SCALE: 3/8" =1'-0"

NOTES:

1. FOR NOTES AND LEGEND, SEE DRAWING S6-21.

1. The rectangular shaped box with a circle does represent hanger brackets. Drawing S6-87 represents the typical transition of the widened edge girder at construction joints at Bents 6, 8 and 10 in arch spans to the typical edge girder width of 7'-3". See Note 3 on Drawing S6-87. All hanger work point locations are provided in Drawings S5-49 through S5-74. Provided dimensions and stations should always be used and drawings should never be scaled. The PT profile is provided in the Prestress Elevation. This elevation is applicable at all frame construction joints. See Note 6 on Drawing S6-87 for further information.

2. At the "Inside Eccentricity" and "Outside Eccentricity", all details below the baseplate are identical. Therefore, details below the baseplate at the Outside Eccentricity have not been repeated. Standard bridge detailing practice dictates that dimensions and details are only shown once to avoid confusion. This practice differs from shop drawings where details are repeated often to assist with fabrication. Details should not be scaled. Typical locations of PT ducts are provided on Drawing S6-72.

3. At the first, second, and third lower hanger bracket, note 13 on Drawing S5-72 provides requirements when preparing shop drawings for hanger brackets at these locations.

4. Deck drain required locations at Arch Spans are depicted on Drawing S8-30. These locations should be used in conjunction with Drawing S8-32 to further establish the location of the deck inlets. Any location between the arch rib floor beam and the first typical floor beam that complies with the framing requirements of Drawing S8-32 is acceptable.

5. During previous discussions with SSW, it was determined that deck drainage piping should remain outside of the edge girder to avoid conflict with edge girder reinforcement. This slight adjustment will be recorded on the as-built drawings.

ADDRESS: SIXTH STREET VIADUCT (WHITTIER BLVD) LOS ANGELES, CA

WORK ORDER NO. E700224F

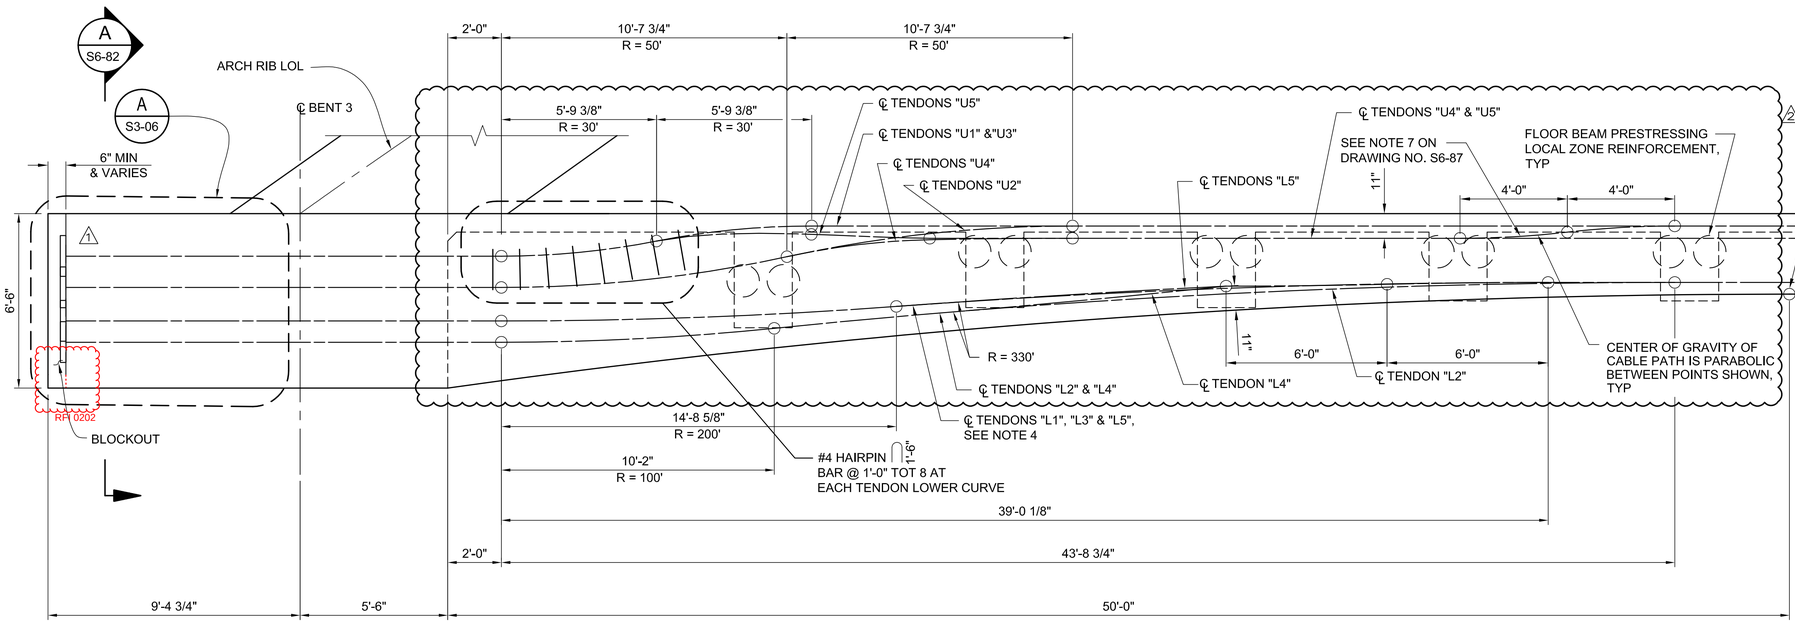
DRAWING NO. S6-79

SHEET 377 OF 560 SHEETS

ADDENDUM 5

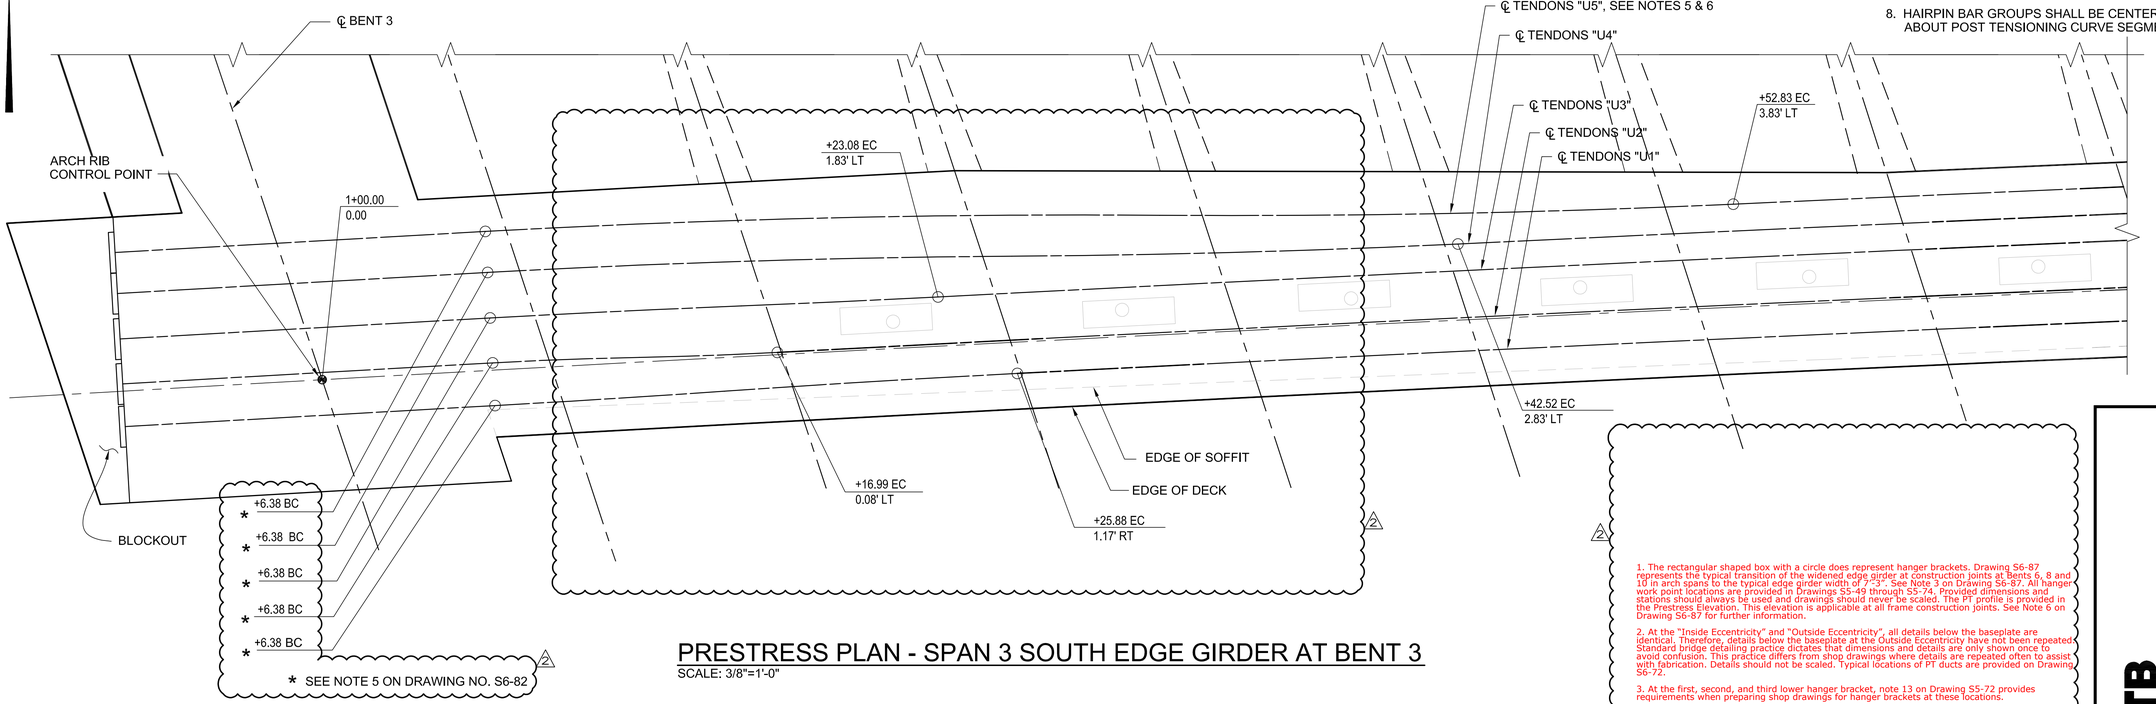


PRESTRESS ELEVATION - SPAN 3 AT BENT 3

SCALE: 3/8"=1'-0"

NOTES:

1. SOUTH EDGE GIRDER ELEVATION SHOWN, NORTH EDGE GIRDER ELEVATION SIMILAR.
2. FOR NORTH EDGE GIRDER PRESTRESS PLAN LAYOUT, SEE DRAWING S6-82.
3. CENTERLINE OF TENDONS ARE PARALLEL TO CENTERLINE OF 6TH STREET VIADUCT U.N.O.
4. FOR ℄ TENDON "L3" ADJUST VERTICAL CURVES TO ACHIEVE POSITION SHOWN AT SECTION A, DRAWING S6-82.
5. HORIZONTAL TENDON LAYOUT AND DATA SHOWN FOR "U" TENDONS. "L" TENDON LAYOUT SIMILAR, BUT OFFSET BY 9" NOMINAL CANT AT THE ANCHORAGE AS SHOWN BY SECTION A/S6-82. LONGITUDINAL TRANSITION FOR CANT OFFSET SHALL OCCUR GRADUALLY BETWEEN FACE OF BENT 3 FLOOR BEAM AND MINIMUM EDGE GIRDER FLARE WIDTH.
6. POST TENSIONING LAYOUT SHOWN AND CURVE DATA MEASURED ALONG HORIZONTAL PLANE PASSING THROUGH TENDONS "U1" AND "U5".
7. FOR BLOCKOUT POUR BACK DETAILS, SEE DRAWING S3-06.
8. HAIRPIN BAR GROUPS SHALL BE CENTERED ABOUT POST TENSIONING CURVE SEGMENT.



PRESTRESS PLAN - SPAN 3 SOUTH EDGE GIRDER AT BENT 3

SCALE: 3/8"=1'-0"

1. The rectangular shaped box with a circle does represent hanger brackets, Drawing S6-87 represents the typical transition of the widened edge girder at construction joints at Bents 6, 8 and 10 in arch spans to the typical edge girder width of 7'-3". See Note 3 on Drawing S6-87. All hanger work point locations are provided in Drawings S5-49 through S5-74. Provided dimensions and stations should always be used and drawings should never be scaled. The PT profile is provided in the Prestress Elevation. This elevation is applicable at all frame construction joints. See Note 6 on Drawing S6-87 for further information.

2. At the "Inside Eccentricity" and "Outside Eccentricity", all details below the baseplate are identical. Therefore, details below the baseplate at the Outside Eccentricity have not been repeated Standard bridge detailing practice dictates that dimensions and details are only shown once to avoid confusion. This practice differs from shop drawings where details are repeated often to assist with fabrication. Details should not be scaled. Typical locations of PT ducts are provided on Drawing S6-72.

3. At the first, second, and third lower hanger bracket, note 13 on Drawing S5-72 provides requirements when preparing shop drawings for hanger brackets at these locations.

4. Deck drain required locations at Arch Spans are depicted on Drawing S8-30. These locations should be used in conjunction with Drawing S8-32 to further establish the location of the deck inlets. Any location between the arch rib floor beam and the first typical floor beam that complies with the framing requirements of Drawing S8-32 is acceptable.

5. During previous discussions with SSW, it was determined that deck drainage piping should remain outside of the edge girder to avoid conflict with edge girder reinforcement. This slight adjustment will be recorded on the as-built drawings.

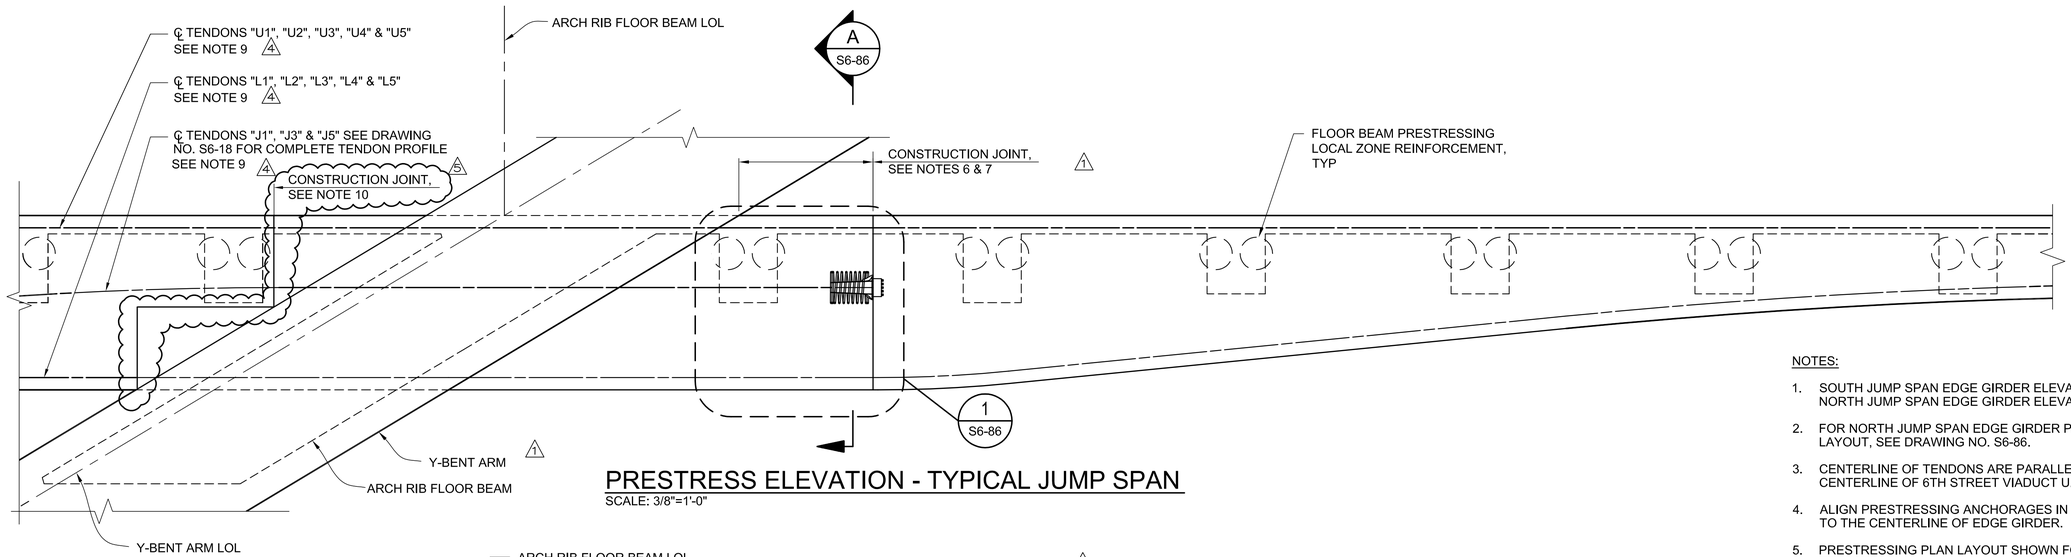
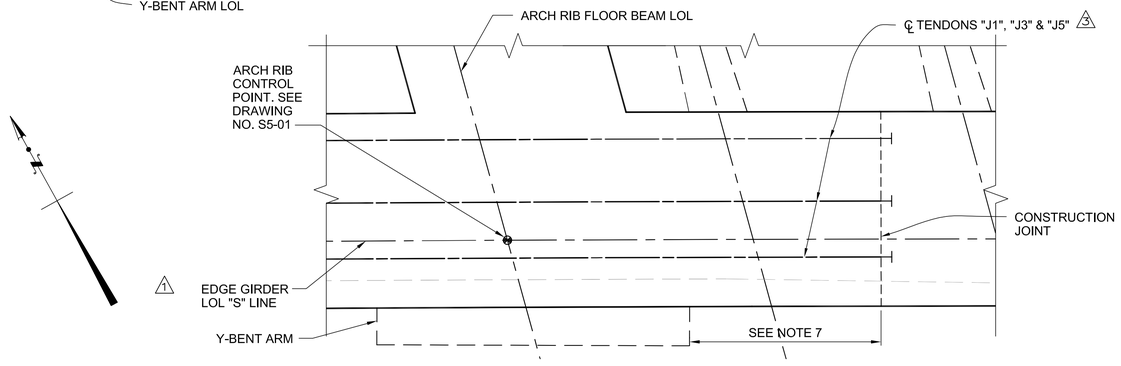
ADDENDUM 5



PRESTRESS ELEVATION - TYPICAL JUMP SPAN

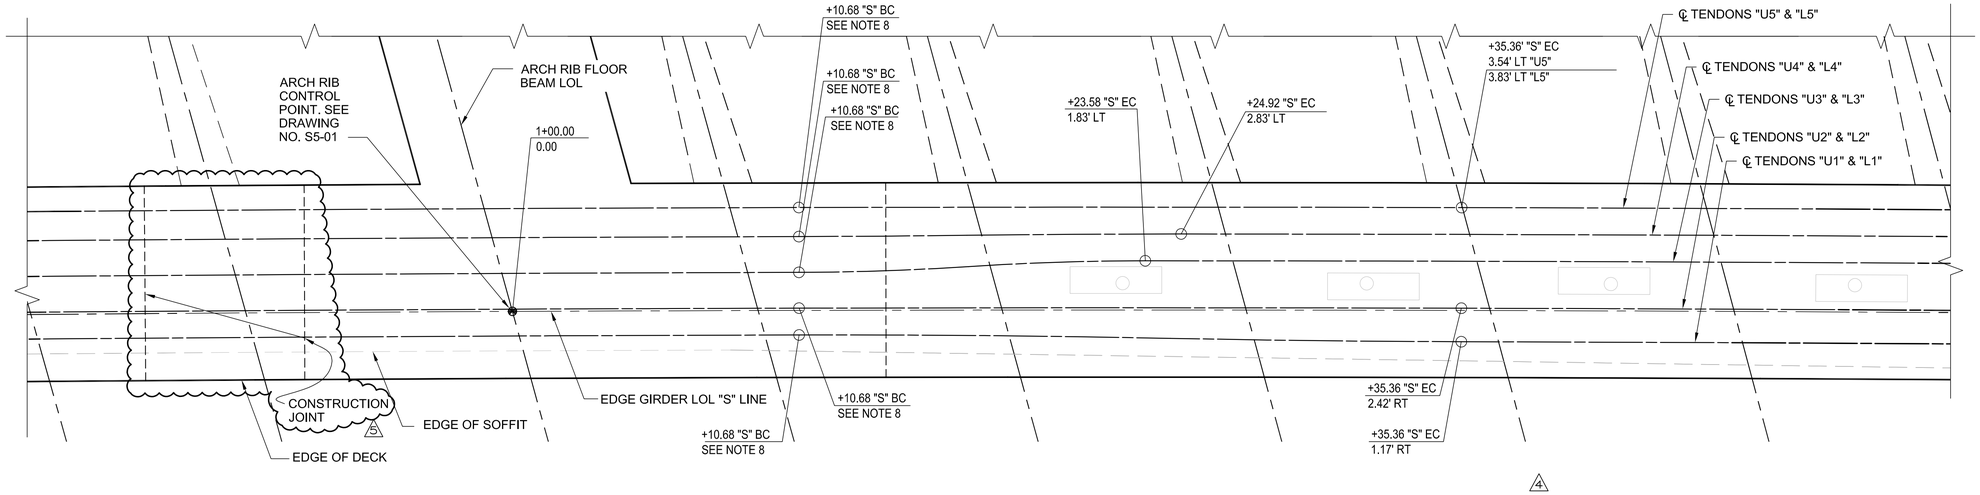
SCALE: 3/8"=1'-0"



PRESTRESS PLAN - TYPICAL JUMP SPAN, J - TENDONS

SCALE: 3/8"=1'-0"

(SOUTH EDGE GIRDER SHOWN, NORTH EDGE GIRDER SIMILAR)



PRESTRESS PLAN - TYPICAL JUMP SPAN, SOUTH EDGE GIRDER

SCALE: 3/8"=1'-0"

(BENT 11 EAST SHOWN, OTHERS SIMILAR)

NOTES:

1. SOUTH JUMP SPAN EDGE GIRDER ELEVATION SHOWN, NORTH JUMP SPAN EDGE GIRDER ELEVATION SIMILAR.
2. FOR NORTH JUMP SPAN EDGE GIRDER PRESTRESS PLAN LAYOUT, SEE DRAWING NO. S6-86.
3. CENTERLINE OF TENDONS ARE PARALLEL TO CENTERLINE OF 6TH STREET VIADUCT U.N.O.
4. ALIGN PRESTRESSING ANCHORAGES IN THE PLANE NORMAL TO THE CENTERLINE OF EDGE GIRDER.
5. PRESTRESSING PLAN LAYOUT SHOWN FOR EAST Y-BENT TRANSITION.
   WEST TRANSITION SIMILAR AND OPPOSITE.
6. FOR CONSTRUCTION JOINT DELINEATION DETAILS, SEE DRAWING NO. S9-08.
7. FOR DIMENSION TO CONSTRUCTION JOINT, SEE DRAWINGS S6-11 TO S6-17. DIMENSION IS MEASURED AT TOP OF DECK. 1
8. THE CHANGE IN ALIGNMENT AT U AND L PRESTRESS DUCTS FACILITATES DUCT CLEARANCE THROUGH THE KNUCKLE REGION OF Y-BENTS. AS DETERMINED BY BIM. TRANSITION POST-TENSIONING DUCTS, BY USING A CIRCULAR REVERSED CURVE. SEE NOTE 2 ON DRAWING NO. S6-80. 4
9. THE CHANGE IN TRANSVERSE ALIGNMENT OF POST-TENSIONING DUCTS THROUGH Y-BENT KNUCKLE JOINTS IS ESTABLISHED THROUGH BIM. IF POST-TENSIONING DUCT TRANSVERSE OFFSETS VARY BETWEEN EAST AND WEST KNUCKLE JOINTS AT JUMP SPANS, MAKE THE TRANSITION WITH A FULL LENGTH CIRCULAR REVERSED CURVE BETWEEN THE EAST FACE OF THE WEST KNUCKLE JOINT AND THE WEST FACE OF THE EAST KNUCKLE JOINT. 2 4
10. LOCATION OF CONSTRUCTION JOINT DETERMINED BY PROVIDING CLEARANCE FOR FLOOR BEAM AND FLOOR BEAM POST TENSIONING ANCHORAGE AND DUCTS. FOR JOINT PREPARATION, SEE NOTE 10 ON DRAWING NO. S6-11. 5

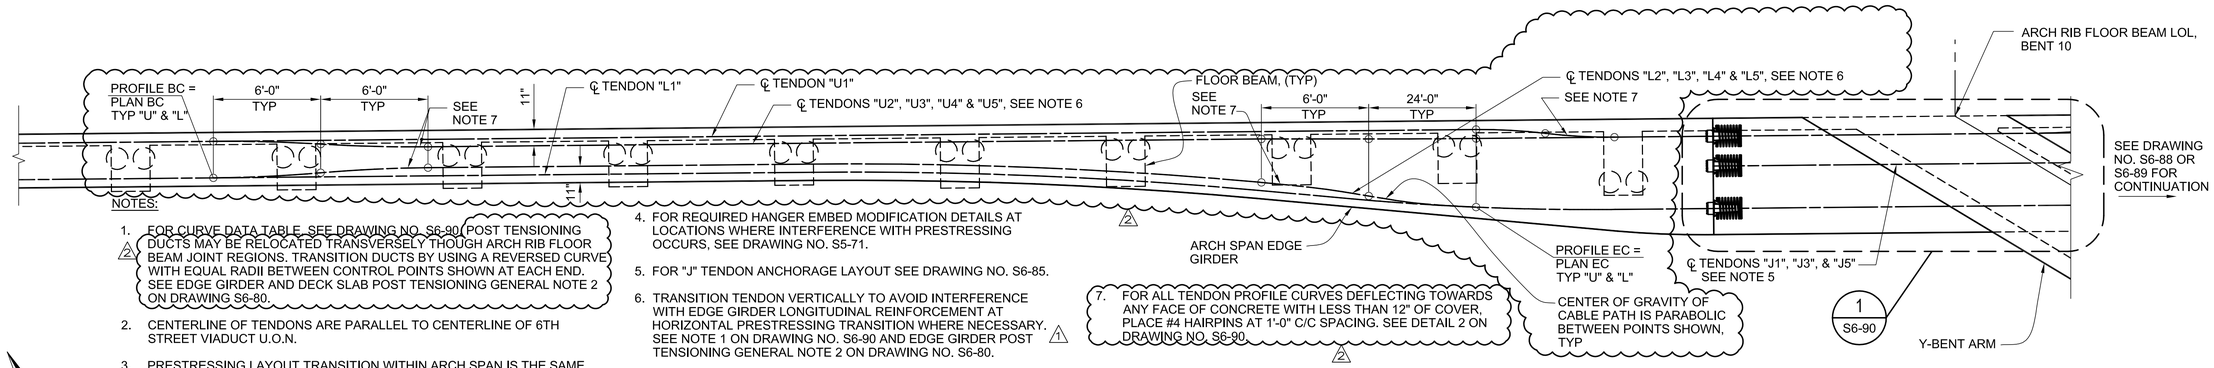
DRAWING NO.
S6-86

SHEET 384 OF 560 SHEETS

ADDENDUM 5

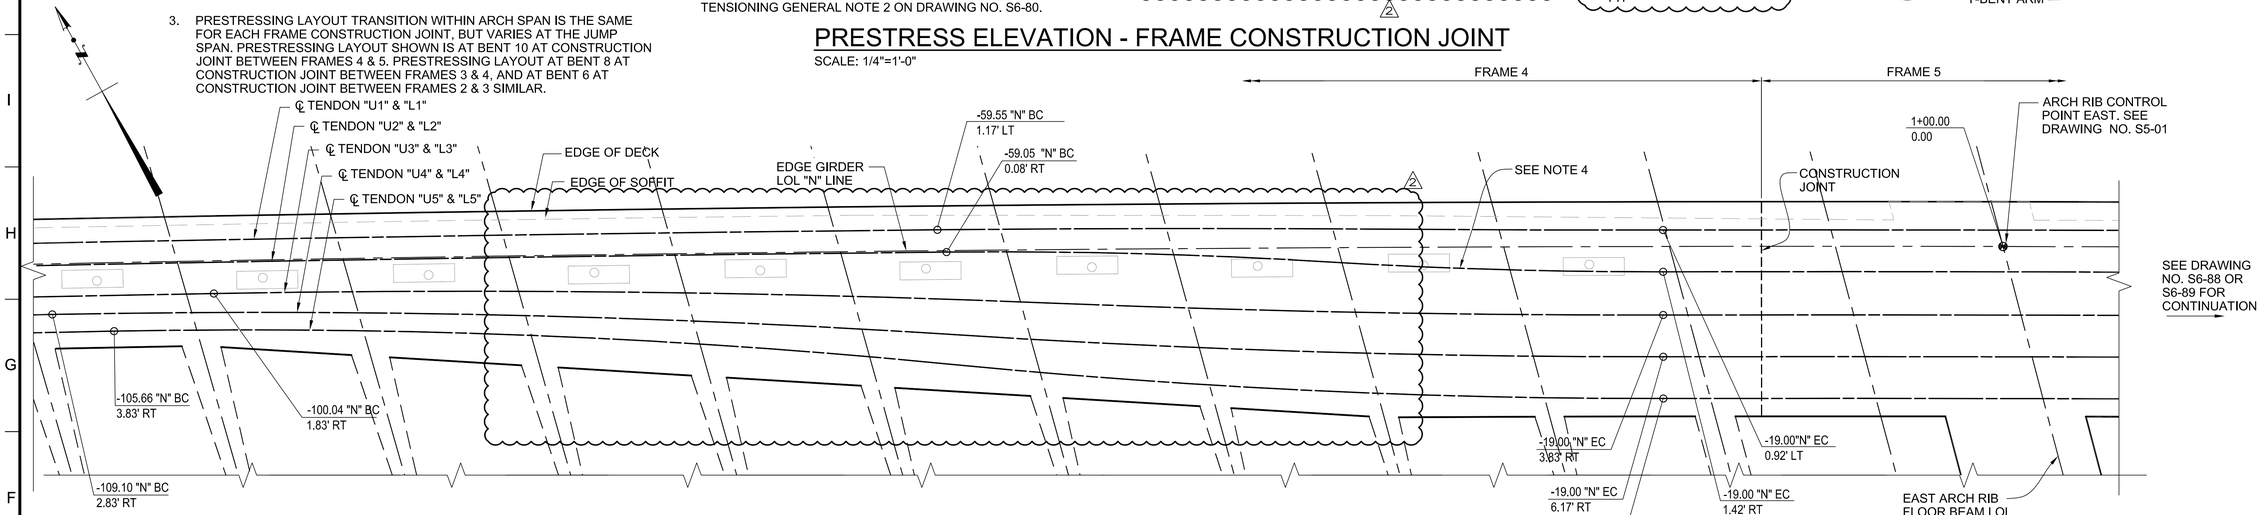


NOTES:

1. FOR CURVE DATA TABLE, SEE DRAWING NO. S6-90. POST TENSIONING DUCTS MAY BE RELOCATED TRANSVERSELY THOUGH ARCH RIB FLOOR BEAM JOINT REGIONS. TRANSITION DUCTS BY USING A REVERSED CURVE WITH EQUAL RADII BETWEEN CONTROL POINTS SHOWN AT EACH END. SEE EDGE GIRDER AND DECK SLAB POST TENSIONING GENERAL NOTE 2 ON DRAWING S6-80.
2. CENTERLINE OF TENDONS ARE PARALLEL TO CENTERLINE OF 6TH STREET VIADUCT U.O.N.
3. PRESTRESSING LAYOUT TRANSITION WITHIN ARCH SPAN IS THE SAME FOR EACH FRAME CONSTRUCTION JOINT, BUT VARIES AT THE JUMP SPAN. PRESTRESSING LAYOUT SHOWN IS AT BENT 10 AT CONSTRUCTION JOINT BETWEEN FRAMES 4 & 5. PRESTRESSING LAYOUT AT BENT 8 AT CONSTRUCTION JOINT BETWEEN FRAMES 3 & 4, AND AT BENT 6 AT CONSTRUCTION JOINT BETWEEN FRAMES 2 & 3 SIMILAR.
4. FOR REQUIRED HANGER EMBED MODIFICATION DETAILS AT LOCATIONS WHERE INTERFERENCE WITH PRESTRESSING OCCURS, SEE DRAWING NO. S5-71.
5. FOR "J" TENDON ANCHORAGE LAYOUT SEE DRAWING NO. S6-85.
6. TRANSITION TENDON VERTICALLY TO AVOID INTERFERENCE WITH EDGE GIRDER LONGITUDINAL REINFORCEMENT AT HORIZONTAL PRESTRESSING TRANSITION WHERE NECESSARY. SEE NOTE 1 ON DRAWING NO. S6-90 AND EDGE GIRDER POST TENSIONING GENERAL NOTE 2 ON DRAWING NO. S6-80.
7. FOR ALL TENDON PROFILE CURVES DEFLECTING TOWARDS ANY FACE OF CONCRETE WITH LESS THAN 12" OF COVER, PLACE #4 HAIRPINS AT 1'-0" C/C SPACING. SEE DETAIL 2 ON DRAWING NO. S6-90.

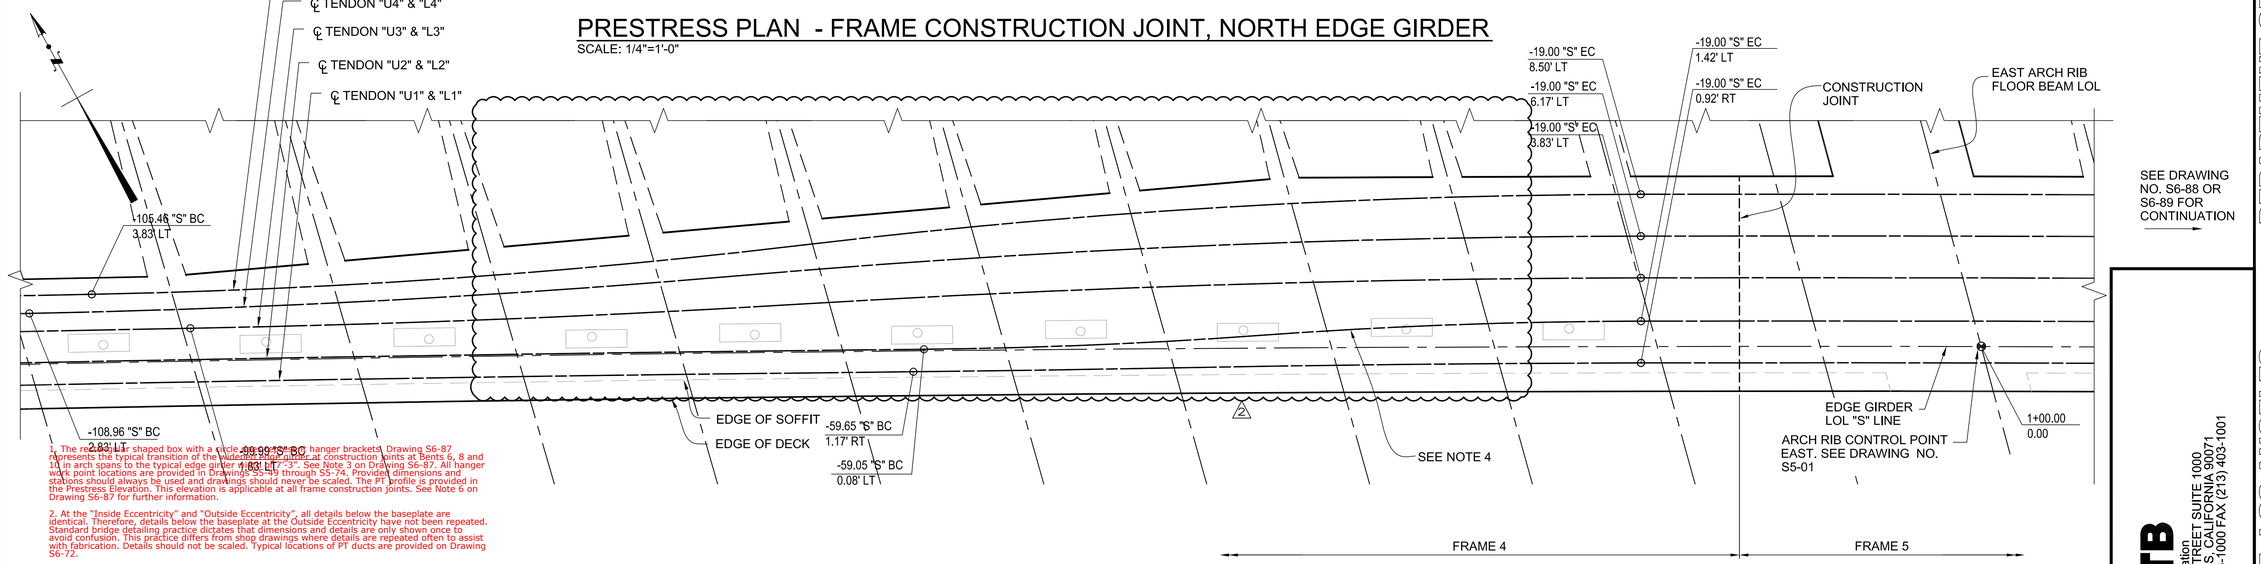
PRESTRESS ELEVATION - FRAME CONSTRUCTION JOINT

SCALE: 1/4"=1'-0"



PRESTRESS PLAN - FRAME CONSTRUCTION JOINT, NORTH EDGE GIRDER

SCALE: 1/4"=1'-0"



1. The rectangular shaped box with a circle around the hanger brackets Drawing S6-87 represents the typical transition of the vertical edge girder at construction joints at Bents 6, 8 and 10 in arch spans to the typical edge girder at "2-3". See Note 3 on Drawing S6-87. All hanger work point locations are provided in Drawings S5-70 through S5-74. Provided dimensions and stations should always be used and drawings should never be scaled. The PT profile is provided in the Prestress Elevation. This elevation is applicable at all frame construction joints. See Note 6 on Drawing S6-87 for further information.

2. At the "Inside Eccentricity" and "Outside Eccentricity", all details below the baseplate are identical. Therefore, details below the baseplate at the Outside Eccentricity have not been repeated. Standard bridge detailing practice dictates that dimensions and details are only shown once to avoid confusion. This practice differs from shop drawings where details are repeated often to assist with fabrication. Details should not be scaled. Typical locations of PT ducts are provided on Drawing S6-72.

3. At the first, second, and third lower hanger bracket, note 13 on Drawing S5-72 provides requirements when preparing shop drawings for hanger brackets at these locations.

4. Deck drain required locations at Arch Spans are depicted on Drawing S8-30. These locations should be used in conjunction with Drawing S8-32 to further establish the location of the deck inlets. Any location between the arch rib floor beam and the first typical floor beam that complies with the framing requirements of Drawing S8-32 is acceptable.

5. During previous discussions with SSW, it was determined that deck drainage piping should remain outside of the edge girder to avoid conflict with edge girder reinforcement. This slight adjustment will be recorded on the as-built drawings.

PRESTRESS PLAN - FRAME CONSTRUCTION JOINT, SOUTH EDGE GIRDER

SCALE: 1/4"=1'-0"

One set of bundles stirrups to be installed in the middle of two tendons as shown here.

These constraints will be maintained.

PLAN

NOTES:

1. THE 3'-9" ANCHORAGE WIDTH SHOWN AT FLOOR BEAM ANCHORAGE ALLOWS UNEQUAL CLOSED STIRRUP SPACING TO ACCOMMODATE FLOOR BEAM POST TENSIONING ANCHORAGE AT ARCH AND JUMP SPANS. THE ANCHORAGE WIDTH MAY BE INCREASED FROM BETWEEN 3'-9" AND 4'-3" ONLY WHERE THE EDGE GIRDER WIDTH AT THE TOP OF DECK EXCEEDS 7'-3" AND AT THE KNUCKLE JOINT REGION SHOWN ON DRAWING NO. S3-24. VERTICAL CROSS TIE AND CLOSED TIE SPACING ARE NOT REQUIRED TO MATCH. VERTICAL CROSS TIES MAY BE BUNDLED.
2. FOR EDGE GIRDER STIRRUP LAYOUT BEYOND ANCHORAGE ZONE, SEE DRAWING NOS. S6-21 TO S6-67. FIRST STIRRUP SPACING FROM ANCHORAGE ZONE SHALL BE EQUAL TO OR LESS THAN THE SPECIFIED TYPICAL STIRRUP SPACING.
3. FLOOR BEAM A SHOWN, OTHER TYPES FLOOR BEAMS ARE SIMILAR.
4. FOR FLOOR BEAM POST TENSIONING LAYOUT, SEE DRAWING NOS. S7-01 AND S7-02.
5. RELOCATE EDGE GIRDER EXTERIOR SIDE FACE REINFORCEMENT AS REQUIRED TO PROVIDE CLEARANCE FOR POST TENSIONING JACKS.
6. WHEN 12 "A" ⌈ TIES ARE SHOWN, OMIT ROW TOWARDS INSIDE FACE OF EDGE GIRDER. WHEN 7 "A" ⌈ TIES ARE SHOWN, OMIT TWO ROWS TOWARDS INSIDE FACE OF EDGE GIRDER.
7. AT THE PT BLOCK-OUT CENTER CLOSED TIE ONLY, THE CLOSED TIE HOOKS CAN USE 90° HOOKS AND BE PLACED AT THE INSIDE OF THE EDGE GIRDER.

TYPICAL FLOOR BEAM POST-TENSIONING LAYOUT - PLAN

SCALE: 1"=1'-0"

FLOOR BEAM REBAR NOT SHOWN FOR CLARITY

RFI 244 proposes to increase the edge girder floor beam block-out dimensions from the size shown on Contract Drawing S7-05 and the block-out dimensions used for portions of Frame 6 pursuant to RFI 243 as follows:

	Drawing S7-05	RFI 243	RFI 244
Block-out Height:	14″	17″	24″
Block-out Width:	36″	36″	44″

RFI 244 does not provide shop drawing details showing the rearrangement of reinforcement to accommodate the proposed increased block-out dimension as required by Standard Specification Section 50-1.01C(3). The following reinforcement rearrangement requirements and other concerns are identified, which have also been illustrated on the attached redlined drawings:

1. With a depth of 1'-1" between the top of the edge girder and the enlarged block-out, there appears to be insufficient clearance to rearrange the horizontal edge girder side face reinforcement above the block-out as proposed by RFI 244.

2. Contract Drawing S7-04 shows edge girder bundled #8 ties at a spacing of 18". The proposed 44" wide block-out will require increasing this spacing to approximately 24". The reinforcement rearrangement must be provided. No reinforcement can be deleted, and contract required placement tolerances must be complied with. Clashes with floor beam post-tensioning (PT) ducts are likely with the increased spacing.

3. The internal concrete step between the two floor beam PT anchorages has been increased from the step size provided by the block-out details provided on Contract Plan S7-05. The greatest stress on this concrete step will occur during PT jacking. DSI must verify stresses within this local anchorage zone at the larger step are acceptable during PT stressing if the proposed increased step dimension is used.

RFI 243 proposed a block-out currently being used at Frame 6 with only slight increases to the block-out dimensions provided on Contract Plan S7-05. This detail requires only minimal rearrangement of reinforcement and will minimize possible clashes with PT ducts when making deviations from the clash-free BIM models previously prepared by SSW for this joint type. If the smaller block-out dimensions are adequate at portions of Frame 6, their use throughout the Viaduct should be considered. Additionally, most floor beams are Type A, where the edge girder has a nominal depth of 36". The 24" block-out depth proposed by RFI 244 will likely not provide sufficient clearance above and below the block-out for required reinforcement. Using a smaller block-out would have the advantage of standardizing the block-out at all floor beam types.

Follow-up: Please standardize the blockouts for the entire structure.

NOTES:

1. THE CONTRACTOR SHALL VERIFY ALL CONTROLLING FIELD DIMENSIONS BEFORE ORDERING OR FABRICATING ANY MATERIALS.
2. ISOLATION BEARINGS AS SHOWN ARE "TRIPLE FRICTION PENDULUM" BEARINGS WITH ARTICULATED SLIDER ELEMENT AND CONCAVE PLATES WHICH PROVIDE LATERAL RESTORING STIFFNESS.
3. ISOLATION BEARING PROPERTIES SHALL MEET REQUIREMENTS SHOWN IN THE "ISOLATION BEARING PERFORMANCE CRITERIA TABLE".
4. EDC IS THE ENERGY DISSIPATED PER CYCLE BY THE BEARING AT THE MAXIMUM DEAD LOAD AND TOTAL DESIGN DISPLACEMENT (TDD) SHOWN IN THE TABLE. EDC IS EQUAL TO THE AREA WITHIN THE CORRESPONDING HYSTERESIS LOOP.
5. TDD IS THE NOMINAL TOTAL DESIGN DISPLACEMENT CORRESPONDING TO THE DESIGN BASIS SEISMIC EVENT. VALUE SHOWN IS A CONSERVATIVE UPPER BOUND VALUE BASED ON A RANGE OF ACTUAL ISOLATOR PROPERTIES.
6. ISOLATION BEARING LATERAL DISPLACEMENT CAPACITIES SHALL BE AT LEAST 25% HIGHER THAN THE TDD.
7. SEISMIC LATERAL FORCED F TRANSFERRED THROUGH THE ISOLATION BEARING, AT DESIGN DISPLACEMENT TDD, EXPRESSED AS RATIO OF THE VERTICAL LOAD ON THE BEARING.
8. NON-SEISMIC LATERAL FORCE- THE DESIGN NON-SEISMIC LATERAL FORCE, (WIND ON STRUCTURE) TRANSFERRED THROUGH THE ISOLATION BEARING.
9. ALL HOLES IN MOUNTING PLATES, HOUSING PLATES AND OTHER CONNECTING PLATES SHALL BE DRILLED WITH MATCHING METAL TEMPLATES.
10. ISOLATION BEARING MANUFACTURER SHALL PROVIDE CLEARANCE BETWEEN UPPER AND LOWER CONCAVE UNITS FOR THE SPECIFIED MAXIMUM RELATIVE ROTATION.
11. ISOLATION BEARING INSTALLATION SHALL BE PER MANUFACTURER'S INSTRUCTIONS AND RECOMMENDATIONS, SUBJECT TO APPROVAL OF THE ENGINEER.
12. THE MAXIMUM THERMAL LONGITUDINAL DISPLACEMENT TRANSFERRED THROUGH THE ISOLATION BEARING UNDER VERTICAL DEAD LOAD CONDITION (DL). DISPLACEMENT IS APPROXIMATE BASED ON INITIAL ASSUMED STIFFNESS OF BEARING.
13. THE MINIMUM BEARING LATERAL FORCE TO ACTIVATE THE SECONDARY EARTHQUAKE RESISTANCE SYSTEM (SERS) IS THE FORCE NECESSARY TO INITIATE PLASTIC HINGING IN SUPPORTING DRILLED SHAFTS. EXPRESSED AS A RATIO OF THE VERTICAL DEAD LOAD ON THE BEARING WITH OVERTURNING EFFECTS.
14. STIFFNESS Keff IS THE BEARING EFFECTIVE LATERAL STIFFNESS AT A DISPLACEMENT OF TDD EXPRESSED AS A RATIO OF THE VERTICAL DEAD LOAD ON THE BEARING WITHOUT OVERTURNING EFFECTS.
15. MAXIMUM RELATIVE ROTATION IS THE NET ROTATION BETWEEN THE TOP AND BOTTOM OF THE ISOLATION OCCURRING AT THE MAXIMUM OF THE 7 GROUND MOTIONS (MAXIMUM VALUE OF APPROXIMATELY 22") AND EXTRAPOLATED TO A DISPLACEMENT OF 1.75 TDD (42").
16. FOR REQUIRED INITIAL OFFSETS OF THE INTERNAL BEARING SLIDER FROM THE CENTROID OF THE BEARING, SEE DRAWING NO. S8-03.

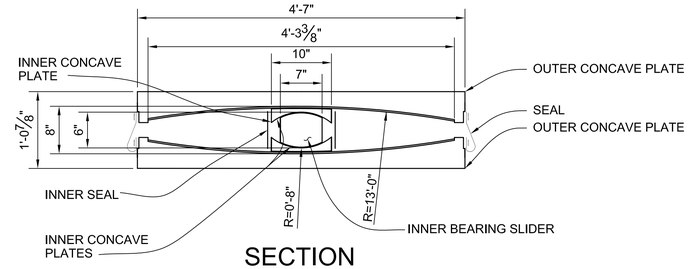
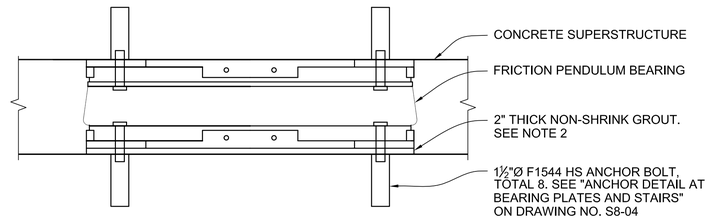
ISOLATION BEARING INITIAL OFFSET NOTES:

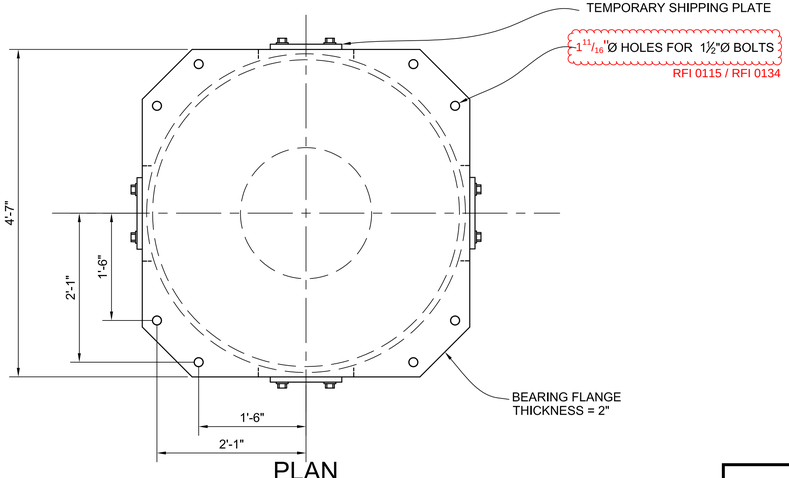
1. AT THE TIME OF BEARING INSTALLATION, THE ISOLATION BEARING SHALL BE OFFSET FROM THE NEUTRAL POSITION SO THAT AT A TIME OF 10 YEARS AFTER THE COMPLETION OF CONSTRUCTION, BOTH THE TOP AND BOTTOM OUTER CONCAVE PLATES WILL BE WITHIN 1" OF THE NEUTRAL POSITION. THE BEARING IS IN NEUTRAL POSITION WHEN THE CENTROIDS OF THE INNER SLIDER AND OUTER AND INNER CONCAVE PLATES ALIGN. THE REQUIRED OFFSET SHALL BE OBTAINED BY OFFSETTING THE UPPER AND LOWER OUTER CONCAVE PLATES EQUAL AMOUNTS WITH THE INNER SLIDER AND INNER CONCAVE PLATES AT THE NEUTRAL POSITION. THE ISOLATOR SHALL BE SHIPPED FROM THE FACTORY IN THIS POSITION AND LOCKED IN THE POSITION WITH THE EXTERNAL RESTRAINING PLATES.
2. ESTIMATES OF THE ISOLATOR OFFSET AT A TIME OF 10 YEARS AFTER THE COMPLETION OF CONSTRUCTION ARE PROVIDED IN THE "ISOLATION BEARING INITIAL OFFSET" TABLE. THE CONTRACTOR SHALL PROVIDE THE ACTUAL OFFSETS BASED ON THE SPECIFIC ERECTION SEQUENCE AND CONCRETE MATERIAL PROPERTIES USED TO CONSTRUCT THE VIADUCT. SEE "CONTRACTOR RESPONSIBILITIES AND GEOMETRIC CONTROL NOTES" ON DRAWING NO. S9-05.
3. FOR X AND Y COORDINATE ORIENTATION, SEE DRAWING NO. S3-12.



SECTION



ELEVATION



PLAN

ISOLATION BEARING AT STAIRS

SCALE: 1"=1'-0"

NOTES:

1. SEE DRAWING NO. S8-02 FOR ADDITIONAL NOTES.
2. NON-SHRINK GROUT BELOW ISOLATION BEARING PLATES SHALL HAVE A STRENGTH OF F'c=7.5 KSI. GROUT SHALL BE PLACED PRIOR TO BEARING PLACEMENT.

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

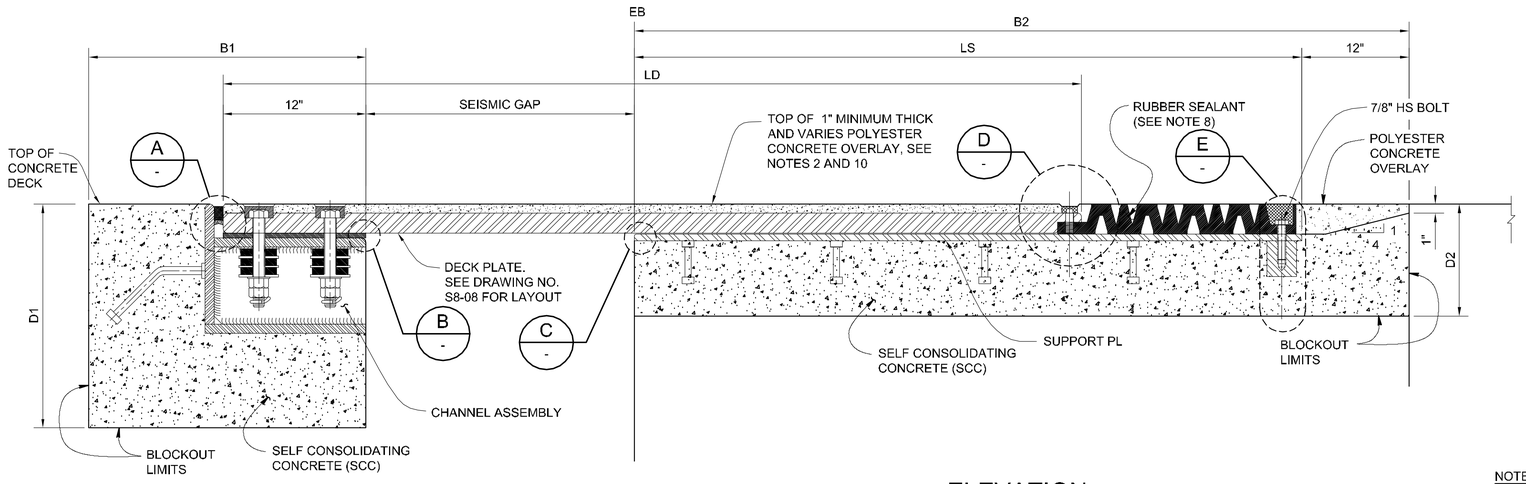
SHEET 402 OF 560 SHEETS



ELEVATION

NO SCALE

JOINT INFORMATION (MAXIMUM NON-SEISMIC MR=14")			
LOCATION		ABUT 1	ABUT 13
SKEW (°)		0°	15°
DECK PLATE	THICKNESS TD (IN)	2 1/4	2 1/4
	LENGTH LD (IN)	90	90
SUPPORT PLATE	THICKNESS TS (IN)	3/4	3/4
	LENGTH LS (IN)	72	72
SEISMIC GAP (SEE NOTE 16)	(IN)	30	30
BLOCKOUT	B1 (IN)	30	30
	B2 (IN)	84	84
	D1 (IN)	18	18
	D2 (IN)	12	12

NOTES:

1. INSTALL SEISMIC JOINT AFTER THE VIADUCT IS FULLY CONSTRUCTED.
2. TOP OF POLYESTER CONCRETE OVERLAY, RUBBER SEALANT AND SCC SHALL MATCH TOP OF DECK PROFILE.
3. FOR DECK PLATE DETAILS SEE DRAWING NOS. S8-07 & S8-08.
4. FOR MILD REINFORCEMENT IN BLOCKOUT AREAS, SEE DRAWING NOS. S8-12 AND S8-14.
5. FOR ANCHOR PLATE DETAILS, SEE DRAWING NO. S8-09.
6. PLACE DECK PLATE, SUPPORT PLATE AND ANCHOR PLATE SO THAT FULL BEARING IS ACHIEVED BETWEEN DECK PLATE AND SUPPORT PLATES AND BETWEEN DECK PLATE AND ANCHOR PLATE.
7. SELF-CONSOLIDATING CONCRETE SHALL BE USED IN JOINT BLOCKOUT.
8. STEEL REINFORCED MOLDED RUBBER EXPANSION JOINT SYSTEM WITH A MOVEMENT RATING (MR) OF 14". AT THE TIME OF INSTALLATION, RUBBER SEALANT SHALL BE COMPRESSED FROM THE NEUTRAL POSITION SO THAT AT A VIADUCT TEMPERATURE OF 70°F ONLY 4" OF ADDITIONAL CONTRACTION CAPACITY REMAINS AND 10" OF EXPANSION CAPACITY IS PROVIDED.
9. FOR SUPPORT PLATE DETAILS SEE DRAWING NO. S8-11.
10. TYPICAL DEPTH OF POLYESTER CONCRETE OVERLAY ON THE DECK PLATE IS 1". DEPTH OF OVERLAY VARIES AT WALKWAYS, SEE DRAWING NO. S8-05. APPLY POLYESTER OVERLAY AT MANUFACTURING SHOP.
11. ANCHOR PLATE AND ANCHOR PLATE CONCRETE ANCHOR STUDS AND SHEAR LUGS MUST BE GALVANIZED IN ACCORDANCE WITH ASTM A153. ANCHOR STUDS AND SHEAR LUGS AT SUPPORT PLATE MUST BE ZINC COATED.
12. APPLY MEDIUM STRENGTH ANAEROBIC THREAD LOCKER TO THREADS.
13. PIN MUST BE MADE FROM ASTM A449 ROD. PIN AND/OR HS BOLT SIZE MAY CHANGE PER RUBBER SEALANT SUPPLIER RECOMMENDATIONS. GALVANIZED PIN AND BOLT THREADS SHALL MATCH RUBBER SEALANT STEEL PLATE THREADS.
14. PINS AND BOLTS ARE PROVIDED BY THE RUBBER SEALANT SUPPLIER AND SHALL FIT TO RUBBER SEALANT HOLES.
15. RUBBER SEALANT SHALL NOT BE PLACED UNTIL ALL CONSTRUCTION OF THE ENTIRE VIADUCT BETWEEN ABUTMENTS 1 AND 13 IS COMPLETE.
16. SEISMIC GAP IS AT A VIADUCT TEMPERATURE OF 70°F AT THE END OF VIADUCT CONSTRUCTION.

ADDENDUM 5

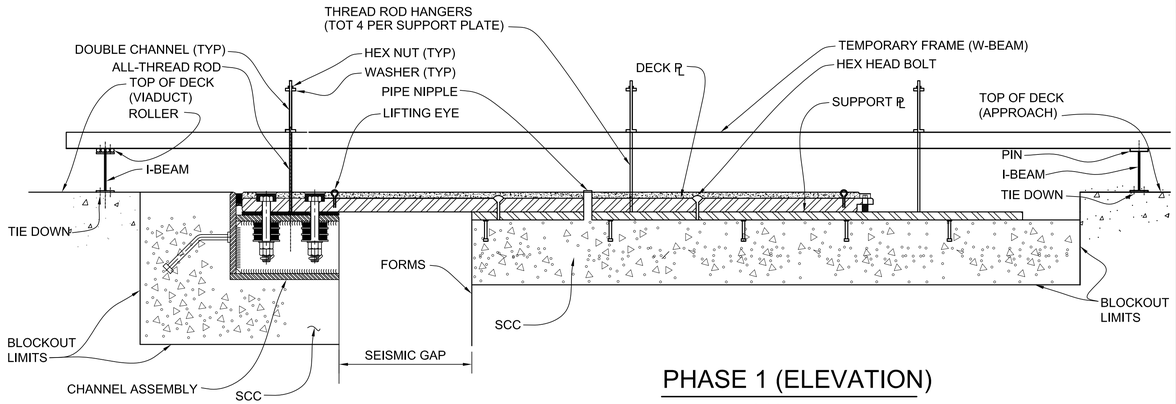
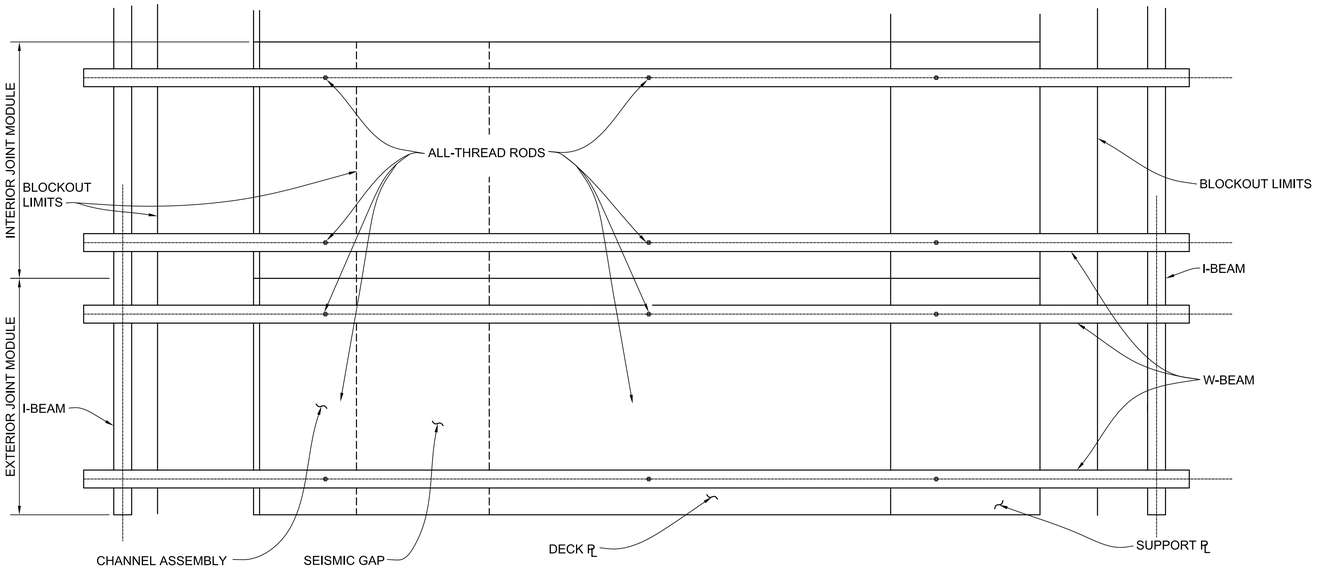
INSTALLATION DETAIL

NO SCALE



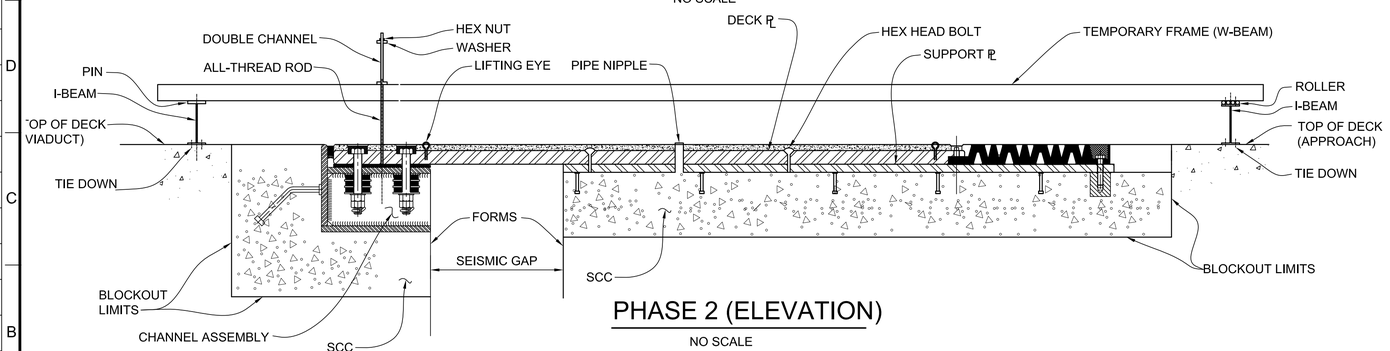
PHASE 1 (ELEVATION)

NO SCALE



PARTIAL PLAN

NO SCALE



PHASE 2 (ELEVATION)

NO SCALE

PHASE 1 NOTES:

1. CLEAN JOINT BLOCKOUT, PLACE FORMS AND MILD REINFORCEMENT.
2. SET FULLY ASSEMBLED JOINT MODULES INTO PLACE SO THAT THE SUPPORT PLATE ALIGNS WITH THE FACE OF THE SEISMIC GAP (APPROACH SLAB SIDE). TEMPORARILY SUPPORT JOINT MODULES ON TIMBER TO CORRECT POSITION ½ " BELOW FINAL ELEVATION. EACH JOINT MODULE CONSISTS OF THE CHANNEL ASSEMBLY AND THE DECK AND SUPPORT PLATES CLAMPED TOGETHER AT THE SHOP WITH JOINT OPENING DETERMINED FROM FIELD MEASUREMENTS AND SHIPPED TO THE SITE.
3. INSTALL TEMPORARY STEEL FRAME, WITH ROLLER ON ANCHOR PLATE SIDE AND PIN ON SUPPORT PLATE SIDE.
4. SET ALL-THREAD RODS TO SUPPORT AND ADJUST JOINT MODULES.
5. ALIGN AND SECURE ALL JOINT MODULES TOGETHER TO FINAL POSITION, REMOVE TEMPORARY TIMBER SUPPORTS.
6. POUR SCC BELOW SUPPORT PLATES. LET CONCRETE SET, THEN REMOVE PIPE NIPPLE AND THREADED ROD HANGERS AT SUPPORT PLATE.

PHASE 2 NOTES:

1. CHANGE THE PIN SUPPORT OF THE TEMPORARY FRAME TO ROLLER. RELEASE DECK PLATE FROM SUPPORT PLATE. SLIDE DECK PLATE AND CHANNEL ASSEMBLY TOGETHER SO THE FACE OF THE JOINT OPENING (CHANNEL ASSEMBLY SIDE) IS ALIGNED WITH THE CHANNEL ASSEMBLY. CHANGE THE ROLLER SUPPORT OF THE TEMPORARY FRAME TO PIN (CHANNEL ASSEMBLY SIDE). SECURE ALL JOINT MODULES TOGETHER TO FINAL POSITION.
2. JUST PRIOR TO PLACING SCC AT ANCHOR PLATE, REMOVE HEX HEAD BOLTS SECURING DECK PLATE TO SUPPORT PLATE. POUR SCC AT THE CHANNEL ASSEMBLY.
3. RELEASE JOINT AND REMOVE TEMPORARY STEEL FRAME.
4. REMOVE PIPES, BOLTS, FORMS AND CLEAN SURFACES.
5. PLACE RUBBER SEALANT.
6. PLACE POLYESTER CONCRETE.
7. IF PIPE NIPPLES USED, PLUG PIPE NIPPLE HOLES WITH THREADED STEEL PLUGS; FILL DECK HOLES AND SEAL JOINT WITH SILICONE.

NOTES:

1. NOT ALL REINFORCEMENT AND JOINT DETAILS ARE SHOWN FOR CLARITY.
2. PIPE NIPPLES ARE OPTIONAL.
3. AFTER INSTALLATION FILL ALL DECK HOLES WITH SILICONE AND PIPE NIPPLE HOLES, IF USED, WITH THREADED STEEL PLUGS.

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

PLAN

SCALE: 1" = 20'

DESIGN NOTES

DESIGN: AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS, 2012 EDITION WITH CALTRANS AMENDMENTS, PREFACE DATED JANUARY 2014

LIMIT STATES: SERVICE I, STRENGTH I & II , EXTREME II AND FATIGUE I (γ_{FAT} = 1.0)

DEAD LOAD: INCLUDES 35 PSF FOR FUTURE WEARING SURFACE

LIVE LOAD: HL93 AND PERMIT DESIGN LOAD
EQUIVALENT STRIP WIDTH METHOD: W_1 = 12 FT
SLAB SPAN: L_1 = 24.5 FT

REINFORCED CONCRETE:
F_y = 60 KSI
F'_c = 3.6 KSI
N = 8

NOTES:

1. FOR JOINT PROTECTION DETAILS, BLOCKOUT DIMENSIONS FOR JOINT SEAL PLATE, AND OTHER DETAILS NOT SHOWN, SEE OTHER PLAN SHEETS.
2. FOR DRAINAGE DETAILS, SEE DRAWING NO. S8-17.
3. TRANSVERSE JOINT MUST BE A MINIMUM OF 5'-0" FROM AN EXISTING OR CONSTRUCTED WEAKENED PLANE JOINT IN APPROACH PCC ROADWAY PAVEMENT. REFER TO STANDARD PLANS P10 AND P14.
4. AT THE CONTRACTOR'S OPTION, APPROACH SLAB TRANSVERSE REINFORCEMENT MAY BE PLACED PARALLEL TO BB OR EB. SPACING OF TRANSVERSE REINFORCEMENT IS MEASURED ALONG ROADWAY.
5. SEE DRAWING S8-08 FOR B. STAGGER SPACING AT B/2 WITH SUPPORT PLATE CONCRETE ANCHORS.

1. ALL BEARING ARTICULATED COVER AND BEARING SHIELD COMPONENTS, INCLUDING FASTENERS, ARE GALVANIZED.
2. APPLY MEDIUM STRENGTH ANAEROBIC THREAD LOCKER TO THREADS.
3. PROVIDE ONE COVER PLATE ACROSS 6'-6" WIDTH OF THE BEARING PLATES AND 2 EQUAL WIDTH COVER PLATES WITH A 2" GAP BETWEEN COVER PLATES AT THE 10'-4" WIDTH OF THE BEARING PLATES.
4. PAINT ALL GALVANIZED STEEL, EXCLUDING ISOLATION BEARING PLATES, IN ACCORDANCE WITH TECHNICAL SPECIFICATION SECTION 59-3. FINISH COATS ARE IN ACCORDANCE WITH TECHNICAL SPECIFICATION SECTION 59-2. COLOR WILL BE SELECTED BY THE ENGINEER.
5. AT THE 6'-6" WIDTH OF THE BEARING PLATE, PROVIDE AN OPEN COVER PLATE INSPECTION RESTRAINT AT EACH OF THE COVER PLATES CONSISTING OF A 3/8" DIAMETER EYE HOOK PLACED AT 2" ABOVE THE LOWER HINGE AND CENTERED ON EACH COVER PLATE AND EITHER WELDED OR BOLTED TO THE COVER PLATE. WITH THE COVER PLATE IN THE OPEN POSITION, PROVIDE A MATCHING 3/8" DIAMETER EYE-HOOK INSTALLED IN A 3" DEEP CONCRETE SLEEVE ANCHOR, CHAIN, AND SWIVEL EYE SNAP HOOK TO PROVIDE A RESTRAINT IN THE OPEN POSITION, ALL STAINLESS STEEL.

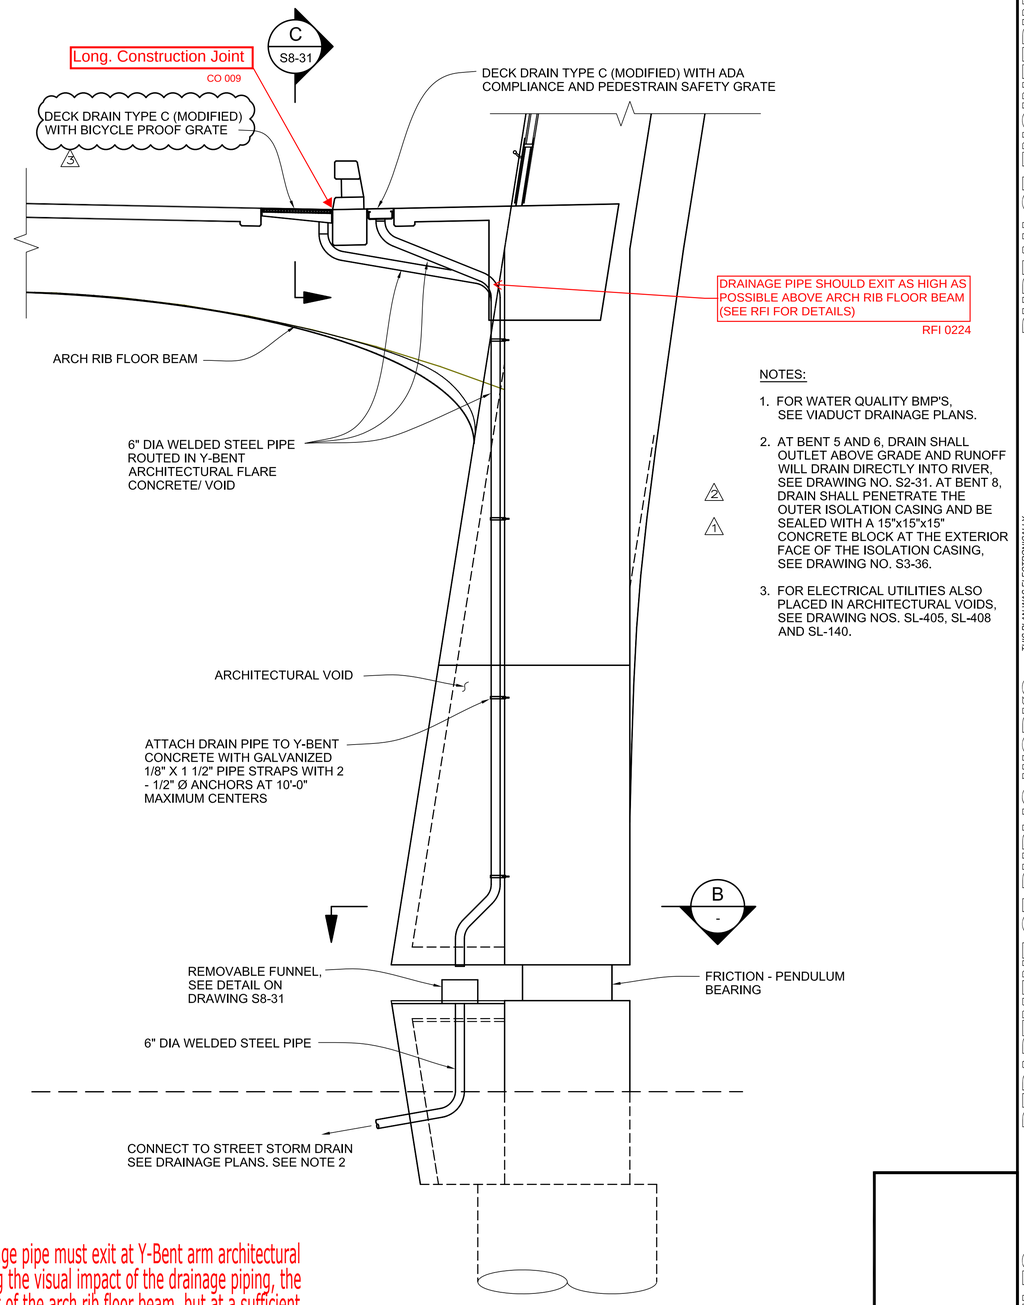
Longitudinal deck construction joint barrier between #6 tie legs



NOTES:

1. FOR WATER QUALITY BMP'S, SEE VIADUCT DRAINAGE PLANS.
2. AT BENT 5 AND 6, DRAIN SHALL OUTLET ABOVE GRADE AND RUNOFF WILL DRAIN DIRECTLY INTO RIVER, SEE DRAWING NO. S2-31. AT BENT 8, DRAIN SHALL PENETRATE THE OUTER ISOLATION CASING AND BE SEALED WITH A 15"x15"x15" CONCRETE BLOCK AT THE EXTERIOR FACE OF THE ISOLATION CASING, SEE DRAWING NO. S3-36.
3. FOR ELECTRICAL UTILITIES ALSO PLACED IN ARCHITECTURAL VOIDS, SEE DRAWING NOS. SL-405, SL-408 AND SL-140.

SECTION
SCALE: 1/4"=1'-0"
A
-

RFI:224
There is no required specific elevation that the drainage pipe must exit at Y-Bent arm architectural concrete. To optimize bridge aesthetics by minimizing the visual impact of the drainage piping, the piping should exit as high as possible above the soffit of the arch rib floor beam, but at a sufficient depth to avoid interference with structural concrete and to permit routing the pipe to the deck drains as shown on Contract Drawings S8-30 and S8-31. All piping must conform to Standard Plan B7-6 and all other applicable Contract requirements.

Sheet Version 3.0

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

ADDENDUM 5

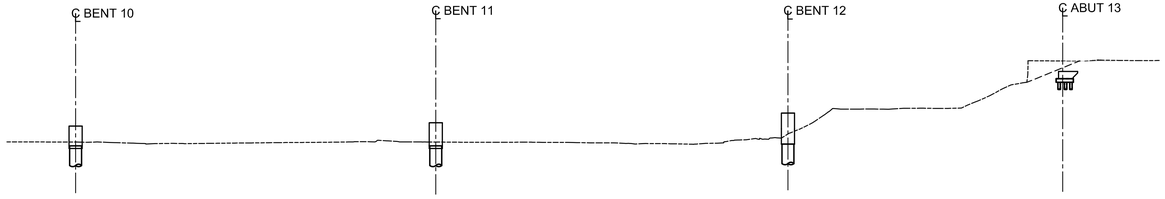
STAGE 1

1. CONSTRUCT CIDH PILES AT ALL BENTS FOR THE FIRST FRAME SEGMENT OF THE CONTINUOUS VIADUCT (SEE NOTE 1).
2. EXCAVATE FOR PILE CAP AND CONSTRUCT CIDH PILES AT ABUTMENT.

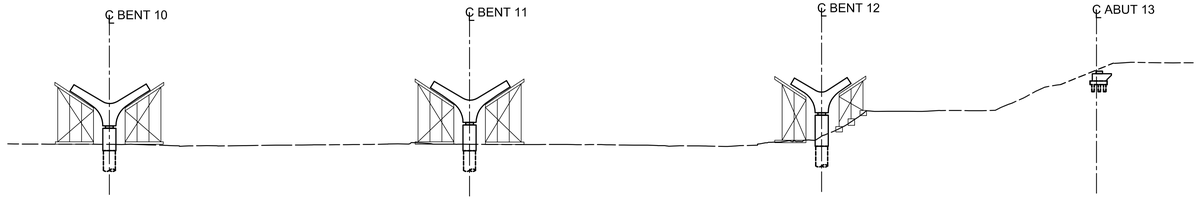


STAGE 2

1. CONSTRUCT COLUMN SEGMENT BELOW ISOLATION BEARINGS.
2. AT ABUTMENT, CONSTRUCT PILE CAP AND STEM WALL BELOW ISOLATION BEARINGS.

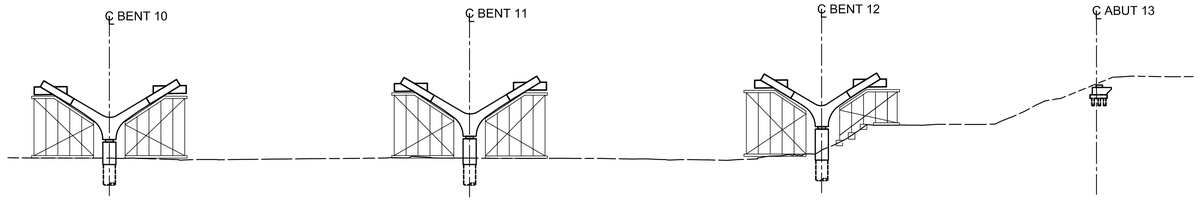
STAGE 3

1. SET ISOLATION BEARINGS ON COLUMNS AND ABUTMENT. SET BEARINGS TO ACCOMMODATE ANTICIPATED FRAME SHORTENING. SEE GEOMETRIC CONTROL NOTE 4.



STAGE 4

1. CONSTRUCT FALSEWORK SUPPORT FOR Y-BENT FROM BEARING TO UPPER CONSTRUCTION JOINT.
2. INSTALL ISOLATION BEARING LOCK-UP DEVICE. SEE TABLE ON DRAWING NO. S9-09 FOR REQUIRED LATERAL CAPACITY. LOCK-UP DEVICE SHALL NOT BE REMOVED UNTIL THE END OF STAGE 10.
3. CONSTRUCT Y-BENT FROM TOP OF BEARING TO UPPER CONSTRUCTION JOINT.



STAGE 5

1. ERECT FALSEWORK FOR KNUCKLE JOINT REGION AND ARCH RIB FLOOR BEAM. INCLUDE 5' OF EDGE GIRDER FROM EACH SIDE OF THE ARCH RIB.
2. CONSTRUCT UPPER PORTIONS OF Y-BENT ARMS, KNUCKLE JOINT REGION AND ARCH RIB FLOOR BEAM.
3. PARTIALLY POST-TENSION ARCH RIB FLOOR BEAMS AND THEN REMOVE ARCH RIB FLOOR BEAM FALSEWORK. KNUCKLE JOINT REGION FALSEWORK TO REMAIN IN PLACE.

ERECTION SEQUENCE GENERAL NOTES:

1. THE COMPLETED VIADUCT WILL BE A CONTINUOUS STRUCTURE BETWEEN ABUTMENTS, BUT WILL BE CONSTRUCTED IN DISCRETE FRAME SEGMENTS.
2. THE MAXIMUM LENGTH OF ANY DISCRETE SEGMENT SHALL INCLUDE NOT MORE THAN 3 ARCH SPANS.
3. CONSTRUCTION STAGING OF ARCH SPANS IS SHOWN FOR THE FRAME SEGMENT FROM BENT 10 TO ABUTMENT 13, BUT IS SIMILAR FOR OTHER DISCRETE FRAME SEGMENTS. FRAME SEGMENT PHASING IS SHOWN ON S9-07.
4. STAGES 4 THROUGH 10 ARE INTENDED SPECIFICALLY FOR ARCH SPANS. CONVENTIONAL ERECTION STAGING SHALL BE USE FOR BOX GIRDER SPANS 1 AND 2.
5. FOR CLARIFICATION OF CONSTRUCTION JOINT LOCATIONS AND CONSTRUCTION JOINT SEQUENCE DELINEATION, SEE DRAWING NO. S9-08.
6. KNUCKLE JOINT REGION REFERS TO THE COMBINED JOINT REGION OF THE Y-BENT ARM, EDGE GIRDER, AND ARCH RIB FLOOR BEAM.
7. THE CONTRACTOR'S FALSEWORK DESIGN SHALL ACCOMMODATE STRUCTURAL SHORTENING OF THE VIADUCT FRAMES AND ANY RESISTANCE OF THE FALSEWORK SHALL BE INCLUDED IN THE CONTRACTOR'S GEOMETRIC CONTROL PLAN AND ERECTION MANUAL.
8. ADDENDUM NO. 1 CONSTRUCTION SEQUENCE CHANGES WERE PROVIDED BY THE CONTRACTOR'S PHASE 1 GEOMETRIC CONTROL MANUAL AND LOCK-UP DEVICE SUBMITTALS.

CONTRACTOR RESPONSIBILITIES AND GEOMETRIC CONTROL NOTES:

1. THE ERECTION SEQUENCE SHOWN WAS PROVIDED BY THE CONTRACTOR DURING DESIGN DEVELOPMENT AND MAY BE AMENDED OR CHANGED BY THE CONTRACTOR. THE SEQUENCE SHOWN IS NOT THE COMPLETE STEP BY STEP PROCEDURE REQUIRED TO CONSTRUCT THE VIADUCT. THE CONTRACTOR SHALL DETERMINE THE COMPLETE ERECTION SEQUENCE, REQUIRED EQUIPMENT AND TEMPORARY SUPPORTS.
2. THE CONTRACTOR SHALL PREPARE AN ERECTION MANUAL THAT SHALL PROVIDE A DETAILED ERECTION SEQUENCE INCLUDING CALCULATIONS AND DETAILED DRAWINGS. THE ERECTION MANUAL SHALL BE SUBMITTED FOR REVIEW. ALL CALCULATIONS AND DRAWINGS SHALL BE SEALED BY A CALIFORNIA LICENSED PROFESSIONAL ENGINEER.
3. THE ERECTION MANUAL SHALL PROVIDE FULL GEOMETRY CONTROL FOR THE ENTIRE VIADUCT AND PROVIDE COMPLETED CAMBER VALUES SO THAT THE FINAL VIADUCT GEOMETRY SHOWN ON DRAWINGS IS ACHIEVED AT AN AGE OF 10 YEARS AFTER COMPLETION OF CONSTRUCTION. FOR ADDITIONAL INFORMATION CONCERNING GEOMETRY CONTROL, SEE DRAWING NOS. S5-23, S6-10 AND S7-01.
4. ISOLATION BEARING SHALL BE SET TO ACCOMMODATE ANTICIPATED FRAME SHORTENING. FOR AN ESTIMATE OF THE REQUIRED BEARING INITIAL OFFSET, SEE DRAWING S8-03. ACTUAL BEARING OFFSETS SHALL BE DETERMINE BY THE CONTRACTOR'S ERECTION MANUAL.

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

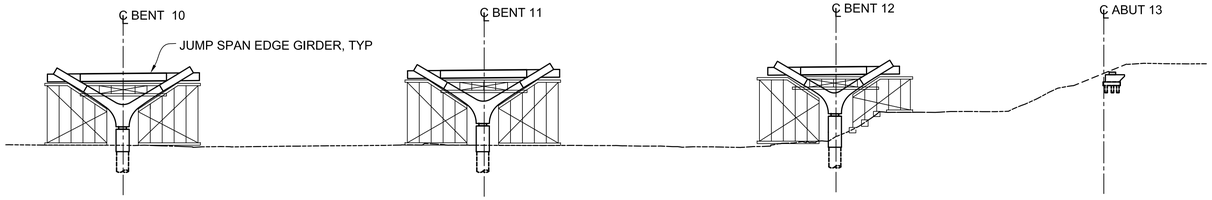
SHEET 24 OF SHEETS

ADDENDUM 5

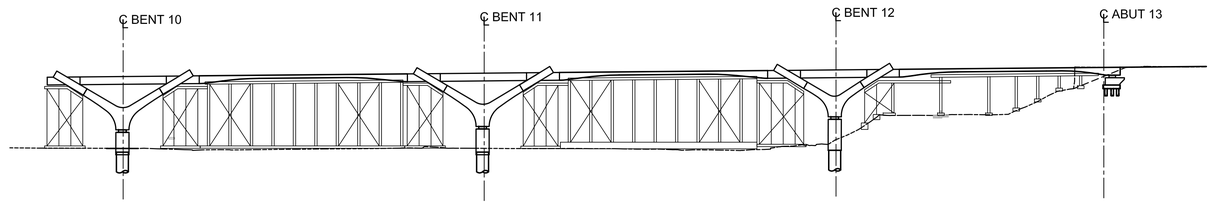


ERECTION SEQUENCE GENERAL NOTES:

1. THE REMOVAL OF ISOLATION BEARING LOCK-UP DEVICES (LUD) OR THEIR CONVERSION TO SHEAR KEYS BEGGING DURING STAGE 7 OCCURS AFTER FRAME CONTINUITY IS ACHIEVED BY PLACING ARCH SPAN AND JUMP SPAN EDGE GIRDERS. FOR THE SEQUENCE OF LUD REMOVAL OR CONVERSION, REFER TO THE CONTRACTOR'S LUD SUBMITTAL.

STAGE 6

1. CONSTRUCT FALSEWORK FOR JUMP SPAN EDGE GIRDERS AND FLOOR BEAMS.
2. CONSTRUCT JUMP SPAN EDGE GIRDERS, AND FLOOR BEAMS, AND DECK SLAB.
3. STRESS JUMP SPAN "J" POST TENSIONING TENDONS.



STAGE 7

1. CONSTRUCT FALSEWORK FOR ARCH SPAN EDGE GIRDERS, FLOOR BEAMS, AND DECK SLAB.
2. CONSTRUCT ARCH SPAN EDGE GIRDERS, FLOOR BEAMS AND DECK SLAB WITH LOWER HANGER BRACKET ANCHOR BOLTS IN PLACE.
3. STRESS TRANSVERSE POST-TENSIONING IN FLOOR BEAMS AND ARCH RIB FLOOR BEAMS. RESHORE FLOOR BEAMS AND ARCH RIB FLOOR BEAMS AS REQUIRED.
4. REMOVE FALSEWORK AT JUMP SPANS. (1)

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

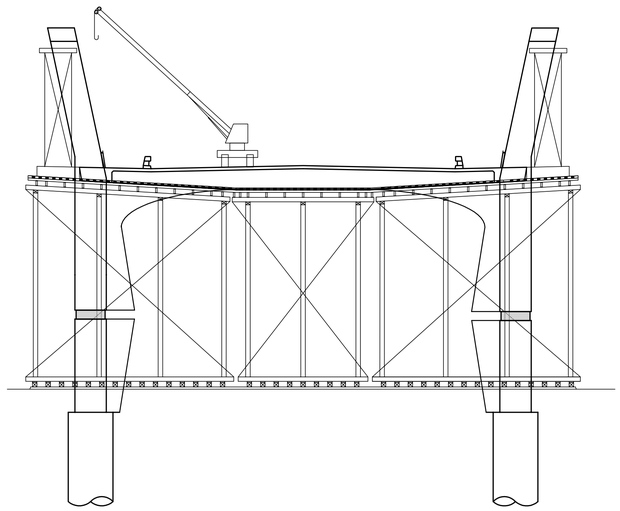
ADDRESS: SIXTH STREET VIADUCT (WHITTIER BLVD) LOS ANGELES, CA

WORK ORDER NO. E700224F

DRAWING NO. S9-06

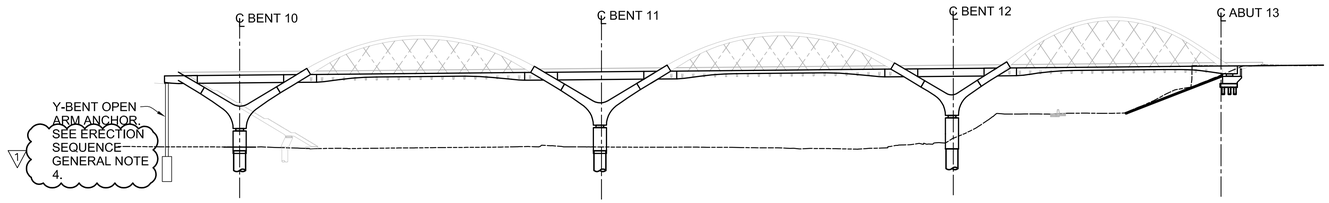
SHEET 25 OF SHEETS

ADDENDUM 5



STAGE 8

1. WITH CRANE PLACED ON FALSEWORK SUPPORTED DECK, CONSTRUCT FALSEWORK FOR ARCH RIBS.
2. CONSTRUCT ARCH RIBS WITH UPPER HANGER BRACKET ANCHOR BOLTS IN PLACE.

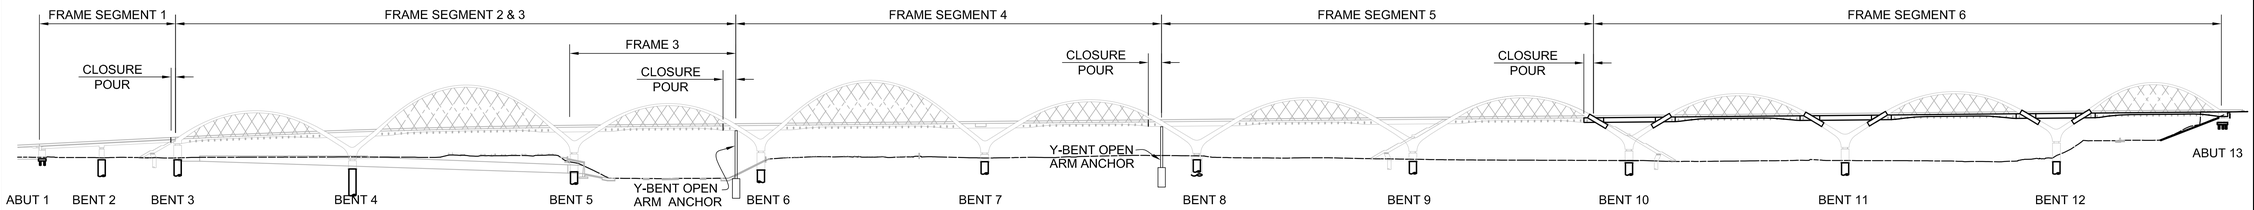


STAGE 9

1. INSTALL UPPER AND LOWER HANGER BRACKETS.
2. STRESS BRACKET ANCHOR BOLTS PER STRESSING SEQUENCE SHOWN ON DRAWING NO. S5-72.

STAGE 10

1. PLACE CONCRETE IN FLOOR BEAM STRESSING POCKETS.
2. STRESS LONGITUDINAL POST-TENSIONING "U" AND "L" TENDONS IN EDGE GIRDERS.
3. INSTALL HANGERS. STRESS HANGER PER APPROVED ERECTION MANUAL AND GEOMETRIC CONTROL PLAN.
4. INSTALL Y-BENT OPEN ARM ANCHOR. SEE TABLE ON DRAWING NO. S9-09 FOR REQUIRED ANCHOR AXIAL STIFFNESS AND TENSION CAPACITY. SEE ERECTION SEQUENCE GENERAL NOTE 4. 1
5. REMOVE ALL FALSEWORK PER APPROVED FALSEWORK REMOVAL PLAN.
6. REMOVE ISOLATION BEARING LOCK-UP DEVICE INSTALLED IN SEQUENCE STAGE 4 PER APPROVED LOCK-UP DEVICE REMOVAL PLAN. SEE ERECTION SEQUENCE GENERAL NOTE 1 ON DRAWING NO. S9-06. 1
7. PLACE ABUTMENT BACKWALL AND WINGWALLS AT ABUTMENT.
8. REPEAT STAGES 1 THROUGH 10 FOR OTHER FRAME SEGMENTS.



STAGE 11 (SEE NOTE 1)

1. CONSTRUCT CONCRETE BARRIERS
2. CONSTRUCT STEEL RAILING
3. CONSTRUCT EXPANSION JOINTS
4. CONSTRUCT STRUCTURE APPROACH SLABS

VIADUCT FRAME SEGMENT PHASING

SEE ERECTION SEQUENCE GENERAL NOTE 3. 1

ERECTION SEQUENCE GENERAL NOTES :

1. Y-BENT OPEN ARM ANCHORS ARE REMOVED ONCE STAGE 10 OF THE ADJOINING FRAME IS COMPLETED.
2. FOR DECK POST-TENSIONING SEQUENCE, SEE NOTE 12 ON DRAWING NO. S6-11.
3. FRAME SEGMENTS ARE PHASED SEQUENTIALLY BEGINNING WITH FRAME SEGMENT 6. BETWEEN BENT 3 AND ABUTMENT 13 POST TENSIONING COUPLERS ARE REQUIRED AT EDGE GIRDER CLOSURE POURS TO PROVIDE CONTINUOUS POST-TENSIONING.
4. THE CONTRACTOR'S PHASE 1 GEOMETRIC CONTROL MANUAL ELIMINATES Y-BENT OPEN ARM ANCHORS BY LEAVING FALSEWORK IN THE ARCH SPAN ADJACENT TO THE CLOSURE POUR OF A COMPLETED FRAME SEGMENT UNTIL EDGE GIRDER POST-TENSIONING OF THE ADJACENT WESTERLY FRAME IS COMPLETED. IT IS THE CONTRACTOR'S RESPONSIBILITY TO VERIFY THE ADEQUACY OF THE ALTERNATE SUPPORT SCHEME, DETERMINE CONSTRUCTION SEQUENCE CONSEQUENCES AND VERIFY THE ADEQUACY OF ALL VIADUCT COMPONENTS IF LOADING CONDITIONS ARE ALTERED. 1

GENERAL NOTES:

1. FOR POST ANCHORAGE DETAILS NOT SHOWN, SEE CALTRANS XS SHEET CHAIN LINK RAILING TYPE 7L DETAILS NO. 1, TYPICAL POST DETAIL.
2. METAL BRIDE RAILING MUST CONFORM TO CALTRANS STANDARD SPECIFICATION SECTION 83-1.02G.
3. FIELD WELDING OF METAL RAILING AFTER THE INSTALLATION OF POST-TENSIONING IN THE VIADUCT WILL ONLY BE PERMITTED IF PRECAUTIONS ARE TAKEN TO PREVENT ANY STAY CURRENT FROM REACHING THE POST-TENSIONING DUCTS. NO WELDING WILL BE PERMITTED UNTIL ALL POST-TENSIONING DUCTS ARE FULLY GROUTED. IF FIELD WELDING OF RAILING IS PROPOSED, YOU MUST SUBMIT A WELDING PROCEDURE SHOWING HOW ALL WELDING ELECTRIC CIRCUITS WILL BE GROUNDED TO ENSURE STAY CURRENTS HAVE NO POTENTIAL TO REACH THE HIGH STRENGTH STRAND CONTAINED WITHIN POST-TENSIONING DUCTS. NO FIELD WELDING OF RAILING SHALL BE PERMITTED UNTIL THE PROCEDURE IS SUBMITTED AND THE ENGINEER AUTHORIZES USE OF THE PROPOSED PROCEDURES.

Addendum No. 6

September 26, 2022

ENGINEERING
CITY OF LOS ANGELES

TED ALLEN, PE
CITY ENGINEER

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue
W.O. E700235F & SZC14224

Bidders are required to acknowledge receipt of this addendum in the space provided on page 1-4 of the Bid Proposal. This addendum consists of this one-page transmittal.

Bidders are hereby notified of the following changes:

I. MODIFICATIONS TO BID PROPOSAL:

1. Bidders are advised that a **new** Pre-Bid Meeting has been scheduled.

Pre-Bid Meeting: October 4, 2022 at 1:00 p.m. via Google Meet. Join by Phone: (US) +1 978-484-2377, PIN: 547 133 118# or Video Link: meet.google.com/uzy-fbdn-vre

Bidders who attended an earlier Pre-Bid Meeting for this project are not required to attend the Pre-Bid Meeting scheduled for October 4, 2022.

II. QUESTIONS FROM BIDDERS (Q) AND ANSWERS FROM CITY (A):

(Q1) Can you confirm that lighting fixture type “XF4A” is a 10’ pole with (6) 40w flood lights?

(A1) The XF4A pole height, wattage, and quantity can be confirmed on drawing number E-407 of the project plans.

Sincerely,

Gregg Vandergriff, P.E.
Division Engineer
Project Award and Control Division
Bureau of Engineering

CITY OF LOS ANGELES

CALIFORNIA

Addendum No. 7

October 3, 2022

ERIC GARCETTI
MAYOR

ENGINEERING
CITY OF LOS ANGELES

TED ALLEN, PE
CITY ENGINEER

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue
W.O. E700235F & SZC14224

Bidders are required to acknowledge receipt of this addendum in the space provided on page 1-4 of the Bid Proposal. This addendum consists of this three-page transmittal and 5 attachments totaling 9 pages.

Bidders are hereby notified of the following changes:

I. MODIFICATIONS TO BID PROPOSAL:

1. **Replace** the **Required Insurance and Minimum Limits** in **Part IV** of the Bid Proposal with **attached revised Required Insurance and Minimum Limits** (1 Page).

2. **Add** the following language under Part IV of the Table of Contents:

   "Executive Directive 35: Equitable Access to Contracting Opportunities… 1 Page"

3. **Add** the attached Executive Directive 35 document to Part IV of the Bid Proposal (1 page).

II. MODIFICATIONS TO PLANS:

1. **Replace** Plan sheet CU503 with the **attached revised plan sheet CU503** (1 page).

2. **Replace** Plan sheet SD101 with the **attached revised plan sheet SD101** (1 page).

III. MODIFICATIONS TO SPECIFICATIONS:

1. **Add** the following section in the **Specifications: Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements Attachment No. 10 Arts Plaza As-Built Site Survey**. This is the as-built survey of the Arts Plaza and Sixth Street tunnel opening. The bidder shall use Attachment No. 10 as the basis of the as-built condition for earthwork quantities in the Arts Plaza. (2 Pages).

IV. QUESTIONS BIDDERS (Q) AND ANSWERS FROM CITY (A):

(Q1) Please provide videos and condition assessment reports for the existing 36" Sewer to be rehabilitated.

(A1) The sewer inspection CCTVs are available on a YouTube channel named "The LA BAVN Bid Videos" see link below:

LA BAVN Bid Videos - YouTube

(Q2) On page 31 of the general conditions, it notes that Builder's Risk is required for the project, but when you look at the Required Insurance and Minimum Limits statement in the Bid Proposal document, it does not have the builder's risk box checked. Does the project require builder's risk or not?

(A2) Builder's Risk is required.

(Q3) Section 01721 Mobilization in the Master General Requirements: are two (2) field offices required…one for the Inspector and one for the Engineer? Does only the Engineer's field office require the computer equipment noted in 1.1.B.2b?

(A3) Yes, two (2) trailers are required, one each for the Inspector and the Engineer. Computer equipment listed is for the Engineer only.

(Q4) Section 02824 Fog Misting System of the Technical Specifications: will you provide contact information and website for the proprietary Fog Misting System. Searching the one manufacturer listed in 2.1.B.1a "Fog Misting System" results in many different manufacturers, none of which are named "Fog Misting System."

(A4) The Fog Misting System is a delegated design that is to meet the performance requirement as described in the Technical Specification section 02824. This is not tied to a single manufacturer. Different manufacturers can develop a misting system to meet the specification requirements.

V. MISCELLANEOUS:

1. The sewer inspection CCTVs are available on a YouTube channel named "The LA BAVN Bid Videos" see link below:

LA BAVN Bid Videos - YouTube

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue

Form Gen. 146 (Rev. 9/06)

ADDENDUM 7

Required Insurance and Minimum Limits

Name: _____ Date: 10/03/2022

Agreement/Reference: Sixth Street Park, Arts and River Connectivity Improvements (PARC) W.O. E700235D; LA Hands Art Sculpture Foundations W.O. No. E700235F; CBD Unit 11A- 6th St Siphon to Santa Fe Ave W.O. No. SZC14224

Evidence of coverages checked below, with the specified minimum limits, must be submitted and approved prior to occupancy/start of operations. Amounts shown are Combined Single Limits ("CSLs"). For Automobile Liability, split limits may be substituted for a CSL if the total per occurrence equals or exceeds the CSL amount.

Limits

✔ **Workers' Compensation - Workers' Compensation (WC) and Employer's Liability (EL)**

WC ***Statutory***

EL **$1,000,000**

☑ Waiver of Subrogation in favor of City ☐ Longshore & Harbor Workers ☐ Jones Act

✔ **General Liability** ($5 Million Aggregate) City of Los Angeles must be named as an additional insured party. **$2,000,000**

☑ Products/Completed Operations ☐ Sexual Misconduct _____

☐ Fire Legal Liability _____

☐ _____

✔ **Automobile Liability** (for any and all vehicles used for this contract, other than commuting to/from work) **$1,000,000**

✔ **Professional Liability** (Errors and Omissions) **$1,000,000**

Discovery Period 12 Months After Completion of Work or Date of Termination

✔ **Property Insurance** (to cover replacement cost of building - as determined by insurance company) _____

☐ All Risk Coverage ☐ Boiler and Machinery

☐ Flood _____ ☑ Builder's Risk

☐ Earthquake _____ ☐ _____

✔ **Pollution Liability** **$1,000,000**

☑ Contractor's Pollution Liability

✔ **Surety Bonds -** Performance and Payment (Labor and Materials) Bonds 100% of the contract price

____ **Crime Insurance** _____

Other: *Professional Liability Insurance is required for Contractor or any Sub-Contractor performing Professional Design/Engineering type work as part of the project.

Executive Directive 35: Equitable Access to Contracting Opportunities

Respondents are advised, pursuant to Executive Directive 35, if a bidder is selected and awarded a contract, and if the contractor is a for-profit company or corporation, the contractor shall, within 30 days of the effective date of the contract and on an annual basis thereafter (i.e., within 30 days of the anniversary of the effective date of the contract), report the following information to City via the Regional Alliance Marketplace for Procurement (“RAMP”) or via another method specified by City: contractor’s and any subcontractor’s annual revenue, number of employees, location, industry, race/ethnicity and gender of majority owner ("contractor/subcontractor Information"). On an annual basis, the contractor shall further request that any subcontractor input or update its business profile, including the contractor/subcontractor information, on RAMP or via another method prescribed by City.

CITY OF LOS ANGELES

TED ALLEN, PE
CITY ENGINEER

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue
W.O. E700235F & SZC14224

Bidders are required to acknowledge receipt of this addendum in the space provided on page 1-4 of the Bid Proposal. This addendum consists of this two-page transmittal and 4 attachments totaling 11 pages.

Bidders are hereby notified of the following changes:

I. QUESTIONS BIDDERS (Q) AND ANSWERS FROM CITY (A):

(Q1) Is the Pre-bid optional. Addendum no. 1 says it is.

(A1) For clarification, there is the pre-bid job walk and the pre-bid meeting. Addendum No. 1 modified the pre-bid job walk to be optional. For the pre-bid meeting, please refer to the Bid Proposal Part III Section D Indicator 2.

(Q2) Today's 2nd pre-bid meeting is being held on 10/04/22, but the date to complete the BIP Outreach closes on 10/05/22 and the City's system won't allow any submissions past this date. What do we do?

(**A2) The City is making a determination of what can be modified in the bid documents in order to reopen the BIP Outreach window.**

(Q3) Does the City have a list of prime contractors who will be submitting a bid?

(A3) Other than the Plan Holder's List on the Bureau of Engineering website, the City does not know which prime contractor will be submitting a bid.

II. MISCELLANEOUS:

1. Sign in sheet for the 2nd Pre-Bid Teleconference Meeting on 10/04/2022 at 1:00pm via Google Meet due to the Pandemic (1 page).
2. 2nd Pre-Bid Meeting Agenda (1 page).
3. 2nd Pre-Bid Meeting Minutes (2 pages).
4. Bond Assistance Program Power Point Presentation (5 pages).

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue

Meeting ID
meet.google.com/uzy-fbdn-vre

Phone Numbers
(US)+1 978-484-2377
PIN: 547 133 118#

I. Introduction

The BOE project manager introduced City staff and informed participants to provide their information in order to record attendance.

II. General Project Overview

A description of the three projects was provided, including City Engineer's estimate, liquidated damages, project duration, and interim milestone.

The Sixth Street Viaduct PARC project will develop a new 12-acre park underneath and adjacent to the Sixth Street Viaduct from Mateo Street on the west to the US101 freeway to the east. The park features walking/jogging paths, dog parks, restroom buildings, Rec & Park staff building, cafe building, performance arts plaza, adult fitness equipment, synthetic soccer field, multi-purpose fields, basketball court, children's mister area, picnicking/grilling areas, general landscaping and irrigation, fencing, lighting, and tunnel improvements.

The Dept. of Cultural Affairs LA Hands Art Piece Foundations project will construct the two foundations to support the commissioned artist's art work.

Rehabilitate approximately 477 linear feet of existing 36-inch circular sewers in the Central Business District by ultra violet cured-in-place pipe (UV CIPP). The alignment of the reach begins at the 6th Street Siphon outlet structure continuing west on 6th Street towards Santa Fe Avenue, then south on Santa Fe Avenue. Rehabilitate 6th Street Siphon outlet structure and existing maintenance holes.

City Engineer's Estimate: $36,979,003.00
Duration: 730 calendar days
Liquidated Damages: $5,000 per day
Interim Milestone: 555 calendar days.
Interim Milestone Liquidated Damages: $12,000 per day

Refer to the General Requirements Section 01112 for detailed information regarding the interim milestone.

Additionally, bidders were advised to pay attention to the sequence of work to have the soil remediation completed first, followed by the installation of the storm drain to collect the run off from the Viaduct. Again, this is described in the General Requirement Section 01112.

III. Bureau of Contract Administration

A. Business Inclusion Program

Lisa Adams from the Bureau of Contract Administration (BCA) described the Business Inclusion Program (BIP) and explained the steps to fulfill the BIP obligations. Questions can be sent to bca.biphelp@lacity.org

B. Project Labor Agreement

Jacqueline Basuel from BCA discussed the Project Labor Agreement (PLA) that will be implemented for this project and provided information on how it will evaluate labor compliance. Questions can be sent to ocps.help@lacity.org

IV. Contractor Development Technical Assistance and Bonding Assistance

Elizabeth Juarez from Merriwether & Williams presented the various resources it has available to assist contractors for technical development and bonding assistance. Questions can be addressed to Elizabeth at ejuarez@imwis.com.

V. Questions

The meeting was opened for questions.

Question: Does the City have a list of prime contractors who will be submitting a bid?

Response: Other than the Plan Holder's List on the Bureau of Engineering website, the City does not know which prime contractor will be submitting a bid.

Question: Is the Pre-bid optional. Addendum no. 1 says it is.

Response: For clarification, there is the pre-bid job walk and the pre-bid meeting. Addendum No. 1 modified the pre-bid job walk to be optional.

For the pre-bid meeting, please refer to the Bid Proposal Part III Section D Indicator 2.

Question: Today's 2nd pre-bid meeting is being held on 10/04/22, but the date to complete the BIP Outreach closes on 10/05/22 and the City's system won't allow any submissions past this date. What do we do?

Response: The Project Manager will look into this.
Post Meeting follow up response: The City is making a determination of what can be modified in the bid documents in order to reopen the BIP Outreach window.

The project manager informed the group to submit technical questions as Requests for Information (RFI) which will be addressed via an addendum. Send questions to gary.lam@lacity.org.

ADDENDUM 9

PROJECT DESCRIPTION

THE PROJECT IS AN ART INSTALLATION THAT IS PART OF THE 6TH STREET VIADUCT. THE ARTWORK CONSISTS OF TWO 20-FT TALL CAST BRONZE STEEL SCULPTURES WITH INTERNAL STAINLESS STEEL STRUCTURES. THE STEEL STRUCTURES ARE SUPPORTED ON CONCRETE SPREAD FOOTINGS. THE SCOPE OF WORK SHOWN IN THIS DOCUMENT REPRESENTS COMPLIANCE WITH THE 2019 CALIFORNIA BUILDING CODE.

GENERAL NOTES

1. ALL WORK AND MATERIALS SHALL CONFORM TO THE REQUIREMENTS OF THE 2019 CALIFORNIA BUILDING CODE (REFERRED TO HEREINAFTER AS CBC) AND 2019 LOS ANGELES BUILDING CODE AMENDMENTS.
2. ALL DETAILS, SECTIONS AND NOTES SHOWN ON THE DRAWINGS ARE INTENDED TO BE TYPICAL AND SHALL APPLY TO SIMILAR SITUATIONS ELSEWHERE, UNLESS NOTED OTHERWISE. NOTES AND DETAILS ON THE DRAWINGS TAKE PRECEDENCE OVER THE GENERAL NOTES AND TYPICAL DETAILS.
3. ALL OMISSIONS AND CONFLICTS BETWEEN VARIOUS ELEMENTS OF THE WORKING DRAWINGS AND/OR ARCHITECTURAL SPECIFICATIONS (WHERE APPLICABLE) SHALL BE BROUGHT TO THE ATTENTION OF THE STRUCTURAL ENGINEER BEFORE PROCEEDING WITH ANY OF THE WORK INVOLVED.
4. AT ALL TIMES THE CONTRACTOR SHALL BE SOLELY AND COMPLETELY RESPONSIBLE FOR THE CONDITIONS OF THE JOB SITE INCLUDING SAFETY OF THE PERSONS AND PROPERTY, AND FOR ALL NECESSARY INDEPENDENT ENGINEERING REVIEWS OF THESE CONDITIONS. THE ARCHITECT'S OR ENGINEER'S JOB SITE REVIEW IS NOT INTENDED TO INCLUDE REVIEW OF THE ADEQUACY OF THE CONTRACTOR'S SAFETY MEASURES.
5. DURING AND AFTER CONSTRUCTION, BUILDER AND/OR OWNER SHALL KEEP LOADS ON STRUCTURE WITHIN THE LIMITS OF DESIGN LOADS.
6. IN NO CASE SHALL WORKING DIMENSIONS BE SCALED FROM PLANS, SECTIONS OR DETAILS ON THE STRUCTURAL DRAWINGS.
7. SHOP DRAWINGS SHALL BE SUBMITTED TO THE STRUCTURAL ENGINEER PRIOR TO FABRICATION WITH SUFFICIENT TIME FOR REVIEW OF DESIGN INTENT (A MINIMUM OF 10 WORKING DAYS) FOR THE FOLLOWING ITEMS:
   a. STRUCTURAL STEEL
   b. REINFORCING STEEL
8. NO OPENINGS, CHASES, NOTCHES, ETC. SHALL BE PLACED IN COLUMNS, JOISTS, BEAMS, BEARING WALLS, AND SHEAR WALLS UNLESS SPECIFICALLY NOTED ON THESE DRAWINGS. THE CONTRACTOR SHALL NOTIFY THE STRUCTURAL ENGINEER WHEN DRAWINGS BY OTHERS SHOW SUCH OPENINGS.
9. CONTRACTOR SHALL COORDINATE ALL STRUCTURAL FRAMING WITH MECHANICAL, PLUMBING AND ELECTRICAL INFRASTRUCTURE, INCLUDING, BUT NOT LIMITED TO, RECESSED AND SEMI-RECESSED LIGHTING, MECHANICAL DUCTS AND PIPING, FIRE SPRINKLER PIPE AND HEADS AND PLUMBING DRAINS, WASTE AND SUPPLY LINES.
10. ALL ASTM DESIGNATIONS SHALL BE AS AMENDED TO DATE UNLESS NOTED OTHERWISE.

DESIGN CRITERIA

1. DEAD LOADS:
   a. CAST BRONZE SCULPTURE SELF WEIGHT = 10,315 LB MAXIMUM
2. SEISMIC DESIGN PARAMETERS:

a.	IMPORTANCE FACTOR	I = 1.0
b.	RISK CATEGORY	II
c.	SITE CLASS	D
d.	MAPPED SHORT PERIOD ACCELERATION	S_s = 1.930
e.	SITE COEFFICIENT	F_a = 1.0
f.	DESIGN SHORT PERIOD ACCELERATION	S_{DS} = 1.287
g.	MAPPED ONE SECOND ACCELERATION	S_1 = 0.688
h.	SITE COEFFICIENT	F_v = 1.7
i.	DESIGN ONE SECOND ACCELERATION	S_{D1} = 0.780
j.	SEISMIC DESIGN CATEGORY	D

DESIGN BASE SHEAR: V = Cs*W AT STRENGTH LEVEL
(W = EFFECTIVE SEISMIC WEIGHT)

k.	AMUSEMENT STRUCTURE	
	SEISMIC RESPONSE COEFFICIENT	C_s = 0.643
	RESPONSE MODIFICATION FACTOR	R = 2

4. WIND DESIGN PARAMETERS:

a.	BASIC WIND SPEED	95 MPH
b.	RISK CATEGORY	II
c.	EXPOSURE CATEGORY	B
d.	WIND PRESSURES	16.0 PSF

5. FOUNDATION DESIGN PARAMETERS (SPREAD FOOTING PARAMETERS)

•	ALLOWABLE SOIL PRESSURE:	
	DEAD LOADS:	3,200 PSF
	DEAD PLUS LIVE LOADS:	3,200 PSF
	DEAD PLUS LIVE PLUS SEISMIC:	4,267 PSF
•	COEFFICIENT OF FRICTION	0.36
•	PASSIVE PRESSURE	350 PCF

FOUNDATION

1. FOUNDATION DESIGN IS BASED ON THE GEOTECHNICAL REPORT BY TETRA TECH DATED AUGUST 3, 2021. A COPY OF THIS REPORT MAY BE OBTAINED FROM THE ARCHITECT'S OFFICE.
2. INSTALLATION OF THE FOUNDATIONS WITH RESPECT TO THE DEPTH BELOW FINISHED OR NATURAL GRADE SHALL BE AT A MINIMUM ACCORDING TO THE FOUNDATION DETAILS ON THESE PLANS. FIELD DISCOVERED CONDITIONS MAY NECESSITATE DEEPER FOUNDATIONS.
3. EXCEPT WHERE OTHERWISE SHOWN, EXCAVATIONS SHALL BE MADE AS NEAR AS POSSIBLE TO THE NEAT LINES REQUIRED BY THE SIZE AND SHAPE OF THE STRUCTURE.
4. ALL EXCAVATIONS, FORMS AND REINFORCING ARE TO BE INSPECTED BY GEOTECHNICAL ENGINEER PRIOR TO PLACING CONCRETE.
5. ALL WATER, SOIL, AND OTHER DEBRIS SHALL BE REMOVED FROM FOUNDATION EXCAVATIONS PRIOR TO PLACING OF CONCRETE.
6. ALL BACKFILL WITH ENGINEERED FILLS SHALL BE COMPACTED TO 95% RELATIVE DENSITY.

CONCRETE

1. ALL CONCRETE CONSTRUCTION SHALL BE PER CBC CHAPTER 19 AND IN ACCORDANCE WITH ACI 318-11, SPECIFICATIONS FOR STRUCTURAL CONCRETE.
2. ALL CONCRETE SHALL HAVE A MAXIMUM WATER-CEMENT RATIO OF 0.48 FOR FOUNDATIONS AND ALL STRUCTURAL ELEMENTS, 4"±1" SLUMP, AND SHALL OBTAIN A 28 DAY MINIMUM COMPRESSIVE STRENGTH OF 4,000 PSI.
3. ALL CONCRETE SHALL BE NORMAL WEIGHT CONCRETE, WEIGHING LESS THAN 150 PCF, UNLESS OTHERWISE NOTED.
4. CEMENT SHALL CONFORM TO ASTM C150, TYPE II (OR ENGINEERED MAXIMUM DESIGN TO STRENGTH).
5. HARD ROCK AGGREGATES SHALL CONFORM TO ASTM C33. MAXIMUM NORMAL SIZE OF AGGREGATE SHALL NOT EXCEED 1 1/2 INCHES FOR FOUNDATION CONCRETE AND 1 INCH FOR STRUCTURAL CONCRETE ABOVE THE FOUNDATION. SEE ALSO THE REQUIREMENTS IN ACI STANDARD SPECIFICATIONS. MAXIMUM NORMAL SIZE SHALL ALSO BE SELECTED SUCH THAT WORKABILITY AND PLACEABILITY OF CONCRETE ARE FACILITATED.
6. ALL ALTERNATE CONCRETE MIX DESIGN AND TEST STRENGTHS SHALL BE SUBMITTED TO THE STRUCTURAL ENGINEER FOR APPROVAL PRIOR TO CONSTRUCTION.
7. MAXIMUM VERTICAL DROP OF CONCRETE SHALL BE NO MORE THAN 2'-0" FROM END OF PLACEMENT DEVICE TO PLACEMENT SURFACE.
8. CONCRETE COVER AT REINFORCING SHALL BE AS FOLLOWS:

a.	CAST AGAINST AND PERMANENTLY EXPOSED TO EARTH:	3" CLEAR
b.	EXPOSED TO EARTH OR WEATHER BUT CAST AGAINST FORMS	2" CLEAR
c.	BARS PARALLEL TO COLD JOINTS	2" CLEAR

9. ALL REINFORCING STEEL, DOWELS, ANCHOR BOLTS, PIPE SLEEVES AND OTHER INSERTS SHALL BE SECURED IN POSITION PRIOR TO PLACING OF CONCRETE. WET SETTING WILL NOT BE ALLOWED.
10. THE SURFACE OF ALL CONSTRUCTION JOINTS SHALL BE CLEANED AND ROUGHENED BY REMOVING THE ENTIRE SURFACE AND EXPOSING CLEAN AGGREGATE SOLIDLY EMBEDDED IN MORTAR MIX.
11. EPOXY SET ANCHORS SHALL BE INSTALLED IN CONCRETE THAT HAS A MINIMUM AGE OF 21 DAYS PER ACI D5.5.2.

REINFORCING BAR

1. REINFORCING STEEL SHALL BE DEFORMED BARS PER ASTM A615 WITH BAR MARKS LEGIBLY ROLLED INTO THE SURFACE INDICATION SIZE, TYPE OF STEEL, AND YIELD STRENGTH DESIGNATION:
   a. #3 BARS AND SMALLER — GRADE 40 OR GRADE 60
   b. #4 BARS AND LARGER — GRADE 60
   c. ALL BARS TO BE WELDED — GRADE A706
2. REINFORCING SHALL HAVE A MINIMUM LAP IN CONFORMANCE WITH DETAILS AND SPECIFICATIONS SHOWN ON THESE DRAWINGS. STAGGER SPLICES WHENEVER POSSIBLE. VERTICAL WALL REINFORCING BARS SHALL EITHER EXTEND INTO FOOTINGS OR LAP SPLICED WITH FOOTING DOWELS OF THE SAME SIZE BARS.
3. BENDING OF REINFORCING SHALL BE IN CONFORMANCE WITH DETAILS AND SPECIFICATIONS SHOWN ON THESE DRAWINGS. FIELD BENDING OF BARS THAT ARE IN PLACE IS NOT PERMITTED UNLESS APPROVED BY THE STRUCTURAL ENGINEER.
4. ALL BARS SHALL BE FREE OF LOOSE AND FLAKY RUST AND SCALE, GREASE, OR OTHER MATERIALS WHICH MIGHT AFFECT OR IMPAIR BOND.

STRUCTURAL STEEL

1. CARBON STEEL MATERIALS SHALL CONFORM TO THE FOLLOWING:

W SHAPES	ASTM A992 (Fy=50ksi)
HSS SHAPES	ASTM A500, GRADE B
OTHER SHAPES AND PLATES	ASTM A36
ELECTRODES	ASTM E70XX
BASE PLATES	ASTM A36
ANCHOR BOLTS	ASTM F1554, Fy=36 ksi
MACHINE BOLTS	ASTM A307
HIGH STRENGTH BOLTS	ASTM F3125
WELDED STUDS	ASTM A108
THREADED RODS	ASTM A193, GRADE B7

2. STAINLESS STEEL MATERIALS SHALL CONFORM TO THE FOLLOWING:

HSS SHAPES	ASTM A276 SS 304
OTHER SHAPES AND PLATES	ASTM A276 SS 304
ELECTRODES	AWS E308L-XX
BASE PLATES	ASTM A276 SS 304
ANCHOR BOLTS	ASTM F593, SS 304

3. ALL STRUCTURAL STEEL SHALL CONFORM TO AISC SPECIFICATIONS FOR THE DESIGN, FABRICATION, AND ERECTION OF STRUCTURAL STEEL FOR BUILDINGS. BOLT HOLES SHALL BE 1/16" OVERSIZED, EXCEPT AT BASE PLATES WHERE THEY CAN BE 5/16" OVERSIZED, WITH WELDED WASHERS.
4. ALL SHOP AND FIELD WELDING SHALL BE INSPECTED BY AN APPROVED TESTING LABORATORY. SPECIAL INSPECTION REQUIREMENTS OF CHAPTER 17, 2018 IBC, APPLY TO ALL WELDING.
5. ALL WELDING TO CONFORM TO THE REQUIREMENTS OF THE LATEST AWS D1.1 STRUCTURAL WELDING CODE AND SHALL BE PERFORMED BY CERTIFIED WELDERS.
6. ALL WELDS NOT SPECIFIED SHALL BE CONTINUOUS FILLET WELDS, USING NOT LESS THAN THE MINIMUM SIZES BASED ON THICKNESS OF THICKER PART JOINED PER AISC/AWS, AND IN NO CASE LESS THAN 1/4" UNLESS NOTED OTHERWISE.
7. WHERE WELDS ARE DESIGNATED AS DEMAND CRITICAL, THEY SHALL BE MADE WITH A FILLER METAL CAPABLE OF PROVIDING A MINIMUM CHARPY V-NOTCH (CVN) TOUGHNESS OF 20 FT-LB AT -20°F AS DETERMINED BY THE APPROPRIATE AWS CLASSIFICATION TEST METHOD OR MANUFACTURER CERTIFICATION.
8. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE CONTROL OF ALL ERECTION PROCEDURES AND SEQUENCES ESPECIALLY WITH RELATION TO TEMPERATURE DIFFERENTIALS, ERECTION TOLERANCES, AND WITH RESPECT TO STRUCTURAL STEEL FRAMING INTO REINFORCED CONCRETE WALLS.
9. THE STRUCTURAL STEEL CONNECTIONS CONSIST OF THE FOLLOWING:
   a. ALL MAJOR STRUCTURAL STEEL CONNECTIONS ARE DETAILED ON THE DRAWINGS. THE DETAILS INDICATE THE REQUIRED MINIMUM PLATE THICKNESSES, ANGLES, WELDS, BOLTS AND GENERAL CONNECTION CONFIGURATION. THE FINAL DIMENSIONAL CONFIGURATION INCLUDING ADJUSTMENTS FOR CAMBER SHALL BE DETERMINED BY THE FABRICATOR ON SHOP DRAWINGS.
   b. ANY PROPOSED REVISIONS OR MODIFICATIONS TO THE CONNECTIONS AS SHOWN ON THE DRAWINGS SHALL BE FULLY ENGINEERED BY THE FABRICATOR. SHOP DRAWINGS AND CALCULATIONS PREPARED AND STAMPED BY A PROFESSIONAL ENGINEER LICENSED IN THE STATE OF MARYLAND SHALL BE SUBMITTED FOR REVIEW. THE CAPACITY OF CONNECTIONS SHALL NOT BE REDUCED FROM THAT PROVIDED BY THE DETAIL AS SHOWN WHERE NOT SHOWN OR INFERRED FROM DRAWINGS, THE CONNECTION SHALL BE CAPABLE OF NOT LESS THAN 120% OF THE MEMBER CAPACITY IN TENSION. ANY PROPOSED REVISIONS SHALL BE AT NO ADDITIONAL COST TO THE OWNER.
10. ALL CARBON STEEL EXPOSED TO "WEATHER" SHALL BE HOT-DIPPED GALVANIZED INCLUDING BUT NOT LIMITED TO WF BEAMS AND FASTENERS. AFTER WELDING, "WELDING SLAG" MUST BE REMOVED AND ZINC-RICH PAINT MUST BE APPLIED TO WELD AND ADJACENT AREAS WHERE COATING HAS BEEN DAMAGED. ZINC-RICH PAINT MUST BE APPLIED TO A THICKNESS EQUIVALENT TO HOT-DIPPED GALVANIZED COATING.

STRUCTURAL OBSERVATIONS

1. THE FOLLOWING ITEMS SHALL HAVE PERIODIC STRUCTURAL OBSERVATION BY THE STRUCTURAL ENGINEER OF RECORD PER CBC SECTION 1704.5:
   a. REINFORCING STEEL PRIOR TO POURING CONCRETE
   b. ANCHOR BOLTS AND HOLD DOWNS ANCHORS PRIOR TO POURING CONCRETE
   c. STRUCTURAL STEEL CONSTRUCTION PRIOR TO COVER
   d. STRUCTURAL FRAMING AND CONNECTER PRIOR TO COVER
2. THE CONTRACTOR SHALL NOTIFY THE STRUCTURAL ENGINEER A MINIMUM OF 48 HOURS (EXCLUDING WEEKEND DAYS) PRIOR TO THE TIME OF A REQUIRED STRUCTURAL OBSERVATION.
3. OBSERVATION VISITS TO THE JOB SITE BY THE ENGINEER'S FIELD REPRESENTATIVE SHALL BE CONSTRUED AS NEITHER INSPECTION NOR APPROVAL OF CONSTRUCTION.

SPECIAL INSPECTIONS

1. THE FOLLOWING CONTINUOUS OR PERIODIC SPECIAL INSPECTIONS, AS REQUIRED BY CBC CHAPTER 17, SHALL BE PERFORMED BY THE OWNER'S TESTING AND INSPECTION AGENCY:
   a. CONCRETE. DURING THE TAKING OF TEST SPECIMENS AND PLACING OF REINFORCED CONCRETE.
   b. REINFORCING STEEL. DURING PLACING OF REINFORCING STEEL FOR CONFORMANCE TO THE APPROVED PLANS PRIOR TO THE CLOSING OF FORMS OR THE DELIVERY OF CONCRETE TO THE JOBSITE.
   c. STRUCTURAL WELDING. DURING THE WELDING OF ANY MEMBER OR CONNECTION IN THE SHOP OR FIELD, INCLUDING NON-DESTRUCTIVE TESTING OF SPECIAL MOMENT-RESISTING AND ECCENTRICALLY BRACED STEEL FRAMES. PERIODIC INSPECTIONS PERMITTED ONLY AS NOTED IN CONTRACT DOCUMENTS. DURING THE WELDING OF REINFORCING STEEL.
   d. GRADING, EXCAVATIONS AND FILLING. DURING EARTH-WORK EXCAVATIONS, GRADING AND FILLING OPERATIONS.
   e. STEEL CONSTRUCTION AND WELDING.
   f. EPOXY CONNECTED HOLDOWNS TO EXISTING CONCRETE.

EPOXY ANCHORING:

1. EPOXY OR RESIN ADHESIVE SHALL BE ON OF THE FOLLOWING:
   - HILTI HIT-RE 500 V3 ADHESIVE (ICC-ES-ESR-3814)
   - HILTI HIT-HY 200 ADHESIVE (ICC-ES-ESR-3187)
   - SIMPSON SET-3G ADHESIVE (ICC-ES-ESR-4057)
   - SIMPSON SET-XP ADHESIVE (ICC-ES-ESR-2508)
   - EQUIVALENT ALTERNATES WILL BE CONSIDERED UPON REQUEST AND SUBMISSION OF SPECIFICATIONS AND ICBO EVALUATION REPORT.
2. EPOXY ADHESIVE WILL BE USED IN ALL LOCATIONS WHERE EITHER THREADED STEEL ROD OR REBAR IS BEING EMBEDDED INTO EXISTING CONCRETE OR MASONRY AS TENSION AND/OR SHEAR ELEMENTS.
3. CONTRACTOR SHALL MIX AND INSTALL RESIN AND HARDENER PER MANUFACTURER'S SPECIFICATION.
4. HOLES SHALL BE DRILLED WITH ROTARY DRILL. DRILL BIT DIAMETER SHALL BE ⅛" LARGER THAN BOLT/REBAR DIAMETER OR PER THE MANUFACTURERS SPECIFICATION. EXISTING REINFORCEMENT SHALL NOT BE CUT OR DAMAGED UNLESS PERMITTED IN WRITING BY THE ENGINEER. IMMEDIATELY BEFORE APPLYING ADHESIVE, HOLES SHALL BE REAMED WITH A CIRCULAR WIRE BRUSH ATTACHED TO A DRILL MOTOR (MINIMUM OF 4 CYCLES) AND THEN BLOWN OUT WITH OIL-FREE COMPRESSED AIR FOR A MINIMUM OF 4 SECONDS. COMPRESSED AIR NOZZLE MUST REACH THE BOTTOM OF THE HOLE.
5. CONTINUOUS OR PERIODIC SPECIAL INSPECTION IS REQUIRED FOR THREADED STEEL ROD EPOXY SET IN EXISTING CONCRETE OR MASONRY.
   a. CONTINUOUS SPECIAL INSPECTION SHALL BE THE FULL TIME OBSERVATION OF WORK BY AN APPROVED SPECIAL INSPECTOR WHO IS PRESENT IN THE AREA WHERE THE WORK IS BEING PERFORMED. INSPECTOR SHALL OBSERVE WORK IS IN CONFORMANCE TO THE APPROVE DRAWINGS AND NOTIFY ENGINEER OF ANY EXCEPTIONS
   b. PERIODIC INSPECTION SHALL BE AS FOLLOWS:
      - 5% OF TENSION BOLTS OR A MINIMUM OF 2 ANCHORS SHALL BE TESTED USING THE DIRECT TENSION LOAD METHOD:
      - TENSION RODS SHALL BE SUBJECT TO DIRECT TENSION LOAD AS SHOWN FOR FIVE MINUTES (10 PERCENT DEVIATION). THE DISTANCE BETWEEN THE ANCHOR AND THE TEST APPARATUS SUPPORT SHALL NOT BE LESS THAN 75 PERCENT OF THE EMBEDMENT OF THE ANCHOR BOLT.
      - 20% OF ANCHOR BOLTS TORQUE TEST

TESTING LOAD, U.O.N.		
THREADED ROD DIAMETER	DIRECT TENSION LOAD	TORQUE TEST LOAD
1/2" ø	–	20 FT-LB
5/8" ø	7,000 LBS	30 FT-LB
3/4" ø	8,500 LBS	45 FT-LB
7/8" ø	10,000 LBS	60 FT-LB
1" ø	18,000 LBS	80 FT-LB

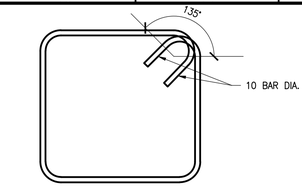
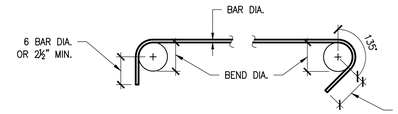
ADDENDUM 9



TYPICAL STIRRUP (CLOSED–TIE)



90° HOOK 135° HOOK

NOTE:
1. MINIMUM BEND DIAMETER FOR STIRRUPS AND TIES IS 4d FOR #5 BARS & SMALLER AND 6d FOR #6 THRU #8 BARS.
2. STIRRUPS CALLED OUT ON THE DRAWINGS MAY NEED TO BE INSTALLED IN PIECES TO ACCOMMODATE FIELD AND EXISTING CONDITIONS. WHERE THIS NEEDS TO OCCUR EACH PIECE NEEDS TO HAVE HOOKED ENDS AS SHOWN IN THIS DETAIL.
3. ON DRAWINGS, WHERE A STIRRUP CORNER SHOWS DOUBLE HOOKS, IT MEANS THAT HOOKS LAP AT CORNER. THIS THEREFORE IDENTIFIES THE PIECES OF THE STIRRUP

3 STIRRUP & TIE BENDS

SCALE: N.T.S.

SECTION 01280
MEASUREMENT AND PAYMENT

PART 1 - GENERAL

1.01 PAYMENT

A. Upon Contract award, the accepted Schedule of Work and Prices shall become the Payment Schedule. Payment for Work under the Contract shall be made at the unit prices listed in the Payment Schedule. For lump sum bid items, payment shall be made in accordance with Section 01298.

B. Payment for the measured quantities of Work performed shall be considered full compensation for all of the CONTRACTOR's costs associated with the performance of the Work. These costs comprise direct labor, materials, tools, equipment, transportation, supplies, incidentals, and subcontract Work; and indirect costs such as field and home office overhead, consulting and design services, establishment, operation and removal of general plant, taxes, insurance, permits, bond, profit, and contingencies for the performance of all Work specified.

C. The costs for conforming to the requirements for measuring quantities shall be considered included in the fixed, unit, or lump-sum prices paid for the quantities being measured, and no additional compensation will be made therefore.

D. Except for items subject to the Variation in Quantities clause, the unit prices listed in the Payment Schedule shall be applicable for calculating the amount payable under each item of the Schedule. Estimated quantities indicated in the Payment Schedule are for bidding purposes only. Payment will be determined by actual measured quantities of the Work installed/performed as verified by the INSPECTOR.

E. Work specified or shown on the drawings for which the Payment Schedule does not provide a separate lump sum or unit price is considered incidental and is not separately paid. The cost for such Work is compensated in the prices bid for other Work items and no additional compensation shall be allowed.

1.02 MEASUREMENT OF QUANTITIES

A. Measure quantities in accordance with standard industry practice and as specified herein. The CITY will verify measurements. Measure quantities to the nearest whole number of units. Round down fractional units less than one-half; round up fractional units one-half or greater.

1. Measure sewer debris volumes by weight as described herein.

2. Measure areas in two mutually perpendicular axes in the plane of the surface being measured.

3. Measure linear quantities along the longitudinal centerline of the item, except as otherwise specified.

B. Measurement of a lump sum item shall be for the entire item, unit of Work, structure, or combination thereof, as listed or indicated in the Payment Schedule, except as otherwise

specified. Progress payments for lump sum items in the Payment Schedule shall be made in accordance with Section 01298.

C. Determine quantities of Work performed for payment purposes and submit them to the INSPECTOR for approval. Assist the INSPECTOR in the taking of measurements by providing equipment, workers, and survey crews as required to verify quantities in accordance with the provisions for measurement specified herein.

1.03 REJECTED, EXCESS, AND WASTED MATERIALS

A. The following shall not be measured for payment:

1. Quantities of material wasted or otherwise disposed.

2. Rejected loads of material, including material rejected after it has been placed for failure to comply with specified requirements.

3. Material remaining on the transporting vehicle or in the pipeline.

4. Muck material not removed from designated location.

5. Material placed outside specified or indicated lines or limits.

6. Material not incorporated into the Work.

7. Material remaining on hand after completion of the Work.

B. No payment will be made for loading, hauling, and disposing of rejected material.

1.04 PAYMENT SCHEDULE

A. **BID ITEM 1: General Mobilization** (Lump Sum)

1. The amount payable under this item is fixed at the bid price and shall be no more than 5 percent of the Contract amount. This bid price for costs of work in advance of construction operations. This Bid Item is not included and attributable directly to any other specific Bid Items. For progress payments, the amount payable under this item shall be determined in accordance with Section 01292.

2. The Work shall include:

a. The movement of personnel, equipment, supplies and incidentals to the project sites.

b. Temporary laydown area and obtaining all permits and clearance requirements to secure and utilize the laydown area

c. The establishment of field offices, parking, utilities and other facilities at the Work Area Sites for the CITY and the CONTRACTOR, as specified in Section 01721.

d. Work, such as engineering designs and submittals, must be performed and expended in advance of actual construction. This Work shall include any additional investigations of the condition of the NOS that the CONTRACTOR deems

necessary to conduct the Work in compliance with applicable safety and other regulatory requirements.

e. Applying for permits (if applicable) and coordinating work with other agencies such as USACE, LADOT, AQMD, LADBS, LADWP, SCG and other utility companies and public agencies.

f. Work, such as handling homeless encampment within and/or adjacent to work site (if applicable) & community outreach regarding disruption to the Los Angeles River Bike Path and Recreational Parks (if applicable) at pit locations and bypass locations must be performed and resolved during mobilization. This work shall be, but is not limited to, installation 12 feet chain link and gates per S-691 around the pit(s) and/or at field office locations.

CONTRACTOR shall coordinate with Public Affair Office (PAO) of BOS for any related issues mentioned above:

Tonya Durrell
(213) 978-0333 (office)
(213) 798-6085 (cell)
Tonya.durrell@lacity.org

In addition, contact LA – Homeless Services Authority at (213) 225-6581 to handle any homeless issues

CONTRACTOR shall comply with all instructions and requirements of the PAO and the Mayor's office regarding homeless encampment issues. In addition, the CONTRACTOR shall comply with all instructions and requirements by the PAO, LADOT, LA County, and Mayor's office regarding any construction/bypass activities. All the costs related and associated with these issues shall be included in the Bid Item 1 "Mobilization".

1

B. **BID ITEMS 2 through 13: Allowance Items**

1. Allowance items have been established in the Bid Schedule to compensate the CONTRACTOR for the cost of performing such items as the CITY may require for the construction of the Work, but for which it is impracticable to ascertain the scope prior to bid. If the total cost compensable under each allowance item differs from the amount set forth in the SCHEDULE OF WORK AND PRICES, the Contract Price shall be adjusted by a Change Order for the difference between the total actual costs and the allowance amount as an additional amount due the CONTRACTOR or a credit to the CITY, as appropriate.

2. Reimbursement for all allowance items shall be as determined by GR-Section 01212.

3. The allowance items are as follows:

a. **Bid Item 2: Allowance for Electrical and Water Service Fees**

Reimbursement for CONTRACTOR's expenses for electrical and water service fees without compensation for any mark-ups. The CONTRACTOR shall include in the Bid the amount stipulated under ALLOWANCE FOR ELECTRICAL AND WATER

SERVICE FEES in the SCHEDULE OF WORK AND PRICES in the Bid Proposal as an allowance for the costs of all required electrical and water service fees.

Costs shall be limited to the actual fees paid to the agencies and will be reimbursed based on original receipts only. No overhead, profit, or mark-ups shall be added to the cost of the fees. The CONTRACTOR shall deliver to the ENGINEER with each service the original receipt. After all services have been obtained and delivered, the actual costs of all service fees shall be reviewed by the CONTRACTOR and the ENGINEER.

b. **Bid Item 3: Allowance for Engineer's and Inspector's Field Office Supplies**

Reimbursement for CONTRACTOR's expenses for furnishing, installing, and maintaining field office facilities for CITY construction management staff beyond specified requirements in the Section 01721 of these GENERAL REQUIREMENTS. As determined by Section 01212 of these GENERAL REQUIREMENTS.

c. **Bid Item 4: Allowance for Differing Site Conditions**

This allowance will compensate the CONTRACTOR the additional expenses and measures taken to address and to mitigate Differing Site Condition(s) as defined and approved by the CITY per conditions set forth in Section 01253 of the specification in addition to abandoning and/or relocation of site utilities encountered during construction but not shown on the current project plans as directed by the CITY or the ENGINEER.

This allowance will compensate CONTRACTOR in the event of an omission of an existing utility in the contract, or if an existing utility needs to be relocated due to its location in the field differing significantly from that shown in the contract drawings, and in the opinion of the ENGINEER that the utility relocation is necessary to avoid impacting the Work. If actual utilities are within 2 feet off location shown on the drawings (centerline to centerline), there will be no compensation provided under this bid item. This allowance shall not compensate the CONTRACTOR to relocate existing utilities shown on the contract drawings proposed or specified for relocation by others.

d. **Bid Item 5: Allowance for Permits**

Reimbursement for CONTRACTOR's expenses for permits fees without compensation for any mark-ups. The CONTRACTOR shall include in the Bid the amount stipulated under PERMITS in the SCHEDULE OF WORK AND PRICES in the Bid Proposal as an allowance for the costs of all required permits.

Costs shall be limited to the actual fees paid to the agencies and will be reimbursed based on original receipts only. No overhead, profit, or mark-ups shall be added to the cost of the permits. The CONTRACTOR shall deliver to the ENGINEER with each permit the original receipt. After all permits have been obtained and delivered, the actual costs of all permits shall be reviewed by the CONTRACTOR and the ENGINEER.

e. **Bid Item 6: Allowance for Opportunity to Partner**

Reimbursement of 100 percent of the expenses for partnering, as determined by Section 01353 of these GENERAL REQUIREMENTS. There shall be no mark-ups for overhead or profit.

f. **Bid Item 7: Allowance for City Inspection**

Reimbursement for the CONTRACTOR's expenses associated with payment of City inspection and travel costs as described in Section 01453. There shall be no mark-ups for overhead or profit.

g. **Bid Item 8: Allowance for Sewer Bypass**

This allowance item is for the design and installation of any bypasses (NOS, local sewers and HCs) deemed necessary by the CONTRACTOR and LOS ANGELES SANITATION AND ENVIRONMENT (LASAN) to complete all the work. The temporary bypass shall encroach within City's public right of way. This item shall include all work including labor, materials, equipment and any incidentals to design, implement, and maintain bypass operation without any interruptions of construction activities. For further details, refer to Section 01563 and the contract drawings. Refer to section 01212 for overhead and profit markups.

h. **Bid Item 9: Allowance for Additional Potholing**

This bid item allows compensation for exploratory excavations by potholing to verify or to discover the actual locations and size of existing underground utilities or improvements that were not shown on the plans. This allowance shall only be used to reimburse the CONTRACTOR for potholing utilities not shown on the plans. For further details refer to section 01732.

i. **Bid Item 10: Allowance for Archaeological Monitoring**

Reimbursement for archaeological monitoring and consultation. There shall be no mark-ups for overhead or profit. For further details refer to section 01562.

j. **Bid Item 11: Allowance for Street Damage Restoration Fee**

Reimbursement for street damage restoration fees. There shall be no mark-ups for overhead or profit. For further details refer to section 02710.

k. **Bid Item 12: Allowance for Urban Forest**

This allowance will compensate the contractor for the installation of additional landscaping improvements in the project area south of the Arts Plaza in lieu of the construction of the decomposed granite as shown in the contract drawings. This allowance shall include furnishing all labor, materials, tools, equipment, and incidentals to install up to (21) 24" box trees, (65) 5-gallon shrubs, (550) 1-gallon shrubs, (20) landscape boulders, 7,780 square feet of 4" deep mulch, and 7,780 square feet of Soil-2A with Soil-2B at tree locations. This allowance shall also include the installation of a non-drip irrigation system for the 7,780 square foot planting area, the installation of a separate power service from LADWP, the construction of 280 linear feet of 8' tall CMU screen walls including foundations, and performing all earthwork activities in the area including the removal of excess soils.

1

l. **Bid Item 13: Allowance for Additional Perimeter Fencing and Gates**

This allowance will compensate the contractor for additional perimeter fencing, gates and hardware that is needed to enclose the park perimeter to the public right-of-way and neighboring parcels. This allowance shall include furnishing all labor, materials, tools, equipment, and incidentals.

1

C. Bid Item 14: West Park Improvements

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all work within the West Park limits between Mateo Street and Santa Fe Avenue. Work shall include, but not be limited to, demolition; relocations; reconstructions; adjustments to grade; clearing and grubbing; erosion and sediment control; SWPPP preparation and implementation; earthwork including all import, export, excavation, overexcavation, shoring, trenching, subgrade preparation, backfill, and compaction; hardscape improvements; planting improvements and plant establishment; irrigation improvements; site furnishing improvements; signage improvements; soil improvements; potable water system improvements; sanitary sewer system improvements; storm drain system improvements; electrical improvements; west restroom building construction; and west café building construction.

Payment for all West Park Improvements shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

D. Bid Item 15: Arts Plaza and Los Angeles River Tunnel Improvements

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all work within the Arts Plaza limits between Santa Fe Avenue and the Los Angeles River. This item shall also include the improvements to the project area located south of the Arts Plaza. Work shall include, but not be limited to, demolition; relocations; reconstructions; adjustments to grade; clearing and grubbing; erosion and sediment control; SWPPP preparation and implementation; earthwork including all import, export, excavation, overexcavation, shoring, trenching, subgrade preparation, backfill, and compaction; hardscape improvements; terracing construction; retaining wall construction; tunnel reconstruction; tunnel rehabilitation including resurfacing and painting improvements; planting improvements and plant establishment; irrigation improvements; site furnishing improvements; signage improvements; Los Angeles River flood warning system design and installation; soil improvements; potable water system improvements; sanitary sewer system improvements; storm drain system improvements; and electrical improvements.

Payment for all Arts Plaza and Los Angeles River Tunnel Improvements shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

E. Bid Item 16: East Park Improvements

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all work within the East Park limits between the Los Angeles River and the U.S. 101 Highway, as well as the planting and irrigation improvements between the U.S. 101 Highway and the northbound on-ramp. Work shall include, but not be limited to, demolition; relocations; reconstructions; adjustments to grade; clearing and grubbing; erosion and sediment control; SWPPP preparation and implementation; earthwork including all import, export, excavation, overexcavation, shoring, trenching, subgrade preparation, backfill, and compaction; hardscape improvements; synthetic turf improvements; terracing construction; retaining curb construction; Viaduct historic arch improvements; Viaduct historic lighting improvements; planting improvements and plant establishment; irrigation improvements; site furnishing improvements; signing and striping improvements; soil improvements; potable water system improvements; sanitary sewer system improvements; storm drain system improvements; electrical improvements; and the east buildings construction.

Payment for all East Park Improvements shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1 **F. Bid Item 17: Roadway Improvements**

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all roadway improvements along Mateo Street, Santa Fe Avenue, Mission Road, Anderson Street, and Clarence Street. Work shall include, but not be limited to, demolition; relocations; reconstructions; adjustments to grade; clearing and grubbing; erosion and sediment control; SWPPP preparation and implementation; earthwork including all import, export, excavation, overexcavation, shoring, trenching, subgrade preparation, backfill, and compaction; hardscape improvements; site furnishings improvements; utility connections; signing and striping improvements; storm drain system improvements; and electrical improvements;.

Payment for all Roadway Improvements shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1 **G. Bid Item 18: Security Camera Infrastructure**

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the trenching and installation of approximately 5,000 linear feet of 4” diameter electrical conduit with pull strings and up to thirty-five 24”x36”x24” junction boxes. This infrastructure shall be used for the future installation of CCTV system. Junction boxes shall be concrete, traffic rated, and equipped with a locking cover. Work shall include, but not be limited to, trenching, conduit and pull tape installation, reinforced concrete bedding, backfill, compaction, and junction box installation.

Payment for all Security Camera Infrastructure work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1 **H. Bid Item 19: Remedial Action Plan Permitting and Regulatory Compliance**

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all work for permitting and regulatory compliance as described in the Remedial Action Plan included as Attachment No. 2 of the Project Specifications. Work shall include, but not be limited to, preparing all required plans and submittals, notifying all regulatory agencies, obtaining all permitting and regulatory approvals, and paying all fees. CONTRACTOR must possess a current Class A General Contractor’s license with a HAZ Certification.

Payment for all Remedial Action Plan Permitting and Regulatory Compliance work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1 **I. Bid Item 20: Remedial Action Plan Preliminary Activities**

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all preliminary activity work as described in the Remedial Action Plan included as Attachment No. 2 of the Project Specifications. Work shall include, but not be limited to, the performance of all site inspections, screenings, and site preparations.

Payment for all Remedial Action Plan Preliminary Activities work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

J. Bid Item 21: Remedial Action Plan Engineering Oversight

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all engineering oversight work as described in the Remedial Action Plan included as Attachment No. 2 of the Project Specifications. Work shall include, but not be limited to, all field monitoring, sampling, analytical testing, documentation preparation, and reporting.

Payment for all Remedial Action Plan Engineering Oversight work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

K. Bid Item 22: Remedial Action Plan Soil Excavation

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for removing, shoring as needed, and temporarily stockpiling waste soils in accordance with the Remedial Action Plan included as Attachment No. 2 of the Project Specifications. Quantities shall be based upon “cut” yardage quantities. Any swell of the “cut” material shall not be added to the “cut” quantities and shall be considered included within the unit price for each “cut” cubic yard of in place material.

Payment for all Remedial Action Plan Soil Excavation work shall be at the contract unit price bid per Cubic Yard. No additional compensation will be allowed.

1

L. Bid Item 23: Remedial Action Plan RCRA-Hazardous Waste Soil Removal

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for loading, transporting, and disposing of RCRA hazardous waste soil at a Class I landfill in accordance with the Remedial Action Plan included as Attachment No. 2 of the Project Specifications.

Payment for all Remedial Action Plan RCRA-Hazardous Waste Soil Removal work shall be at the contract unit price bid per Ton. No additional compensation will be allowed.

1

M. Bid Item 24: Remedial Action Plan Non-RCRA-Hazardous Waste Soil Removal

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for loading, transporting, and disposing of non-RCRA hazardous waste soil at a Class II landfill in accordance with the Remedial Action Plan included as Attachment No. 2 of the Project Specifications.

Payment for all Remedial Action Plan Non-RCRA-Hazardous Waste Soil Removal work shall be at the contract unit price bid per Ton. No additional compensation will be allowed.

1

N. Bid Item 25: Remedial Action Plan Non-Hazardous Waste Soil Removal

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for loading, transporting, and disposing of non-hazardous waste soil in accordance with the Remedial Action Plan included as Attachment No. 2 of the Project Specifications.

Payment for all Remedial Action Plan Non-Hazardous Waste Soil Removal work shall be at the contract unit price bid per Ton. No additional compensation will be allowed.

1

O. Bid Item 26: Remedial Action Plan Soil Vapor Extraction Pilot Test in AOC 8

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all work for the Soil Vapor Extraction Pilot Test in AOC 8 as described in the Remedial Action Plan included as Attachment No. 2 of the Project Specifications. Work shall include, but not be limited to, all well installations, temporary piping installations, equipment rentals, monitoring, sampling, testing, and reporting.

Payment for all Remedial Action Plan Soil Vapor Extraction Pilot Test in AOC 8 work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

P. Bid Item 27: Remedial Action Plan Soil Vapor Extraction in AOC 7

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of all work for the Soil Vapor Extraction in AOC 7 as described in the Remedial Action Plan included as Attachment No. 2 of the Project Specifications. Work shall include, but not be limited to, all well installations, conveyance piping installations, equipment rentals, obtaining power from LADWP, monitoring, sampling, testing, reporting, and performance of the 12-month operations and monitoring period.

Payment for all Remedial Action Plan Soil Vapor Extraction in AOC 7 work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

Q. Bid Item 28: Remedial Action Plan Waste Stabilization Analysis

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of the waste stabilization analysis as described in the Remedial Action Plan included as Attachment No. 2 of the Project Specifications.

Payment for the Remedial Action Plan Waste Stabilization Analysis shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

1

R. Bid Item 29: Methane Testing

Bid item shall include furnishing all labor, materials, tools, equipment, and incidentals for the completion of methane testing to determine the methane gas concentrations and methane gas pressures at the proposed locations of the West Park restroom building and café building in accordance with the Division 71 Methane Seepage Regulations and the LADBS Site Testing Standards for Methane (Information Bulletin Document No. P/BC 2020-101).

Payment for all Methane Testing work shall be at the contract bid lump sum (LS) price. No additional compensation will be allowed.

(END OF SECTION)

SECTION 01212
FIXED CASH ALLOWANCE ITEMS

1.1 THE REQUIREMENT

A. A fixed cash allowance has been allocated to each of the following items of the Bid Breakdown (see Bid Proposal). Requirements for each Fixed Cash Allowance Item are specified in the GENERAL REQUIREMENTS (GR) section referenced below. Overhead and Profit, at the rates listed below, shall be added to the actual invoiced amount.

Bid Item No.	Description	Overhead and Profit
1	31. Allowance to furnish all labor, tools, equipment, and materials for the installation of accent lighting for the two (2) art pieces (by ARTIST) (GR Section 01112)	Per Sec. 01254

B. If these items are not executed, or are only partially executed, or the allowance for any item is not expended or partially expended, then a deductive Change Order shall be issued for the amount that is not expended. If, however, these items are over expended (with ENGINEER'S prior approval), then an appropriate Change Order shall be executed in accordance with the provisions of the GENERAL REQUIREMENTS Section 01254 –- CHANGE ORDERS, except for Overhead and Profit wherein the above listed rates shall apply.

(END OF SECTION)

SECTION 01280
MEASUREMENT AND PAYMENT

PART 1 - GENERAL

1.01 PAYMENT

A. Upon Contract award, the accepted Schedule of Work and Prices shall become the Payment Schedule. Payment for Work under the Contract shall be made at the unit prices listed in the Payment Schedule. For lump sum bid items, payment shall be made in accordance with Section 01298.

B. Payment for the measured quantities of Work performed shall be considered full compensation for all of the CONTRACTOR's costs associated with the performance of the Work. These costs comprise direct labor, materials, tools, equipment, transportation, supplies, incidentals, and subcontract Work; and indirect costs such as field and home office overhead, consulting and design services, establishment, operation and removal of general plant, taxes, insurance, permits, bond, profit, and contingencies for the performance of all Work specified.

C. The costs for conforming to the requirements for measuring quantities shall be considered included in the fixed, unit, or lump-sum prices paid for the quantities being measured, and no additional compensation will be made therefore.

D. Except for items subject to the Variation in Quantities clause, the unit prices listed in the Payment Schedule shall be applicable for calculating the amount payable under each item of the Schedule. Estimated quantities indicated in the Payment Schedule are for bidding purposes only. Payment will be determined by actual measured quantities of the Work installed/performed as verified by the INSPECTOR.

E. Work specified or shown on the drawings for which the Payment Schedule does not provide a separate lump sum or unit price is considered incidental and is not separately paid. The cost for such Work is compensated in the prices bid for other Work items and no additional compensation shall be allowed.

1.02 MEASUREMENT OF QUANTITIES

A. Measure quantities in accordance with standard industry practice and as specified herein. The CITY will verify measurements. Measure quantities to the nearest whole number of units. Round down fractional units less than one-half; round up fractional units one-half or greater.

1. Measure sewer debris volumes by weight as described herein.

2. Measure areas in two mutually perpendicular axes in the plane of the surface being measured.

3. Measure linear quantities along the longitudinal centerline of the item, except as otherwise specified.

B. Measurement of a lump sum item shall be for the entire item, unit of Work, structure, or combination thereof, as listed or indicated in the Payment Schedule, except as otherwise

specified. Progress payments for lump sum items in the Payment Schedule shall be made in accordance with Section 01298.

C. Determine quantities of Work performed for payment purposes and submit them to the INSPECTOR for approval. Assist the INSPECTOR in the taking of measurements by providing equipment, workers, and survey crews as required to verify quantities in accordance with the provisions for measurement specified herein.

1.03 REJECTED, EXCESS, AND WASTED MATERIALS

A. The following shall not be measured for payment:

1. Quantities of material wasted or otherwise disposed.

2. Rejected loads of material, including material rejected after it has been placed for failure to comply with specified requirements.

3. Material remaining on the transporting vehicle or in the pipeline.

4. Muck material not removed from designated location.

5. Material placed outside specified or indicated lines or limits.

6. Material not incorporated into the Work.

7. Material remaining on hand after completion of the Work.

B. No payment will be made for loading, hauling, and disposing of rejected material.

1.04 PAYMENT SCHEDULE FOR LA HANDS ART SCULPTURE FOUNDATIONS

1

A. **BID ITEM 30: Art Piece Foundation and Pedestal** (Lump Sum)

1. This lump sum bid item compensates the CONTRACTOR for the necessary labor, tools, equipment and materials for the construction of two (2) foundations and pedestals. Installation of the ARTWORK is by other (refer to Sections 01112 and 01120 for more information).

1

B. **BID ITEM 31: Allowance Items**

1. Allowance items have been established in the Bid Schedule to compensate the CONTRACTOR for the cost of performing such items as the CITY may require for the construction of the Work, but for which it is impracticable to ascertain the scope prior to bid. If the total cost compensable under each allowance item differs from the amount set forth in the SCHEDULE OF WORK AND PRICES, the Contract Price shall be adjusted by a Change Order for the difference between the total actual costs and the allowance amount as an additional amount due the CONTRACTOR or a credit to the CITY, as appropriate.

2. Reimbursement for all allowance items shall be as determined by Section 01212.

3. The allowance items are as follows:

a. **Bid Item 31: Allowance for Art Piece Accent Lighting**

This allowance shall be used to compensate the CONTRACTOR for the necessary labor, tools, equipment and materials for the installation of electrical conduit, wiring, and accent lighting fixture(s) for each art piece. For further details refer to section 01112.

(END OF SECTION)

SECTION 01212
FIXED CASH ALLOWANCE ITEMS

1.1 THE REQUIREMENT

A. A fixed cash allowance has been allocated to each of the following items of the Bid Breakdown (see Bid Proposal). Requirements for each Fixed Cash Allowance Item are specified in the GENERAL REQUIREMENTS (GR) section referenced below. Overhead and Profit, at the rates listed below, shall be added to the actual invoiced amount.

Bid Item No.	Description	Overhead and Profit
33.	**Allowance for Payment for Permits**	**0%**
34.	**Allowance for Differing Site Conditions**	**Per Sec. 01254**
35.	**Allowance for Community Impact Mitigation**	**5%**

1

B. If these items are not executed, or are only partially executed, or the allowance for any item is not expended or partially expended, then a deductive Change Order shall be issued for the amount that is not expended. If, however, these items are over expended (with ENGINEER'S prior approval), then an appropriate Change Order shall be executed in accordance with the provisions of the GENERAL REQUIREMENTS Section 01254 –- CHANGE ORDERS, except for Overhead and Profit wherein the above listed rates shall apply.

C. The ENGINEER'S AND INSPECTOR'S field office supply allowance is to be used at the ENGINEER'S and/or INSPECTOR'S discretion to purchase office supplies and/or office equipment, perform repairs to field offices or equipment owned or leased by the City, pay field office utility bills, purchase reference documents, etc. The items covered by this allowance are in addition to those required to be furnished by the CONTRACTOR under GR Section 01721-Mobilization. The CONTRACTOR shall be reimbursed the actual invoice amount plus the markup allowed by Section A, above.

(END OF SECTION)

SECTION 01280
MEASUREMENT AND PAYMENT

PART 1 - GENERAL

1.01 PAYMENT

A. Upon Contract award, the accepted Schedule of Work and Prices shall become the Payment Schedule. Payment for Work under the Contract shall be made at the unit prices listed in the Payment Schedule. For lump sum bid items, payment shall be made in accordance with Section 01298.

B. Payment for the measured quantities of Work performed shall be considered full compensation for all of the CONTRACTOR's costs associated with the performance of the Work. These costs comprise direct labor, materials, tools, equipment, transportation, supplies, incidentals, and subcontract Work; and indirect costs such as field and home office overhead, consulting and design services, establishment, operation and removal of general plant, taxes, insurance, permits, bond, profit, and contingencies for the performance of all Work specified.

C. The costs for conforming to the requirements for measuring quantities shall be considered included in the fixed, unit, or lump-sum prices paid for the quantities being measured, and no additional compensation will be made therefore.

D. Except for items subject to the Variation in Quantities clause, the unit prices listed in the Payment Schedule shall be applicable for calculating the amount payable under each item of the Schedule. Estimated quantities indicated in the Payment Schedule are for bidding purposes only. Payment will be determined by actual measured quantities of the Work installed/performed as verified by the INSPECTOR.

E. Work specified or shown on the drawings for which the Payment Schedule does not provide a separate lump sum or unit price is considered incidental and is not separately paid. The cost for such Work is compensated in the prices bid for other Work items and no additional compensation shall be allowed.

1.02 MEASUREMENT OF QUANTITIES

A. Measure quantities in accordance with standard industry practice and as specified herein. The CITY will verify measurements. Measure quantities to the nearest whole number of units. Round down fractional units less than one-half; round up fractional units one-half or greater.

1. Measure sewer debris volumes by weight as described herein.

2. Measure areas in two mutually perpendicular axes in the plane of the surface being measured.

3. Measure linear quantities along the longitudinal centerline of the item, except as otherwise specified.

B. Measurement of a lump sum item shall be for the entire item, unit of Work, structure, or combination thereof, as listed or indicated in the Payment Schedule, except as otherwise specified. Progress payments for lump sum items in the Payment Schedule shall be made in accordance with Section 01298.

C. Determine quantities of Work performed for payment purposes and submit them to the INSPECTOR for approval. Assist the INSPECTOR in the taking of measurements by providing equipment, workers, and survey crews as required to verify quantities in accordance with the provisions for measurement specified herein.

1.03 REJECTED, EXCESS, AND WASTED MATERIALS

A. The following shall not be measured for payment:

1. Quantities of material wasted or otherwise disposed.

2. Rejected loads of material, including material rejected after it has been placed for failure to comply with specified requirements.

3. Material remaining on the transporting vehicle or in the pipeline.

4. Muck material not removed from designated location.

5. Material placed outside specified or indicated lines or limits.

6. Material not incorporated into the Work.

7. Material remaining on hand after completion of the Work.

B. No payment will be made for loading, hauling, and disposing of rejected material.

1.04 PAYMENT SCHEDULE FOR CBD REHAB UNIT 11A

1 A. **BID ITEM 32: General Mobilization** (Lump Sum)

1. The amount payable under this item is fixed at the bid price and shall be no more than 5 percent of the Contract amount. This bid price for costs of work in advance of construction operations. This Bid Item is not included and attributable directly to any other specific Bid Items. For progress payments, the amount payable under this item shall be determined in accordance with Section 01292.

2. The Work shall include:

a. The movement of personnel, equipment, supplies and incidentals to the project sites.

b. Temporary laydown area and obtaining all permits and clearance requirements to secure and utilize the laydown area

c. The establishment of field offices, parking, utilities and other facilities at the Work Area Sites for the CITY and the CONTRACTOR, as specified in Section 01721.

d. Work, such as engineering designs and submittals, must be performed and expended in advance of actual construction. This Work shall include any additional investigations of the condition of the NOS that the CONTRACTOR deems necessary to conduct the Work in compliance with applicable safety and other regulatory requirements.

e. Applying for permits (if applicable) and coordinating work with other agencies such as USACE, LADOT, AQMD, LADBS, LADWP, SCG and other utility companies and public agencies.

f. Work, such as handling homeless encampment within and/or adjacent to work site (if applicable) & community outreach regarding disruption to the Los Angeles River Bike Path and Recreational Parks (if applicable) at pit locations and bypass locations must be performed and resolved during mobilization. This work shall be, but is not limited to, installation 12 feet chain link and gates per S-691 around the pit(s) and/or at field office locations.

CONTRACTOR shall coordinate with Community Outreach Team (COT) of BOS for any related issues mentioned above:

Tonya Durrell
(213) 978-0333 (office)
(213) 798-6085 (cell)
Tonya.durrell@lacity.org

In addition, contact LA – Homeless Services Authority at (213) 225-6581 to handle any homeless issues

1 CONTRACTOR shall comply with all instructions and requirements of the COT and the Mayor's office regarding homeless encampment issues. In addition, the CONTRACTOR shall comply with all instructions and requirements by the PAO, LADOT, LA County, and Mayor's office regarding any construction/bypass activities. All the costs related and associated with these issues shall be included in the Bid Item 32 "Mobilization".

1 B. **BID ITEMS 33 through 35: Allowance Items**

1. Allowance items have been established in the Bid Schedule to compensate the CONTRACTOR for the cost of performing such items as the CITY may require for the construction of the Work, but for which it is impracticable to ascertain the scope prior to bid. If the total cost compensable under each allowance item differs from the amount set forth in the SCHEDULE OF WORK AND PRICES, the Contract Price shall be adjusted by a Change Order for the difference between the total actual costs and the allowance amount as an additional amount due the CONTRACTOR or a credit to the CITY, as appropriate.

2. Reimbursement for all allowance items shall be as determined by GR-Section 01212.

3. The allowance items are as follows:

1

a. **Bid Item 33: Allowance for Permits**

Reimbursement for CONTRACTOR's expenses for permits fees without compensation for any mark-ups. The CONTRACTOR shall include in the Bid the amount stipulated under PERMITS in the SCHEDULE OF WORK AND PRICES in the Bid Proposal as an allowance for the costs of all required permits.

Costs shall be limited to the actual fees paid to the agencies and will be reimbursed based on original receipts only. No overhead, profit, or mark-ups shall be added to the cost of the permits. The CONTRACTOR shall deliver to the ENGINEER with each permit the original receipt. After all permits have been obtained and delivered, the actual costs of all permits shall be reviewed by the CONTRACTOR and the ENGINEER.

1

b. **Bid Item 34: Allowance for Differing Site Conditions**

This allowance will compensate the CONTRACTOR the additional expenses and measures taken to address and to mitigate Differing Site Condition(s) as defined and approved by the CITY per conditions set forth in Section 01253 of the specification in addition to abandoning and/or relocation of site utilities encountered during construction but not shown on the current project plans as directed by the CITY or the ENGINEER.

This allowance will compensate CONTRACTOR in the event of an omission of an existing utility in the contract, or if an existing utility needs to be relocated due to its location in the field differing significantly from that shown in the contract drawings, and in the opinion of the ENGINEER that the utility relocation is necessary to avoid impacting the Work. If actual utilities are within 2 feet off location shown on the drawings (centerline to centerline), there will be no compensation provided under this bid item. This allowance shall not compensate the CONTRACTOR to relocate existing utilities shown on the contract drawings proposed or specified for relocation by others.

1

c. **Bid Item 35: Allowance for Community Impacts Mitigation**

This allowance bid item shall be used solely to reimburse any/all CONTRACTOR's costs associated with performance of extra work related to community relations at the direction of the ENGINEER.

Reimbursement shall be determined by Section 01254 of the General Requirements

(1) Compensation for noise, vibration and other mitigation measures beyond the requirements indicated and specified in Sections 01561 and 01562 of these GENERAL REQUIREMENTS.

This allowance shall not compensate CONTRACTOR for costs associated with applying for or complying with requirements established because of any CONTRACTOR request for nighttime work hours beyond the allowable working hours. This allowance shall not compensate CONTRACTOR for any means or methods or required change to its means or methods to comply with Sections 01561 and 01562 of the GENERAL REQUIREMENTS.

(2) Construction Mitigation Fund: As part of CITY's Public Outreach Program, a Construction Mitigation Fund has been established which can include, but is not limited to, the following types of mitigation efforts by the CONTRACTOR to assist nearby residents or businesses, as approved by the City of Los Angeles Department of Public Works Public Affairs Office staff:

a. Purchasing car washing certificates, house cleaning/window washing certificates for residents near construction to mitigate for dust from the project site.

b. Coordinating with local businesses and property owners to allow access to their businesses/properties during construction

c. Producing and posting signs or banners for nearby businesses to inform customers that they are open during construction or to direct customers to an alternate access point.

d. Producing and placing an advertisement in the local newspaper to announce that the businesses near the construction are open during construction and/or to announce that the construction has finished, and the businesses are open.

1 C. **BID ITEM 36: Temporary Sewer Bypass**

This bid item is for the design and installation of any and all bypasses (CBD, local sewers and HCs) deemed necessary by the CONTRACTOR to complete all the work. The temporary bypass shall encroach within City's public right of way. The Lump Sum bid price shall include all work including labor, materials, equipment and any incidentals to implement and maintain bypass operation without any interruptions of construction activities.

Submittal(s) on bypass plan(s) shall be required for each setup throughout the project to the City Engineer, for approval.

Further, the scope shall include but not limited to planning implementing, potholing, excavation, trenching, temporary connections, disconnections, laying bypass pipes, maintaining the bypass operation and restoration of all services after the bypass operation is completed.

The cost shall also include but not limited to any special measures like installing stop logs, constructing dams inside the NOS to block or divert flows for accomplishing lining operation during slip-lining and/or during man-entry, or during open trench operation, installing maintenance holes, chimneys or reconnecting the lateral sewers/house connections.

Developing and negotiating any temporary easement with private property/business owner(s) and any public agencies such as USACE, LA County, LADOT, Caltrans for routing the bypass pipeline and facilities, temporary storing the pipes, bulkhead before reinstallation shall be included in this bid item. Any permit process time delay may not be used as a basis for delay of work claim. The contractor is advised that USACE permit will take approximately 12 to 15 months for approval and no claim for delay will be given if the contractor chooses the LA River bike path route for the temporary bypass.

For any excavation work, bid item cost includes compliance with T-CAP and T-CUT requirements per Standard Plan S-477.

1 D. **Bid Item 37 – Worksite Traffic Control**

This lump sum price shall compensate the CONTRACTOR for the cost of designing, furnishing, implementing, monitoring and removing traffic signs and control details for the construction of all the WORK described herein of for the convenience of the CONTRACTOR. The CONTRACTOR shall include the cost for developing the traffic control details in their bid item for only those candidate work areas required for their work and other locations to facilitate their construction means and methods.

Traffic Control shall include preparation of Worksite Traffic Control Plan, submitting plan for review, and obtaining approval from appropriate agencies.

1 E. **Bid Item 38 – Pre and Post CCTV of existing host pipe**

The CONTRACTOR shall be compensated per lineal feet for the following:

a. Furnishing all data and associated report as outlined in section 500 under "Television Inspection", and the associated Brown Book.

b. All CCTV shall be submitted in a high-definition color digital format with a resolution no less than 720 per line. Data shall be given to Project Engineer in 2 (two) solid state external hard drives.

1 F. **Bid Item 39 – Sewer Cleaning and Debris Removal**

The CONTRACTOR shall be compensated per lineal feet for the following:

a. Labor, materials, equipment, and incidentals for cleaning and removing all debris out of the sewer per section 500 of the SSPWC and the associated Brown Book.

b. Refer to the technical specification Section 02955 "Restoration of Underground Pipe", for further details on cleaning process to bring the interior condition of the host pipe to an acceptable condition for installing liners. Refer to technical specification Section 02590 "Cleaning of Brick/Clay Tiled Liner Host Pipe".

c. The price bid per linear foot (LF) shall compensate the CONTRACTOR for the cost of performing all work associated with the sewer cleaning, including removal and disposal of falling tiles and bricks. The CONTRACTOR shall exercise with care not to collapse the sewer.

d. For progress payments, the amount payable under this item shall be determined in accordance with the liner foot (LF) of sewer cleaned.

1 G. **Bid Item 40 – Storing, hauling, and disposal of Debris – Non-Hazardous/Contaminated**

The price per dry-ton shall include all work including labor, materials, equipment and incidentals for removing, hauling, stockpiling, testing, handling, treating and disposal of all debris removed from the sewer by following all applicable local & state laws and regulations and per section 500 of the SSPWC. All costs associated with the collection and testing of samples shall also be included in the bid price. Laboratory tests must have determined and classified this quantity as contaminated but non-Hazardous. Debris with levels of TRPH (crude oil, waste oil and

diesel) great than 100 ppm is gasoline greater than 10 ppm, or benzene, toluene, ethylbenzene, and xylenes (BTEX) greater than 1/50/50/50 ppm respectively will be considered contaminated.

The weight shall be per weigh-master certificates/tickets at the disposal site or per weight measured and recorded in presence of the Inspector(s) prior to disposal but not before draining excess water for at least 24 hours.

1 H. **Bid Item 41 – Storing, hauling, and disposal of Debris – Hazardous/Contaminated (Incremental Cost)**

The price per dry-ton shall include all additional work and costs, beyond those covered in Bid Item 40, for removal and disposal of material that is identified as hazardous during testing. The price shall include all additional labor, materials equipment, and incidentals for removing, hauling, stockpiling, testing handling, treating and disposal of hazardous debris removed from the sewer. All costs associated with the collection and testing of samples, beyond those required to satisfy Bid Item 40, shall be included in the price. Laboratory tests must have determined and classified this quantity as HAZARDOUS to qualify for payment under Bid Item 41.

The weight shall be per weigh-master certificates/tickets at the disposal site or per weight measured and recorded in presence of the Inspector(s) prior to disposal but not before draining excess water for at least 24 hours

Payment to the CONTRACTOR for debris quantities classified as HAZARDOUS shall be made from both unit prices from bid items 40 and 41. The total quantities listed for the bid items 40 and 41 [see Schedule of work & prices] refer to the same volume of debris to be removed from this project.

1 ~~I.~~ **Bid Item 42 – Rehabilitate Existing 36" Circular Sewer by Cured-in-Place Pipe**

The price bid per linear foot (LF) shall compensate the CONTRACTOR for the installation of the liner per technical specification, including all labor and material, and all other related works.

For progress payments, the amount payable under this item shall be determined in accordance with the liner foot (LF) installed.

1 J. **Bid Items 43 – Construct and Backfill Pit #1, and remove and replace 36" VCP**

The lump sum price shall include all costs associated with construction, removal and relocation of existing city utilities and improvements such as sewers, storm drains, abandoned pipes, maintenance holes, street light conduits and appurtenances, groundwater dewatering system (if applicable), maintenance and restoration of the area to original condition per plan in connection with rehabilitating the pipe. Further, providing/maintaining construction access but not limited to, excavation of the pit including demolition, support, protection, waterproofing, shoring, fencing, k-rails, traffic control, daily steel plating to cover the pit during non-working hours, all utility/utility pole(s) support and protection (including overhead utilities), tree trimming (if applicable), covering, sealing concrete blanketing the liner pipe within the pit, backfilling the pit, pit worksite security, removing the shoring and lagging and restoring all existing street improvements including reconstruction of access ramps, curb and gutter, driveway, alley apron, and sidewalk that is affected by the construction activities to City standards. Liner pipe installed

through pits shall be paid separately by the linear foot as part of the liner pipe cost. (See Bid Item for Sewer rehab). The CONTRACTOR shall not close/block entrances to any businesses.

For any excavation work, bid item cost includes compliance with T-CAP and T-CUT requirements per Standard Plan S-477.

The unit bid price for Access Pit #1 includes all costs addressed above.

The CONTRACTOR will not be compensated for any eliminated access pits during construction or if any access pit work is not done per defined work scope.

All construction work must be performed within the public right of way and/or within established easement limits. If additional construction space is required, the CONTRACTOR shall be responsible for developing and negotiating any temporary construction easement with private property/Business owner(s) with no additional cost to the city.

1

K. **Bid Items 44 – Partially Remove and Reconstruct and rehabilitate (type I liner) existing Maintenance Hole (51509157)**

This lump sum price shall compensate the CONTRACTOR for the cost of all labor, materials, equipment, and incidentals to partially remove and reconstruct the maintenance hole shaft.

The work shall include all activities associated with the removal and reconstruction of the maintenance hole shaft per details indicated on plans. These activities include, but are not limited to, development of surface accesses, excavation, shoring, removal of existing maintenance hole frame and cover, brickwork, reconstruction of maintenance hole shaft, designing the shaft above the grade beam, installation of approved protective lining Type 1, and installation of new frame and cover per standard plan S-283-3.

For any excavation work, bid item cost includes compliance with T-CAP and T-CUT requirements per Standard Plan S-477.

1

L. **Bid Items 45 – Partially Remove and Reconstruct and rehabilitate (Type I liner) existing chamber (55109108)**

This lump price shall compensate the CONTRACTOR for the cost of all labor, materials, equipment, and incidentals to partially remove and reconstruct the maintenance hole shaft.

The work shall include all activities associated with the removal and reconstruction of the maintenance hole shaft per details indicated on plans. These activities include, but are not limited to, development of surface accesses, excavation, shoring, removal of existing maintenance hole frame and cover, brickwork, reconstruction of maintenance hole shaft per the contract documents, installation of new frame and cover per standard plan S-283-3, and installation of approved protective lining Type 1.

For any excavation work, bid item cost includes compliance with T-CAP and T-CUT requirements per Standard Plan S-477.

1

M. **Bid Items 46 – Rehabilitate Existing Siphon Outlet Structure (51509151) by Type I Liner**

This lump sum price shall compensate the CONTRACTOR for all the costs including all labor, materials, equipment, and incidentals to rehabilitate the existing siphon outlet structure with Type 1 liner per the contract documents.

1 N. **Bid Items 47 – Reconnect Existing Lateral Sewers (Connectivity Node 51509149)**

This lump sum price shall compensate the CONTRACTOR for all the costs including all labor, materials, equipment, and incidentals to reconnect existing later sewer along the alignment.

1 O. **Bid Items 48 – Grind one (1) protruding 8" lateral sewer at connectivity node 51509149 and two (2) protruding house connections near stations 223+97 and 223+ 98**

This lump sum price shall compensate the CONTRACTOR for all the costs including all labor, materials, equipment, and incidentals to grind protruding lateral sewer and house connections along the alignment.

Addendum No. 10
November 2, 2022

ENGINEERING
CITY OF LOS ANGELES
TED ALLEN, PE
CITY ENGINEER

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue
W.O. E700235F & SZC14224

Bidders are required to acknowledge receipt of this addendum in the space provided on page 1-4 of the Bid Proposal. This addendum consists of this four-page transmittal and 6 attachments totaling 90 pages.

Bidders are hereby notified of the following changes:

I. MODIFICATIONS TO PLANS:

1. **Add Plan sheet drawing no. C-607A** to the Sixth Street Viaduct – Park, Arts, and River Connectivity Improvements Plan Drawings (1 page).

2. **Replace** Plan sheet drawing nos. C-400, C-401, C-403, C-403A, C-406, C-407, C-411, and C-607 with the **attached revised plan sheets C-400, C-401, C-403, C-403A, C-406, C-407, C-411, and C-607** in Sixth Street Viaduct – Park, Arts, and River Connectivity Improvements Plan Drawings (8 pages).

II. MODIFICATIONS TO SPECIFICATIONS:

1. **Add** the following to the Master General Requirements: **Master General Requirements Table of Contents** (2 pages).

2. **Add** the following to the Sixth Street Viaduct – Park, Arts, and River Connectivity Improvements Technical Specifications: **Sixth Street Viaduct – Park, Arts, and River Connectivity Improvements Technical Specifications Table of Contents** (5 pages).

3. **Add** the following section in the Sixth Street Viaduct – Park, Arts, and River Connectivity Improvements Technical Specifications: **Section 111136 Electric Vehicle Charging Equipment – Level 2** (9 pages).

4. **Replace** the following section in the Sixth Street Viaduct – Park, Arts, and River Connectivity Improvements Technical Specifications: **Section 02225 Lead Based Pain Removal** (14 pages).

5. **Add** the following section in the **Specifications: Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements Attachment No. 11 Sixth Street Viaduct Lead Sampling Report** (47 pages).

III. QUESTIONS BIDDERS (Q) AND ANSWERS FROM CITY (A):

(Q1) There is no Table of Contents for the Technical Specifications (file 1C-1 PARC TS). Please provide these, we need this to make sure the specs are complete.

(A1) The Table of Contents is included in Addendum No. 10.

(Q2) Please clarify who the manufacturer is regarding Security Screens & Frame for the buildings?

(A2) Perforated aluminum frame security shutters to be fabricated per drawings; frame/panel material, perforation pattern, size, and open area are as represented in drawing elevations 2/AE5-04 and corresponding details. There is no specific manufacturer.

(Q3) Who is furnishing and installing the 2 each EV chargers shown on plan sheet E-106? If the contractor is to furnish and install the EV chargers, please provide specifications & foundation details.

(A3) The EV chargers for the project will be furnished and installed by the project Contractor. Technical Specification Section 111136 is included in Addendum No. 10.

(Q4) Spec Section 02225 – Lead Based Paint Removal paragraph 1.5. Insurance Requirements (For Lead-Based Paint Removal) states “Bidder shall furnish within ten days after notification of pending award, properly completed City Special Endorsement forms or binders of insurance with coverage as set forth in the attached Insurance Requirements sheet. Failure to comply will render the bid nonresponsive and no award will be made to the firm.” Please confirm that these limits and provisions need to be added by General Contractor or if the Subcontractor performing the work outlined in this specification section needs to have this. Also confirm City will be providing 10 day notice of award as this is not standard practice.

(A4) A revised Master General Requirements Specification Section 02225 Lead Based Paint Removal has been included in Addendum No. 10 to address the issues raised in the question.

(Q5) Spec section 02225 – Lead Based Paint Removal paragraph 1.2.A.1 states "A Hazardous Material Survey Report not been prepared for the arch piece. It is expressly understood that the City will not be responsible for interpretations or conclusions drawn by the Bidder/Contractor as to the nature of or full extent of the existing lead-based paint". As this is a competitive Lump Sum Bid, we are requesting City to provide report for proper bidding or allocate an Allowance Order for this task.

(A5) Attachment No. 11 Sixth Street Viaduct Lead Sampling Report is included in Addendum No. 10.

(Q6) GR 01280 – Measurement and payment paragraph 1.04.A Bid Item 1: General Mobilization (lump sum) 2.f. states "Work, such as handling homeless encampment within and/or adjacent to work site (if applicable) & community outreach regarding disruption to the Los Angeles River Bike Path and Recreational Parks (if applicable) at pit locations and bypass locations must be performed and resolved during mobilization." In order to provide a competitive bid, we need to have a quantity (or maximum quantity) of encampments to be able determine GC efforts and associated costs for this task. We believe that limiting the efforts to the mobilization cost needs to be revised. Please provide a quantity and modify the SOV/measurements and payments to have a separate line item for this task.

(A6) Encampments outside of the project site in the public right-of-way will be managed by the City. The Contractor shall follow the project site security requirements to prevent non-authorized access as described in the Master General Requirements Section 01140 Contractor's Use of the Premises and 01721 Mobilization.

(Q7) Permits by GC: we are requesting a schedule of permits with estimated costs or for the City to consider providing reimbursable allowance order for permits due the magnitude or the project and the number of permits required by the GC to obtain and pay for.

(A7) An allowance for permits is included in Bid Item No. 5 of the Bid Proposal's Schedule of Work and Prices.

Sixth Street Viaduct – Park, Arts, and River Connectivity (PARC) Improvements; Department of Cultural Affairs LA Hands Art Piece Foundations; and CBD Sewer Rehab Unit 11A – 6th Street Siphon to Santa Fe Avenue

- PROPOSED STORM DRAIN MAIN LINE (Ø ≥ 18")
- PROPOSED STORM DRAIN LATERAL (Ø ≤ 18")
- PROPOSED SUBSURFACE NON-PRESSURIZED IRRIGATION SYSTEM (SEE STORM DRAIN PLANS)

NOTES:

1. EXISTING UTILITIES ARE SHOWN FOR REFERENCE ONLY. ACTUAL LOCATIONS MAY VARY. CONTRACTOR TO VERIFY THE LOCATIONS AND ELEVATIONS OF EXISTING UTILITIES IN THE FIELD.
2. CONTRACTOR SHALL COORDINATE THE INSTALLATION OF ALL SERVICE TAPS AND WATER METERS WITH LADWP. CONTRACTOR SHALL BE RESPONSIBLE FOR THE PAYMENT OF ALL FEES.
3. THRUST BLOCKS SHALL BE CONSTRUCTED AT ALL VERTICAL AND HORIZONTAL FITTINGS AND ANGLES FOR PIPES WITHOUT RESTRAINED JOINTS PER DETAIL 5, SHEET C-604.
4. POTABLE WATER LINES SHALL BE LOCATED 1' MINIMUM (OD TO OD) ABOVE ALL CROSSING SANITARY SEWER AND STORM DRAIN LINES. 10' MINIMUM (OD TO OD) HORIZONTAL CLEARANCE SHALL BE MAINTAINED BETWEEN PARALLEL SANITARY SEWER AND POTABLE WATER LINES. 4' MINIMUM (OD TO OD) HORIZONTAL CLEARANCE SHALL BE MAINTAINED BETWEEN PARALLEL STORM DRAIN AND POTABLE WATER LINES.
5. REFER TO STORM DRAINAGE SHEETS FOR PROPOSED STORM DRAINAGE SYSTEMS.
6. REFER TO SANITARY SEWER SHEETS FOR PROPOSED SEWER LATERALS.
7. PROPOSED ELECTRICAL CONDUIT NOT SHOWN FOR CLARITY. REFER TO ELECTRICAL PLANS. CONTRACTOR RESPONSIBLE FOR ALL COORDINATION TO AVOID CONFLICTS WITH THE PROPOSED POTABLE WATER SYSTEMS.
8. EXISTING FIRE HYDRANTS TO BE RELOCATED BY LADWP. CONTRACTOR RESPONSIBLE FOR ALL COORDINATION AND PAYMENT OF ANY REQUIRED FEES.
9. VIADUCT CONTRACTOR REMOVED PORTIONS OF THE OLD VIADUCT REINFORCED CONCRETE FOUNDATIONS TO A DEPTH OF A FEW FEET BELOW THE EXISTING GROUND SURFACE. PARC CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING EXISTING CONDITIONS AND REMOVING ANY ADDITIONAL PORTIONS OF THE FOUNDATIONS THAT CONFLICT WITH THE PROPOSED PARC IMPROVEMENTS.

REVISION DATES (DESIGN STAGE ONLY)

THE CITY OF LOS ANGELES OR ITS OFFICERS OR AGENTS SHALL NOT BE RESPONSIBLE FOR THE ACCURACY OR COMPLETENESS OF ELECTRONIC COPIES OF THIS PLAN SHEET.

Sheet Version 3.0

ADDENDUM 10

1. SUBGRADE REQUIREMENTS
1.1. EPIC™ SUBGRADE MUST BE LASER LEVEL.
1.2. NATIVE SOIL INSTALLATIONS: SUBGRADE TO BE COMPACTED, MIN. 90% STD. PROCTOR DENSITY.
1.3. ADJACENT STRUCTURES/BUILDINGS/WALLS: DESIGN ENGINEER TO VERIFY WITH APPROPRIATE CONSULTANTS PLACING OF EPIC™ PLANTED AREAS NEAR OTHER STRUCTURES (INCLUDING FREESTANDING FENCES AND WALLS). UNLIKE COMPACTED SOIL, EPIC™ DOES NOT PROVIDE ANY LATERAL STRUCTURAL SUPPORT.

2. SYSTEM STANDARDS
2.1. EPIC™ GRAVEL LAYER MUST BE EXACTLY 2 INCHES IN DEPTH.
2.2. EPIC™ SAND LAYER MUST BE EXACTLY 16 INCHES IN DEPTH.
2.3. PASSIVE SYSTEM: ALL INCOMING AND OVERFLOW PIPES SHALL BE SIZED BY OTHERS ACCORDING TO APPLICABLE CODES AND REGULATIONS AND IN A MANNER SUCH AS IT SHALL NOT TAKE INTO ACCOUNT ANY VOLUMES RETAINED BY THE EPIC™ SYSTEM.
2.4. AUXILIARY STORAGE: AUXILIARY STORAGE IS ANY EPIC™-APPROVED STORAGE WHICH LOCATED OUTSIDE OF THE EPIC™ SYSTEM.
2.4.1. PUMP FOR EPIC™ AUXILIARY STORAGE: SHALL BE DESIGNED BY ENGINEER OF RECORD AND IT IS NOT PROVIDED BY EPIC™.
2.4.2. LADPH ENVIRONMENTAL HEALTH SERVICES CROSS CONNECTION PROGRAM: SYSTEMS WITH AUXILIARY STORAGE REQUIRE COMPLIANCE WITH REQUIREMENTS WHICH ARE BEYOND THE SCOPE OF THE EPIC™ LAYOUT DESIGN AND MUST BE PROCESSED FOR APPROVAL WITH THE APPROPRIATE AGENCIES AS REQUIRED BY APPLICABLE CODES.
2.4.3. LANDSCAPING:
2.4.3.1. UNDER NORMAL OPERATING CONDITIONS, THE TOP 2" OF EPIC™ PROFILE WILL REMAIN DRY.
2.4.3.2. LANDSCAPE ARCHITECT TO DETERMINE APPROPRIATE NUTRIENT ADDITIVES AND FERTILIZERS BASED ON THE PROPOSED PLANTING.
2.4.3.3. AUTOMATED FERTIGATION IS AN ACCEPTABLE METHOD FOR DELIVERY OF NUTRIENTS.
2.4.3.4. NO SOIL OF ANY KIND SHALL BE PLACED ON TOP OR MIXED INTO THE EPIC™ PROFILE.
2.4.4. IRRIGATION:
2.4.4.1. EPIC™ IS DESIGNED TO FUNCTION AS A HIGH-EFFICIENCY, SUBSURFACE, NON-PRESSURIZED IRRIGATION SYSTEM.
2.4.4.2. EPIC™ IRRIGATION DESIGN AND CONNECTIONS MUST FOLLOW THE STANDARD SPECIFICATIONS SHOWN AND COMPLY WITH LADPH ENVIRONMENTAL HEALTH SERVICES CROSS CONNECTION PROGRAM REQUIREMENTS (SEE SECTION 3 HEREIN)

3. LADPH ENVIRONMENTAL HEALTH CROSS CONNECTION PROGRAM
3.1. EPIC™ SYSTEM COMPLIES WITH TIER II OUTDOOR CATEGORY IN *"GUIDELINES FOR HARVESTING RAINWATER, STORMWATER, & URBAN RUNOFF FOR OUTDOOR NON-POTABLE USES" (2015 CPC: CHP. 16, SEC. 1602.9.4)*
3.2. ALL CAPTURE & USE BMP DESIGN AND INSTALLATION MUST COMPLY WITH THE REQUIREMENTS HEREIN. PLANS AND APPLICABLE FEES MUST BE SUBMITTED TO THE PROGRAM FOR OBTAINING A SITE NUMBER AND/OR REVIEW:
COUNTY OF LOS ANGELES DEPARTMENT OF PUBLIC HEALTH
ENVIRONMENTAL HEALTH - CROSS CONNECTION PROGRAM
5050 COMMERCE DRIVE, BALDWIN PARK CA 91706
(888) 700-9995
3.3. EPIC™ IRRIGATION SYSTEM SUPPLIED FROM THE DOMESTIC WATER SHALL BE PROTECTED WITH AN APPROVED AND DEDICATED BACKFLOW PREVENTION ASSEMBLY, I.E. PRESSURE VACUUM BREAKER (PVB) OR REDUCED PRESSURE PRINCIPLE BACKFLOW PREVENTION DEVICE (RP). THE RESULTING IRRIGATION CAN BE USED AS THE MAKE-UP WATER SUPPLY FOR EPIC™ AS LONG AS THEY DISCHARGE WITHIN THE EPIC™ PROFILE AS SHOWN ON THE LAYOUTS. DIRECT CONNECTION TO ANY EPIC™ STORAGE (INTEGRATED OR AUXILIARY) IS NOT ALLOWED UNDER ANY CIRCUMSTANCES. (*2019 CPC: CHP. 6, SEC. 603.5.6*)
3.4. ALL WATER CONVEYANCE PIPES AND VALVES SHALL BE IDENTIFIED WITH CONTINUOUS PIPELINE IDENTIFICATION TAPE (TAGS FOR VALVES) WITH DIRECTION OF NORMAL FLOW, ATTACHED TO THE PIPE AND SECURED EVERY 5 FEET. PIPE LABELING SHALL BEGIN AT THE APPROVED BACKFLOW PREVENTER DEVICE AND CONTINUE UNINTERRUPTED UNTIL THE FINAL DISCHARGE POINT OR, FOR POTABLE WATER, UNTIL IT ENTERS THE BUILDING. TAPE SHALL READ AS FOLLOWS:

TOTAL WATER SOLUTIONS

DESIGN ENGINEER IS RESPONSIBLE FOR VERIFYING ALL OTHER PERTINENT INFORMATION AND ENSURING SYSTEM DESIGN IS NOT ALTERED BEYOND THE ABOVE MANUFACTURER DESIGN PARAMETERS WHICH WILL RENDER THE SYSTEM NON-FUNCTIONAL AND IT MAY NOT PERFORM AS INTENDED.

FOR EPIC™ MAKE-UP IRRIGATION WATER FROM A PROTECTED POTABLE SOURCE: "NON-POTABLE IRRIGATION WATER - DO NOT DRINK" ON YELLOW TAPE WITH BLACK UPPERCASE LETTERS; VALVES - "NON-POTABLE IRRIGATION WATER - DO NOT DRINK" YELLOW WITH BLACK UPPERCASE LETTERS.
FOR EPIC™ AUXILIARY STORAGE: CONVEYANCE PIPELINES FROM PUMP - "CAUTION UNSAFE CISTERN WATER - SUBSURFACE IRRIGATION ONLY" ON PURPLE TAPE WITH BLACK UPPERCASE LETTERS; VALVES - "CAUTION UNSAFE CISTERN WATER - SUBSURFACE IRRIGATION ONLY" PURPLE WITH BLACK LETTERS.
ALL OTHER POTABLE WATER SYSTEM: PIPELINES - "POTABLE WATER" ON BLUE OR GREEN TAPE WITH WHITE UPPERCASE LETTERS; VALVES - "POTABLE WATER" ON BLUE OR GREEN WITH WHITE LETTERS. (*2019 CPC: CHP. 6, SEC 601.3 AND 601.3.2; CHP. 16, SEC. 1602.9.1*)

3.5. OVERFLOW FROM EPIC™ SYSTEM AND EPIC™ SYSTEM WITH STORAGE MUST OCCUR WITHIN THE EPIC™ PROFILE AT THE ELEVATION PRESCRIBED BY EPIC™ MANUFACTURER STANDARDS.
3.6. INSPECTION: ALL WATER CONVEYANCE PIPING SHALL BE INSPECTED BY A REPRESENTATIVE OF THE PROGRAM FOR CONFIRMATION OF PROPER IDENTIFICATION AND SEPARATION REQUIREMENTS.
3.7. FINAL APPROVAL: PRIOR TO FINAL CONSTRUCTION APPROVAL, A CROSS-CONNECTION, PRESSURE AND SEPARATION TEST SHALL BE PERFORMED TO ENSURE SEPARATION BETWEEN ALL WATER SYSTEMS ON SITE. THE EPIC™ MAKE-UP IRRIGATION SYSTEM MUST BE AT 100% FUNCTIONALITY TO SHOW COMPLIANCE.
3.8. RESPONSIBLE PARTY
3.8.1. OWNER AND/OR THEIR REPRESENTATIVES SHALL DISTRIBUTE THIS INFORMATION AND/OR THE PROGRAM CONDITIONAL APPROVAL LETTER TO THE PROJECT CONTRACTORS/EPIC™ ™ SYSTEM INSTALLERS.
3.8.2. AN ON-SITE WATER SUPERVISOR SHALL BE DESIGNATED AND SHALL BE RESPONSIBLE FOR INSTALLATION, OPERATION, AND MAINTENANCE OF THE EPIC™ SYSTEM AND POTABLE WATER SYSTEMS. THE WATER SUPERVISOR SHALL ALSO PREVENT POTENTIAL HAZARDS, IMPLEMENT THESE GUIDELINES AND COORDINATE FUTURE INSPECTIONS WITH THE CROSS-CONNECTION CONTROL PROGRAM OF BOTH THE MUNICIPAL WATER PURVEYOR AND THE LADPH-EH CROSS-CONNECTION PROGRAM.
3.9. OPERATION & MAINTENANCE
THE EPIC™ OPERATION & MAINTENANCE MANUAL PROVIDED BY THE MANUFACTURER SHALL BE SUPPLIED TO THE BUILDING OWNER AND SHALL REMAIN WITH THE BUILDING THROUGHOUT THE LIFE CYCLE OF THE STRUCTURE AND SYSTEM. UPON CHANGE OF OWNERSHIP THE NEW OWNER SHALL BE NOTIFIED THE PROPERTY CONTAINS AN EPIC™ SYSTEM AND PROVIDED WITH THE MANUAL. THE EPIC™ OPERATION & MAINTENANCE MANUAL SHALL BE PROVIDED AT THE TIME OF FINAL INSPECTION. (*2019 CPC: CHP. 6, SEC. 1601.5*)

4. INSTALLATION NOTES
4.1. GENERAL:
4.1.1. ALL EPIC™ INSTALLATIONS SHALL BE PERFORMED BY LICENSED CONTRACTORS AND WITH ON-SITE TECHNICAL SUPPORT PROVIDED BY CERTIFIED MANUFACTURER'S REPRESENTATIVE.
4.1.2. INSTALLATION TECHNICAL SUPPORT SHALL NOT BE DEEMED AS ASSUMPTION OF ANY LIABILITY BY THE MANUFACTURER, REGIONAL REPRESENTATIVE OR THEIR EMPLOYEES, AGENTS AND REPRESENTATIVES.
4.1.3. SUPPORT IS PROVIDED TO INSTALLATION CONTRACTOR AS A GUIDANCE TO ENSURE PROPER INSTALLATION AND, ULTIMATELY, PROPER FUNCTION OF THE SYSTEM. ANY ALTERATIONS, ADDITIONS, SUBTRACTIONS OR OTHER DEVIATIONS FROM THE ORIGINAL APPROVED PLANS FOR THE EPIC™ SYSTEM SHALL BE REVIEWED AND APPROVED BY THE PROJECT DESIGN ENGINEER.
4.1.4. MANUFACTURER REPRESENTATIVE, RESERVES THE RIGHT TO STOP INSTALLATION WORK UNTIL THE DESIGN ENGINEER HAS REVIEWED AND APPROVED PROPOSED CHANGES. ANY WORK THAT IS PERFORMED DURING SUCH STOPPAGE, MAY BE INADEQUATE, INCORRECT AND MAY HAVE TO BE REDONE.
4.2. CONSTRUCTION:
4.2.1. NATIVE SOIL INSTALLATIONS: SUBGRADE TO BE COMPACTED, MIN. 90% STD. PROCTOR DENSITY.
4.2.2. INVERTS FOR INCOMING PIPES, AREA CONNECTOR PIPES AND OVERFLOW PIPES MUST BE MET AS PRECISELY AS POSSIBLE. IF THE SUBGRADE ELEVATIONS ARE NOT EXACTLY MET PER PLAN, THE INVERTS MUST BE ADJUSTED ACCORDINGLY. ADJUSTMENT AND VERIFICATION OF THE INVERTS MUST BE DONE BY THE PROJECT DESIGN ENGINEER. FAILURE TO ADJUST THE INVERTS MAY RESULT IN IMPROPER SYSTEM FUNCTION.
4.2.3. PLACEMENT OF THE EPIC™ UNITS MUST FOLLOW THE DESIGN PLANS. ANY FIELD ADJUSTMENTS MUST BE REVIEWED AND APPROVED BY MANUFACTURER REPRESENTATIVE.
4.2.4. PRIOR TO PLACING ANY AGGREGATE AND SAND, EPIC™ UNITS MUST BE WEIGHTED DOWN WITH SAND BAGS AT EACH END. THE SAND FOR THE SAND BAGS MUST BE THE EPIC™-SPECIFIC SAND TO PREVENT ANY NON-APPROVED MEDIA GETTING MIXED IN WITH THE WASHED EPIC™ SAND.
4.2.5. THE 2" GRAVEL LAYER CANNOT EXCEED 2", MUST BE NO LESS THAN 1" AND MUST COVER THE EPIC™ UNIT OPENINGS COMPLETELY TO PREVENT SAND FROM ENTERING EPIC™.
4.2.6. THE SAND LAYER MUST BE PLACED AT A DEPTH AS SHOWN ON THE DESIGN PLANS. ANY DEPTH DIFFERENCE MUST BE APPROVED BY MANUFACTURER REPRESENTATIVE.
4.2.7. CONTRACTOR MUST ENSURE THAT ALL EPIC™ AGGREGATE AND SAND MEDIA IS PROTECTED FROM CONTAMINATION AFTER IT IS DELIVERED ON SITE. IF NECESSARY, PLASTIC TARPS MAY BE USED AS PROTECTION FROM DIRT AND OTHER DEBRIS. FAILURE TO KEEP AGGREGATE AND SAND MEDIA CLEAN AND FREE OF CONTAMINANTS AND TRASH MAY RESULT IN IMPROPER SYSTEM FUNCTION.
4.3. LANDSCAPE INSTALLATION:
4.3.1. FERTILIZER AND/OR NUTRIENT MIX MUST BE ADDED AND MIXED INTO THE TOP OF THE EPIC™ PROFILE AND PROPAGATED WITH TOP WATERING PRIOR TO PLANTING. TYPE OF FERTILIZER AND/OR NUTRIENT MIX SHALL BE PER LANDSCAPE ARCHITECT SPECIFICATIONS.
4.3.2. PRIOR TO PLANTING ANY PLANTS, EPIC™ SYSTEM MUST BE FULLY CHARGED. WATER MUST BE APPLIED TO REACH MAXIMUM OPERATING CAPACITY WITHOUT CAUSING OVERFLOW TO OCCUR (APPROXIMATELY 3.5" WATER LEVEL WITHIN SYSTEM PROFILE). WATER MUST BE APPLIED AT A SLOW RATE OVER A 24 HOUR PERIOD TO ALLOW FOR CAPILLARY ACTION TO DISTRIBUTE IT EVENLY. SYSTEM IS CONSIDERED CHARGED WHEN MOISTURE IS PRESENT AT ABOUT 1-2" BELOW THE SURFACE OF EPIC™.
4.3.3. DURING THE PLANTING ESTABLISHMENT PERIOD, SYSTEM SHOULD NOT BE ALLOWED TO DRY OUT COMPLETELY. TOP WATERING BY HAND OR USING TEMPORARY DRIP IRRIGATION SHALL BE UTILIZED TO KEEP SAND PROFILE MOIST TO FACILITATE PROPER ROOT GROWTH.

SECTION 111136
ELECTRIC VEHICLE CHARGING EQUIPMENT - LEVEL 2

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes EV charging equipment that provides Level 2 EV charging.

1.3 DEFINITIONS

A. EV: Electric vehicle.

B. EV Cable: The off-board cable containing the conductor(s) to connect the EV power controller to the EV that provides both power and communications during energy transfer.

C. EV Capable: Parking spaces that include nearby termination of raceway (conduit) to a power source with sufficient electrical panel capacity designed for simultaneous charging of electric vehicles in all planned EV parking spaces. Electrical wiring need not be pulled through raceway (conduit) until charging station is installed.

D. EV Charger or EV Charging Equipment: See "EVSE".

E. EV Connector: A conductive device that, when electrically coupled to an EV inlet, establishes an electrical connection to the EV for the purpose of power transfer and information exchange. This device is part of the EV coupler.

F. EV Coupler: A mating EV inlet and connector set.

G. EV Inlet: The device in the vehicle into which the EV connector is inserted, and a conductive connection is made for the transfer of power and communication. This device is part of the EV coupler.

H. EV Make Ready: Parking spaces that include nearby termination of raceway (conduit) and electrical wiring pulled to a power source with sufficient electrical panel capacity for simultaneous charging of electric vehicles in all EV parking spaces.

I. EVSE: Electric Vehicle Supply Equipment. It includes the EV charging equipment and conductors, including the ungrounded, grounded, and equipment grounding conductors and EV cables, attachment plugs, and all other fittings, devices, power outlets, or apparatus installed specifically for transferring energy between the premise wiring and the EV.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for EV charging equipment.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings: For EV charging equipment.

1. Include plans, elevations, sections, mounting, and footing details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Detail fabrication and assembly of mounting assemblies for EV charging equipment.
4. Include diagrams for power, signal, and control wiring.
5. Include verification of wireless communications service at each location of EV charging equipment.

C. Structural Calculations: Contractor shall submit structural calculations, signed and stamped by a Registered Civil or Structural Engineer in the State of California, for the design and sizing of the EV charging station anchorage and concrete footing.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Area plans and details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Structural members to which equipment will be attached.
2. Electrical service.
3. Communications service.
4. Items penetrating finished floor.

B. Seismic Qualification Certificates: For EV charging station, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For EV charging equipment to include in operation and maintenance manuals.

B. Software and Firmware Operational Documentation:

1. Online training and help documentation.
2. Station activation sticker.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

C. Comply with UL 2231-1. UL 2231-2, UL 2594, and NEC Article 625.

D. Comply with SAE J1772.

E. Comply with FCC Part 15 Class A.

1.8 FIELD CONDITIONS

A. Wireless Survey: Complete wireless survey to determine if wireless provider signals meet or exceed manufacturer's recommended minimum values.

B. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not exceeding minus 22 to plus 122 deg F (minus 30 to plus 50 deg C).
2. Altitude: Not exceeding 6600 feet (2000 m).

C. Rate Equipment for non-operation under the following conditions:

1. Ambient Temperature: Not exceeding minus 40 to plus 140 deg F (minus 40 to plus 60 deg C).
2. Altitude: Not exceeding 6600 feet (2000 m).

D. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of electric service.
2. Do not proceed with interruption of electric service without Owner's written permission.

1.9 WARRANTY

A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components of EV charging units that fail(s) in materials or workmanship within specified warranty period.

1. Standard Warranty Period: One year from date of Substantial Completion.
2. Extended Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Provide ChargePoint CT4000 family of electric vehicle charging stations for commercial applications or approved equal.

B. Source Limitations: Obtain EV charging equipment from single manufacturer.

2.2 EV CHARGING EQUIPMENT DESCRIPTION

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

B. Comply with NFPA 70.

C. ADA compliant.

D. Metering: +/- 2 percent from 2 percent to full scale of output (30 A).

E. EV Charging Equipment Mounting: Bollard and footing mount.

F. Enclosures:

1. Rated for environmental conditions at installed location.

a. Indoor Locations: NEMA 250, Type 3R.
b. Outdoor Locations: NEMA 250, Type 3R.
c. Aluminum and UV-resistant plastic.
d. Paint and Anodized.
e. Charging components protected by security screws.
f. Charging connectors in locking holsters.
g. Meter, modem, and CPU, tamper resistant.

G. EV Cable and Connectors:

1. SAE J1772 connector.
2. One connector with locking holster.
3. 23-foot cable with cable management system.

H. Status Indicators:

1. LEDs to indicate power, vehicle charging, charging complete, system status, faults, and service, as well as authorization.

I. Display Screen:

1. VGA-resolution, daylight-viewable LCD screen with UV protection. Daylight readable and fingerprint resistant.
2. Displays power, charging, charging complete, remote control, system status, faults, payment and pricing details, and service.

J. Networking:

1. WAN Communications: Cellular GSM/GPRS and CDMA.
2. LAN Communications : 2.4 GHz Wi-Fi 802.11b/g/n.
3. Capable of remote configuration, diagnostics and reporting.
4. Capable of remote software updates (future proof).

K. Payment System:

1. RFID (ISO 15693, ISO 14443), NFC, Contactless credit card reader.
2. PCI (Payment Card Industry) compliant.
3. Capable of remote control and authorization including mobile phone application or toll free phone number.

L. Charging Network: Compatible with the ChargePoint or approved equal manufacturer EV charging network.

1. Multiple units shall independently connect to charging network.
2. Multiple units shall have one unit designated as a master unit that is configured as a gateway unit between the EV charging equipment and the charging network.
3. Individual units shall be capable of indicating station status and availability providing or connecting user to customer support and remote control.

2.3 PERFORMANCE REQUIREMENTS

A. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

B. Surge Withstand: 6 kV at 3000 A.

C. Integral GFCI.

D. Auto-GFCI fault retry.

E. Input Power:

1. 40 A, 208/240-V ac, 60 Hz, single phase per charger.

F.EV Charging Levels:

1. Single vehicle: AC Level 2 at up to 7.2 kW (CT4000) per vehicle.

2.4 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for EV charging equipment electrical conduit to verify actual locations of conduit connections before equipment installation.

C. Examine walls, floors, and pavement for suitable conditions where EV charging equipment will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 1 and NECA 413.

B. Concrete Base Mounting:

1. Install EV charging equipment on 24-inch minimum nominal-diameter and 24-inch deep minimum concrete base. Contractor shall be responsible for determining final sizing and configuration. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete".

a. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
b. Install anchor bolts to elevations required for proper attachment to supported equipment.
c. Secure EV charging equipment to concrete base according to manufacturer's written instructions.

C. Wall Mounting: (NOT APPLICABLE)

D. Bollard Mounting:

1. Allow a minimum of 24 inches (600 mm) of clearance around EV charging equipment.
2. EV charging equipment receptacles or holders shall be not less than 24 inches (600 mm) and not more than 4 feet (1.2 m) above finished grade.
3. Mount EV charging equipment plumb and rigid without distortion of enclosure.
4. Secure EV charging equipment according to manufacturer's written instructions.

E. Wiring Method: Install cables in raceways and cable trays. Conceal raceway and cables except in unfinished spaces. Comply with the requirements of the Divisions 16 specifications.

F. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

G. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

H. Circuit Breakers: Comply with the requirements of the Divisions 16 specifications.

I. Secure covers to enclosure.

3.3 CONNECTIONS

A. Connect wiring according to Section 16150 "Conductors, 600 Volts and Below."

B. Comply with grounding requirements in Section 16290 "Municipal Facilities Grounding Systems."

C. Comply with requirements for installation of conduit in Section 16110 "Raceways." Drawings indicate general arrangement of conduit, fittings, and specialties.

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

3.4 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 16190 "Electrical Identification."

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Tests and Inspections:

1. For each unit of EV charging equipment, perform the following tests and inspections:

    a. Unit self-test.
    b. Operation test with load bank.
    c. Operation test with EV.
    d. Network communications test.

D. EV charging equipment will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 ONGOING MANAGEMENT SERVICES

A. Engage a station manufacturer that offers a service to manage the administration and policies of the electric vehicle charging stations on an ongoing basis.

3.8 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for the duration of an active ChargePoint Network Service Plan or approved manufacturer equal.

B. Upgrade Service: At Substantial Completion, remotely update software to latest version. Install and program software upgrades that become available while an active ChargePoint Network Service Plan or an approved manufacturer equal is maintained. Upgrading software shall include operating system and new or revised licenses for using software.

3.9 DEMONSTRATION

A. Utilize ChargePoint Station Management Services and ChargePoint Assure Services (or an approved manufacturer's equal service), or Train Owner's maintenance personnel to adjust, operate, and maintain EV charging equipment.

END OF SECTION 111136

SECTION 02225
LEAD BASED PAINT REMOVAL

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The Lead-Based Paint (LBP) Abatement Contractor (hereinafter referred to as "Contractor") is responsible for and shall furnish all labor, material, equipment, and services necessary or required for the removal of the LBP and LBP-containing surfaces from the salvaged Historic Sixth Street Viaduct Steel Arch Piece, prior to the "Site Renovation" operations specified in another section.

B. Work under this Section shall include initial cleanup, critical barriers and work area(s) preparation, removal of LBP, removal of and LBP-containing surface, final cleanup, and disposal of LBP. With LBP detected on mostly all surfaces of the arch piece, the Contractor shall remove all painted surfaces. The painted surfaces shall include interior and exterior faces of the arch.

C. Contractor shall provide all coordination, equipment, material, medical surveillance, biological monitoring and site monitoring necessary to protect his personnel and area occupants while performing the work.

D. Contractor shall furnish all labor, material, equipment and services necessary or required for the removal of the polychlorinated biphenyl (PCB) containing material.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 09900 Painting.

1.2 WORK REQUIRED

A. **<u>General</u>:** Removal of LBP and LBP-containing surfaces from the existing steel arch, prior to or during Site Renovation, as specified herein and in another Section.

2

1. A Hazardous Material Survey Report was prepared for the Sixth Street Viaduct Project. The report has been included as Attachment No. 11 of the Project Specifications. The information/measurements are approximate and for the Bidder's/Contractor's information only. It is expressly understood that the City will not be responsible for interpretations or conclusions drawn by the Bidder/Contractor as to the nature of or full extent of the existing lead-based paint

2. The Contractor shall remove and dispose of all LBP and LBP-containing surfaces, including areas where access is restricted.

3. The Contractor shall determine the route and method of moving the LBP-containing surfaces and debris and include in the detailed plan submitted for City Engineer's approval

B. Nature of the Work:

1. General: The work required by this Section includes handling, removing, cleanup, transporting, and off-site disposing of removed LBP-containing surfaces and debris. The Contractor shall provide all equipment, material, personnel monitoring; necessary to protect his personnel or area occupants (general public), from contact with airborne LBP-containing debris. The Contractor shall perform this work in accordance with the methods and procedures prescribed by this section and in compliance with all applicable rules and regulations described below, but not necessary limited to:

Code of Federal Regulations (CFR)

a.	29 CFR 1910.134	Respiratory Protection
b.	29 CFR 1910.145	Specifications for Accident Prevention Signs and Tags
c.	29 CFR 1926.62	Lead Exposure in Construction
d.	40 CFR 260	Hazardous Waste Management System: General
e.	40 CFR 261	Identification and Listing of Hazardous Waste
f.	40 CFR 262	Standards Applicable to Generator of Hazardous Waste
g.	40 CFR 263	Standards Applicable to Transporter of Hazardous Waste
h.	40 CFR 264	Standards for Owners and Operators of Hazardous Waste Treatment, Storage and Disposal Facilities
i.	40 CFR 265	Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage and Disposal Facilities
j.	40 CFR 268	Land Disposal Restrictions
k.	49 CFR 178 & 179	United States Department of Transportation
l.	49 CFR 172 & 173	United States Department of Transportation

California Code of Regulations (CCR)

a.	Title 8, 1532.2	Construction Safety Orders – Lead
b.	Title 8, 5216	General Industry Safety Orders – Lead
c.	Title 8, 5194	Hazard Communications
d.	Title 13	Dept. of Calif. Highway Patrol Regulations

e. Title 22 — Hazardous Waste Handling

American National Standards Institute (ANSI) Publications

a. ANSI Z9.2 — 1979 Fundamental Governing the Design and Operation of Local Exhaust Systems

b. ANSI Z88.2 — 1980 Practice for Respiratory Protection

c. ANSI Z86.1 — 1973 Commodity Specifications for Air

Underwriters' Laboratory Inc. (UL) Publication

a. UL 586 — 1990 High Efficiency Particulate Air (HEPA) Filter Units

Any other federal, state, county, and City regulations, codes, and ordinances that are applicable.

2. Controlled Work Area(s): The controlled work area(s) will be the entire specified work area where the LBP containing material shall be removed. The specified work area will be vacated.

3. Title to Construction Debris: Materials and debris resulting from LBP removal work, unless otherwise indicated shall become the property of the Contractor. The LBP shall be disposed of properly, as specified in Section 3.

4. Protection of Existing Work to Remain: The LBP and LBP-containing surfaces removal work shall not damage or contaminate adjacent areas or other ongoing construction work. Areas that are damaged or contaminated by the Contractor shall be restored to original condition by the Contractor.

5. City's Representatives: The City's representatives shall be the responsible party for the required work. The City's representatives shall include, but not be limited to the Project Manager and Construction Manager; the Abatement Consultant for the project, City's Industrial Hygienist and Consultant Architect.

C. **Pre-Bid Meeting (Job-Walk Through)**: A pre-bid meeting and job walk-through will be held for the bidders at times and places directed by the City's representatives and noted in the Bid Documents. The Contract Drawings and Project Manual will be available for reference at this meeting. In addition, the City's representatives will be available to answer all questions by the bidders, submitted in writing.

1.3 QUALITY ASSURANCE

A. **Contractor's Qualifications:** The Contractor or Subcontractor performing the work of this Section shall submit information demonstrating that they posses the following qualifications:

1. A minimum of 10 years specializing in the safe removal of LBP and LBP-containing surfaces, with evidence of having successfully completed projects with requirements similar to this one.

2. Contractor or Subcontractor shall be duly licensed by the State of California with the provisions of Chapter 9, Division 3, Business and Professions Code, as

amended.

3. The Contractor shall carry insurance in accordance with the City's requirements.

4. The Contractor shall be registered with the Carcinogen Control Unit, California Occupational Safety and Health Administration (OSHA).

5. The Contractor shall present proof of personnel's training, in regards to LBP abatement work.

6. The Contractor shall present standard operating procedures and employee protection plans with specific reference to their OSHA medical, exposure monitoring and respirator training programs.

7. The Contractor shall present references on previous jobs and work projects, on demand.

8. The Contractor shall present documentation on three successful completions of lead-based paint removal projects within the last 2 years.

B. <u>Air Monitoring and Inspection Firm to be Provided by the Contractor</u> :

1. Qualifications:

   a. The Air Monitoring and Inspection Firm shall be completely independent of, and in no way affiliated with the Contractor. The duties of the Air Monitoring and Inspection Firm will be described in Section 3.

   b. The Air Monitoring and Inspection Firm to be provided by the Contractor shall present at least three references.

2. Entry to the Site: Air Monitoring and Inspection Firm and City's representatives shall have the right of entry to the work areas, at any time, for purposes of inspection and monitoring.

   a. The Contractor shall provide the appropriate protective clothing for inspection and monitoring and to City's representatives.

3. Interpretation: Matters concerning interpretation of standards will be submitted to all City representatives and to appropriate administrative agency for resolution, as necessary. Where requirements of these specifications and referenced documents differ, the more stringent requirements shall apply.

4. Protective Measures: The Air Monitoring and Inspection Firm and the City's representatives reserve the right to require additional protective measures at any time during the course of the LBP and LBP-containing surfaces removal work, to protect workers, City Employees and other users.

1.4 SUBMITTALS

A. Submittals shall meet the requirements set forth in Section 01330 – Shop Drawings/Submittals.

B. **<u>LBP and LBP-Containing Surfaces Removal Plan</u>:**

1. Prior to the start of LBP and LBP-containing surfaces removal work, the Contractor shall submit a detailed plan of work procedures to be used in removal and disposal of materials containing LBP to the City for reviews. Contractor shall incorporate all comments and corrections prior to submitting to Federal and State governing authorities having jurisdiction for approval. The plan shall be approved by governing authorities prior to start of work. The plan shall include the location and layout of decontamination areas; the sequencing of LBP and LBP-containing surfaces removals; the interface of trades involved in the performance of work; work schedule including work shift time, number of employees, date of start and completion including dates of preparation work, removal, and final clearance dates; methods to be used to assure the safety of workers, City employees, and the public; type of wetting agent or encapsulate; disposal plan including location of approved disposal site; and a detailed description of the methods to be employed to control pollution and an emergency evacuation plan. Expand upon the use of portable HEPA-filtered ventilation system, method of removal to prohibit visible emissions in work area, and packaging of removed asbestos debris. Submit evidence of approvals to the City's representatives prior to start of work.

C. 1. Training**:** The Contractor shall submit certificates, signed by each employee, stating that employee has received training in proper handling of materials that contain LBP understands health implications and risks involved, including illnesses possible from exposure to airborne lead particles; and understands the use and limits of respiratory equipment to be used; and understands results of monitoring of airborne quantities of lead-based paint as related to health and respiratory equipment.

2. All employees must have baseline and post abatement blood lead level screenings results provided to City for review.

D. **<u>Local Exhaust Equipment (Differential Pressure Air Machines)</u>:** The Contractor shall submit evidence of conforming to ANSI Z9.2 "Fundamentals Governing the Design and Operation of Local Exhaust Systems" for equipment required to contain HEPA filters in differential pressure air machines for personnel monitoring and site air monitoring.

E. **<u>Permits and Notifications</u>:** The Contractor shall secure the necessary permits in conjunction with LBP and LBP-containing surfaces removal, hauling, and disposition and provide timely notification of such actions as may be required by Federal, State, Regional, City and County of Los Angeles Governments.

1. Notify Regional Office of United States Environmental Protection Agency (USEPA) and South Coast Air Quality Management District (SCAQMD) and provide copies of notification to City's Representative and State Environment Regulatory Agency at least 10 working days prior to start of work.

2. Notify the nearest district office of CAL/OSHA, Division of Occupational Safety and Health, at least 3 working days prior to start of work.

3. Notify the air monitoring and inspection firm at least 3 working days prior to start of work.

4. Satisfactory proof to the City that required notifications and/or remediation plans, have been filed and permits have been obtained and are in full force and

effective throughout course of work of this Section.

F. **Project Log Book**: The Contractor shall maintain a project log book, which will be kept up-to-date and available at the job-site. Upon completion of the work, a copy shall be submitted to the Air Monitoring and Inspection Firm for approval. After approval, two copies shall be submitted to the City's representatives. The Project Log Book will contain and conform to the following:

1. Documentation of all Notices and Submittals.

2. Permits.

3. Medical Records - Proof of Personnel's Medical Physicals.

4. Emergency Notification Data.

5. Sign-in log book, shall be filled out daily:

- Name of person visiting the controlled work area;
- Time entered/exited the controlled work area;
- Affiliation and purpose;
- Description of activity performed;
- Description of daily work performed;
- Any damages to the structure or furnishings;
- Any loss of air pressure differential;
- Any accidents (including minor accidents);
- Results of any air samples collected by the Contractor;
- Signature of Project Superintendent and date;

G. **Landfill:** The Contractor shall submit written evidence that the disposal facility is approved for lead disposal by EPA and State or Local Regulatory Agencies, when the LBP waste is characterized as hazardous waste. All disposal or recycling facilities used in this Project shall be located within the State of California.

H. **Monitoring Results:** The Contractor shall submit monitoring results to the City's representatives and the Air Monitoring and Inspection Firm within 3 working days. Complete airborne lead concentration analysis and notify the City's representatives.

I. **Air Pressure Differential Recordings:** The Contractor shall submit air pressure differential recordings for each work to Air Monitoring and Inspection Firm for review, and then submit to the City's representatives within 48 hours from end of each work day. Notify the City's representatives immediately of any variance in pressure differential which could cause exposure of adjacent areas to fiber concentrations in excess of acceptable time-weighted average (TWA).

J. **Hazardous Manifest**: The Contractor shall maintain a log of all manifests (hazardous and non-hazardous). The Contractor shall submit to City Engineer duplicate copies of all logs and generator's copy of the manifest to City Engineer for process. Upon receipt of the completed manifest from the Treatment, Storage or Disposal (TSD) facility where the waste has been sent, the City will make progress payment for the completed abatement work in accordance with Section 3, regardless the LBP waste characterized as hazardous or non-hazardous waste.

1.5 INSURANCE REQUIREMENTS (FOR LEAD-BASED PAINT REMOVAL)

2

~~**A.** Bidder shall furnish within ten days after notification of pending award, properly completed City Special Endorsement forms or binders of insurance with coverage as set forth in the attached Insurance Requirements sheet. Failure to comply will render the bid non-responsive and no award will be made to the firm.~~

B. Lead-Based Paint Abatement Contractor must provide a certified copy of a General Liability Insurance Policy or other evidence acceptable to the City Attorney showing that the Contractor is insured for work in the Lead-Based Paint, removal and/or encapsulation field. The actual policy declaration must contain wording that the coverage is for a Lead-Based Paint Abatement Contractor and must include coverage for completed operations.

C. Because of the severely limited availability of Lead-Based Paint Abatement Liability insurance, we are modifying the requirements to allow compliance by any of the following alternatives:

Type of Policy	Coverage	Limits/Aggregate
Comp. General Liability- Occurrence basis	Products/Completed operations	$1,000,000 $2,000,000
1986 Comp. General Liability- Occurrence basis	Products/Completed operations	$1,000,000/ $2,000,000
1986 Comp. General Liability- Claims-made basis	Products/Completed operations	$1,000,000/ $2,000,000
Owners and Contractors Protective Liability	Lead-Based Paint [PCB] Removal (City as Named Insured)	$1,000,000
Project Specific General Liability	Products/Completed operations	$1,000,000

D. If the contractor has a claims-made basis policy and changes insurance carriers, it is critical that there be no gap in coverage and that a retroactive policy be provided.

1. The foregoing applies only to the Lead-Based Paint Removal insurance requirements. All other insurance requirements remain unchanged.

E. Refer to Section 00316 - INDEMNIFICATION and Section 00317 - INSURANCE, GENERAL CONDITIONS, for additional information.

PART TWO - PRODUCTS

2.1 EQUIPMENT

A. **Respirators:** The Contractor shall use respirators from those approved by the National Institute of Occupational Safety and Health, Department of Health and Human Services.

1. Powered Air Purifying Respirators (PAPR) shall be the minimum level of respiratory protection employed during work area(s) removal of LBP LBP-containing surfaces and cleanup.

B. **Protective Clothing:** The Contractor shall provide personnel exposed to airborne lead

particles with disposable protective whole-body clothing, including head coverings and foot covering. Make sleeves secured at wrists and make foot coverings secured at ankles. Provide disposable plastic of rubber gloves to protect hands and face shields, vented goggles, or other appropriate protective equipment.

C. **Decontamination Enclosure Facilities:** The Contractor shall provide a decontamination enclosure facility for personnel required to wear whole-body protective clothing and work in the controlled work area. These facilities, and their use, shall comply with the requirements of 29 CFR 1926.62 and CCR Title 8, 1532.1 CCR Title 22.

1. The decontamination enclosure systems shall be constructed, affixed, and connected in such a manner as not to compromise the airtightness of the containment.

2. Build suitable wood or metal stud frame; or use an existing room or enclosure approved by the City's representatives and Air Monitoring and Inspection Firm. Portable, pre-fabricated units may be used if approved by the City's representatives and Air Monitoring and Inspection Firm. Approval will be based upon, but not limited to, the construction, floor plan, dimensions, materials, sizes, thicknesses, plumbing, electrical outlets, etc.

3. In all cases, access between contaminated and uncontaminated rooms or areas shall be through a decontamination enclosure system. In all cases, access between any two rooms within the decontamination enclosure shall be through an air lock with two curtained doorways.

4. Worker and Visitor Decontamination Enclosure: Construct a workers and visitor's decontamination enclosure adjoining the work area(s) consisting of three totally enclosed chambers, an equipment room, a shower room and a clean room.

   a. The equipment room shall be connected to the work area(s) and contain an air lock leading to the shower room. In addition, the equipment room shall contain a marked receptacle for the discarding of contaminated clothing prior to entering the shower room.

   b. The shower room shall be connected to the equipment room and the clean room by an air lock. An additional pan shall be placed below the stall of sufficient size to contain 5 cubic feet of water. The shower(s) shall be equipped with hot and cold or warm water. If necessary, Contractor shall provide portable hot water heater to supply hot water. The shower(s) shall have sufficient soap, shampoo, and disposable towels at all times.

   c. The shower room shall not leak, and the water shall be appropriately filtered and/or properly disposed of.

   d. The clean room shall be connected to the shower room by one air lock, with a curtained doorway leading to any other non-contaminated space within the Worker Decontamination Enclosure.

   e. It shall be large enough to provide storage for the workers street clothes, towels, or any other non-contaminated items.

5. Equipment Decontamination Enclosure: Construct an equipment decontamination enclosure consisting of two totally enclosed chambers, a

washroom and a holding area

a. The washroom constituting an air lock shall be connected to the holding area by a curtained doorway.

b. The holding area will be connected to any uncontaminated area by a curtained.

c. These spaces shall be for the cleaning and decontamination of bagged wastes. In addition, this is preferred ingress and egress point for equipment. All equipment will be thoroughly decontaminated before leaving the decontamination enclosure facility.

d. Water in this enclosure shall be collected, filtered, and/or properly disposed.

e. The decontamination enclosure facilities shall be maintained to ensure that the barriers, air locks, and plastic linings are effectively sealed and taped.

f. Repairs shall be undertaken immediately upon discovery of a defect.

g. Visually inspect and thoroughly clean the decontamination enclosure system at the beginning and end of each workday.

6. In all cases, project site (interior and exterior) shall be protected from any contamination. No Lead-Based paint, construction or cleaning water shall be directed toward on-site soil, paving or flooring opening, drain system, and etc. No airborne duct shall be caused or directed to adjacent property.

D. **Air Pressure Differential to be Provided by Contractor:** Each controlled work area(s) shall be maintained at a minimum air pressure differential of 0.02" W.G. to adjacent areas by means of differential pressure air machines equipped with HEPA filtration. The Contractor will provide a sufficient number of differential pressure air machines to exchange the air within the controlled work area(s) every 15 minutes. The air pressure differential shall be referenced to ambient pressure within the clean room of the decontamination enclosure facilities to the controlled work area.

F. **Differential Pressure Air Machine**: The Contractor shall verify the efficiency of each differential pressure air machine and the efficiency rating shall be used in the calculations of air exchange within the controlled work area. The differential pressure air machine shall be equipped with three stages of filters, a HEPA-filtered and two pre-filters.

1. Differential pressure air machines will remain in use until a final clearance has been attained. No removal activities will be allowed without proper air pressure differential.

2.2 CAUTION SIGNS AND LABELS

A. **General:** Provide signs at approaches to LBP and LBP-containing surface removal controlled work areas. Locate signs at such distance that personnel may read sign and take necessary protective steps required before entering the controlled work area. Signs shall be bilingual, English and Spanish.

1. Signs and labels shall conform with the requirements of 29 CFR 1926.62, 40 CFR 260, CCR Title 8, 1532.1 and Title 22.

2.3 MATERIALS

A. **Encapsulant:** EPA-approved asbestos encapsulant, tinted with contrasting color to plastic sheeting surfaces, and suitable to be sprayed-applied by airless sprayer, BWE 5000 or equivalent.

B. **Plastic Sheeting:** Fire-retardant, 6-mil polyurethane plastic used to cover the critical barriers; the controlled work area(s), ceiling and floor; and decontamination enclosure facilities.

C. **Runners:** Paper, of sufficient width and length to protect floors of the building entrances to work area(s).

D. **Spray Adhesive**: 3M spray adhesive.

E. **Tape:** Duct tape.

PART THREE - EXECUTION

3.1 GENERAL

A. The painted surfaces anticipated for the LBP removal and LBP-containing surfaces removal shall include interior and exterior faces of the arch piece.

3.2 PREPARATION PROCEDURES OF THE CONTROLLED WORK AREA (S)

A. **General Preparation:** To the controlled work area(s) for the removal of LBP and LBP-containing surfaces

1. Prior to commencing any preparation of the controlled work area(s), the Contractor shall post all required documents, warning signs, and erect any physical barriers in order to secure the work area(s). The previously described project log book shall be kept updated and available for review at all times.
2. The Contractor is responsible for the work area(s) security upon establishing, preparing, and maintaining the controlled work area(s). The responsibility of security extends 24 hours per day. The Contractor may be required to retain a security service. NOTE: Only authorized visitors will be allowed on the work site.
3. The Contractor shall disconnect and lock out existing electric power to the work area(s). Provide temporary electric power and lighting and ensure safe installation of temporary power sources and equipment per applicable electrical code requirements.
4. The Contractor shall erect a sealed containment structure for the work area.
5. Unless otherwise specified, the Contractor shall install differential air pressure machines. The number of the machines required for the controlled work area(s) shall be calculated using the following:
    a. Cubic feet per minute (cfm) flow rate of the machine at a 75 percent efficiency.
    b. Cubic feet (cf) volume of the controlled work area(s) including the above ceiling space.

c. Four air changes per hour.

6. The Contractor shall exhaust the differential pressure air machines to the exterior of the containment structure.

8. Moveable and loose items located in the work area(s) shall be cleaned using HEPA-filtered vacuum equipment and/or wet cleaning methods as appropriate or shall be removed from the work area(s).

B. **Additional Preparation**: To the controlled work area(s) for the removal of LBP from surfaces and other renovation work over existing LBP.

1. The Contractor shall contain the LBP-containing surface inside a controlled work area by either building containment around the LBP-containing surface or building containment and relocating the surface inside it. The containment shall have the walls, ceilings and floors covered with plastic sheeting. All joints and seams of the plastic sheeting shall be overlapped a minimum of 12 inches, glued, and taped together and to existing walls in a manner to prevent and prohibit water and air movement through the covered areas.

2. All project site (interior and exterior) shall be protected from any contamination in accordance with Subsection 2.1 (c)6.

3. The Contractor shall install the required differential air pressure machine, as previously described, inside the controlled work area(s).

4. If water is used to remove the LBP from surfaces, the Contractor shall construct a water capturing device. The water shall be collected, filtered and/or properly disposed.

5. The Contractor shall establish emergency fire exits in compliance with applicable fire codes/regulations. The emergency fire exits shall not be used for entering or exiting the work area, except in case of emergency. The Contractor shall post the necessary abatement warning signs in each of the fire stairwells for two floors below and one floor above the controlled work area(s), or as required by applicable fire codes/regulations. All exits shall be marked in bold red lettering "Emergency Exit."

6. The Contractor shall install their communication equipment. Equipment should be operating properly and maintained as such during removal and cleanup operations.

3.3 REMOVAL PROCEDURES OF LBP FROM SURFACES

A. Prior to beginning the removal and other renovation work activities, the Air Monitoring and Inspection Firm shall conduct a visual walk-through inspection of the controlled work area, as specified in Subsection 3.8.

B. The Contractor shall use LBP removal procedures, which prevents airborne dust and debris, approved by the City Engineer. The Contractor may elect to use chemical strippers, HEPA-filtered vacuum blasting or sanding, and/or heat blower guns with the approval of the City Engineer.

C. The removed LBP chips, flakes, dust, and debris must be evaluated and characterized as

to lead content and concentration, as per CCR Title 22, Chapter 11, Article 3. The LBP chips, flakes, dust and debris must be collected and placed into 55-gallon, heavy duty type "17H" open head, non-leaking, polyurethane-lined steel drums, as per 49 CFR 173, 178, and 179.

3.4 CLEANUP OF CONTROLLED WORK AREA (S) AND DISPOSAL PROCEDURES OF LBP WASTE

A. **Housekeeping:** Upon removal of LBP and LBP-containing surfaces or other renovation work, the following cleanup procedures, unless otherwise specified in detailed plans, shall commence:

1. Once the LBP chips, flakes, dust, and debris have been collected and placed into the specified steel drums, the Contractor shall HEPA-filtered vacuum and wet wipe all surfaces inside the controlled work area(s).

2. Request visual clearance inspection by Air Monitoring and Inspection Firm. Criteria for visual clearance inspection shall include:

   a. Completion of removal of LBP and LBP-containing surfaces.
   b. Adequate cleanup of the controlled work area.

B. **Hauling and Disposal:** All applicable Federal, State, and Local requirements shall be complied with.

1. The Contractor shall contact the City to obtain all technical information needed to complete all notification, permit and manifest before securing permit to proceeding with any work.

2. The Air Monitoring and Inspection Firm shall verify the number of steel drums and the City's representatives will sign the manifest prior to hauling and disposal of the LBP hazardous or nonhazardous waste. No progress or final payment will be made until all completed manifests have been received and approved by the City.

3. All dump receipts, trip tickets, or other documentation of disposal shall be delivered to the City's representative.

4. All shipping will be in accordance with Title 49, CFR Part 172, 173, 178 and 179.

5. All respiratory requirements specified herein shall be complied with.

3.5 SITE AIR MONITORING AND INSPECTIONS

A. **General:** Air monitoring and inspections shall be performed by the Air Monitoring and Inspection Firm in the controlled work areas as described below:

1. All air samples shall be of sufficient volume to establish a detection limit of micrograms of lead per cubic meter of air (ug/m^3) and provided by the Contractor.

B. **Prior to Removal Procedures of the LBP and LBP-Containing Surfaces and Other Renovation Work:** Air monitoring and inspections shall be performed throughout the course of the controlled work area(s) preparation, to verify that all specifications are met, and to ensure that the preparation activities do not release airborne lead particles. The

inspection shall determine if all appropriate procedures, methods, measures and engineering controls have been addressed. The inspection will address:

1. Observation of the work area.

2. Observation of barriers, air locks, curtained doorways and emergency exits.

3. Observation of the decontamination enclosure system.

4. Observation of differential pressure air machines and presence of sufficient air pressure differential.

5. Observation of respirator equipment.

6. Observation to verify that all notices and warnings are posted.

7. Observations to verify the Contractor's workers have proper submittals and the project log book is up-to-date.

8. Any deficient or omissions in the controlled work area(s) preparation procedures noted by routine inspections or the City's representative shall be promptly addressed by the Contractor.

9. Any debris resulting from preparation procedures will be effectively cleaned up by the Contractor immediately.

C. **Final Inspections of the Controlled Work Area(s):** At the conclusion of the controlled work area(s) cleanup, a final inspection shall be performed to verify the removal and cleanup of LBP and LBP-containing surfaces have been completed and that no LBP chips, flakes, dust, or debris is present in the controlled work area.

D. **Clearance Air Monitoring of the Controlled Work Area(s):** After final inspection has been successfully completed, clearance air sampling shall be performed by the Contractor:

1. The clearance air sampling will be conducted using aggressive air sampling techniques, such as leaf blowers, fans, or other air agitation devices.

2. The clearance air sampling will be conducted to analyze the airborne lead particle inside the controlled work area(s). Air sampling clearance results shall indicate airborne lead particle concentrations are equal to or below 3 ug/m^3.

3. Additional cleaning tasks and air clearance sampling shall be provided by the Contractor at no additional cost to the City, as needed to meet the above criterion.

4. Upon receipt of satisfactory clearance of air sampling results, isolation measures may be removed, and the controlled work area(s) released for other construction trades.

3.6 MEASUREMENTS AND PAYMENTS:

A. All work included herein shall be part of the Contract lump sum bid price and be paid for in accordance with Section 01292 – PARTIAL PAYMENT of GENERAL

REQUIREMENTS of the Project Manual.

Re: Asbestos and Lead Sampling: 6th Street Viaduct Bridge

Dear Mr. Morelan,

This report documents the findings, recommendations, and conclusions from the sampling conducted by Robert Rinck, a California Department of Public Health Certified Inspector/Risk Assessor (#4868) and a California Certified Asbestos Consultant (#03-3374), Glenn Gutierrez, a California Certified Site Surveillance Technician (#06-3391) and a California Department of Public Health (CDPH) Certified Lead Inspector/Risk Assessor (#20133) and Robert Pitzer, a California Department of Public Health Certified Inspector/Risk Assessor (#16091) and a California Certified Site Surveillance Technician (#07-4235) at the 6th Street Viaduct Bridge in Los Angeles, California. The purpose of the survey was to review previous asbestos and lead surveys of the bridge and to provide confirmation sampling of known materials and sampling of materials that may have been overlooked. The reports reviewed for this report include the following:

- Bulk Asbestos and Lead-Based Paint Survey prepared by SCA Environmental, Inc., project L-9393 dated April 2009.
- Asbestos and Lead report prepared by TRC, project 228333 dated October 2009
- Metals Analysis report, City of Los Angeles, Work Order no. E700224L

Additional sampling by Aurora was conducted on March 9, 2015, July 28, 2015, August 7, 2015, and August 11, 2015.

EXECUTIVE SUMMARY

The following materials were found to be Asbestos Containing Materials (ACM - 1% or greater):

Material	Location	Result	Amount
Cementitious grout, black	Lower sidewalks adjacent to bridge	3-6% Chrysotile	775 linear feet (approximately 1" wide)
	West side column bases		840 linear feet at 24 columns bases (approximately 1" wide)

The following materials were found to be Asbestos Containing Construction Materials (ACCM – less than 1% but greater than 0.1%):

Material	Location	Result (point count)	Amount
Expansion joint material, black	Bridge expansion joint at Santa Fe (below deck)	0.16% Chrysotile	<100 SF
Sealant tar, black	Bridge wall at river north bank	0.2% Chrysotile	5 LF
Sealant tar, black	Bridge expansion joint and column #8 N side	0.3% Chrysotile	15 LF

Lead-based paint (5000 ppm or greater) was detected on the following components:

Component	Color	Substrate	Condition	Location
Structure steel	Gray/beige	Metal	Fair	Arches, structural steel
Striping	Yellow	Asphalt	Fair	Below bridge
Light post access hatches	Gray	Metal	Poor	Bridge light posts

Lead-containing paint (defined as less than 5000 ppm but greater than 600 ppm) was detected on the following components:

Component	Color	Substrate	Condition	Location
Striping	Yellow	Asphalt	Fair	Roadway
Light post bases	Beige	Concrete	Poor	Bridge
Light post	N/A	N/A	N/A	Eastside (Anderson)
Light post	N/A	N/A	N/A	Westside (Anderson)
Light post	N/A	N/A	N/A	Westside (Mission)
Bridge Structure	Beige	Concrete	Poor	Above RR tracks
Bridge Structure	N/A	N/A	N/A	Westside on-ramp

INVESTIGATION

Asbestos

Aurora collected ten (10) bulk samples on March 9, 2015. These samples were analyzed by Polarized Light Microscopy (PLM) for Asbestos via EPA Method 600/R-93/116 "Method for Determination of Asbestos in Bulk Building Materials" by EMS Laboratories. EMS is an EPA accredited laboratory located at 117 West Bellevue Drive in Pasadena, California.

Aurora collected thirteen (13) bulk samples of expansion joint material on July 28, 2015 and two (2) samples of black, grout-like material on August 7, 2015. These samples were analyzed by Polarized Light

Microscopy (PLM) for Asbestos via EPA Method 600/R-93/116 "Method for Determination of Asbestos in Bulk Building Materials". Samples collected on July 28, 2015 were analyzed by EMLabP&K. EMLabP&K is an EPA accredited laboratory located at 1010 North Central Avenue in Glendale, California. The two samples collected on August 7, 2015 and the two samples collected on August 11, 2015 were analyzed by LA Testing. LA Testing is an EPA accredited laboratory located at 520 Mission Street in South Pasadena, California

Samples approximately 1 cubic centimeter (cc) in size were obtained using appropriate sampling equipment. The sampling area was misted with water to minimize the potential for the release of airborne fibers. Collected samples were placed in sealed plastic bags, labeled and transported under chain of custody to the laboratories.

Lead

Aurora collected ten (10) paint chip samples on March 9, 2015 and nine (9) paint chip samples on July 28, 2015. These samples were analyzed for lead content by Atomic Absorption Spectrophotometry by EMS Laboratories. The collected samples were assigned a unique sample identification number, placed in a sealed container, labeled, and transported under chain of custody to EMS. The sample was reported by weight of lead/weight of sample (mg/kg). A laboratory result of 5000 ppm (0.5%) was considered positive for lead based paint, in accordance with Chapter 7 (revised, 1997) of the Housing and Urban Development Guidelines for Lead Based Paint Inspection.

SAMPLING DATA

Table 1: Aurora - Asbestos Sampling from July 28, 2015, August 7, 2015, and August 11, 2015. (Expansion joints are numbered beginning at the west end of the bridge)

Sample #	Material	Location	Result
EJ001	Black expansion joint material with yellow foam	Expansion joint #1	None Detected
EJ002	Black expansion joint material with yellow foam	Expansion joint #2	None Detected
EJ003	Black expansion joint material with yellow foam	Expansion joint #3	None Detected

DISCUSSION AND RECOMMENDATIONS

Cementitious Grout

The asbestos survey prepared by SCA Environmental, Inc., project L-9393 dated April 2009 reported a "Cementitious grout, black" material located between the concrete handrails and sidewalks of the bridge. The north and south handrails were inspected for the length of the bridge. Three areas of concrete were removed from the handrail to reveal the seam between the handrail and the sidewalk. **Grout material was not found in our inspection at the concrete handrails on the bridge.**

Asbestos was detected in a black, grout-like material that is located at the ground level sidewalks adjacent to the bridge and the bridge walls and at the bases of the west side columns (24). This material is approximately a half-inch thick. Approximately 425 linear feet was observed at Mesquit Street and 350 linear feet was observed at East 6th Street. 840 linear feet were observed at the twenty-four columns located on the west side of the river.

Expansion Joints

Thirty-one (31) samples of material described as "expansion joint" materials were sampled. The result of three samples collected by SCA and identified as expansion joint material collected from the underside of the bridge above Santa Fe were less than 1% but above 0.1% asbestos content. There is less than 100 square feet of expansion joint material at this location. **Asbestos was not detected on any other samples of expansion joint – including two samples collected from the underside of the bridge by Aurora Industrial Hygiene at the same location as the SCA. We recommend that the expansion joint material be treated as negative for asbestos.**

Five (5) square feet of ACCM black sealant tar at the bridge wall at the river north bank and fifteen (15) square feet of ACCM black sealant tar at the column #8 north side collected by TRC were also identified in their report. **It is likely this material is a patch and should be considered a separate homogeneous area.**

Asbestos Regulatory Information

Listed below are a summary of regulations that apply if the asbestos containing materials are removed. It is not meant to be conclusive. The contractor is responsible for ensuring that they are in compliance with all local, state and federal requirements regarding asbestos containing materials:

1. A property owner has the responsibility for ensuring that asbestos containing material is maintained in good condition. Custodial or maintenance staff must be trained regarding proper handling of the material as part of an ongoing operations and maintenance operation. CalOSHA 8 CCR 1529, California Health and Safety Code Section 25915, and Proposition 65.
2. If more than 100 square feet of materials that contain greater than 0.1% asbestos will be removed, the materials must be removed by a registered asbestos abatement contractor and transferred to a waste facility that will accept asbestos waste. CalOSHA 8 CCR 1529.

3. ACM that is classified by OSHA as other/miscellaneous materials are present. Removal of these materials is considered a Class II activity according to CalOSHA regulations. Work practices and engineering controls for Class II work are specified in CalOSHA 8 CCR 1529.
4. Notifications and abatement practices must follow the South Coast Air Quality Management District (SCAQMD). Rule 1403.

Lead

Lead based paint was detected on the structural steel of the bridge, including the arches and support structure, the yellow striping below the bridge, and on the light post access hatches. This material is in fair to poor condition. Lead containing paint at greater than 600 ppm but less than 5000 ppm was detected on the light post bases, roadway striping and on the concrete bridge above the railroad tracks. This paint is in poor condition.

We recommend that all lead paint be stabilized and any lead waste be tested and disposed of as described below:

Lead Regulatory Information

Lead-safe work practices (such as using plastic tarps to catch paint chips and debris) are required regardless of the size of the project or the amount of lead present. The damaged paint should be cleaned from the substrate and this waste tested as described below: Title 17, CA Code of Regulations, Section 36050.

Handling/Disposal

A composite sample should be analyzed for Total Threshold Limit Concentration (TTLC) by USEPA reference method SW846. If the concentration of lead is greater than 1000 mg/kg the sample must be disposed of by a landfill which can handle such wastes. If the concentration is less than 50 mg/kg the sample may be disposed of as construction debris, if it is to remain in California. If the result falls between 50 mg/kg and 1000 mg/kg, the sample must be further analyzed by the Waste Extraction Test (WET) for Soluble Threshold Limit Concentration (STLC) as described in 22 CCR 66261.24a. If this concentration exceeds 5 mg/liter the sample must be handled and disposed of as hazardous waste.

Outside of California

All lead-containing paint which may be disposed of outside the State of California must be tested for Toxicity Characteristic Leaching Procedure (TCLP) regardless of whether it is essentially intact. The sample may be a composite of the paint and the substrate if the paint is intact. Any material with results exceeding 5 mg/l must be treated as hazardous waste.

Hazard communication training and exposure assessments are required for employees who may be exposed to lead. 8 CCR 1532.1.

Limitations

This report is based solely upon the condition of the property on the dates of the inspection. Aurora has performed this work, made the findings, and proposed the recommendations described in this report in accordance with generally accepted industrial hygiene practices in effect at the time the work was performed. This report is limited to accessible materials that could be sampled with discretion and with minimum damage to the property. No warranties, express or implied, are made by Aurora as to the use of any information disclosed in this report.

I hope that this information is helpful. Site diagrams, photos, and inspector certifications are attached.

Sincerely,

AURORA INDUSTRIAL HYGIENE, Inc.

Robert Rinck, CDPH #4868, CAC #03-3374

Analyst - MEGHAN SWEENEY **Approved Signatory** Laboratory Director

The EPA method is a semi-quantitative procedure. The detection limit is between 0.1-1% by area and dependent upon the size of the asbestos fibers, the means of sampling and the matrix of the sampled material. The test results reported are for the sample(s) delivered to us and may not represent the entire material from which the sample was taken. The EPA recommends three samples or more be taken from a "homogeneous sampling area" before friable material is considered non-asbestos-containing. Negative floor tile samples may contain significant amounts (>1%) of very thin fibers which cannot be detected by PLM. Confirmation by TEM is recommended by the EPA (Federal Register Vol.59, No.146). Asbestos fibers bound in a non-friable organic matrix may not be detected by PLM. Alternative preparation methods are recommended. This report, from a NIST-accredited laboratory through NVLAP, must not be used by the client to claim product endorsement by NVLAP or any agencyof the U.S. government. This report shall not be reproduced, except in full, without the written approval of EMS Laboratories, Inc. Samples were received in good condition unless otherwise noted.

EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Samples received in good condition unless otherwise noted. Estimated accuracy, precision and uncertainty data available upon request. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Reporting limit is 1%

The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government. EMLab P&K reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed. Floor tile samples may contain large amounts of interference material and it is recommended that the sample be analyzed by gravimetric point count analysis to lower the detection limit and to aid in asbestos identification.
‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

Summary Result of Lead Paint Testing by the City of Los Angeles

---------- Forwarded message ----------
From: **Thomas, Kurt** <Kurt.Thomas@skanska.com>
Date: Mon, Apr 7, 2014 at 7:32 AM
Subject: RE: Pb results
To: Ibrahim Hafeez <ibrahim.hafeez@lacity.org>
Cc: "Damore, Lawrence" <Lawrence.Damore@skanska.com>

Here are our environmental consultants comments on the results and pictures I sent to him.

I sounds like the peeling paint on the structure should be abated.

Kurt,

We reviewed the lead sample data from the Sixth Street bridge and have the following observations and recommendations:

1. The sample results were compared to TTLC limits, which is not a value used to determine if

remediation is required. TTLC comparison is used for the disposal of the waste.

2. Lead exposures to workers during demolition are regulated by Cal/OSHA, which has certain regulatory requirements for identifying and controlling potential lead exposures. Currently applicable regulations for the construction industry have been adopted by Cal/OSHA (8 CCR 1532.1) from the Federal OSHA regulations. The current OSHA 8-hour Permissible Exposure Level (PEL) for lead is 50 µg/m3. The PEL is specifically for worker exposure to airborne lead. During demolition, crushed painted concrete and dust from the lead paint and material will become airborne, and worker exposure to lead cannot exceed 50 µg/m3 over an 8-hour period. While CalOSHA standards do not apply to community exposure, effective dust control measures typically minimize exposure to both workers and community. Water spray is used during demolition to eliminate dust.
3. Current EPA and Cal/EPA regulations do not require Lead Based Paint to be removed prior to renovations, unless loose and peeling. Provided that the paints are securely adhered to the substrates (i.e., non-flaking or non-peeling), disposal of the debris may be handled in California as non-hazardous and non-RCRA waste, pending characterization of the waste. The removed paint chips will need to be analyzed for waste disposal. Removed loose and peeling LBP or other wastes exceeding the Total Threshold Level Concentration (TTLC) of 1,000 ppm (mg/kg) or exceed the Soluble Threshold Level Concentration (STLC) of 5 mg/liter, are required to be disposed of as non-RCRA hazardous waste (Any TTLC results over 50 mg/kg will require analysis by STLC and any level over 100 mg/kg will require analysis by TCLP). However, if the leachable lead contents of the wastes exceed the Toxicity Characteristic Leaching Procedure (TCLP) of 5 mg/liter, the wastes must be disposed of as RCRA hazardous waste.
4. The California Department of Public Health (CDPH) regulation 17 CCR Sections 35001 through 36100 requires all demolition, stabilization or scraping for repainting of paints defined as “lead-based paints” to be completed by Certified Lead Workers and Supervisors.
5. The lead sampling report looks to be sufficient to contract the lead abatement.
6. Based on the lead paint sample results, it is recommended that the lampposts and railings be abated of peeling lead paint. Removed paint chips shall be collected in containers and disposed separately. A painted encapsulating layer should be applied to stabilize the remaining lead painted areas. The encapsulating layer reduces dust generation from the paint during demo. Demolition could proceed after with substantial dust control measures and monitoring.
7. The steel components must be abated of lead paint in areas were hot-work or grinding will take place.

Call to discuss further if you would like.

Take care,

Kurt

ADDENDUM 10

PUBLIC WORKS & GANG REDUCTION

MOTION

The Sixth Street Viaduct Replacement Project (Project) is a $482 million dollar replacement of the old Sixth Street Viaduct (Viaduct), with a new iconic 3,500 linear foot viaduct over the Los Angeles River. In order to construct the new Project, the City acquired properties adjacent to and beneath the old Viaduct for the construction of a new structure in keeping with State and Federal Highway standards.

Upon the completion of the new Viaduct, the Department of Public Works will retain access underneath and adjacent to the Viaduct for inspection and maintenance of the Viaduct. The Department of Recreation and Parks (RAP) has also agreed to be the City agency designated with the operation and maintenance responsibilities, for park purposes, of the land acquired by the City for the Project. To effectuate this shared use, the Bureau of Engineering must be authorized and directed to complete a non-financial transfer of jurisdiction of those properties acquired for Project purposes to the ownership and control of RAP. Such actions to include the execution of all necessary documents to effectuate the transfer of the acquired properties.

I THEREFORE MOVE that the Bureau of Engineering, the Department of Recreation and Parks, and the Department of General Services be instructed, with the assistance and cooperation of the City Attorney and City Administrative Officer, to undertake all actions necessary to effectuate a non-financial transfer of jurisdiction of those properties acquired by Department of Public Works, Bureau of Engineering, for the Sixth Street Viaduct Replacement Project, including all appropriate survey data, creation of the correct legal description, preparation and review of related title documents, and acquiring other necessary approvals.

COUNCIL FILE NO. 14-1510-S11 SIXTH STREET VIADUCT REPLACEMENT PROJECT / NON-FINANCIAL TRANSFER

Dear Councilmember Lee and Honorable Members:

On May 31, 2019, the City Council authorized the Bureau of Engineering (BOE), the Department of Recreation and Parks, and the Department of General Services, with assistance and cooperation of the City Attorney and City Administrative Officer to undertake the necessary actions to effectuate a non-financial transfer of jurisdiction of those properties acquired by the BOE for the Sixth Street Viaduct Replacement Project. This report follows up on the previous report to delineate the areas of responsibility and to provide details of the actions that must occur in order to clearly assign the operations and maintenance responsibilities.

SUMMARY

The Sixth Street Viaduct Replacement Project is a $588 million bridge replacement project between the neighborhoods of Boyle Heights and the Arts District in Council District 14. The old viaduct, which was demolished beginning in 2016, was determined to have a condition called Alkali-Silica Reaction (ASR), leaving it extremely vulnerable to structural failure in a major earthquake. In order to rectify this, the City is constructing a new 3,500 linear foot viaduct in place of the old structure.

In accordance with Council File No. 14-1510-S11, the City Council authorized City departments to undertake the necessary actions to effectuate a non-financial transfer of jurisdiction of those properties acquired by the BOE for the Sixth Street Viaduct Replacement Project to allow the Department of Recreation and Parks to operate and maintain the open space below the viaduct.

It is noted that within the open space is the existing Sixth Street tunnel, which is located within the public right-of-way and provides access to the Los Angeles River (LA River). The City has ownership of the tunnel, with maintenance performed by StreetsLA. The tunnel is used by the US Army Corps of Engineers (USACE) and Los Angeles County Flood Control District (LACFCD) to maintain their flood control facilities. Prior to the new Viaduct construction, USACE and LACFCD were provided unrestricted vehicular access to the LA River. This will continue to be the case once the landscaping and open spaces are developed. While USACE and LACFCD have access through the tunnel, there was no previous record of an access easement. If required, an access easement will be prepared and recorded.

The recommendations below provide the necessary steps to effectuate the non-financial transfer of jurisdiction as directed by the previous City Council action, and implement actions necessary to allow for operations and maintenance of the open space property beneath the viaduct:

RECOMMENDATION

Therefore, the departments recommend that the City Council, subject to the approval of the Mayor:

1. REQUEST that the Department of Recreation and Parks be the designated entity to operate and maintain the public right-of-way areas depicted in Exhibit (A) as a landscaped and open space area.

2. REQUEST the City Attorney to prepare and present an ordinance that would transfer jurisdiction and control of the property depicted in Exhibit (A) from the Department of Public Works to the Department of Recreation and Parks.

3. REQUEST the Department of Recreation and Parks consider, approve, and accept the area in Exhibit (A) for use as public open space.

4. DESIGNATE the Board of Recreation & Parks Commissioners as the sole entity responsible for issuing any permits for use of the areas shown in Exhibit (A)

5. REQUEST the Department of Recreation and Parks to establish any necessary funds and/or accounts to receive any revenues generated from the operation of the land in Exhibit (A) and to expend funds related to operation, maintenance, landscaping and improvements of the land in Exhibit (A)

6. REQUEST that the Department of Recreation and Parks determine that funds or revenues generated from the use of the land in Exhibit (A) shall solely be used for the operations, maintenance, programming, and improvements of the land in Exhibit (A)

7. INSTRUCT the Department of Public Works to retain control and jurisdiction of the public right-of-way and serve as the designated City entity to inspect and maintain

the viaduct, in accordance with applicable maintenance agreements with the California Department of Transportation, along with all associated structures including, but not limited to tunnel and access ways, bicycle ramps, stairs, sanitary sewers, storm drains, and lighting as depicted in Exhibit (B). Storm drains that serve the park shall be maintained by the Department of Recreation and Parks as depicted in Exhibit (B).

8. AUTHORIZE the Department of Public Works, Office of Community Beautification, to issue Right-of-Entry permits to city graffiti contractors to remove graffiti and other items from the bridge and all associated structures, including, but not limited to, the bicycle ramps, stairs, and lighting as depicted in Exhibit (B).

9. INSTRUCT the Bureau of Engineering, in coordination with the Department of Recreation and Parks, to conduct all necessary surveys, execute all land dedications, and perform other actions as necessary to establish the legal description of all easements, maintenance boundaries, right of way maps or other documentation needed to effectuate this action.

Department staff hereby submits the attached report for consideration by the Council.

Sincerely,

MICHAEL A. SHULL
General Manager, Department of Recreation & Parks

BARBARA ROMERO
Director and General Manager, LA Sanitation & Environment

GARY LEE MOORE, PE, ENV SP
City Engineer

Exhibit (B): Sixth Street Viaduct - Department of Public Works Maintenance Map

PUBLIC WORKS COMMITTEE REPORT relative to a non-financial transfer of jurisdiction of properties for the Sixth Street Viaduct Replacement Project.

Recommendations for Council action, SUBJECT TO THE APPROVAL OF THE MAYOR:

1. REQUEST that the Department of Recreation and Parks (RAP) be the designated entity to operate and maintain the public right-of-way areas depicted in Exhibit A of the RAP, Bureau of Sanitation (BOS), and Bureau of Engineering (BOE) joint report dated March 16, 2022, attached to the Council file, as a landscaped and open space area.

2. REQUEST the City Attorney to prepare and present an ordinance that would transfer jurisdiction and control of the property depicted in Exhibit A of said report from the Department of Public Works (DPW) to the RAP.

3. REQUEST the RAP to consider, approve, and accept the area in Exhibit A of said report for use as public open space.

4. DESIGNATE the Board of Recreation and Parks Commissioners as the sole entity responsible for issuing any permits for use of the areas shown in Exhibit A of said report.

5. REQUEST the RAP to establish any necessary funds and/or accounts to receive any revenues generated from the operation of the land in Exhibit A or said report and to expend funds related to operation, maintenance, landscaping and improvements of the land in Exhibit A of said report.

6. REQUEST that the RAP determine that funds or revenues generated from the use of the land in Exhibit A of said report shall solely be used for the operations, maintenance, programming, and improvements of the land in Exhibit A of said report.

7. INSTRUCT the DPW to retain control and jurisdiction of the public right-of-way and serve as the designated City entity to inspect and maintain the viaduct, in accordance with applicable maintenance agreements with the California Department of Transportation, along with all associated structures including, but not limited to tunnel and access ways, bicycle ramps, stairs, sanitary sewers, storm drains, and lighting as depicted in Exhibit B of said report. Storm drains that serve the park shall be maintained by the RAP as depicted in Exhibit B of said report.

8. AUTHORIZE the DPW, Office of Community Beautification, to issue Right-of-Entry permits to City graffiti contractors to remove graffiti and other items from the bridge and all associated structures, including, but not limited to, the bicycle ramps, stairs, and lighting as depicted in Exhibit B of said report.

9. INSTRUCT the BOE, in coordination with the RAP, to conduct all necessary surveys, execute all land dedications, and perform other actions as necessary to establish the legal description of all easements, maintenance boundaries, right of way maps or other documentation needed to effectuate this action.

10. INSTRUCT the RAP to issue a master Right of Entry agreement to the BOS for maintenance of City storm drains and sewers.

Fiscal Impact Statement: None submitted by the RAP, BOS, nor BOE. Neither the City Administrative Officer nor the Chief Legislative Analyst has completed a financial analysis of this report.

Community Impact Statement: None submitted

SUMMARY

At the meeting held on April 13, 2022, your Public Works Committee considered a RAP, BOS, and BOE joint report relative to a non-financial transfer of jurisdiction of properties for the Sixth Street Viaduct Replacement Project.

After an opportunity for public comment, the Committee moved to approve the recommendations as amended in said report, as detailed above. This matter is now forwarded to the Council for its consideration.

Respectfully Submitted,

PUBLIC WORKS COMMITTEE

Executive Summary

Introduction and Background

This Draft Environmental Impact Report (EIR) evaluates the Sixth Street Park, Arts, River & Connectivity Improvements (PARC) Project (proposed Project) in the City of Los Angeles pursuant to the requirements of the California Environmental Quality Act (CEQA, Public Resources Code sections 21000 et. seq.) and the CEQA Guidelines. The City of Los Angeles (City), on behalf of the Department of Public Works, Bureau of Engineering (LABOE), is the Lead Agency under CEQA.

The proposed Project includes the creation of public recreational space on approximately 13 acres underneath and adjacent to the Sixth Street Viaduct (Viaduct), also known as the "Sixth Street Bridge." The Viaduct was recently demolished as part of the Sixth Street Viaduct Seismic Improvement (Replacement) Project, referred to in this EIR as the "Viaduct Replacement Project." Construction of the new Viaduct is anticipated to be substantially complete in 2022. As part of the Viaduct Replacement Project, the City acquired the land underneath and adjacent to the Sixth Street Viaduct. Rather than keep this land vacant, the City is proposing to transform this land into a public recreational space, while still providing required access for inspection and maintenance of the viaduct.

This Executive Summary provides an overview of the proposed Project and its environmental effects in accordance with Section 15123 of the CEQA Guidelines. As described in **Table ES-3**, at the end of this Executive Summary, all impacts would be reduced to less than significant impacts with adherence to standard regulatory and permit requirements or implementation of mitigation measures and identified project design features.

Project Location and Setting

The Project Area spans from Mateo Street in Downtown Los Angeles' (LA) Arts District, over the LA River, to United States Highway 101 (U.S. 101) in Boyle Heights between Fourth Street and Seventh Street. The Project Area is within a fully developed, mixed-use urban setting adjacent to the LA River. Land uses along the north and south sides of the Viaduct are predominately industrial and commercial. The Viaduct crosses over several railroad tracks on both sides of the LA River.

The majority of the Project Area is currently being used as a construction and staging site for the Viaduct Replacement Project. An existing pedestrian and maintenance tunnel, which is owned by the City, is located under the Viaduct on the west side of the LA River. This tunnel provides access to the LA River from Santa Fe Avenue. This segment of the LA River is contained within a concrete flood control channel.

Proposed Project Summary

The City is proposing to create approximately 13 acres of public recreational space underneath and adjacent to the Sixth Street Viaduct. The proposed Project would be divided into two phases. The following elements would be constructed as part of Phase I of the proposed Project. Elements that would be subject to available funding are identified with an asterisk (*).

- **General Park Elements:** Elements that would be constructed throughout the Sixth Street PARC would include constructing or installing typical park site furnishings, pedestrian and bicycle paths, interpretive exhibits, utility connections and irrigation, crosswalks, and stormwater infrastructure improvements.
- **East Park:** The proposed East Park, located in the Boyle Heights Community Plan area, would include amenities such as a concessions area, public restrooms, office and storage space for operations and maintenance staff, sports courts and fields, two flexible play and performance lawns,* adult fitness circuit,* splash pad with outdoor shower,* picnic and grilling areas,* on-street parking, landscaped seating areas and rain gardens, small and large dog play areas,* children's play area,* and skate park elements. A public art piece could also potentially be installed in East Park.
- **West Park:** The proposed West Park, located in the Central City North Community Plan area, would include amenities such as a flexible play and performance lawn, small and large dog play areas, an adult fitness circuit, a café building,* public restroom, landscaped areas and a rain garden, and a public art piece.
- **Arts Plaza and River Gateway:** The proposed Arts Plaza, located in the Central City North Community Plan area, would include amenities such as performance and public gathering areas and space for future mobility hub elements, bike parking, and bikeshare. The proposed River Gateway would include rehabilitating an existing pedestrian/vehicular tunnel that provides access to the LA River channel.

Phase II would include installing reinforced concrete planted terraces on the east and west banks of the LA River channel. The proposed Project generally includes components noted in the Los Angeles River Revitalization Master Plan (City of Los Angeles, 2007).

Project Objectives

The proposed Project has the following objectives:

- Serve the open space and recreational needs of surrounding communities;
- Connect and improve neighborhoods;
- Incorporate sustainable design consistent with the City's plans and goals;
- Encourage active modes of transportation and public transit;
- Promote beneficial stormwater treatment and/or capture; and
- Provide safe pedestrian and bicycle access to the LA River.

Project Schedule

Construction would be divided into two phases. Phase I, which includes construction of the West Park, Arts Plaza, and East Park elements, is anticipated to begin September 2022 and finish by 2024. Phase II, which would include the construction of the LA River portion, including reinforced concrete planted terraces, would be constructed independently of Phase I. The timing of Phase II construction, which may occur concurrently with or after Phase I construction, is dependent on available funding and approval by

the United States Army Corps of Engineers. For purposes of this environmental review, Phase I and II construction activities may overlap. Currently, Phase I is expected to run from 2022-2024, and Phase II is expected to begin in 2025 or later.

Construction would be coordinated with the Sixth Street Viaduct Replacement Project to the greatest extent feasible to ensure that Viaduct work would not be interrupted and to prevent potential conflicts. Construction of the Viaduct is expected to be completed by mid-2022.

Required Approvals

Table ES-1 lists the anticipated permits and approvals required for the proposed Project.

Table ES-1: Required Permits, Approvals, and Permission

Responsible Agency	Anticipated Permits, Approvals, and Related Issues
Federal	
United States Army Corps of Engineers	Clean Water Act (CWA) Section 404 Permit Section 14 of the Rivers and Harbors Act (Section 408) Permit, includes National Environmental Policy Act (NEPA) approval
Federal Railroad Administration	Any applicable permits
Federal Transit Administration	Any applicable permits
State	
Department of Toxic Substances Control	Any applicable permits
California Department of Fish & Wildlife	Section 1602 Streambed Alteration Agreement
California State Historic Preservation Office	National Historic Preservation Act Section 106 consultation and agreement document to resolve any potential adverse effects to historic resources
Regional	
Regional Water Quality Control Board	CWA Section 401 Water Quality Certification CWA Section 402 National Pollutant Discharge Elimination System (NPDES) Permit
Los Angeles County Metropolitan Transit Authority	Any applicable permits Coordination related to public transit, bikeways, and adjacent facilities
Los Angeles County Public Health Department	Review plans for children's splash pad
Los Angeles County Fire Department	Review and advise on site remediation plans
South Coast Air Quality Management District	Any applicable permits

Responsible Agency	Anticipated Permits, Approvals, and Related Issues
Local	
City of Los Angeles Department of Recreation and Parks	Responsible for operation and maintenance of portions of the park
City of Los Angeles Department of City Planning	Potential changes to land use designations or zoning, as well as street designations Any applicable permits
City of Los Angeles Department of Water and Power	Any applicable permits, coordination, and approval
City of Los Angeles Bureau of Sanitation	Low Impact Development Compliance, system design coordination, system design approval, and maintenance of a portion of stormwater infrastructure (if applicable)
City of Los Angeles Fire Department	Any applicable permits Coordination related to emergency access
City of Los Angeles Department of Transportation	Non-CEQA Transportation Assessment Guidelines Consistency Review Traffic management plans
City of Los Angeles Bureau of Street Lighting	Street lighting design and approval
City of Los Angeles Board of Public Works	Recommendations regarding Project approval and Environmental Impact Report (EIR) certification
Los Angeles City Council	Project approval and certification of EIR
City of Los Angeles Department of Building and Safety	Any applicable permits
City of Los Angeles Cultural Affairs Department	Any applicable permits and coordination related to public art
All railroad agencies owning and operating railroad tracks along both sides of the LA River	Railroad Maintenance Agreement for work within railroad right-of-way

Comments Received on the Notice of Preparation

In accordance with Section 15082 of the CEQA Guidelines, LABOE prepared a Notice of Preparation/Initial Study (NOP/IS) for the proposed Project on April 13, 2017. The NOP was circulated for 30 days. The comment period ended on May 15, 2017.

The NOP/IS was circulated to members of the public, local and state agencies, organizations, and interested parties to solicit comments on the proposed Project. The NOP/IS was available on the LABOE website and at local public facilities. A newspaper advertisement, informing the public of the availability of the NOP/IS, was printed in English in *DTLA News* and in Spanish in *La Opinión*. Comment letters were

received from agencies, tribes, interested organizations, and the public. In addition, scoping meetings were held on May 3, 2017 (English), and on May 11, 2017 (Spanish).

Public comments submitted during the scoping period expressed concerns regarding the following issues, which are discussed in more detail in the following section:

- Air Quality
- Cultural Resources
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise and Vibration
- Population and Housing
- Public Services
- Transportation and Traffic
- Utilities and Service Systems

The public comment letters are included in **Appendix A** (Notice of Preparation/Initial Study) of this EIR.

Issues Raised

Table ES-2, includes a summary of comments received and issues raised during the public scoping period in response to the NOP/IS. This table includes issues identified and discussed in comment letters and orally at public meetings and identifies the section of the Draft EIR where the issues are addressed, as applicable.

Issues to Be Resolved

Issues to be resolved by the City, include the following:

- Determine whether the EIR adequately describes the environmental impacts of the proposed Project;
- Determine whether the recommended mitigation measures should be adopted or modified;
- Determine whether additional mitigation measures need to be applied to the proposed Project; and
- Consider the information contained in the administrative record, created during the environmental review process, and determine whether to approve the proposed Project.

Summary of Environmental Impacts

Impacts Determined to Require No Further Consideration in This EIR

The Initial Study determined that the proposed Project would have no impact or less than significant impacts on mineral resources and agriculture and forestry resources. Therefore, these resources are not analyzed in this Draft EIR.

Impacts Determined to Be Less than Significant

The City determined that the proposed Project with implementation of best management practices or mitigation would have a less than significant impact on the following resources:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources and Tribal Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise and Vibration
- Population and Housing
- Public Services
- Recreation
- Transportation and Traffic
  Utilities and Service Systems

These impacts are evaluated in detail in Chapter 3 of this Draft EIR and are summarized in **Table ES-3** at the end of this Executive Summary.

Table ES-2: Summary of Comments Received during the Public Scoping Period

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
State Agencies					
Dianna Watson, IGR/CEQA Branch Chief	California Department of Transportation	May 10, 2017	Letter	Per Senate Bill 743, the agency expressed that Vehicle Miles Traveled (VMT) should be used as the primary metric for identifying transportation impacts. The agency requested that the development should consider multi-modal and complete streets transportation elements. The agency also provided a list of elements to include in the traffic study.	Transportation and Traffic
Juli Propes, Unit Chief	California Department of Toxic Substances Control	May 22, 2017	Letter	The agency provided direction regarding the discussion of hazardous wastes and substances and plans for managing hazards in the draft EIR, as well as procedures for handling environmental remediation and contaminated substances.	Hazards and Hazardous Materials
Gayle Totton, Associate Governmental Program Analyst	Native American Heritage Commission	April 18, 2017	Letter	The agency recommended that the City consult with all California Native American tribes affiliated with the Project Area.	Cultural Resources
Regional Agencies					
Lijin Sun, Program Supervisor	South Coast Air Quality Management District	May 5, 2017	Letter, Email	The agency provided information regarding analysis, mitigation measures, alternatives, permits, and data sources related to air quality impacts.	Air Quality

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
Local Agencies					
Ali Poosti, Division Manager	City of Los Angeles Bureau of Sanitation	May 1, 2017	Letter	The agency wanted to be notified of additional Project description details as they relate to sewer capacity availability. In addition, the agency communicated their role in ensuring implementation of the Municipal Stormwater Permit requirements, including post-construction mitigation requirements, Green Street elements, construction requirements, groundwater dewatering reuse options, and solid resource requirements.	Hydrology and Water Quality Utilities and Service Systems
Paul J. Davis, Environmental Supervisor	City of Los Angeles Department of Recreation and Parks	May 24, 2017	Email	The department expressed concerns regarding the exposure of sensitive receptors to pollution and noise. The department requested that through streets and pedestrian safety be discussed. The department also provided clarification on materials used for synthetic sports fields.	Air Quality Hazards and Hazardous Materials Transportation and Traffic
Edgar Mercado, P.E. Charles C. Holloway, Manager of Environmental Planning and Assessment	City of Los Angeles Department of Water and Power (LADWP)	May 12, 2017	Email	Water – The agency expressed that they will follow up with additional comments and provided water system contacts. Power – The agency listed the potential conflicts the Project may have on LADWP power system facilities within the Project Area.	Utilities and Service Systems
Armando D'Angelo	Los Angeles County Flood Control District	March 15, 2018	Email	The agency requested that LADWP Transmission Right of Way (TLRW) should be acknowledged	Utilities and Service Systems

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
	River Cooperation Committee			and that LADWP be included as a Responsible Agency.	
Therese W. McMillan, Chief Planning Officer	Los Angeles County Metropolitan Transportation Agency	May 22, 2017	Letter	The agency expressed the desire to ensure that the Project be designed to accommodate existing transportation facilities and the transportation investments that are currently under development. The agency would also like to explore opportunities for a Metro station in the Project vicinity that would serve the park and surrounding areas. In addition, the agency requested that the City consider potential impacts of the Project on existing rail facilities, with special attention to ROW impacts. The agency provided the Adjacent Construction Design Manual for guidelines on constructing a project near Metro facilities.	Transportation and Traffic
Native American Groups					
Andrew Salas, Chairman	Gabrieleño Band of Mission Indians-Kizh Nation	April 18, 2017	Letter	The tribe submitted a request for consultation pursuant to Assembly Bill 52.	Cultural Resources
Other Interested Parties/Public					
Wade Smith	Amtrak	May 15, 2017	Email	Concerns regarding public safety and security were expressed. The agency suggested that protective measures to minimize future fatalities of trespassers on rail tracks should be considered. The agency also expressed that existing and future rail activities may produce lights, noise, and diesel engine exhaust, and a sufficient buffer area should be considered.	Air Quality Land Use and Planning Public Services Noise and Vibration

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
Miguel Vargas, Executive Director	Arts District Los Angeles Business Improvement District	May 17, 2017	Email	The organization expressed a variety of concerns regarding future transit opportunities, existing utilities, bike and facility rental opportunities, facility maintenance and management, security, homelessness, incorporation of the LA River Revitalization Master Plan, and mechanical and electrical requirements for Project operations.	Land Use and Planning Population and Housing Transportation and Traffic Public Services Utilities and Service Systems
Joe Diaz	Boyle Heights Technology Youth Center	May 3, 2017	Oral Comment	The commenter expressed support for the proposed Project and suggested that community meetings should also be held in different locations throughout the Project Area to receive more community input.	N/A
Joanne Danganan	Central City Association	May 3, 2017	Oral Comment	The commenter expressed support for the proposed Project and the inclusion of a Metro Station to the LA Arts District to increase business and walkability in the area.	Transportation and Traffic
Jessica Lall, President and CEO	Central City Association of Los Angeles	May 22, 2017	Letter	The organization expressed a desire to integrate a potential Sixth Street Metro Station into the park design to address growth in the surrounding area and attract visitors to the park.	Transportation and Traffic
Marissa Christiansen, Executive Director	Friends of the LA River	May 18, 2017	Letter	The organization encouraged that the draft EIR discuss the Project's impact on the LA River, as well as evaluate the Project's potential effect on and consistency with the LA River Revitalization Master Plan. The agency also expressed a strong desire for the inclusion of terraced banks and a	Hydrology and Water Quality Land Use and Planning

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
				public access tunnel to the LA River to provide safe pedestrian and bicycle access.	
Margarita Amador	Hollenbeck Community – Police Advisory Board	May 3, 2017	Oral Comment	The commenter expressed concerns regarding pedestrian access, street lighting, public transit, park maintenance, safety and security, potential filming at the proposed Project Site, and irrigation.	Transportation and Traffic Public Services Hydrology and Water Quality
Raul Diaz	Homeboy Industries	May 3, 2017	Oral Comment	The commenter expressed concerns regarding the protection of soil and inspection prior to construction; traffic concerns surrounding the Project Area; pedestrian safety concerns; suggestions for an industrial building on Anderson Street, adjacent to the proposed Project Site; and suggestions for historic landmarks in the proposed Project Site.	Geology and Soils Transportation and Traffic Public Services Cultural Resources
Melissa Uribe	Innercity Struggle	May 3, 2017	Comment Card	The commenter expressed concerns regarding gentrification, population growth, and displacement, calling attention to the preservation of existing Rent Stabilization Ordinance, affordable housing, and small businesses on the east side of the LA River.	Population and Housing
Edwin Amorado	Keep LA Green	May 3, 2017	Oral Comment	The commenter expressed support for the proposed Project. The commenter also expressed interest in including a boxing gym at the proposed Project Site, parking reduction to increase walkability, and 24-hour lighting to deter crime in the area.	Transportation and Traffic Public Services

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
Mitra Khayyam	Public	April 19, 2017	Email	The commenter expressed support for the project and called attention to paving of the Seventh Street Bridge.	N/A
Chloe Ginnegar	Public	May 3, 2017	Comment Card	The commenter expressed concerns regarding housing development, gentrification, and rent prices on the east side of the LA River.	Population and Housing
Daría Nuñez	Public	May 3, 2017	Oral Comment	The commenter expressed support for the project; concern for pollution during construction of the project; and suggested that there should be more community meeting in different locations, project documents in Spanish, facilities for children and seniors, services in the evening for the youth, and an aquatic park.	Air Quality
Samuel Gonzales	Public	May 3, 2017	Oral Comment	The commenter expressed concern regarding health issues in the community due to air pollution, chemical contamination from the existing railroad tracks, and hazardous material disposal. The commenter also expressed interest in artistic and cultural representation in the proposed Project Site.	Air Quality Hazards and Hazardous Materials Cultural Resources
Lori Atwater	Public	May 21, 2017	Email, Oral Comment	The commenter expressed concerns regarding the effects of development and construction on homeless populations and advised that homeless populations are described as part of the existing populations. The commenter also advised that the project incorporate recommendations from	Population and Housing

Commenter	Agency/ Interested Party	Date of Correspondence	Type of Correspondence	Summary of Issues	Section of EIR Where Issue Is Addressed
				local and statewide legislation regarding homelessness.	
Russell Brown	Regional Connector Community Leadership Council	May 3, 2017	Oral Comment	The commenter expressed that there should be multiple transit stations included as part of the project on First, Second, and Sixth Street; as well as the inclusion of multimodal forms of transportation.	Transportation and Traffic
Ana Hernández	Resident Advisory Committee Pico Gardens	May 3, 2017	Oral Comment	The commenter expressed concerns regarding the increase of pollution in the community of Boyle Heights and resident displacement; suggested that project documents should be translated into Spanish; and requested that community meetings be held within the affected community, and that representative organizations such as Proyecto Pastoral and Union de Vecinos be invited to increase community participation.	Air Quality Population and Housing
Delmira Gonzalez	Resident Advisory Committee Pico Gardens	May 3, 2017	Oral Comment	The commenter expressed concerns regarding traffic in the Project Area, synthetic turf being used for the sports fields, and increases in noise and air pollution. The commenter also suggested that the proposed Project should include a skate park, an aquatic park, and an entertainment area for children.	Transportation and Traffic Noise and Vibration Air Quality
Ofelia Platon	Union de Vecinos	May 3, 2017	Oral Comment	The commenter expressed concerns regarding the increase of pollution in Boyle Heights from the construction and operation of the Viaduct, water contamination, and safety and security for the proposed Project. The commenter also	Air Quality Hydrology and Water Quality Public Services

				suggested that housing for homeless people should be constructed instead of a park.	Population and Housing
Madeline E. Roebke, Senior General Counsel	Union Pacific Railroad	May 15, 2017	Email	The stakeholder expressed concerns related to traffic, trespassing, noise and vibration, and storm water drainage.	Hydrology and Water Quality Land Use and Planning Noise and Vibration Transportation and Traffic

N/A = Not Applicable

Significant Unavoidable Impacts

With implementation of mitigation measures, the proposed Project would not result in significant unavoidable impacts.

Cumulative Impacts

With implementation of mitigation measures, the proposed Project's contribution to cumulative impacts would be less than significant.

Significant Irreversible Environmental Changes that Would Be Caused by the Proposed Project Should It Be Implemented

Implementation of the proposed Project would commit nonrenewable (e.g., petroleum) or slowly renewable (e.g., timber) resources during Project construction and operation. In order to construct the proposed Project, machinery, equipment, materials (e.g., lumber, sand, gravel) and workers would be required, representing an irreversible commitment of some of these resources. Similarly, during operation, some of these resources (e.g., energy, electricity) would again be needed, representing a long-term commitment and permanent investment. The consumption and use of some of these resources would limit their availability for future generations. In addition, construction of the proposed Project would also irreversibly change existing views to and from the Project Area. However, the proposed Project would serve the open space and recreational needs of the surrounding communities, connect and improve neighborhoods, incorporate sustainable design elements, encourage active modes of transportation and public transit, and promote beneficial stormwater treatment and/or capture. In addition, the proposed Project would provide safe pedestrian and bicycle access in the vicinity of the LA River, which could accommodate potential future connections to other planned pedestrian and bicycle paths. Therefore, the City determined that irreversible changes are acceptable in light of the proposed Project's overall benefits.

Growth-Inducing Impacts

One of the primary objectives of the proposed Project is to serve the open space and recreational needs of surrounding communities. By providing open space, connecting neighborhoods, providing access in the vicinity of the LA River, and promoting beneficial stormwater treatment and/or capture, active modes of transportation (i.e., walking and biking), and other sustainable design features, the proposed Project would be consistent with the City's plans and goals. Because the proposed Project would not provide residences or substantial employment opportunities, the proposed Project is not intended to facilitate population or employment growth. Rather, the proposed Project would address existing deficiencies by providing a park with recreational opportunities to communities that demonstrate high need for these facilities. Therefore, the proposed Project is not considered growth inducing.

Alternatives and the Environmentally Superior Alternative

Section 15126.6(a) of the CEQA Guidelines requires that an EIR "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic

objectives of the project but would avoid or substantially lessen any of the significant effects of the project." In addition, Section 15126.6(e) requires that an EIR evaluate a "no project" alternative. The City and its design team conducted meetings to develop design options for the proposed park (see Chapter 4 for additional information). The following two build alternatives were developed and evaluated in addition to the proposed Project and the No Project Alternative:

- Alternative 1 – Nature Focused Alternative
- Alternative 2 – Sports Focused Alternative

CEQA Guidelines require the identification of the environmentally superior alternatives. The No Project Alternative would be the environmentally preferred alternative. Section 15126.6(e)(2) of the CEQA Guidelines state, "If the environmentally superior alternative is the no project alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives." Based on the analysis in Chapter 4 of this EIR, Alternative 1 was determined to be the Environmentally Superior Alternative. This analysis focused on impacts identified as significant and unavoidable.

Summary of Impacts and Mitigation Measures

Table ES-3 includes a summary of impacts by environmental resource area, the significance determination before mitigation, proposed mitigation measures (if any), and any remaining impacts after mitigation is applied. Best management practices that would be adopted as part of the project are identified in **Table ES-4**.

Table ES-3: Summary of Environmental Impacts and Mitigation Measures

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Aesthetics			
I(a). Scenic Vistas There are no officially designated scenic vistas, resources, or highways that are within the Project Area or visible from the Project Area. The Downtown LA skyline is visible from the Project Area and could be considered a valued landscape. Construction equipment would introduce new vertical elements in the Project Area, but they would not obstruct views of the Downtown LA skyline. The proposed Project would introduce vertical elements (i.e., large vegetation, trees, a 30-foot tall public art piece, and general site and sports field lighting). These vertical elements would not obstruct the view of the Downtown LA Skyline. Therefore, the proposed Project would not affect scenic vistas.	Less than Significant	No mitigation measures are required.	Less than Significant
I(c). Scenic Quality The Project Area is in an urbanized area. Los Angeles zoning code and regulations would not prohibit any of the proposed construction activities or the operational land use. The proposed Project design would be consistent with the design guidelines established for the River Improvement Overlay district. Therefore, the proposed Project would not conflict with applicable zoning and other regulations governing scenic quality.	Less than Significant	No mitigation measures are required.	Less than Significant
I(d). Light and Glare Perimeter lighting may be required on the construction site for security purposes during nighttime. If nighttime	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
lighting at the construction site is required, lighting would be directed downward, on-site, and away from surrounding land uses. The proposed Project would comply with the provisions in the City's Municipal Code. Proposed Project operations would introduce new sources of light to the Project Area to increase public safety and visibility at night. The sports fields and performance areas would feature switchable and dimmable lights when the facilities are not in use; lighting for recreational activities would be limited to the proposed operating hours; and lighting would be directed away from surrounding land uses. Therefore, the proposed Project would not result in adverse impacts related to light, glare, or nighttime illumination.			
Air Quality			
III(a). Conflict with or obstruct implementation of the applicable air quality plan Short-term construction is projected to result in increased nitrogen oxide (NO_x) emissions that would exceed the South Coast Air Quality Management District's (SCAQMD) recommended significance threshold. Emissions generated during construction could potentially conflict with or obstruct air quality planning efforts. Operation of the proposed Project would not result in overall increases in emissions of ozone-precursor pollutants (volatile organic compounds [VOC] and NO_x) or particulate matter (PM) that would exceed SCAQMD's recommended significance thresholds When evaluated on an annual basis, considering the number of events	Potentially Significant (Construction) Less than Significant (Operation)	Implement **MM-AQ-1: Newer/Tier 4 Engines in Haul Trucks and Construction Equipment** • Include in all construction contracts the requirement to use 2007 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export). • Include in all construction contracts the requirement that all off-road diesel-fueled construction equipment greater than 50 horsepower shall meet Tier 4 off-road emission standards. In addition, if not already supplied with a factory-equipped diesel particulate filter, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices	Less than Significant (Construction and Operation)

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
anticipated to occur, the proposed Project would result in an overall emissions reduction when compared to the existing industrial uses that were removed.		certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. To the extent locally available, construction equipment shall incorporate emissions savings technology such as hybrid drives. In the event that any equipment required under this mitigation measure is not available, provide documentation as information becomes available. A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit at the time of mobilization of each applicable unit of equipment shall be provided. • Maintain construction equipment by conducting regular tune-ups according to the manufacturers' recommendations. • To the extent possible, the import and export of onsite materials shall be scheduled to minimize empty return trips. Implement **MM-AQ-2: Construction Equipment Requirements** • All on- and off-road diesel-fueled equipment shall not idle for more than 5 minutes when not in use. The idling of diesel-fueled equipment and haul trucks within 1,000 feet of nearby residential land uses shall be prohibited. Signs shall be posted in the designated queuing areas	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		and or job sites to remind drivers and operators of the 5-minute-idling limit. • Staging and queuing areas shall be located at the furthest distance possible from nearby residential land uses; • Use alternatively fueled (e.g., compressed natural gas, liquefied natural gas, propane), gasoline-fueled, or electrified construction equipment in place of diesel-fueled equipment to the extent locally available. The following additional measures are recommended to help ensure consistency with SCAQMD rules and regulations, including (but not limited to) Rule 403 for the control of fugitive dust. Implement **MM-AQ-3: Fugitive Dust Controls** • All active portions of the construction site shall be watered twice daily to prevent excessive amounts of dust. • Non-toxic soil stabilizers shall be applied to all inactive construction areas (previously graded areas inactive for 20 days or more, assuming no rain) according to manufacturers' specifications. • All excavating and grading operations shall be suspended when wind gusts (as instantaneous gust) exceed 25 miles per hour. • On-site off-road equipment and on-road vehicles used on-site shall be limited to 15 miles per hour.	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		• All on-site roads shall be paved as soon as feasible, watered twice daily, or chemically stabilized. • Visible dust beyond the property line which emanates from the project shall be prevented to the maximum extent feasible. • All material transported off-site shall be either sufficiently watered or securely covered to prevent excessive amounts of dust prior to departing the job site. • Track-out devices shall be used at all construction site access points. • All delivery truck tires shall be watered down and/or scraped down prior to departing the job site. • Streets shall be swept at the end of the day if visible soil material is carried onto adjacent paved public roads and use of SCAQMD Rule 1186 and 1186.1 certified street sweepers or roadway. • Replace ground cover in disturbed areas as quickly as possible. • All trucks that are to haul excavated or graded material on-site shall comply with State Vehicle Code Section 23114 (Spilling Loads on Highways), with special attention to Sections 23114(b)(F), (e)(4) as amended, regarding the prevention of such material spilling onto public streets and roads.	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		• Conduct continuous, direct-reading, near real-time ambient monitoring of PM10. Install appropriate signage and notify the SCAQMD in accordance with Rule 1466, Control of Particulate Emissions from Soils with Toxic Air Contaminants, prior to conducting any earth-moving activities on any site meeting the applicability of the rule.	
III(b). Cumulatively considerable net increase of criteria pollutants. Construction-generated emissions of NOx would exceed SCAQMD's significance threshold of 100 pounds per day. Construction of the proposed Project could result in a cumulatively considerable net increase of ozone-precursor pollutants for which the region is designated non-attainment, particularly if other projects in the general vicinity of the project site are under construction during the same construction period. Operational emissions associated with the proposed Project would not exceed SCAQMD's recommended significance thresholds.	Potentially Significant (Construction) Less than Significant (Operation)	Implement **MM-AQ-1** through **MM-AQ-3** described above.	Less than Significant (Construction and Operation)
III(c). Expose sensitive receptors to substantial pollutant concentrations. *Localized Pollutant Concentrations from Onsite Sources* Construction-generated and operational emissions would not exceed SCAQMD localized significance thresholds (LSTs). *Asbestos*	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
The Project Site is not located in an area of naturally occurring asbestos. In addition, construction and operation of the proposed Project would not involve the demolition of structures having asbestos containing materials. *Diesel-Exhaust Particulate Matter (DPM)* Proposed construction activities would involve the use of diesel-fueled equipment. Because the use of off-road heavy-duty diesel equipment would be temporary and episodic occurring over a relatively large area, and DPM has highly dispersive properties, project construction would not expose sensitive receptors to substantial emissions of DPM in excess of applicable thresholds. *Mobile-Source Carbon Monoxide* Operation of the proposed Project would not result in a degradation of LOS at primarily affected intersections that are projected to operate at unacceptable levels of service. Therefore, impacts related to the project's contribution to localized CO concentrations would be less than significant.			
III(d). Other emissions including those leading to odors Proposed construction activities would emit exhaust fumes, which may be considered objectionable by some people. In addition, pavement and architectural coatings would also emit temporary odors. Construction-generated emissions would occur intermittently and would dissipate rapidly within increasing distance from the source. As a result, short-term construction activities would not expose a substantial number of people to frequent odorous emissions.	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
No major sources of odors have been identified in the Project Area. In addition, operation of the proposed Project would not include the installation of any major sources of odors.			
Biological Resources			
IV(a). Candidate, Sensitive, or Special-Status Species *Special-Status Plants* Special-status plants species are not expected to be in the Project Area. *Special-Status Wildlife* Removal of habitat and increased noise, vibration, light, carbon dioxide, and human activity during proposed construction activities could impact special-status wildlife. BMPs would be implemented to reduce construction-related impacts. Increased lighting, noise, human activity, and regular maintenance of vegetated areas during operation of the proposed Project could result in minor impacts on special-status wildlife; however, because there is already a high level of human activity, lighting, and noise in the Project Area, the proposed Project would not be expected to deter wildlife from using existing habitat. Proposed natural and artificial substrates would potentially create additional nesting and roosting habitat for special-status birds and bats.	Less than Significant	No mitigation measures are required.	Less than Significant
IV(b). State or Federally Protected Wetlands The proposed Project would include changes to the LA River concrete lining and banks outside of the ordinary	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
high-water mark of the LA River. A Waste Discharge Requirements (WDR) from the RWQCB and California Fish and Game Code Section 1602 Streambed Alteration Agreement would be required for temporary activities and fill. In addition, BMPs would be implemented to avoid impacts. There are no wetlands in the Project Area; therefore, there would be no operational impacts on wetlands.			
Cultural Resources			
V(a). Historical Resources Four historical resources were identified within the Project Area: Fourth Street Viaduct, Seventh Street Viaduct, the Los Angeles River, and the Downtown Los Angeles Industrial Historic District. The historic associations, design elements, and character defining features that convey the significance of the four historical resources in the Project Area would not be affected by the activities associated with the construction or operation of the proposed Project.	Less than Significant	No mitigation measures are required.	Less than Significant
V(b). Archaeological Resources There are no unique archaeological resources that would be affected by the Project as presently proposed. The Project Site is characterized by a moderate potential for buried archaeological deposits. Proposed construction activities have the potential to disturb deeply buried and intact prehistoric and historic archaeological resources. Archaeological monitoring would be conducted in certain portions of the Project Site. In the unlikely event that previously undisturbed archaeological resources are	Less than Significant (Construction) No Impact (Operation)	No mitigation measures are required.	Less than Significant (Construction) No Impact (Operation)

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
encountered during construction, all work in the vicinity would be halted until a qualified archaeologist can visit the site of discovery and assess the significance of the resource. Operation of the proposed Project would not involve any ground-disturbing activities. Therefore, there would be no potential to disturb, damage, or degrade an archaeological resource or its setting.			
V(c). Human Remains No human remains are known to exist in the Project Site, and the location does not encompass any formal cemeteries. However, the Project Area is sensitive for prehistoric Native American remains. In the unlikely event of an accidental discovery of any human remains, the City would comply with the process outlined in Health and Safety Code § 7050.5, § 15064.5(e) of the CEQA Guidelines, and PRC § 5097.98. Operation of the proposed Project would not involve any ground-disturbing activities. Therefore, no operational impacts on human remains would occur.	Less than Significant (Construction) No Impact (Operation)	No mitigation measures are required.	Less than Significant (Construction) No Impact (Operation)
XVIII. Tribal Cultural Resources The Project Area is sensitive for prehistoric Native American remains. A Native American monitor would be present to observe ground-disturbing activities. A tribal cultural resources sensitivity training would also be held for the construction contractor prior to construction activities. The City will continue working with the tribe in accordance with the requirements of Assembly Bill 52.	Less than Significant (Construction) No Impact (Operation)	No mitigation measures are required.	Less than Significant (Construction) No Impact (Operation)

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Operation of the proposed Project would not involve ground disturbing activities; therefore, operation of the proposed Project would not disturb prehistoric Native American remains nor cause an adverse change in the significance of a site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American Tribe.			
Energy			
VI(a). Consumption of Energy Resources Proposed Project construction would require fuel consumption for haul trips, equipment use, and worker commute trips, which would represent a negligible increase in regional energy consumption. Best management practices related to air quality and greenhouse gas emissions would be implemented, which would contribute to reductions in energy consumption. Therefore, construction would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources. Operation of the proposed Project would result in an overall net reduction of long-term energy use when compared to the existing industrial land use. The proposed Project would conform with State and City Green Building Codes and would include design features that would reduce energy use, water use, and waste generation. Therefore, proposed Project operation would not result in a potentially significant environmental	Less than Significant	Implementation of air quality mitigation measures **MM-AQ-1** and **MM-AQ-2** would reduce impacts related to construction-related energy use. No further mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
impact due to wasteful, inefficient, or unnecessary consumption of energy resources.			
VI(b). State or Local Plans The proposed Project would include construction BMPs and operational design features that would improve energy efficiency. These energy-saving features would be consistent with the goals outlined in state and local energy plans. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	Less than Significant	Implementation of air quality mitigation measure **MM-AQ-1** would reduce impacts related to construction-related energy use. No further mitigation measures are required.	Less than Significant
Geology and Soils			
VII(b). Soil Erosion or Loss of Topsoil. Soil excavation would be required during construction of the proposed Project. Standard BMPs would be implemented to ensure that substantial erosion or the loss of topsoil would not occur. Construction activities would comply with applicable permits and the City's Municipal Code. During operation of the proposed Project, the topography would be relatively flat, and open spaces would be landscaped or hardscaped. Therefore, substantial soil erosion and loss of topsoil are not anticipated.	Less than Significant	No mitigation measures are required.	Less than Significant
VII(c). Expansive Soils. The Project Area is underlain with gravels, sands, and cobbles, which tend to have a low potential for expansive soils. The Project Area is also underlain with fill material, which could expand when saturated. However, the proposed Project would follow standard engineering	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
practices and recommendations identified in the *Geotechnical Site Investigation* (Hushmand Associates, Inc., 2018) to reduce the potential for hazards during construction and operation.			
VII(f). Paleontological Resources There are no significant paleontological resources that would be affected by the construction of the Project. If an unanticipated fossil discovery is made during Project construction, the City would comply with the Society of Vertebrate Paleontology (SVP) (2010) guidelines. Operation of the proposed Project would not involve any ground-disturbing activities. Therefore, there would be no potential to disturb, damage, or degrade a paleontological resource or its setting.	Less than Significant (Construction) Not Significant (Operation)	No mitigation measures are required.	Less than Significant (Construction) Not Significant (Operation)
Greenhouse Gas Emissions			
VIII(a). Generation of Greenhouse Gas Emissions Proposed construction activities would result in short-term annual GHG emissions. Proposed construction activities include various measures that would reduce short-term emissions from off-road equipment. The proposed Project would incorporate water-saving landscape irrigation features, energy-efficient lighting, and use of low-flow water fixtures per current California building code requirements. In comparison to business-as-usual conditions (without GHG-reduction measures) the proposed Project would result in GHG reductions.	Less than Significant	No mitigation measures are required.	Less than Significant
VIII(b). Conflict with Applicable Plan, Policy, or Regulation	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Construction of the proposed Project includes various measures that would reduce short-term GHG emissions from off-road equipment. Therefore, proposed construction activities would not conflict with any applicable plans, policies, or regulations pertaining to reducing GHG emissions. The proposed Project would result in an overall net reduction of long-term operational GHG emissions in comparison to the existing industrial uses that were removed. Therefore, operation of the proposed Project would not conflict with any applicable plans, policies, or regulations pertaining to reducing GHG emissions.			
Hazards and Hazardous Materials			
IX(a). Routine transport, use, or disposal of hazardous materials Project construction would require the removal of contaminated soils and the use of construction materials that could be hazardous, which would potentially create a significant hazard to the public or the environment. The transport, use, and disposal of these materials would be conducted in compliance with applicable federal, state, and local laws pertaining to the safe handling, transport, and disposal of hazardous materials. The proposed Project may require the use of hazardous materials during operation, such as paint, pesticides, and fertilizers. Hazardous materials would be properly handled, contained, transported, and disposed of in compliance with applicable laws and regulations.	Potentially Significant	Implement **MM-HAZ-1. Remediation Category 1A** The City shall be required to implement the following measures in areas where Resource Conservation and Recovery Act (RCRA) Level Heavy Metals, polychlorinated biphenyls (PCB), or total petroleum hydrocarbon diesel range organics (TPH DRO) will be excavated and disposed of at Class 1 Hazardous Waste Landfills: • Soils will be excavated as needed up to a maximum depth of 4.5 feet below ground surface (bgs), consistent with the limits designated on **Figures 3.8-3a** and **3.8-3b**, Areas of Concern with Contamination. • The transport and disposal of RCRA hazardous waste will be accompanied with a Hazardous Waste Manifest (i.e., documentation	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Therefore, operation of the project would not create a significant hazard to the public or the environment. There are potential health risks to construction workers and park users, primarily due to total petroleum hydrocarbons and lead in the soil. The Project Site would be remediated to standards acceptable by the Los Angeles County Fire Department (LACoFD) and other regulatory agencies as required. Under these standards, the concentrations of contaminants of concern would not pose health risks to construction workers or the public.		accompanying the transport, treatment, storage and disposal of hazardous waste) completed by a licensed transporter. A site-specific CalEPA Hazardous Waste Generator Identification Number will be obtained for each RCRA hazardous waste. Additional sampling and testing will likely be required by the facility accepting the soil for disposal. • For excavations deeper than 4 feet, shoring or other approved means will be required to maintain stability of the excavation walls. • During excavation activities, dust and runoff controls will be implemented to prevent windborne or surface waterborne migration of the soil from the Project Site. The soils will be directly loaded into the transport trucks, which will require tarps to prevent spillage or windblown loss of soil during transport. These controls will be verified and monitored by an independent third party. • A site-specific Health and Safety Plan (HASP) will be prepared and implemented during all proposed construction activities, including full time perimeter sampling and testing of particulates and dust from the Project Site. • All onsite workers and supervisors will complete a 40-hour Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response (HAZWOPER) training course and be equipped	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		with the appropriate personal protective equipment. • Excavated areas will be backfilled with certified clean soil. Implement **MM-HAZ-2. Remediation Category 2A** The City shall be required to implement the following measures in areas where soils contaminated with Heavy Metals and/or TPH DRO that are classified as non-RCRA hazardous waste will be excavated. These contaminated soils shall be disposed at Class 2 Landfills: • Soils will be excavated as needed up to a maximum depth of 6 feet bgs, consistent with the limits designated on **Figures 3.8-3a** and **3.8-3b**, Areas of Concern with Contamination. • The transport and disposal of non-RCRA hazardous waste will be accompanied with a Hazardous Waste Manifest completed by a licensed transporter. A CalEPA Non-RCRA Hazardous Waste Generator Identification Number will be obtained. Additional sampling and testing will likely be required by the facility accepting the soil for disposal. • For excavations deeper than four feet, shoring or other approved means shall be required to maintain stability of the excavation walls. • During excavation activities, dust and runoff controls will be implemented to prevent windborne or surface waterborne migration of	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		the soil from the Project Site. The soils will be directly loaded into the transport trucks, which will require tarps to prevent spillage or windblown loss of soil during transport. These controls will be verified and monitored by an independent third party. • A site-specific HASP will be prepared and implemented during all proposed construction activities, including full time perimeter sampling and testing of particulates and dust from the Project Site. • All onsite workers and supervisors will complete a 40-hour OSHA HAZWOPER training course and be equipped with the appropriate personal protective equipment. • Excavated areas will be backfilled with certified clean soil. Implement **Remediation Category 2B:** In addition to the measures above, the following measures shall be implemented in areas where VOCs were observed in soil gases: • Emission controls will be used to clear the area of emitting VOCs (i.e., spraying water or applying foam agents to all exposed soil surfaces and/or using large, spark-free fans). Full-time monitoring will be required to verify that the emission controls are effective in preventing the VOCs from impacting workers or the public. Monitoring will comply with SCAQMD Rule 1166.	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		• A detailed HASP will be prepared and implemented during the excavation and transport of contaminated soils. • The excavation, transport, and disposal of contaminated soils will require permitting and approval by the CUPA, CalEPA/DTSC, and SCAQMD. A detailed Work Plan/Remedial Action Plan will be prepared and submitted to these agencies for review and approval. Under Rule 1166, a Mitigation Management Plan for potential VOC emissions during excavation will be submitted to SCAQMD and subject to SCAQMD approval. A site-specific CalEPA Hazardous Waste Generator Identification Number will be obtained and manifests completed by the licensed transporter. • A soil vapor extraction (SVE) system will be designed and installed to remove and treat VOCs in the soil gases. If Health Risk Assessments indicate the need, a vertical barrier/line will be installed around the perimeter of the area to prevent soil gases with VOCs from migrating back into the area. Gases migrating from below the clean backfill or deeper depths will be extracted through the SVE slotted wells and treated by the SVE treatment system. Treatment for VOCs typically involves carbon filtration unless hydrogen sulfide is detected in the gas stream. Operating and maintenance procedures for the SVE system and permit applications will be	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		prepared and approved by the oversight agency and SCAQMD. • If the City determines it is necessary, a "Pilot Study" will be designed and implemented to evaluate the sustainable flow rate and concentration of VOCs in the soil gas stream and to determine the size of the final SVE system components. • Design of the SVE system, preparation of a Design Report and Work Plan/Remedial Action Plan (including HASP) will be submitted to and subject to approval by the CUPA and LACoFD Site Mitigation Unit. • The SVE will be implemented and monitored. This may require several months to over a year. • The City shall provide documentation to the CUPA, LACoFD Site Mitigation Unit, and SCAQMD when the SVE has reached the specified clean-up goals. • Excavated areas will be backfilled with certified clean soil. Implement **MM-HAZ-3. Remediation Category 3** The City shall be required to implement one of the following three options in areas where no heavy metals were observed, but VOCs were observed in soil gas: • Option 1: This alternative will involve the same measures as described under Category 2b above. Contaminated soils will be removed to a depth of	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		up to 15 feet or more and shoring of the excavation walls will be necessary. A liner will be installed on the bottom of the excavation area to prevent contaminated soil gas from re-entering the backfill soils. Gas migration from the side walls will be mitigated by either installation of a vertical liner placed on the side walls of the excavation or SVE wells installed vertically outside the limits of the excavation after backfilling is done. The backfill soil will be certified clean fill and placement will need to meet the geotechnical specifications of the proposed Project design. During the process, the site will require strict emissions controls and monitoring. • Option 2: This alternative, the SVE treatment method, utilizes extraction and monitoring wells (In Situ Method) or excavation and encapsulation of impacted soils in above ground piles with horizontal slotted piping (On Site Method), a vacuum pump or pumps, and carbon filtration units to extract and remove VOCs from the soil gas. The process requires several steps as follows: 1. Design and implementation of a "Pilot Study" to evaluate the sustainable flow rate and concentration of VOCs in the soil gas stream and to size the final SVE system components.	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		2. Design of the SVE system, preparation of a Design Report and Work Plan/Remedial Action Plan (including HASP) for submittal to and approval by the CUPA and CalEPA/DTSC. 3. Solicitation of bids for construction and implementation of the remediation. 4. Implementation and monitoring of the SVE. This may require several months to over a year. 5. Reporting to the agencies with documentation that the SVE has reached the specified clean up goals. • Option 3: This alternative will mitigate the impact of the VOCs and/or methane and hydrogen sulfide by precluding soil gases migration from the subsurface soil and intrusion into structures or other facilities and surface emissions. Depending on the type of soil gases and pressure in the soil gas, the systems can include several of the following components: o Shallow excavation (three to four feet below ground surface [bgs]) to allow installation of the mitigation components (some of the soil will be used to backfill trenches) o Gravel layers and slotted piping for gas collection o Liner installation above the slotted piping and extending side wide	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		○ Vacuum pumps for gas extraction or air injection blowers ○ Filtration systems to remove VOCs and/or hydrogen sulfide from the gas stream ○ Geomembrane barriers placed beneath concrete slabs and/or foundations or fill areas ○ Installation of automated and/or manual monitoring systems Implement **MM-HAZ-4. Remediation Category 4** The City shall be required to implement the following measure in areas within Caltrans ROW where soil contains ADL: • In accordance with the Caltrans/DTSC ADL Agreement, soils above a depth of approximately 2.9 feet bgs will require one foot of clean soil cover to remain on site per the Caltrans/DTSC ADL Agreement. Implement **MM-HAZ-5. Soil Gas Sampling** Additional soil gas sampling and testing is recommended for completion in PARC Areas 1A, 5, 6, 7, and 8. The additional sampling could potentially eliminate or reduce the need for soil gas remediation. Ambient air and soil gas samples shall be tested for VOCs. If soil gas samples in PARC Area 6 yield ILCR values below the *de minimis* risk target or within the risk management range, no further mitigation and/or remedial actions will be required. If ILCR values are above the *de minimis* risk target, additional remedial	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		actions will be taken to lower values to within the risk management range, such as applying SVE to a maximum depth of 15 to 20 feet bgs.	
IX(d). Located on a hazardous materials site There are no Hazardous Waste and Substances Sites in the Project Area that are included on the Cortese List (Government Code Section 65962.5). However, areas in the Project Site are underlain with contaminated soils, which would potentially create a significant hazard to the public or the environment. The Project Site would be remediated to standards acceptable by LACoFD and other regulatory agencies as required. Under these standards, the concentrations of contaminants of concern would not pose health risks to construction workers or the public.	Potentially Significant	Implement **MM-HAZ-1** through **MM-HAZ-5** described above. Implement **MM-HAZ-6. Methane Mitigation and Testing** Methane mitigation applies to PARC Area 1A, which is located within the Methane Zone, and portions of PARC Area 7, where soil gases were detected and impervious surfaces are to be constructed adjacent to existing buildings. Any buildings (except naturally vented) to be constructed in Area 1A shall have methane mitigation systems meeting Level II requirements involving membrane and passive venter per Table 71, unless additional testing indicates no subsurface gas pressure and lower methane concentrations. In addition, paved areas that are over 5,000 square feet in area and within 15 feet of the exterior wall of a commercial, industrial, institutional building, shall be vented in accordance with the Methane Mitigation Standards, design Level II, unless additional testing indicates no subsurface gas pressure and lower methane concentrations. Additional testing for methane concentrations and subsurface pressure shall be completed in accordance with the Division 71 Methane Seepage Regulations testing requirements should any buildings or paved areas over 5,000 square feet be proposed in PARC	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		Area 1A and in PARC Area 7 where methane was detected.	
Hydrology and Water Quality			
X(b). Groundwater supplies and groundwater recharge Groundwater is not anticipated to be encountered during excavation activities for the proposed Project. If groundwater is encountered, the contractor would develop a dewatering plan, and a Dewatering Permit with the Los Angeles RWQCB would also be required. The proposed Project would result in the net addition of 1.4 acres of impervious surfaces; however, the increase would not substantially deplete groundwater supplies or interfere with groundwater recharge such that the proposed Project may impede sustainable groundwater management of the basin.	Less than Significant	No mitigation measures are required.	Less than Significant
X(c)(i). Substantial erosion or siltation Grading, excavation, and trenching during construction would result in temporary changes to the drainage pattern of the Project Site. These construction activities would result in erosion and sediment transport, which could increase pollutants in stormwater runoff and receiving waters. To minimize erosion and siltation, the Project Site would be graded to divert water into existing drainages and catch basins. The proposed Project would comply with the provisions of the NPDES MS4 Permit and implement a stormwater pollution prevention plan (SWPPP), which would include BMPs to control erosion and siltation. The proposed Project would comply with all	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
applicable federal, state, and local requirements to reduce the potential for erosion and siltation onsite and offsite. Post-construction stormwater management measures would be installed to control pollutants and runoff generated during operation of the proposed Project. Runoff from the Project Site would be captured by proposed stormwater drainage systems, routed to low impact development (LID) BMPs, and discharged to the existing stormwater drainage facilities adjacent to the site. In addition, the Project Site would include hardscaped and landscaped areas to provide soil stability and further minimize erosion. With incorporation of these stormwater management measures, the proposed Project is not expected to result in substantial erosion or siltation onsite or offsite.			
X(c)(ii). Flooding on- or off-site The proposed Project would result in the net addition of 1.4 acres of impervious surfaces. Therefore, the rate and amount of surface runoff from the Project Site is expected to marginally increase. However, the Project Site would be graded to prevent flooding onsite or offsite. In addition, the proposed Project would implement the minimum construction BMPs included in the MS4 permit to further minimize the potential for flooding. If dewatering is required or if work is performed during the rainy season, the project would comply with comply with all applicable federal, state, and local requirements. Because the proposed Project would increase the impervious surface area of the Project Site, it could increase the potential for flooding onsite or offsite during	Less than Significant (Construction) Potentially Significant (Operation)	Implement **MM-HYDRO-1: Public Safety Plan** Prior to Final Plan approval, the City, in coordination with USACE, shall publish a Public Safety Plan in order to reduce the potential for safety impacts related to flooding. The Public Safety Plan shall include an evacuation plan and protocols for protecting pedestrians and potential homeless populations (e.g., vehicular deterrents such as bollards and safety warning devices) in the LA River Access Tunnel during flood conditions.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
operation. However, the proposed Project would include the installation of storm drainage systems to convey runoff to the existing systems. The existing main line systems had sufficient capacity to convey runoff from the Project Site when it was fully developed with nearly 100 percent impervious surface cover (prior to the construction of the Viaduct Replacement Project). Therefore, the potential for flooding onsite or offsite would be reduced.			
X(c)(iii). Create or contribute runoff water The proposed Project would result in the net addition of 1.4 acres of impervious surfaces. Therefore, runoff from the Project Site is expected to increase over the course of construction and during operation. However, the proposed Project would include the installation of storm drainage systems to convey runoff to the existing systems. The existing main line systems had sufficient capacity to convey runoff from the Project Site when it was fully developed with nearly 100 percent impervious surface cover (prior to the construction of the Viaduct Replacement Project). Therefore, the proposed Project would not contribute runoff water that would exceed the capacity of existing stormwater drainage systems or provide substantial additional sources of polluted runoff.	Less than Significant	No mitigation measures are required.	Less than Significant
X(c)(iv). Impede or redirect flood flows Though the majority of construction staging would be confined to areas outside of the LA River, construction activities for the proposed concrete terracing would occur within the 100-year flood hazard area. To minimize	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
impacts related to flooding, work within the LA River would be performed during the dry season and a water diversion plan would be developed if work is performed during the rainy season. The proposed Project would place structures that would impede or redirect flood flows within a 100-year flood hazard area. However, the proposed terracing is not anticipated to impact flooding within the LA River because of the reduced water surface elevation from the removal of the existing Sixth Street Viaduct as part of the Viaduct Replacement Project.			
X(e). Water quality control plan or sustainable groundwater management plan Proposed construction activities would comply with all applicable federal, state, and local requirements. Therefore, the proposed Project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	Less than significant	No mitigation measures are required.	Less than significant
WQ-3. G.1 Surface Water Hydrology Because proposed construction activities within the LA River would be performed during the dry season, impacts related to flooding during the projected 50-year developed storm event would be minimized. If work is performed during the rainy season (October through April), a water diversion plan would be developed to reduce the potential for flooding that would harm people or damage properties and sensitive biological resources. The proposed Project would result in a relatively small addition of impervious surfaces (1.4 acres), which would	Less than Significant (Construction) Potentially Significant (Operation)	Implement **MM-HYDRO-1: Public Safety Plan** Prior to Final Plan approval, the City, in coordination with USACE, shall publish a Public Safety Plan in order to reduce the potential for safety impacts related to flooding. The Public Safety Plan shall include an evacuation plan and protocols for protecting pedestrians and potential homeless populations (e.g., vehicular deterrents such as bollards and safety warning devices) in the LA River Access Tunnel during flood conditions.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
not substantially reduce or increase the amount of surface water in the LA River. The proposed Project could marginally increase flood levels during the 50-year design storm event. However, as discussed above, the proposed terracing is not anticipated to impact flooding within the LA River due to the removal of the existing Sixth Street Viaduct. The proposed Project would include safety measures to prevent the public from entering the LA River during a storm event. In addition, the City will develop a public safety plan to further minimize impacts related to flooding.			
WQ-7. G.4 Groundwater Quality The handling, storage, and disposal of contaminated soils would comply with all applicable federal, state, and local requirements. The Project Site would be remediated to standards acceptable by LACoFD and other regulatory agencies as required, thereby reducing the area affected by contaminants. Proposed construction activities would not worsen the existing contamination. In addition, proposed construction activities would comply with all applicable federal, state, and local requirements to reduce the potential for the release of contaminants into groundwater and to ensure that pollutants from construction would not substantially degrade water quality. The proposed Project would implement BMPs to prevent, control, and reduce stormwater pollutants. Therefore, the proposed Project would not contaminate sources of drinking water.	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
The proposed Project may require the use of hazardous materials during operation. The handling, storage, and disposal of hazardous materials would comply with all applicable federal, state, and local requirements to reduce the potential for the release of contaminants into groundwater. In addition, the proposed Project would implement LID BMPs to prevent, control, and reduce stormwater pollutants. Therefore, the proposed Project would not contaminate groundwater.			
Land Use and Planning			
XI(b). Conflict with applicable land use plan, policy, or regulation The proposed Project is consistent with the the land use plans, policies, and regulations in the area. Proposed construction activities would not result in zoning or land use changes, or a revision to any of the adopted plans or policies at the local and regional levels. All anticipated permits and approvals would be obtained prior to proposed construction activities and any necessary land use entitlements would be secured prior to the start of construction activities. Proposed construction activities would be conducted in compliance with the City's development requirements, State building standards, and all applicable construction and building permits. The proposed Project is considered a “Park or Playground (Open outdoor space), operated by government agency” land use, which would be permitted in the portions of the Project Area zoned M1, M2, M3, and OS, and would require approval from the City within areas zoned PF. In addition, the proposed Project would conform to the	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
development regulations for the River Improvement Overlay District. LABOE would continue to work with the Los Angeles Department of City Planning to ensure that the proposed Project is consistent with future zoning changes.			
Noise and Vibration			
XIII(a). Ambient noise levels Project construction would not result in a significant increase in daytime ambient noise levels at the nearest noise-sensitive land uses. In addition, proposed construction activities would not be anticipated to result in a substantial increase in traffic noise levels along area roadways that would adversely impact noise-sensitive land uses. However, noise levels from individual pieces of equipment could potentially exceed the allowable noise level stated in the Los Angeles Municipal Code (LAMC). Construction activities would be limited to between the hours outlined in the LAMC, but would be permissible outside of these hours upon approval by the engineer. Implementation of the proposed Project would not result in a significant increase in traffic noise levels under either existing or future cumulative conditions because of the removed industrial land uses. In addition, operational noise levels at the nearest residential land uses would not exceed the "normally acceptable" noise level of 65 dBA CNEL.	Potentially Significant (Construction) Less than Significant (Operation)	Implement **MM-NOISE-1: Construction-Noise Management Plan** A construction-noise management plan (CNMP) shall be prepared for the proposed Project. The CNMP shall, at a minimum, include the following measures: • Construction activities shall be restricted outside the hours of 7:00 a.m. to 9:00 p.m. Monday through Friday, and between the hours of 8:00 a.m. to 6:00 p.m. on Saturdays. While the intention is not to conduct work on Sundays, occasional Sunday work may be required to ensure the proposed Project schedule is met. If it is determined that Sunday work is necessary, the proper permits will need to be obtained through the Police Commission. Construction activities shall be prohibited on federal holidays. • Construction equipment shall be properly maintained and equipped with mufflers. • Equipment shall be turned off when not in use for an excess of five minutes, except for equipment that requires idling to maintain performance.	Less than Significant (Construction and Operation)

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		• A public liaison shall be appointed for project construction and shall be responsible for addressing public concerns about construction activities, including excessive noise. As needed, the liaison shall determine the cause of the concern (e.g., starting too early, bad muffler) and implement measures to address the concern. The liaison will work directly with the construction contractor to ensure implementation of the noise control plan. • The liaison will work directly with the construction contractor to ensure implementation of the noise control plan. • The public shall be notified in advance of the location and dates of construction hours and activities. • Where necessary, temporary sound barriers shall be installed. • Signage and notification on where to report construction-generated noise shall be posted on-site and around the construction area, as well as on the Bureau of Engineering website. • Staging and queuing areas shall be located at the furthest distance possible from nearby residential land uses, as well as any other noise-sensitive land uses identified in the Project Area at the time of construction (e.g., transient lodging, schools, libraries, churches, hospitals, and nursing homes).	

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
		• Limit noise/vibration intensive activities occurring within ten feet of existing structures and occupied land uses. Where possible and to the extent locally available, select low-noise/vibration generating equipment when activities occur within ten feet of adjacent existing structures.	
XIII(b). Excessive groundborne vibration or groundborne noise levels During proposed construction activities, on-road heavy-duty trucks would not generate substantial increases in groundborne vibration that would exceed commonly applied criteria for structural damage or annoyance. Proposed Project operations would not include the use of machinery or equipment that would contribute to excessive groundborne noise or vibration levels.	Less than Significant	No mitigation measures are required.	Less than Significant
Population and Housing			
XIV(a). Induce substantial population growth The proposed Project would not construct new homes or businesses in the Project Area or result in the extension of roads or other infrastructure to undeveloped areas. Construction activities would be temporary and would be limited to the construction site in a heavily developed industrial and commercial area. Operation of the proposed Project may include one or more office/community/concession building(s); however, there are limited business sites available within the Project Site. Because the areas in the vicinity of the Project Area are already highly developed, the proposed Project would not result in the extension of roads or	Less Than Significant	No mitigation measures are required.	Less Than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
infrastructure to undeveloped areas. Therefore, the proposed Project would not result in population growth in the Project Area.			
Public Services			
XV(a). Physical impacts associated with the new or physically altered governmental facilities: *Fire Protection* Construction site hazards could increase the risk of personal injury and fires. In addition, lane and road closures could affect fire protection services. However, proposed construction activities would comply with health and safety requirements and building and fire code standards. The nearest Los Angeles Fire Department (LAFD) responders would be notified to coordinate emergency response routing during construction. Emergency vehicles would continue to have the right-of-way, and emergency vehicle response would not be substantially affected. Construction of additional facilities is not expected to be required to maintain acceptable service ratios, response times, or other performance objectives for fire protection. The proposed Project would incorporate LAFD recommendations and comply with applicable standards and permits, including Fire Code requirements regarding fire department access, response distances, and fire-flow. Therefore, operation of the proposed Project is not expected to result in the need for the expansion of or construction of new fire protection facilities. *Police Protection*	Less than Significant (Construction) Potentially Significant (Operation)	There are no mitigation measures for Public Services. The mitigation measures identified in the Transportation section below address impacts associated with traffic concerns during operation of the proposed Project.	Less than Significant (Construction and Operation)

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Lane or road closures and the movement of construction equipment on local roads could affect police protection services during proposed construction activities. However, the nearest Los Angeles Police Department (LAPD) station would be notified to coordinate emergency response routing during construction. Law enforcement vehicles would continue to have the right-of-way, and police response would not be substantially affected. Construction of additional facilities is not expected to be required to maintain acceptable service ratios, response times, or other performance objectives for police protection. Operation of the proposed Project could increase the demand for LAPD services. Project plans were reviewed by the LAPD, and the proposed Project would be required to incorporate LAPD recommendations in the final design. Police protection services in the park would be covered by the existing park ranger system and LAPD, as mandated in the existing memorandum of understanding between LAPD and RAP. Large events would require approval from the LAPD, and any additional permits or requirements. The proposed Project is not expected to result in the need for the expansion of or construction of new police protection facilities. *Parks* Construction and operation of the proposed Project would not result in population growth or substantial employment growth that would increase the demand for existing parks or other recreational facilities in the Project Area. Rather, the proposed Project would provide			

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
additional recreation and park services that may alleviate the demand for other existing parks and recreational facilities in the surrounding communities.			
Recreation			
XVI(a). Physical deterioration of neighborhood and regional parks or other recreational facilities The proposed Project does not include the construction of housing and construction workers would commute to the job site on a daily basis. Therefore, temporary construction of the proposed Project would not result in population growth that would increase the number of visitors to existing parks or other recreational facilities. The proposed Project would not result in population growth or substantial employment growth that would increase the demand for existing parks or other recreational facilities in the Project Area. In addition, the proposed Project would provide additional recreation and park services that may alleviate the demand for other existing parks and recreational facilities in the vicinity of the Project Area. Therefore, the deterioration of existing facilities is not anticipated to occur or be accelerated.	Less than Significant	No mitigation measures are required.	Less than Significant
REC-2. Recreational facilities that might gave an adverse physical effect on the environment The Project Area is currently a construction site located in a highly developed urban environment. Therefore, the proposed Project would not result in the destruction of the natural environment or alteration of landforms that would have physical impacts on the environment. Rather, the proposed Project would improve the natural	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
environment by providing more open space and remediating hazardous soils to standards acceptable by LACoFD and other regulatory agencies as required.			
REC-3. Demand for recreation and park services anticipated at the time of project buildout The proposed Project would not result in population growth or substantial employment growth that would increase the demand for existing parks or other recreational facilities in the Project Area. In addition, the proposed Project would provide additional recreation and park services that may alleviate the demand for other existing parks and recreational facilities in the vicinity of the Project Area.	N/A (Construction) Less than Significant (Operation)	No mitigation measures are required.	N/A (Construction) Less than Significant (Operation)
Transportation/Traffic			
T-1. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities Construction-generated traffic would be dispersed over multiple roadways, present for the short-term, and scheduled with increased frequency during off-peak hours. Public transportation facilities would not be affected, and temporary detours would be provided for any affected pedestrian and bicycle facilities. Therefore, construction activities would not conflict with adopted policies, plans, or programs supporting alternative transportation. Operation of the proposed Project would provide facilities that would encourage active modes of transportation (i.e., bike/pedestrian ramps and stairs, bike racks, and space	Less than Significant	No mitigation measures are required.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
for future bike parking and bikeshare). In addition, the proposed Project would not exceed the capacity of the existing circulation system during a typical day. Site-specific traffic control plans would be developed during large special events.			
T-2.1. For a land use project, would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)(1)? Would the project cause substantial vehicle miles traveled?	Less than significant	No mitigation measures are required.	Less than significant
T-3. Substantially increase hazards due to a geometric design feature or incompatible use	Less than significant	No mitigation measures are required.	Less than significant
T-4. Conflict with an applicable congestion management program, including, but not limited to, level-of-service standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways Construction activities would generate up to approximately 80 trips per day, which may result in temporary impacts to the circulation system. The construction traffic impacts associated with the proposed Project would be limited to the construction period, and dispersed over multiple roadways, and distributed throughout the day. Access would be maintained through detour routes and no impacts would occur to bus services. On-street parking would be temporarily affected; however, other street parking in the surrounding area would continue to remain available. Therefore, proposed construction activities would not conflict with an applicable congestion management program.	Less than Significant (Construction) Potentially Significant (Operation)	Implement **MM-TRANS-1: Mobility Hub** The City shall reserve space for a mobility hub at the proposed Project Site, including additional amenities for bicyclists, drivers, and transit users, to encourage event attendees to use alternative modes of transportation. Implement **MM-TRANS-2: Bicycle Facilities** The City shall reserve space for a Bike Share hub at the proposed Project Site to allow Bike Share participants to dock bicycles and scooters. Implement **MM-TRANS-3: Rideshare Zones** The City shall create permanent rideshare pick-up and drop-off zones for the East Park and West Park. Rideshare pick-up/drop-off zones could be located on South Santa Fe Street adjacent to the proposed West Park and South Mission Road adjacent to the proposed East Park. The pick-up/drop-off zones shall	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
Operation of the proposed Project would result in less trips than the existing land use; therefore, operational activities would not exceed the capacity of the existing circulation system. Large special events, which would occur infrequently, would increase the number of trips generated, which could result in impacts on the existing circulation system. However, large event permittees would be required to develop site-specific traffic control plans. Proposed and existing parking spaces would not meet the anticipated parking demand during operation of the proposed Project. In addition, large events, which would occur infrequently, could result in impacts on parking.		be clearly marked, and wayfinding signage shall be installed throughout the proposed Project Site. Implement **MM-TRANS-4: Public Transportation** The City shall reserve space at the proposed Project Site to ensure access through the Arts Plaza or adjacent sidewalk to a future Sixth Street Metro Station.	
Utilities and Service Systems			
XIX(a). Significant environmental effects from construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities. The Project Area does not include sensitive biological resources or properties located within special flood hazard areas subject to inundation. The proposed construction site would not be accessible to the public. A water diversion plan or flood evacuation plan would be developed if construction activities are performed during the rainy season. Wastewater generated during proposed construction activities would be collected, screened, and discharged in accordance with the SWPPP and any remaining waste	Less than Significant (Construction) Potentially Significant (Operation)	Implement **MM-HYDRO-1** described under Hydrology and Water Quality above.	Less than Significant

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
would be disposed of in accordance with applicable water and solid waste disposal regulations. The proposed Project includes the construction of new stormwater drainage systems to capture and route runoff from the Project Site to LID BMPs. Proposed stormwater drainage systems and BMPs would comply with all applicable permits, design standards, and regulations to reduce significant impacts. The proposed Project would require construction of new utility connections, relocations and undergrounding of utilities, and other utility improvements. The City would coordinate with service providers to ensure that there are no disruptions in utility services. Though operation of the proposed Project would result in additional water consumption and wastewater generation, the construction of new water or wastewater treatment facilities or the expansion of existing facilities is not anticipated. The irrigation system would be designed to receive recycled water. LID and structural treatment BMPs would be installed to treat captured rainfall and runoff for pollutants of concern. A public safety plan would be developed to reduce the potential to harm people during operation of the proposed Project. Therefore, the proposed Project is not anticipated to cause flooding during the projected 50-year developed storm event that would have the potential to harm people or damage property or sensitive biological resources.			

Environmental Impact	Significance Before Mitigation	Mitigation Measures	Significance After Mitigation
XIX(b). Sufficient water supplies There are sufficient water supplies available to serve the water required for proposed construction activities and new or expanded entitlements would not be required. The proposed Project would implement design features to reduce the consumption of water resources. Operation of the proposed Project would require approximately 20.16 acre-feet of water per year, which is approximately .004 percent of existing LADWP water usage. In addition, the irrigation system for the proposed Project would accommodate recycled water. The proposed Project is not expected to require expanded entitlements.	Less than Significant	No mitigation measures are required.	Less than Significant

Table ES-4: Best Management Practices

Environmental Resource	Best Management Practices
Aesthetics	**BMP-AES-1: Construction Lighting** If nighttime lighting at the construction site is required, lighting shall be directed downward, on-site, and away from surrounding land uses. **BMP-AES-2: Construction Staging and Construction Staging Area** Construction staging shall be coordinated with the construction of the Viaduct Replacement Project; therefore, additional use or acquisition of public space for equipment and vehicles will not be required. The construction area shall be fenced to obscure views of construction activities, materials, and staged equipment. **BMP-AES-3: Operational Lighting** Outdoor lighting for recreational activities shall be limited to the proposed operating hours. **BMP-AES-4: Regulatory Requirements for Lighting** • Proposed Project illumination shall comply with the provisions in the City's Municipal Code, including LAMC Chapter 1, Article 2, Sec. 12.21A5(k); LAMC Chapter 1, Article 7, Sec. 17.08C; and LAMC Chapter 9, Article 3, Section 93.0117. • The new walkway lighting shall be compliant with all regulations set forth by the City's Bureau of Street Lighting Design Standards and Guidelines to ensure that the area receives lighting that meets national illumination standards for vehicular and pedestrian traffic, does not emit light pollution, and produces little glare. • Lighting for sports fields and courts shall operate in compliance with Los Angeles City Recreation and Parks (RAP) illuminance level standards for outdoor sports and recreational facilities. • Lighting for security shall be illuminated in accordance with the Illuminating Engineering Society (IES) standards, IES RP-33-14 *Lighting for Exterior Environments* and IES G-1-03 *Security Lighting for People, Property and Public Spaces*, as updated by IES G-1-16 *Guide for Security Lighting for People, Property and Critical Infrastructure*.

Air Quality	**BMP-AQ-1: SCAQMD Rules and Regulations** The contractor shall implement measures to ensure that all construction activities are consistent with SCAQMD rules and regulations. **BMP-AQ-2: Construction Worker Incentives** The City shall offer ride-share and transit incentives for construction workers to reduce emissions associated with motor vehicle use. **BMP-AQ-3: Construction Equipment Maintenance** The contractor shall maintain construction equipment by conducting regular tune-ups according to the manufacturers' recommendations.
Biological Resources	**BMP-BIO-1: Pre-Construction Wildlife Surveys** Pre-construction wildlife surveys shall be completed by a qualified biologist no more than 48 hours prior to clearing, grubbing, or other construction activities to determine the presence/absence of wildlife species, including special-status species, within 100 feet of the construction area. Special attention will be focused on any existing burrowing, roosting, and nesting habitat within the Project Area. Surveys shall be repeated if construction activities are suspended for five days or more. If any wildlife species are identified, appropriate BMPs shall be developed and implemented to reduce potential impacts on these species, in consultation with regulatory agencies where appropriate. **BMP-BIO-2: Trash and Construction Debris Removal** All trash and construction debris shall be removed from the LA River construction areas on a daily basis. All water quality BMP materials shall be properly maintained during project construction, and removed upon completion of construction activities. After completion of proposed construction activities, all construction equipment and materials shall be removed from the Project Area, and the Project Area shall be returned to pre-project conditions. **BMP-BIO-3: Work Area Limitations** No work for the proposed Project shall be conducted on the Fourth Street Bridge or Seventh Street Bridge structures. **BMP-BIO-4: Nesting Bird Survey** If vegetation trimming or clearing is conducted during the nesting season (typically February 15 through September 15), nesting bird surveys shall be completed by a qualified biologist within 300 feet of potential bird-nesting areas and 500 feet of potential

	raptor-nesting areas no more than 48 hours prior to trimming/removal activities to determine if nesting birds are within the affected vegetation. Surveys shall be repeated if trimming or removal activities are suspended for five days or more. **BMP-BIO-5: Nesting Bird Buffer** If nesting birds protected under the MBTA and California Fish and Game Code Sections are found in the Project Area, appropriate buffer consisting of orange flagging/fencing or similar (typically up to 300 feet for songbirds and 500 feet for raptors shall be installed and maintained until nesting activity has ended, as determined in coordination with the project biologist and regulatory agencies, as appropriate, to ensure that nesting birds and active nests are not harmed. **BMP-BIO-6: Hazardous Material BMPs** Appropriate hazardous material BMPs shall be implemented to reduce the potential for chemical spills or contaminant releases into the LA River, including any non-stormwater discharge. **BMP-BIO-7: Equipment Maintenance** All equipment refueling and maintenance shall be conducted in the staging area. In addition, vehicles and equipment shall be checked daily for fluid and fuel leaks, and drip pans shall be placed under all equipment that is parked and not in operation. **BMP-BIO-8: Regulatory Permits** The City shall consult with the appropriate responsible resource agency (e.g., CDFW and RWQCB) to determine permanent and temporary impact areas. Prior to undertaking ground-disturbing activities within or immediately adjacent to any aquatic resource areas, the City and/or their consultant shall obtain a CWA Section 401 Water Quality Certification, and California Fish and Game Code Section 1602 Streambed Alteration Agreement. **BMP-BIO-9: Pre-Construction Bat Surveys** At least 30 days prior to construction, alterations to the LA River Access Tunnel shall be surveyed by a qualified biologist to assess the presence of bats or potential bat-roosting cavities. If bats or bat-roosting cavities are identified, then during the non-breeding and active season (typically October), bats shall be safely evicted, to the extent feasible, under the direction of a qualified biologist. Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices shall be installed and maintained where appropriate to prevent bats from roosting in these cavities prior to construction. **BMP-BIO-10: Monitoring During LA River Access Tunnel Alteration** In the event that all bats are not able to be excluded from affected roosting habitat, a qualified biologist shall monitor LA River Access Tunnel alterations. If bats are disturbed, work shall be safely suspended until all bats leave the vicinity on their own, or alternative measures can be identified under the direction of a qualified biologist. Work shall resume only once the bats have left the site and/or approval to resume work is given by a qualified biologist.

	BMP-BIO-11: Bat Monitoring In the event that all bats are not able to be excluded from affected roosting habitat, a qualified biologist shall monitor structure alteration activities. If bats are disturbed, work shall be safely suspended until all bats leave the vicinity of the LA River Access Tunnel on their own, or alternative measures shall be identified under the direction of a qualified biologist. Work shall resume only once the bats have left the site and/or approval to resume work is given by a qualified biologist. Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in structures to be removed or altered. In the event that a maternal colony of bats is found, no work shall be conducted within 100 feet of the maternal roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by a qualified biologist. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No activities shall be authorized adjacent to the roosting site. Combustion equipment, such as generators, pumps, and vehicles, shall not be parked or operated under or adjacent to the roosting site. Construction personnel shall not be authorized to enter areas beneath the colony, especially during the evening exodus.
Cultural Resources	**BMP-CUL-1: Archaeological Monitoring During Excavation** A qualified archaeological monitor shall conduct archaeological monitoring in the West Park and East Park for excavations at depths greater than 5 feet. Monitoring efforts may be reduced or eliminated for those portions of the Project Area shown to have been recently disturbed by construction activities associated with the Sixth Street Viaduct Project. **BMP-CUL-2: Tribal Cultural Resources Sensitivity Training** The City shall invite a qualified tribal representative from the Gabrieleño Band of Mission Indians to a pre-construction meeting to provide a training session to the construction contractor regarding potential tribal resources that could be encountered during construction activities and procedures to follow should a tribal resource be encountered. **BMP-CUL-3: Tribal Cultural Resources Monitoring During Excavation** The City shall retain and compensate for the services of a Tribal monitor who is both approved by the Gabrieleño Band of Mission Indians-Kizh Nation Tribal Government and is listed under the NAHC's Tribal Contact list for the Project Area. The Tribal monitor shall only be present on-site during the construction phases that involve ground-disturbing activities in the proposed Arts Plaza. Monitoring efforts may further be reduced or eliminated for those portions of the in the proposed Arts Plaza that (1) are underlain with artificial fill of known origin, (2) require superficial scraping of land at depths less than five feet, or (3) are demonstrated to have been recently disturbed by construction activities associated with the Sixth Street Viaduct Project. The on-site monitoring shall cease when the grading and excavation activities in the proposed Arts Plaza are completed, or when the Tribal representatives and monitor have indicated that the site has a low potential for impacting tribal cultural resources. **BMP-CUL-4: Unanticipated Discovery of Archaeological and Tribal Cultural Resources** In the event that potentially significant buried archaeological materials are encountered within the Project Area, all work in the vicinity must stop until the archaeological and Tribal monitor can visit the site and assess the significance of the resource. If the

	resources are Native American in origin, the Gabrieleño Band of Mission Indians-Kizh Nation shall coordinate with the City regarding treatment and curation of these resources. Work may continue on other parts of the Project Area while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5 [f]). **BMP-CUL-5: Unanticipated Discovery of Human Remains** Health and Safety Code Section 7050.5, Section 15064.5(e) of the CEQA Guidelines, and PRC Section 5097.98 mandate the process to be followed in the unlikely event of an unanticipated discovery of human remains in a location other than a dedicated cemetery. The Los Angeles County Coroner must be notified within 24 hours of the discovery of potentially human remains. The Coroner must then determine within two working days of being notified if the remains are subject to his or her authority. If the Coroner recognizes the human remains (including bone fragments and funerary objects) to be Native American, he or she must contact the NAHC by phone within 24 hours. The NAHC then designates a Most Likely Descendant (MLD) with respect to the human remains within 48 hours of notification. The MLD will then have the opportunity to recommend to the Project proponent means for treating or disposing of, with appropriate dignity, the human remains and associated grave goods within 24 hours of notification.
Geology and Soils	**BMP-GEO-1: Erosion Control** The contractor shall implement standard BMPs, such as the use of fiber rolls and silt fencing, to reduce the amount of dust and dirt from leaving the construction area. **BMP-GEO-2: Geotechnical Site Investigation Recommendations** The Geotechnical Site Investigation report for the proposed Project includes recommendations to ensure that the Project Area is suitable for construction, and to ensure that appropriate measures are taken to reduce impacts during earthwork, excavation, utility trenching, backfilling, and other construction activities (Hushmand Associates, Inc., 2018). Backfill soils shall be moisture-conditioned and recompacted to meet ASTM International standards to counteract the potential adverse effects of soil expansiveness. If import soils are used, the import soil shall not exhibit an Expansion Index greater than 20 or contain more than 35 percent fines (i.e., fine-grained soils), and shall be screened by the geotechnical engineer to meet ASTM International standards. **BMP-PAL-1: Paleontological Sensitivity Training** Prior to the start of construction, all field personnel shall be briefed regarding the types of fossils that could be found and the procedures to follow should paleontological resources be encountered. Specifically, the training shall provide a description of the fossil resources that may be encountered, outline steps to follow when a fossil discovery is made, and provide contact information for a qualified paleontologist. The training shall be developed by a qualified paleontologist and provided as hand-outs or a PowerPoint Presentation that may be presented concurrently with other pre-construction training.

	BMP-PAL-2: Unanticipated Paleontological Resource Discoveries In the event that an unanticipated fossil discovery is made during construction, a qualified professional paleontologist shall be retained to examine the find and to determine whether further paleontological resource mitigation is warranted in accordance with SVP (2010) guidelines.
Greenhouse Gas Emissions	**BMP-GHG-1: Off-Road Equipment Construction Requirements** Idling shall be limited for vehicles and off-road equipment. Off-road equipment shall meet Tier 4 emission standards and newer. Efficient on-road haul trucks shall be used, where practicable.
Hazards and Hazardous Materials	**BMP-HAZ-1: Coordination with Regulatory Agencies** The City shall coordinate with Metro, U.S. EPA, and DTSC during construction activities to minimize health risks to the public or the environment associated with ongoing cleanup actions within the Project Area. **BMP-HAZ-2: Compliance with SCAQMD Rules and Regulations** The contractor shall implement measures to ensure that all construction activities are consistent with SCAQMD rules and regulations, including Rule 1166 - Volatile Organic Compound Emissions from Decontamination of Soil and Rule 1466 - Control of Particulate Emissions from Soils with Toxic Air Contaminants.
Hydrology and Water Quality	The following structure source control BMPs, based on the City's LID handbook, would be implemented during construction and/or operation of the proposed Project, as applicable: **BMP-HYDRO-1: Construction Drainage Design** The proposed Project shall incorporate drainage designs that direct stormwater runoff or irrigation runoff away from structures or the top of the slopes. No stormwater will be allowed to discharge over the top of a cut or fill slope. **BMP-HYDRO-2: Off-Site Sediment Transport** All entrances and exits to the construction site shall be stabilized to reduce transport of sediment off-site. Any sediment or other materials tracked off-site shall be removed within a reasonable time. **BMP-HYDRO-3: Storm Drain Message and Signage** Existing and proposed storm drain catch basins within the vicinity of the Project Site shall be marked and maintained. **BMP-HYDRO-4: Outdoor Material Storage Area Design** Proposed outdoor storage areas shall be organized and maintained to prevent stored materials from being permitted to runoff with stormwater. The outdoor storage of toxic and hazardous materials is not permitted. **BMP-HYDRO-5: Outdoor Trash Storage Area Design**

	Proposed outdoor trash storage enclosures shall be organized and maintained to prevent the transportation of trash and debris in stormwater. Bins and dumpsters shall remain covered. **BMP-HYDRO-6: Employee Training** Operations and maintenance employees shall be trained and made aware of the source controls, LID BMPs, educational materials, and maintenance requirements for the proposed Project at first hire and yearly thereafter. **BMP-HYDRO-7: Common Area Landscape Management** A landscape maintenance program shall be established in order to optimize water efficiency, limit pollutant introduction from fertilizers and pesticides, manage landscape waste, and prevent soil erosion. **BMP-HYDRO-8: Common Area Litter Control** A waste management program shall be implemented to inspect the Project Site for litter and pick up any litter as necessary on a regular basis. **BMP-HYDRO-9: Common Area Catch Basin Inspection** Catch basins shall be inspected and maintained, at a minimum, yearly and prior to the rainy season. **BMP-HYDRO-10: Street Sweeping Parking Lots** The angled parking spaces along Anderson Street shall be vacuum swept, at a minimum, yearly and prior to the rainy season. **BMP-HYDRO-11: BMP Maintenance** Proposed structural source controls, non-structural source controls, and LID BMPs shall be maintained as outlined in the Operations and Maintenance Plan that will be developed for the proposed Project. **BMP-HYDRO-12: Structural and LID BMPs** • Runoff from the Project Site and tributary Viaduct areas shall be captured by proposed stormwater drainage systems, routed to a variety of structural and LID BMPs and discharged to the existing stormwater drainage facilities adjacent to the site. In addition, the Project Site shall include a combination of paved surfaces and landscaped areas to provide soil stability and further minimize erosion. • The remaining localized rainfall falling on the portion of the Project Site outside of the Viaduct's footprint shall be treated through a combination of incidental infiltration during sheet flow along pervious land areas, incidental infiltration within localized vegetated basins, and below-grade capture and use systems below some of the proposed lawn areas in areas with a larger impervious area footprint. The incidental infiltration or capture and use of the stormwater will remove pollutants of concern. Larger storm events will be captured and conveyed through proposed local storm drainage systems to new connections to the existing storm drainage system. • Structural BMPs (i.e., proprietary vaults with media-filled cartridges) shall be installed to treat runoff for pollutants of concern identified in the City's LID Manual, including sediments, oil and grease, metals, organic materials, and nutrients.

	Runoff shall also be treated through lined vegetated biofiltration basins and below-grade capture and use systems, where the runoff will be filtered through the vegetation and soil media to remove pollutants of concern before discharging through a perforated underdrain. **BMP-HYDRO-13: Regulatory Requirements for Water Quality** • To comply with the provisions of the NPDES MS4 Permit, the proposed Project shall implement a SWPPP that includes construction site BMPs to control erosion and sedimentation. BMPs include silt fencing, fiber rolls, sandbag barriers, drainage inlet protections, and berms at the top of all grade slopes. The SWPPP shall also include post-construction stormwater management measures to control pollutants in stormwater discharges during operation of the proposed Project. • If groundwater is encountered, the contractor shall develop a dewatering plan, and a Dewatering Permit with the Los Angeles RWQCB will also be required. Should dewatering be required, the proposed Project shall comply with the General Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties. • Proposed construction activities shall comply with all applicable federal, state, and local requirements to reduce the potential for the release of hazardous waste and other contaminants into groundwater. In addition, construction activities will be subject to the provisions of the CWA and Porter-Cologne Act; and other federal, state, and local requirements to ensure that stormwater pollutants resulting from construction will not substantially degrade water quality. • A water diversion plan is not anticipated for the proposed Project because Phase II construction activities shall be performed during the dry season (April 15 through October 15). However, if work in a flowing stream is unavoidable, a water diversion plan shall be required, and the entire stream flow shall be diverted around the work area by a barrier, temporary culvert, new channel, or other means approved by the CDFW. Should water diversion be necessary, a 401/404 permit will also be required. • An emergency evacuation plan shall be prepared for Phase II construction within the LA River. If measurable rain with 25 percent or greater probability is predicted within 72 hours during project-related activities, all activities within the LA River shall cease and protective measures to prevent siltation/erosion shall be implemented/maintained. With the implementation of BMPs, alterations to drainage patterns during construction in the LA River channel will not result in substantial erosion or siltation onsite or offsite. • A Notice of Intent (NOI) for stormwater discharges associated with construction activities may also be required under the NPDES General Permit. • Stormwater BMPs shall follow the latest California Stormwater Quality Association's Stormwater Best Management Practices Handbook. All entrances and exits to a construction site will be stabilized to reduce transport of sediment off-site. Any sediment or other materials tracked off-site will be removed within a reasonable time.

	• Any non-stormwater discharge shall be controlled and properly disposed of through the sanitary sewer system or transported to an approved processing facility to prevent the contamination of site soils and groundwater. • The handling, storage, and disposal of contaminants shall comply with all applicable federal, state, and local requirements. The Project Site shall be remediated to standards acceptable to LACoFD and other regulatory agencies as required, thereby reducing the area affected by contaminants.
Land Use and Planning	**BMP-LAND-1: Coordination with Los Angeles Department of City Planning** The City BOE shall continue to work with the Los Angeles Department of City Planning to ensure that the proposed Project is consistent with future zoning changes. **BMP-LAND-2: Coordination with Viaduct Replacement Project** Any necessary land use entitlements shall be secured prior to the start of construction activities, and shall be coordinated with construction of the Viaduct Replacement Project. **BMP-LAND-3: Construction Area** Construction equipment, materials storage, and construction activities shall be contained within the limits of construction, and construction areas shall be fenced.
Noise	**BMP-NOISE-1: Construction Equipment Requirements** Construction equipment shall be properly maintained and equipped with mufflers.
Transportation/Traffic	**BMP-TRANS-1: Temporary Detour Routes** During proposed construction activities, temporary detours will be provided for any affected pedestrian and bicycle facilities. **BMP-TRANS-2: Construction Staging Plan** A construction staging plan shall be developed to reduce impacts related to noise, dust, traffic, and other health hazards. In addition, construction site BMPs (e.g., fencing, signs, and detours) shall be implemented to minimize hazards and prevent safety issues on the roadways and sidewalks surrounding the construction site. **BMP-TRANS-3: Construction Traffic** Construction-related trips shall be scheduled with increased frequency during off-peak hours to minimize impacts to commuters. **BMP-TRANS-4: Access to Parcels** If access to any existing parcels is removed during proposed construction activities, temporary access shall be provided, and/or new points of access shall be constructed.

	BMP-TRANS-5: Site-Specific Traffic Control and Transit Plan for Large Events Large event permittees shall develop a site-specific traffic control plan to provide information on parking and circulation and highlight transit options for event attendees to minimize congestion and vehicle miles traveled. Traffic control strategies for events will include inbound/outbound flex lanes and sheriff controlled intersections. Traffic control plans will also identify nearby public parking facilities and identify passenger pick-up/drop-off locations. Permittees will be required to consider the cumulative traffic impacts of their event in relation to other events in the Project Area. The traffic control plans will also identify emergency services egress and access.
Utilities and Service Systems	**BMP-USS-1. Wastewater Treatment** Any wastewater produced as a result of proposed construction activities, such as water containing diesel and oil, paint, solvents, cleaners, and other chemicals, as well as construction debris and dirt, shall be collected in settlement tanks and screened. The clean water shall be discharged, and the remaining sludge shall be disposed of in accordance with water and solid waste disposal regulations, including the CWA, the Porter-Cologne Water Quality Control Act, and the RCRA. **BMP-USS-2. Temporary Stormwater Drainage Measures** Temporary stormwater drainage measures to prevent polluted runoff in the construction site shall include, but not be limited to, the installation of earth dikes, drainage swales, and ditches, silt fences, desilting basins, and stormwater drain inlet protection. **BMP-USS-3. Coordination with Service Providers** The location of underground utilities shall be confirmed prior to proposed construction activities by contacting the Underground Service Alert of Southern California (DigAlert). If necessary, the City shall work in close coordination with utility providers to develop a relocation plan to minimize possible impacts and disruption to service utilities. **BPM-USS-4. Reduced Consumption of Water Resources** Design features to reduce the consumption of water resources shall be implemented, such as low-flow water fixtures and water efficient irrigation design and practices. In addition, drought-tolerant landscaping shall be planted to further reduce water consumption.

Chapter 1
Introduction

This Draft Environmental Impact Report (EIR) evaluates the Sixth Street Park, Arts, River & Connectivity Improvements (PARC) Project (proposed Project) in the City of Los Angeles pursuant to the requirements of the California Environmental Quality Act (CEQA, Public Resources Code sections 21000 et. seq.) and the CEQA Guidelines. The City of Los Angeles (City) Department of Public Works, Bureau of Engineering (LABOE) is the Lead Agency under CEQA.

This chapter presents the following background information for the proposed Project:

- The authority of the City to prepare this Draft EIR,
- The purpose of the environmental review process,
- The scope and content of the Draft EIR,
- Public outreach efforts during the CEQA process,
- Key principles guiding the preparation of this Draft EIR, and
- Related projects considered when analyzing the potential for cumulative environmental impacts.

1.1 Background and Project Overview

The proposed Project would be located in the City between Mateo Street and United States Highway 101 (U.S. 101), underneath and adjacent to the Sixth Street Viaduct (Viaduct). The Viaduct connects the Arts District on the west side of the Los Angeles River (LA River) with Boyle Heights on the east side of the LA River. The City is currently replacing the Viaduct, which is anticipated to be substantially completed in 2022 (Viaduct Replacement Project). The proposed Project would be located on approximately 13 acres owned by the City in Council District 14, at the boundary of the City of Los Angeles' Central City North and Boyle Heights Community Plan areas.

Features of the proposed Project include, but are not limited to, a café, concession area, public restrooms on each side of the LA River, performance and public gathering areas, flexible play areas and lawns, adult fitness equipment, dog play areas, landscaped areas, public art, sports fields and courts, children's play areas and splash pad, picnic and grilling areas, parking spaces, skate park elements, bicycle and pedestrian paths, stormwater infrastructure improvements, and rain gardens. In addition, the proposed Project could include the installation of reinforced concrete planted terraces on the west and east banks of the LA River. The proposed Project would generally include components noted in the *Los Angeles River Revitalization Master Plan* (City of Los Angeles, 2007). Chapter 2, Project Description, provides a more detailed description of the proposed Project.

1.2 Purpose and Intended Use of this EIR

The purpose of this Draft EIR is to inform decision-makers and the general public of the potential environmental impacts that could result from the proposed Project. Under the CEQA Guidelines, an EIR

is the most comprehensive form of environmental documentation. It provides the information needed to assess the environmental consequences of a proposed project, to the extent feasible. EIRs are intended to provide an objective, factually supported, full-disclosure analysis of the environmental consequences associated with a proposed project that has the potential to result in significant, adverse environmental impacts. An EIR is one of the various decision-making tools used by a lead agency to consider the merits and disadvantages of a project that is subject to its discretionary authority.

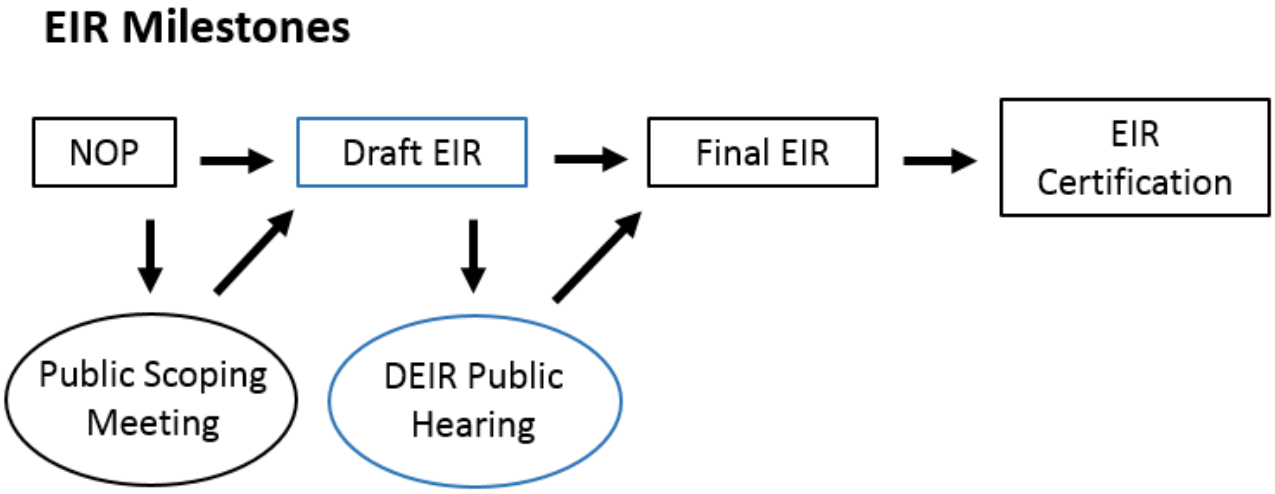
The City of Los Angeles is the CEQA lead agency for the proposed Project. The Draft EIR was prepared by and under the direction of the LABOE, which is responsible for recommending approval and implementing the proposed Project. The LABOE is responsible for obtaining the required environmental and planning permits and approvals as well as designing and constructing the proposed Project. In addition, the Los Angeles City Council must approve and certify the EIR.

CEQA requires the decision-making body to balance, as applicable, the economic, legal, social, technological, or other benefits of the project against the unavoidable environmental risks when determining whether to approve the project. If the benefits of a project outweigh the unavoidable significant environmental impacts of the project, the significant environmental impacts may be considered acceptable. A lead agency is required to prepare a Statement of Overriding Considerations (SOC) when the lead agency approves a project that would result in significant, unavoidable impacts. The SOC contains the specific reasons that support the agency's decision, based on the Final EIR and/or other information in the administrative record. The SOC must be supported by substantial evidence in the record, including findings. In addition, pursuant to Section 21081.6 of CEQA, when approving a project, public agencies must also adopt a mitigation monitoring plan or program for changes that were incorporated into the project or made a condition of project approval to mitigate or avoid significant environmental impacts.

As described in Sections 15121(a) and 15362 of the CEQA Guidelines, an EIR is an informational document that informs public agency decision-makers and the public of the significant environmental effects of a project, identifies possible ways to minimize the significant effects, and describes reasonable alternatives to the project. The purpose of this Draft EIR, therefore, is to focus the discussion on those potential effects of the proposed Project on the environment that the lead agency has determined may be significant. In addition, feasible mitigation measures are recommended, when applicable, to reduce or avoid significant environmental impacts.

As shown in **Figure 1-1**, EIR Process Overview, an EIR is prepared in three key stages. The CEQA process is initiated when the lead agency identifies a proposed project. The lead agency then normally prepares an Initial Study (IS) to identify the preliminary environmental impacts of a proposed project. If the IS determines that a project could have significant, unavoidable environmental impacts, the lead agency must prepare an EIR. A Notice of Preparation (NOP) is prepared to notify public agencies and the general public that the lead agency is initiating the preparation of an EIR. The NOP/IS are circulated for a 30-day review and comment period. During this review period, the lead agency requests comments from agencies, interested parties, stakeholders, and the general public on the scope and content of the environmental information to be included in the Draft EIR.

Figure 1-1: EIR Process Overview



After the close of the 30-day review and comment period, the lead agency continues the preparation of the Draft EIR and associated technical studies (if any). Once the Draft EIR is complete, a Notice of Availability (NOA) is prepared to inform agencies and the general public of the document and the locations where the document can be reviewed. The Draft EIR and NOA are circulated for a 45-day review and comment period, unless the State Clearinghouse approves a shorter period, to provide agencies and the general public an opportunity to review and comment on the adequacy of the analysis and the findings regarding potential environmental impacts of the proposed project. This Draft EIR is being circulated for 60 days.

After the close of the review and comment period, responses to all comments received on the Draft EIR are prepared. The lead agency also prepares a Final EIR, which incorporates the Draft EIR or a revision to the Draft EIR, Draft EIR comments and a list of commenters, and responses to comments. In addition, the lead agency must prepare the following items:

- Findings of fact for each significant effect identified;
- The SOC, if there are significant impacts that cannot be mitigated; and
- A mitigation monitoring and reporting program to ensure that all proposed mitigation measures are implemented.

The Board of Public Works will consider the Final EIR and make a recommendation to the Los Angeles City Council, as the governing body of the City of Los Angeles, regarding certification of the Final EIR and project approval. The City Council may certify and approve the Final EIR or may choose to not approve the project. Recommending bodies (LABOE) and the final decision-makers (City Council) would use the Final EIR to weigh the benefits of the project against its environmental impacts.

During the environmental review and project approval process, people and/or agencies may address the Board of Public Works and City Council regarding the proposed project. Public notification of agenda items for the Board of Public Works would be available online at the following website:

https://www.lacity.org/your-government/departments-commissions/boards-and-commissions/board-public-works-meetings

City Council agenda items are also posted 72 hours prior to a public meeting. The City Council agenda can be obtained by visiting the City Council at the following address:

City Hall
200 North Spring Street
John Ferraro Council Chamber, Room 340
Los Angeles, CA 90012

Agendas can also be accessed via the internet at the link provided above.

Within 5 days of project approval, the LABOE will file a Notice of Determination (NOD) with the County Clerk. The NOD will be posted by the County Clerk within 24 hours of receipt. This begins a 30-day statute of limitations on legal challenges to the CEQA approval by the lead agency. The ability to challenge the approval in court may be limited to those persons who objected to the approval of the proposed project and issues that were presented to the lead agency in writing during the public review and comment periods regarding the EIR.

1.3 Scope and Content of the Draft EIR

In accordance with the requirements of CEQA, the City prepared a NOP/IS, dated April 13, 2017, which identified topics requiring further analysis in the Draft EIR. The IS concluded that the proposed Project would result in less than significant or no impacts related to agriculture and forestry resources and mineral resources. In addition, no impacts related to wildfire are anticipated. Therefore, no further analysis of these resources would be required in the Draft EIR. The focus of this Draft EIR has been limited to the following environmental impact areas:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources and Tribal Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise and Vibration
- Population and Housing
- Public Services
- Recreation
- Transportation and Traffic
- Utilities and Service Systems

1.3.1 Notice of Preparation/Initial Study

As described above, the LABOE prepared a NOP/IS for the proposed Project, dated April 13, 2017, in accordance with Section 15082 of the CEQA Guidelines. The NOP was circulated for 30 days, with the public review period occurring from April 13, 2017, to May 22, 2017.

A notice, informing the public of the availability of the NOP/IS, was printed in English in *DTLA News* and in Spanish in *La Opinión*. The notice was also circulated to members of the public, local and state agencies,

organizations, and interested parties to solicit comments on the proposed Project. Concerns that were expressed in response to the NOP/IS include, but are not limited to:

- Handling hazardous waste and contaminated substances;
- Exposing sensitive receptors to pollutants, lights, noise, and vibration;
- Taking existing and potential transportation facilities into account;
- Considering public safety and security around railroad tracks and the LA River;
- Describing mechanical, electrical, sewer capacity, and stormwater drainage requirements;
- Consulting with Native American Tribes; and
- Discussing potential impacts related to right of way, traffic, population growth, displacement, and homeless populations.

These concerns were addressed during the preparation of this Draft EIR. For a full summary of comments received on the proposed Project, see **Table ES-2**. The NOP/IS and received comments are included in **Appendix A** of this Draft EIR.

The NOP/IS was available at the LABOE website, http://eng.lacity.org/sixthstreet_parks_arts, as well as at the following public facilities during the public review period:

- Central Library, 630 West Fifth Street, Los Angeles, CA 90071
- Little Tokyo Library, 203 South Los Angeles Street, Los Angeles, CA 90012
- Robert Louis Stevenson Library, 803 Spence Street, Los Angeles, CA 90023
- Benjamin Franklin Library, 2200 East First Street, Los Angeles, CA 90033
- BH Technology Center, 1600 East Fourth Street, Los Angeles, CA 90033
- Boyle Heights City Hall, 2130 East First Street Suite 241, Los Angeles, CA 90033

Comment letters regarding the NOP/IS were received from the public, as well as the following organizations, agencies, and interested parties:

- Amtrak
- Arts District Los Angeles Business Improvement District
- California Department of Toxic Substances Control (DTSC)
- California Department of Transportation (Caltrans)
- Central City Association of Los Angeles
- City of Los Angeles Department of Recreation and Parks (RAP)
- City of Los Angeles Department of Water and Power
- City of Los Angeles Sanitation
- Friends of the LA River

- Latham & Watkins LLP
- Los Angeles County Metropolitan Transportation Authority (Metro)
- Native American Heritage Commission
- Gabrieleño Band of Mission Indians-Kizh Nation
- South Coast Air Quality Management District (SCAQMD)
- Union Pacific Railroad (UPRR)

1.3.2 Public Outreach Efforts

Planning efforts to engage local communities and stakeholders in the proposed Project began in January 2017, and included the following:

- **Site tours**: Guided community site tours of the Project Area were conducted on January 7, 2017, with community leaders.
- **Small focus group meetings**: Small focus group meetings were held with community leaders and youth on January 10, 2017; January 12, 2017; and March 8, 2017, to discuss potential park features and uses.
- **Large community meetings**: Community meetings were held on February 7, 2017, at the PUENTE Learning Center, and on February 8, 2017, at the Southern California Institute of Architecture (Sci-Arc). The community meetings had a combined attendance of more than 300 people to discuss potential park features and uses, and the evolving park design process. A survey was distributed at the community meetings and made available on the LABOE website to allow the public to vote on their preferred park features. Over 1,000 survey responses were received. On March 28 and 30, 2017, additional community meetings were held at Sci-Arc and the PUENTE Learning Center, respectively, to present three conceptual approaches for the park, which incorporated public feedback from the surveys. Additional community meetings were held (in English and Spanish) on September 19, 2017, at the Aliso Pico Recreation Center, and on September 20, 2017, at Sci-Arc. At the meetings, attendees voted on the preferred conceptual design for the park.
- **Public Scoping Meetings**: A public scoping meeting was held on May 3, 2017, at the PUENTE Learning Center in Boyle Heights. The purpose of the meeting was to seek input from agencies, organizations, and the public on potentially affected resources, environmental issues to be considered, and the lead agency's planned approach to the analysis in the Draft EIR. A bilingual (English and Spanish) public scoping meeting was held on May 11, 2017, at the Aliso Pico Gymnasium in Los Angeles, in response to public feedback. The bilingual meeting discussed the same topics and provided the same resources as the May 3, 2017, meeting. During the public scoping meetings, the public expressed concerns regarding gentrification, rent prices, housing development, population growth, and the displacement of existing populations and the homeless. **Appendix A** includes comments that were received during the public scoping meetings. Per the requirements of CEQA, a public meeting will be held following completion of the Draft EIR.
- **Small group meetings**: Additional small group meetings, focus groups, and presentations to community stakeholders groups have also occurred.

- **Community survey**: At the community meetings, surveys were conducted to better understand the potential park user needs and obtain public input on desired park uses and amenities. Surveys were also available to public and other interested parties at http://www.sixthstreetviaduct.org/. Over 1,000 people responded and a summary of the results was posted at the website above.

The project design team will continue to engage the community throughout the design process. Updates on upcoming meetings can be found at http://www.sixthstreetviaduct.org.

1.4 Responsible and Trustee Agencies and Project Approvals

Under CEQA, a responsible agency is a public agency, other than the lead agency, that has responsibility to carry out or approve a project (Public Resources Code [PRC] Section 21069). A trustee agency is a state agency that has jurisdiction by law over natural resources that are held in trust for the people of the State of California (PRC Section 21070).

The following agencies and organizations may be required to provide project approvals and/or permits (see also **Table 2-2**, Responsible Agencies in Chapter 2, Project Description, of this Draft EIR):

- Amtrak
- Burlington Northern Santa Fe
- California Department of Fish & Wildlife
- California Department of Toxic Substances Control
- California State Historic Preservation Office
- City of Los Angeles Board of Public Works
- City of Los Angeles Bureau of Street Lighting
- City of Los Angeles City Council
- City of Los Angeles Department of Building and Safety
- City of Los Angeles Department of City Planning
- City of Los Angeles Department of Cultural Affairs
- City of Los Angeles Department of Recreation and Parks
- City of Los Angeles Department of Transportation
- City of Los Angeles Department of Water and Power
- City of Los Angeles Fire Department
- City of Los Angeles Sanitation
- Federal Railroad Administration
- Federal Transit Administration
- Los Angeles County Fire Department

- Los Angeles County Metropolitan Transportation Authority
- Los Angeles Regional Water Quality Control Board
- South Coast Air Quality Management District
- Southern California Regional Rail Authority
- United States Army Corps of Engineers
- Union Pacific Railroad

1.5 Organization of the Draft EIR

This Draft EIR conforms to the content requirements stated in Sections 15120 through 15132 of the CEQA Guidelines. A list of the document's chapters, including a brief description of their content, is provided here to assist the reader in locating information.

Executive Summary: The Executive Summary provides a brief description of the proposed Project, including a summary of the impact analysis and recommended mitigation measures.

Chapter 1. Introduction: This chapter provides general background information regarding project development. In addition, this chapter describes the purpose of CEQA and this Draft EIR, as well as the Draft EIR scoping process, the availability of documents, and the Draft EIR review process.

Chapter 2. Project Description: This chapter presents a statement of the proposed Project's objectives, a description of the location and setting of the proposed Project, a detailed description of the proposed Project's physical characteristics, and related information on phasing and implementation.

Chapter 3. Environmental Impact Analysis: This chapter analyzes the potential impacts that could occur as a result of construction or implementation of the proposed Project. The impact discussion is organized by issues that have the potential to result in significant impacts.

Chapter 4. Comparison of Alternatives: This chapter includes a discussion of the proposed alternatives and compares the impacts associated with each alternative.

Chapter 5. Other Environmental Considerations: This chapter evaluates impacts related to growth-inducing effects and cumulative growth. Impacts found not to be significant and unavoidable adverse impacts are also summarized.

Chapter 6. Preparers, Contributors, and Oversight: This chapter lists the persons who prepared this Draft EIR, as well as the persons who were consulted to obtain the information that was used in the preparation of this Draft EIR.

Chapter 7. References: This chapter lists the sources of information that were referenced for the analyses contained within this Draft EIR.

1.6 Related Projects

The proposed Project would be located underneath and adjacent to the Viaduct. The Viaduct connects the Arts District on the west side of the LA River with Boyle Heights on the east side of the LA River. The

City is currently replacing the Viaduct, which is anticipated to be substantially completed in 2022 (Viaduct Replacement Project).

Other federally funded projects in proximity to the proposed Project have components which include intersection improvements for bicycles and pedestrians, landscaping features, and bicycle lanes in the proposed Project Area. Three separate but related projects that are associated with the proposed Project include Active Transportation Program (ATP) projects that are federally funded but administered through the Los Angeles County Metropolitan Transportation Authority (Metro). ATP-1: Sixth Street Viaduct Replacement Project Bicycle and Pedestrian Facilities (currently in design), ATP-2: Boyle Heights Pedestrian Linkages (currently in design), and ATP-3: Downtown LA Arts District Pedestrian and Cyclist Safety Project (currently in design) include improvements to the safety and accessibility of bicycle and/or pedestrian facilities in the vicinity of the proposed Project. In addition, City of Los Angeles Sanitation is proposing a parking lot with approximately 30 to 40 spaces at the intersection of Jesse Street and Mission Road.

Other development projects within a half-mile buffer of the Project Area are included in **Table 1-1**(see **Figure 1-2**, Development Projects)**.**

1.7 Key Principles

1.7.1 Forecasting

In this Draft EIR, LABOE has made its best effort to predict and evaluate the reasonably foreseeable direct, indirect, and cumulative environmental impacts of the proposed Project and alternatives. CEQA does not require LABOE to engage in speculation about impacts that are not reasonably foreseeable (CEQA Guidelines Sections 15144, 15145). In these instances, CEQA does not require a worst-case analysis.

1.7.2 Reliance on Environmental Thresholds and Substantial Evidence

The identification of environmental impacts as significant or less than significant is an important function of an EIR. Impacts determined to be less than significant only need to be acknowledged as such; however, an EIR must identify mitigation measures for any impact identified as significant. In this Draft EIR, the LABOE based its conclusions about the significance of environmental impacts on identifiable thresholds, specifically those from the Appendix G of the CEQA Guidelines and has supported these conclusions with substantial scientific evidence. In addition, the document includes screening and significance criteria provided in the *L.A. CEQA Thresholds Guide* to assist in determining the significance of environmental impacts on the thresholds identified in Appendix G of the CEQA Guidelines (City of Los Angeles, 2006). The thresholds of significance analyzed in this Draft EIR reflect only those that were not previously eliminated in the IS (see **Appendix A** of this Draft EIR). Therefore, only the remaining thresholds from CEQA Appendix G and the *L.A. CEQA Thresholds Guide* that were not addressed in the IS are evaluated.

Table 1-1: Current and Future Development Projects

Location	Project Name	Address	Proposed/Developed Use
Recently Developed			
RD-1	Garey Building	905 East Second Street	5 story building with 320 residential units, commercial, and retail space
RD-2	Hauser & Wirth	901 East Third Street	Art gallery, bookstore, and restaurant
RD-3	Lee & Associates	330 South Alameda Street	Creative office space
RD-4	One Santa Fe	300 South Santa Fe Avenue	6 story building with residential units, commercial, retail, and restaurant space
RD-5	Fourth & Traction	963 East Fourth Street	Creative office and retail space with a parking structure
RD-6	A+D Architecture and Design Museum	900 East Fourth Street	Architecture and Design Museum
RD-7	Edward Hotel Apartments	713 East Fifth Street	47 Single Room Occupancy apartment units
RD-8	Arts District Park	501 South Hewitt Street	Park
RD-9	Barker Block Lofts	530 South Hewitt Street	Residential units
RD-10	La Kretz Innovation Campus	525 South Hewitt Street	Offices, conference rooms, labs, workshop, training center, and event space
RD-11	Institute of Contemporary Art	1717 East Seventh Street	Exhibition space, retail, and a café
RD-12	Amp Lofts	695 South Santa Fe Avenue	180 live/work units and retail space
RD-13	Ford Factory Building	777 South Santa Fe Avenue	Adaptive reuse of building into a creative office campus

RD-14	Art House Lofts	1200 South Santa Fe Avenue	Adaptive reuse of building into live/work units with retail space
RD-15	Metro Location 64 Maintenance of Way (MOW) Building	590 South Santa Fe Avenue	Facility to repair and maintain track vehicles to maintain the Red and Purple Line tracks and other systems
RD-16	Soho Warehouse	1000 South Santa Fe Avenue	Market, health club, and restaurant
RD-17	Rolling Greens	1005 South Mateo Street	Industrial space for nursery and retail store
Under Construction			
UC-1	Five Arts District Buildings	950 East Third Street	Multiple 5 and 6 story buildings with 471 residential units, commercial space, and amenities
UC-2	Metro Arts District Rail Yard	320 South Santa Fe Avenue	Upgrades to rail yard
UC-3	Restaurant	500 South Mateo Street	High-turnover restaurant
UC-4	At Mateo	555 Mateo Street	Retail, office, and parking space
UC-5	Sixth Street Viaduct	East Sixth Street	Replacement of 3,500-foot-long viaduct
UC-6	Hillcrest Mixed-Use	1745 East Seventh Street	57 apartment units and 6,000 square feet of retail space
UC-7	Mixed-Use Development (Carmel Partners)	520 South Mateo Street	600 live/work units, office space, retail space, and cultural space
UC-8	Office Mixed-Use Complex	640 South Santa Fe Avenue	Office, retail, and restaurant space
Proposed/Planned			
P-1	2nd and Vignes	929 East Second Street	Retail, event space, bar/lounge, offices, private health club, and private movie theater

P-2	Little Tokyo Galleria Redevelopment	333 South Alameda Street	Live/work units, commercial space, and parking
P-3	4th & Hewitt	401 South Hewitt Street	Residential-retail complex with office and retail space
P-4	Alameda and 4th Lofts	360 South Alameda Street	328 apartment units and office, retail, and restaurant space
P-5	Mixed-Use Development (4th & Hewitt)	940 East Fourth Street	93 live/work units and commercial space
P-6	Boutique Hotel/4th & Alameda	400 South Alameda Street	Hotel with retail space
P-7	Office Building	405 South Hewitt Street	11 story building with commercial space and new office space
P-8	Hollenbeck Park Lake Rehabilitation	415 South St Louis Street	Water quality improvements, polluted runoff diversion and treatment, flow diversion and recycled water replenishment, visual park improvements, and development of erosion control methods
P-9	Arts District Center	1101 East Fifth Street	129 live/work units, 113 hotel rooms, and retail space
P-10	Arts District Center (Mixed-Use)	1129 East Fifth Street	Retail, restaurant, hotel room units, apartment units, art school, and art gallery
P-11	ATP Cycle 2/Boyle Heights Pedestrian Linkages	Clarence Street and Anderson Street	Pedestrian infrastructure improvements, including new sidewalk, sidewalk repairs, and installation of pedestrian lighting, continental crosswalks, and curb ramps to improve connectivity
P-12	Mixed-Use/5th & Seaton	1100 East Fifth Street	Live/work units, and restaurant and retail space
P-13	Palmetto Colyton	527 Colyton Street	13 story building with 310 live-work units, retail use, and art production space
P-14	Office	540 South Santa Fe Avenue	Office space
P-15	Charter School	443 South Soto Street	Elementary school with student enrollment of 625

P-16	6th at Central	930 East Sixth Street	236 apartment units and retail space
P-17	ATP Cycle 3/Downton Los Angeles Arts District Pedestrian and Cyclist Safety Project	Area bounded by Second Street, Seventh Street, Alameda Street, and the LA River	Provide pedestrian and cyclist safety, access, and connectivity improvements, including cycle tracks/bike lanes/bike routes; new/widened sidewalks with curb extensions; high visibility and raised crosswalks; traffic controlled intersections; shade trees; pedestrian lighting; wayfinding signage; and alley conversion into a Shared Street connecting to the new Sixth Street Viaduct Arts Plaza
P-18	Roosevelt High School Comprehensive Modernization Project	544 S Mathews Street	Upgrading, renovating, modernizing, and reconfiguring the Roosevelt High School campus to include new classrooms, gymnasium, lunch shelter, and auditorium
P-19	6AM	1211 Wholesale Street	7 story building with residential units, hotel rooms, offices, retail, cultural, and school use
P-20	Density Bonus	733 Boyle Avenue	Up to 10 density bonus units
P-21	641	641 South Imperial Street	140 live/work units, retail, art production, and creative office space.
P-22	LA Sanitation Parking Lot	Intersection of Jesse Street and Mission Road	14,500 square-foot parking lot with approximately 30 to 40 parking spaces
P-23	Mission and Jesse Roundabout	Intersection of Jesse Street and Mission Road	Reconfiguration of the intersection of Mission Road, Jesse Street, and Myers Street
P-24	Mixed-Use Development (Camden USA)	1525 East Industrial Street	7 story building with 344 live/work units and commercial space
P-25	Active Transportation Program (ATP) Cycle 1/Bicycle and Pedestrian Facilities Connection	Along Mission Street and Myers Street between the Sixth Street Viaduct and Seventh Street	Active transportation elements consisting of sidewalk and bike lane improvements, concrete American with Disabilities Act (ADA) ramps at intersections, continental striping, and lighting.

P-26	AvalonBay Communities	668 South Alameda Street	475 live/work units and retail space
P-27	Mixed-Use/Industrial & Mateo	676 South Mateo Street	Live/work units and restaurant space
P-28	670 Mesquit	670 Mesquit Street	Office space, residential units, 2 hotels, and retail
P-29	Mixed-Use/7th & Mesquit	2051 East Seventh Street	320 apartment units and restaurant and retail space
P-30	Elm Tree Investments	1800 East Seventh Street	7 story complex with 125 live/work units, retail space, artist production space, green space, and parking
P-31	Mixed-Use/7th Street	2030 East Seventh Street	Office and retail space
P-32	Boutique Hotel/7th & Santa Fe	710 South Santa Fe Avenue	Remodel a vacant fire house into a 10 room hotel with restaurant and retail space
P-33	Mixed-Use/Violet & Mateo	826 South Mateo Street	90 live/work units and retail and restaurant space
P-34	Mixed-Use Development (Violet St)	2143 East Violet Street	13 story building with 509 live/work units and commercial space (Omni Group)
P-35	The Fig Project	2130 East Violet Avenue	Office, retail and restaurant space
P-36	Mixed-Use Development (Tishman Speyer)	2159 East Bay Street	8 story building with offices, retail, and parking spaces
P-37	Mixed-Use Campus	2110 Bay Street	99 apartment units including 11 affordable housing units, and office and retail space
P-38	Mixed-Use/Bay & Mateo	1024 Mateo Street	Apartment units, office, restaurant, retail, and light industrial space
P-39	Los Angeles River Bike Path Gap Closure Project	Along LA River from Elysian valley through Downtown Los Angeles to the City of Vernon	Planned extension of existing segments of the 32-mile greenway proposed in the Los Angeles River Revitalization Master Plan

P-40	Los Angeles (Union Station) to Anaheim (Anaheim Regional Transportation Intermodal Center [ARTIC]) Project Section of the California High-Speed Rail (HSR) System	Located at the ARTIC near Angels Stadium and the Honda Center.	HSR system from the city of Los Angeles to Anaheim

1.7.3 Disagreement among Experts

During the public review of this Draft EIR, evidence that might raise disagreements may be presented. Such disagreements will be noted and will be considered by the decision-makers during the public hearing process. In accordance with the provisions of the CEQA Guidelines, known controversies concerning the environmental impacts of the proposed Project have been identified in the Draft EIR. The Draft EIR has included sufficient information to allow the public and decision-makers to make an informed judgment about the environmental consequences of the proposed Project.

1.8 Review of the Draft EIR

This Draft EIR will be circulated for review and comments from the public and other interested parties, agencies, and organizations for 60 days. Due to the global pandemic, a virtual public meeting in English and Spanish will be held on **July 14, 2021 at 6:30 PM** on Zoom. In-person accommodation, at a location in or near Boyle Heights, will also be made available for anyone requiring access to a screen or internet connection. Details about the in-person location will be available closer to the meeting date. A notice regarding the public review period and how to access the public meeting will be posted on the BOE project website: https://eng.lacity.org/about-us/divisions/environmental-management/projects/sixth-street-park-arts-river-connectivity-improvements-parc, and published in the *DTLA News* in English and *La Opinion* in Spanish. Project stakeholders will also receive mail and email notification.

During the public comment period, all comments or questions about the Draft EIR should be addressed to:

Dr. Jan Green Rebstock, Environmental Supervisor II
Department of Public Works
Bureau of Engineering, Environmental Management Group
1149 South Broadway, Suite 600, Mail Stop 939
Los Angeles, CA 90015
Email: Jan.Green.Rebstock@lacity.org

Following public review of the Draft EIR, a Final EIR will be prepared in response to comments received during the public review period. The LABOE does not have an obligation to respond to comment letters received after the close of the public comment period (Public Resources Code Section 21091(d)(1) and Public Resources Code Section 21092.5(c)). The Board of Public Works will consider the proposed Project and make recommendations to the Los Angeles City Council, the governing body of the City of Los Angeles, regarding certification of the Final EIR and project approval. The City Council may certify and approve the Final EIR or may choose not to approve the proposed Project.

The Final EIR will be available for public review at least 10 days prior to its certification (State CEQA Guidelines Section 15088(b)). All responses to comments submitted on the EIR by public agencies will be provided to those agencies at least 10 days prior to final action on the project. The City Council will make findings regarding the extent and nature of the impacts, as depicted in the Final EIR.

During the environmental review and project approval process, people and/or agencies may address the Board of Public Works and City Council regarding the proposed Project. Public notification of agenda items for the Board of Public Works would be available online at the following website:

https://www.lacity.org/your-government/departments-commissions/boards-and-commissions/board-public-works-meetings

City Council agenda items are also posted 72 hours prior to a public meeting. The City Council agenda can be obtained by visiting the City Council at the following address:

City Hall
200 North Spring Street
John Ferraro Council Chamber, Room 340
Los Angeles, CA 90012

Agendas can also be accessed via the internet at the link provided above.

Within 5 days of project approval, the LABOE will file a NOD with the State Clearinghouse and County Clerk. The NOD will be posted by the County Clerk within 24 hours of receipt. This begins the 30-day statute of limitations on legal challenges to CEQA approval by the lead agency. The ability to challenge the approval in court may be limited to those persons who objected to approval of the proposed Project and issues that were presented to the lead agency in writing during the public review and comment periods for the EIR.

Chapter 2
Project Description

2.1 Introduction

The Sixth Street Viaduct Division of the City of Los Angeles (City) Department of Public Works, Bureau of Engineering (BOE), is proposing the construction of the Sixth Street Park, Arts, River & Connectivity Improvements (PARC) Project (proposed Project). The Sixth Street PARC Project includes the creation of public recreational space on approximately 13 acres, in areas underneath and adjacent to the upcoming Sixth Street Viaduct (Viaduct) in the City of Los Angeles (Project Site). The City is the Lead Agency for the proposed Project under the California Environmental Quality Act (CEQA).

2.2 Project Location and Environmental Setting

The proposed Project would be located under and adjacent to the Sixth Street Viaduct between Mateo Street to the west and the United States Highway 101 (U.S. 101) to the east, in the City of Los Angeles (Project Area) (see **Figure 2-1**, Regional Location and **Figure 2-2**, Project Area). The Project Area, which includes the potential area of direct and indirect impacts resulting from the proposed Project, spans from the Downtown Los Angeles Arts District on the west side of the Los Angeles River ("River" or "LA River") to the neighborhood of Boyle Heights on the east side of the LA River.

The Sixth Street Viaduct was a vital connection between Downtown Los Angeles and Boyle Heights. The majority of the Project Area is currently a construction site for the Sixth Street Viaduct Replacement Project ("Viaduct Replacement Project"), which began in 2016. As such, the Project Area primarily consists of fencing around an area of exposed soil with staged construction equipment and materials.

The Project Area is located in Council District 14 at the boundary of the City of Los Angeles' Central City North and Boyle Heights Community Plan areas. Land uses along the north and south sides of the Viaduct are predominately industrial and commercial. The nearest residence borders the northeastern edge of the Project Area at the intersection of South Clarence Street and Inez Street, and the eastern edge of the Project Area at the intersection of Boyle Avenue and Whittier Boulevard.

Railroad corridors are adjacent to the east and west banks of the LA River within the Project Area. The Los Angeles County Metropolitan Transportation Authority (Metro), Southern California Regional Rail Authority (SCRRA), Burlington Northern Santa Fe (BNSF), Amtrak, and Union Pacific Railroad (UPRR) own and/or operate railroad corridors within the Project Area. The Los Angeles Department of Water and Power's (LADWP) Transmission Right of Way (TLRW) is also located along the east and west banks of the River.

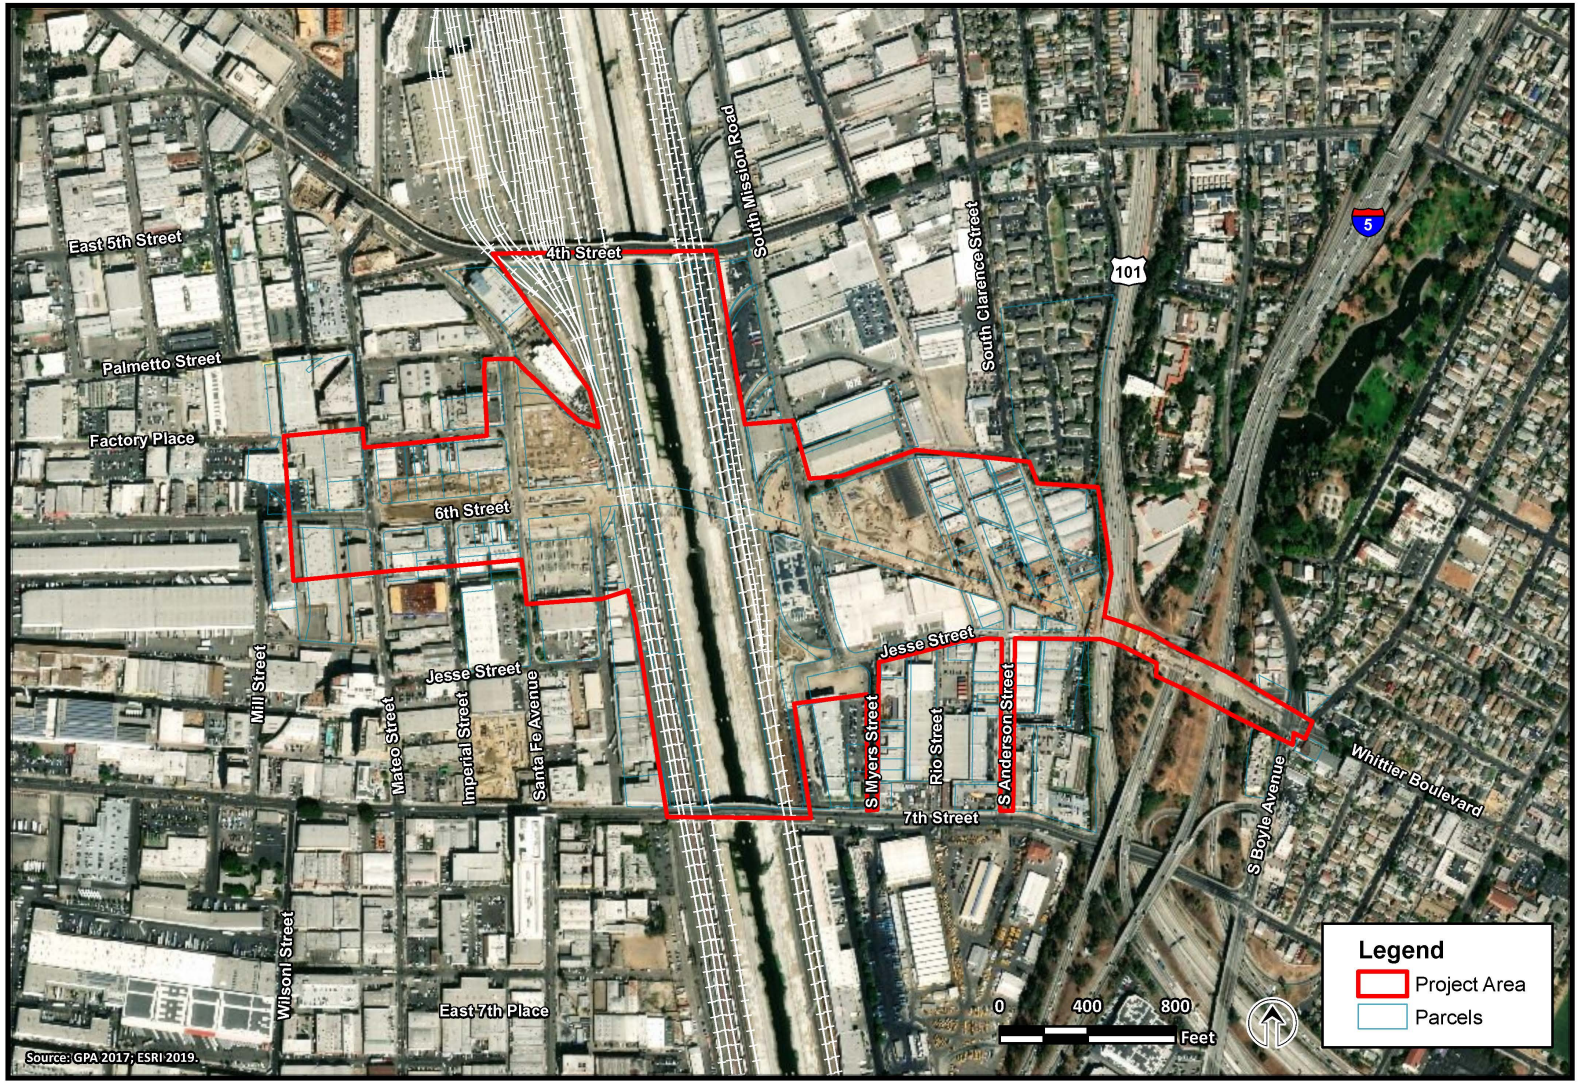
The segment of the LA River within the Project Area is a trapezoidal concrete-lined channel, which serves as a flood control channel that receives stormwater runoff from the surrounding watershed. The River discharges to an estuary south of the project area in Queensway Bay, in the Long Beach Harbor. An existing tunnel (LA River Access Tunnel) is located under the railroad tracks west of the River. LADWP

Figure 2-1: Regional Location

ENGINEERING
CITY OF LOS ANGELES

FIGURE 2-1. REGIONAL LOCATION
Sixth Street PARC Project

Figure 2-2: Project Area



ENGINEERING
CITY OF LOS ANGELES

FIGURE 2-2. PROJECT AREA
Sixth Street PARC Project

TLRW used this tunnel to access the River from Santa Fe Avenue. The City of Los Angeles owns and operates this tunnel.

2.3 Land Use Designation and Zoning

The Project Area is within the Central City North and Boyle Heights Community Plan areas, which were last updated in 2000 and 1998, respectively (City of Los Angeles, 2000; City of Los Angeles, 1998). Both Community Plans are currently undergoing an update. The Project Area includes the following land use designations under the City of Los Angeles Planning and Zoning Code: Limited Industrial (zoned M1), Light Industrial (zoned M2), Heavy Industrial (zoned M3), Open Space (zoned OS) within the River channel, and Public Facilities (zoned PF).

2.4 Project Objectives

The proposed Project has the following objectives:

- Serve the open space and recreational needs of surrounding communities;
- Connect and improve neighborhoods;
- Incorporate sustainable design consistent with the City's plans and goals;
- Encourage active modes of transportation and public transit;
- Promote beneficial stormwater treatment and/or capture; and
- Provide safe pedestrian and bicycle access to the LA River.

The proposed Project would be designed to conform to the *Los Angeles River Revitalization Master Plan* (City of Los Angeles, 2007), the City of Los Angeles' *Mobility Plan 2035* (City of Los Angeles, 2016), the *One Water LA 2040 Plan* (City of Los Angeles, 2018), and other local and adopted plans as applicable. Consistent with the project objectives, the proposed Project would endeavor to adhere to the following guidelines and design goals:

- Active and passive recreation that serves the needs of the community, particularly Boyle Heights and the Arts District.
- Connections to improvements within the neighborhoods in proximity to the Sixth Street Viaduct open spaces.
- Advanced design in keeping with the City's sustainability, low impact development (LID), green building, and Envision goals, which would include sensitivity to supporting all modes of traversing under the Viaduct.
- Promotion of multi-modal active transportation components, including linking to existing and future bicycle and pedestrian facilities.
- Environmentally friendly design that promotes beneficial stormwater treatment and/or capture throughout the site.

The most extensive project scope and associated impacts are being presented in this EIR; however, the City would only construct project elements that are within available funding at the time of construction bidding.

2.5 Proposed Project Elements

The proposed Project would create public recreational space on approximately 13 acres in areas underneath and adjacent to the Viaduct. Approximately 5.8 acres of the PARC would be directly under the Viaduct. The proposed Project is divided into the following sections: (1) West Park, which is located in the Central City North Community Plan; (2) Arts Plaza and River Gateway, which is located in the Central City North Community Plan and along the west and east banks of the LA River channel; and (3) East Park, which is located in the Boyle Heights Community Plan (see **Figure 2-3**, Project Site).

The City's Department of Recreation and Parks or some other entity will be responsible for programming activities for the proposed Project. **Table 2-1** provides the proposed programming activities and assumed traffic generators for the proposed Project. **Figure 2-4**, Proposed Site Plan, shows the overall site plan. Detailed site plans and renderings for the proposed park sections are included at the end of Chapter 2 (see **Figure 2-7** through **Figure 2-20**). Construction would be divided into two phases. Phase I would consist of constructing the General Park Elements as well as East Park, West Park, Arts Plaza and River Gateway. Phase II could consist of installing reinforced concrete planted terraces along the banks of the LA River. The proposed Project elements that are denoted with an asterisk (*) have been selected as bid alternates and are subject to available funding.

2.5.1 Phase I

Construction within Phase I may be phased from East to West as space becomes available below the Viaduct. The following elements would be constructed as part of Phase I of the proposed Project:

General Park Elements

- Typical park site furnishings and amenities, which would include benches, tables, bike racks, bicycle rentals, kiosks, drinking fountains, safety bollards, lighting and signage, fencing, gates, trash receptacles/enclosures, and equipment and maintenance storage unit(s);
- Pedestrian paths, bicycle paths and connections, and internal park roadways and service roads;
- Park lighting;
- Minor relocations of existing street lighting along Santa Fe Avenue, Mission Road, and Anderson Street within the Project Area;
- Pedestrian street lighting on Santa Fe Avenue, Anderson Street, and South Clarence Street;
- Public art sculptures (up to 30 feet high, 24 feet wide, by 11 feet long) and associated interpretive exhibits;
- Utility connections (electrical and plumbing);

- Utility relocations and undergrounding in some areas may be required; Other miscellaneous utility improvements such as installation of WiFi, security cameras, and hookups for food trucks, temporary performance equipment (sound and lighting), and water;
- Site soil would be remediated to standards acceptable by the Los Angeles County Fire Department and other regulatory agencies as required prior to proposed Project construction. Some soil remediation activities may also be required during construction;
- Irrigation systems and open space;
- Demolition of existing urban infrastructure, such as pavement and roadways;
- Landscaping would be consistent with the City's River Improvement Overlay (RIO) Ordinance (Ordinance Number 183145), which requires that 75 percent of any project's newly landscaped area be planted with any combination of native trees, plants and shrubs, species defined as WatershedWise (i.e., climate adapted and non-invasive plants), or species listed in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palette;
- Connectivity improvements, which may include, but are not limited to, a pedestrian activated crosswalk signal on Santa Fe Avenue, a speed table at the continental crosswalk on Santa Fe Avenue, and speed tables with solar-powered rectangular rapid flashing beacons at South Clarence Street, Mission Road, and South Anderson Street;
- Retaining wall(s), which would be between approximately 2- and 17-feet high; and
- Stormwater infrastructure improvements, which would include proposed stormwater drainage systems that would capture runoff from the proposed Project Site and tributary Viaduct areas, route stormwater to structural and LID best management practices (BMP) (e.g., proprietary vaults with media-filled cartridges, catch basin filter inserts, incidental infiltration during sheet flow and within localized vegetated basins, and below-grade capture and use systems), and discharge to existing stormwater drainage facilities that drain to the LA River.

Table 2-1: Proposed Programming Activities and Assumed Traffic Generators

Event Type	Location	Approximate Event Capacity	Estimated Annual Frequency	Approximate Event Duration (hours)	Time of day/week
Concerts, performances	Arts Plaza - stage area	1,000	24 events: (2) 1000-persons (10) 200-persons (12) 50-persons	3	Evenings; Weekends
Concerts, Performances, Events, Festivals	East Park - flex play and performance lawns (2)	2,000 (1,000 each area)	26 events: (4) 500-persons (20) 100-persons (2) 1000-persons	6	Evenings; Weekends
Soccer games	East Park - soccer fields	100 (50 each field)	104 (twice a week)	2.5	Evenings; Weekends
Soccer practices	East Park – soccer fields	50 (25 each field)	104 (twice a week)	1.0	Evenings; Weekends
Soccer Tournaments	East Park – Sports courts, Lawns, and Flex Court	(2-day Tournaments) Under 10 Division = 510/day Under 8 Division = 510/day 2,040 total	1-2 times per year	All day (9:00 a.m. – 8:00 p.m.)	All Day
Volleyball, futsal games	East Park - flex court	25	104	2	Evenings; Weekends
Basketball games	East Park - flex court	25	104	2	Evenings; Weekends
Café and outdoor plaza	Arts Plaza	50	Intermittent	11 a.m. – 7 p.m.	7 days/ week
Concessions	East Park	25	Intermittent	Intermittent	Evenings; Weekends
Farmers Market	Various	150	52	4 (8 a.m. – 12 p.m.)	Mornings; Weekends
Large Events	East Park – Various Locations	3,300 (flex lawn 1 – 1,300 flex lawn 2 – 1,500 basketball court – 500)	1-2 times per year (1) 5,000-person event/year	All day (11:00 a.m. – 10:00 p.m.)	All Day

ENGINEERING
CITY OF LOS ANGELES

FIGURE 2-4. PROPOSED SITE PLAN
Sixth Street PARC Project

This page intentionally left blank.

East Park

- East Building with approximately 332-square-foot concession area, 252-square-foot public restrooms, and 635-square-foot office space and 571-square-foot storage space for City of Los Angeles Department of Recreation and Parks (RAP);
- Two synthetic turf soccer fields with field lighting, one for youth Under-8 players, and one for youth Under-10 players;
- Two flexible play and performance lawns with combined capacity to hold events up to approximately 2,800 people*;
- Adult-sized flexible sports court for basketball, futsal, and volleyball*;
- Salvaged bridge light poles and salvaged arch as barrier/seat wall*;
- Nature walk, meadow and adult fitness circuit*;
- Splash pad with outdoor shower*;
- Designated picnic and grilling areas*;
- Landscaped seating areas and rain gardens*;
- Small dog and large dog play areas*;
- On-street angled parking with 14 dedicated spaces on-site (approximately 9 of which would be used by RAP staff);
- Children's play area*; and
- Skate park elements.

West Park/Arts Plaza and River Gateway

- One approximately 620-square-foot café building with outdoor plaza seating*;
- One approximately 162-square-foot building with public restrooms;
- Arts Plaza performance area(s), public gathering/assembly areas with capacity up to approximately 1,000 people;
- One flexible play and performance lawn;
- Adult fitness equipment;
- Small dog and large dog play areas;
- Landscaped seating area;
- Rain garden;
- Reconstruction and rehabilitation of existing pedestrian/vehicular LA River Access Tunnel entrance to the River (widening the tunnel opening; resurfacing the tunnel entryway, pavement, and tunnel floor; painting; and lighting improvements). Installation of safety features, including removable

bollards or a gate to restrict vehicle access to the tunnel and warning devices to deter pedestrian access during flood events;

- Space for future electric vehicle charging station and City of Los Angeles Department of Transportation (LADOT) mobility hub elements;
- Space for secure bike parking and space for Metro bikeshare; and
- Space for future landscaped areas.

2.5.2 Phase II

Phase II would include the installation of reinforced concrete planted terraces on up to approximately 20,000 square feet of the west and east banks of the LA River channel (see **Figure 2-5**, River Channel Design Concept and **Figure 2-6**, River Channel Site Plan). Terracing would be up to approximately 10 feet wide and located as high as possible on the west and east LA Riverbanks, above the estimated Ordinary High Water Mark. The terraces would be anchored into the existing slope liner and would not require excavation into the LA River channel. All landscaping would consist of species included in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palette, consistent with the City's RIO Ordinance (Ordinance Number 183145). Existing access to the LA River would be maintained.

Figure 2-5: River Channel Design Concept

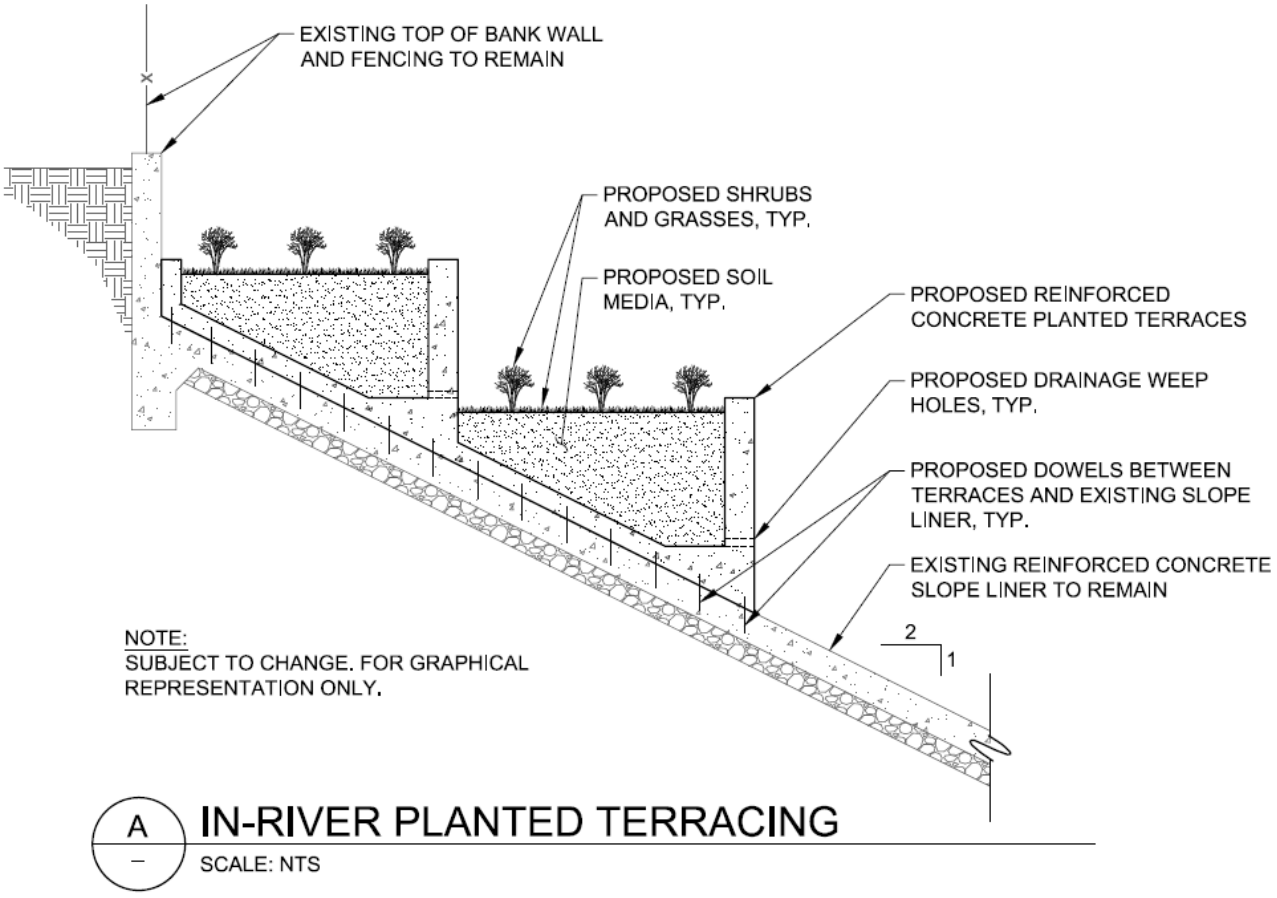

Figure 2-6: River Channel Site Plan

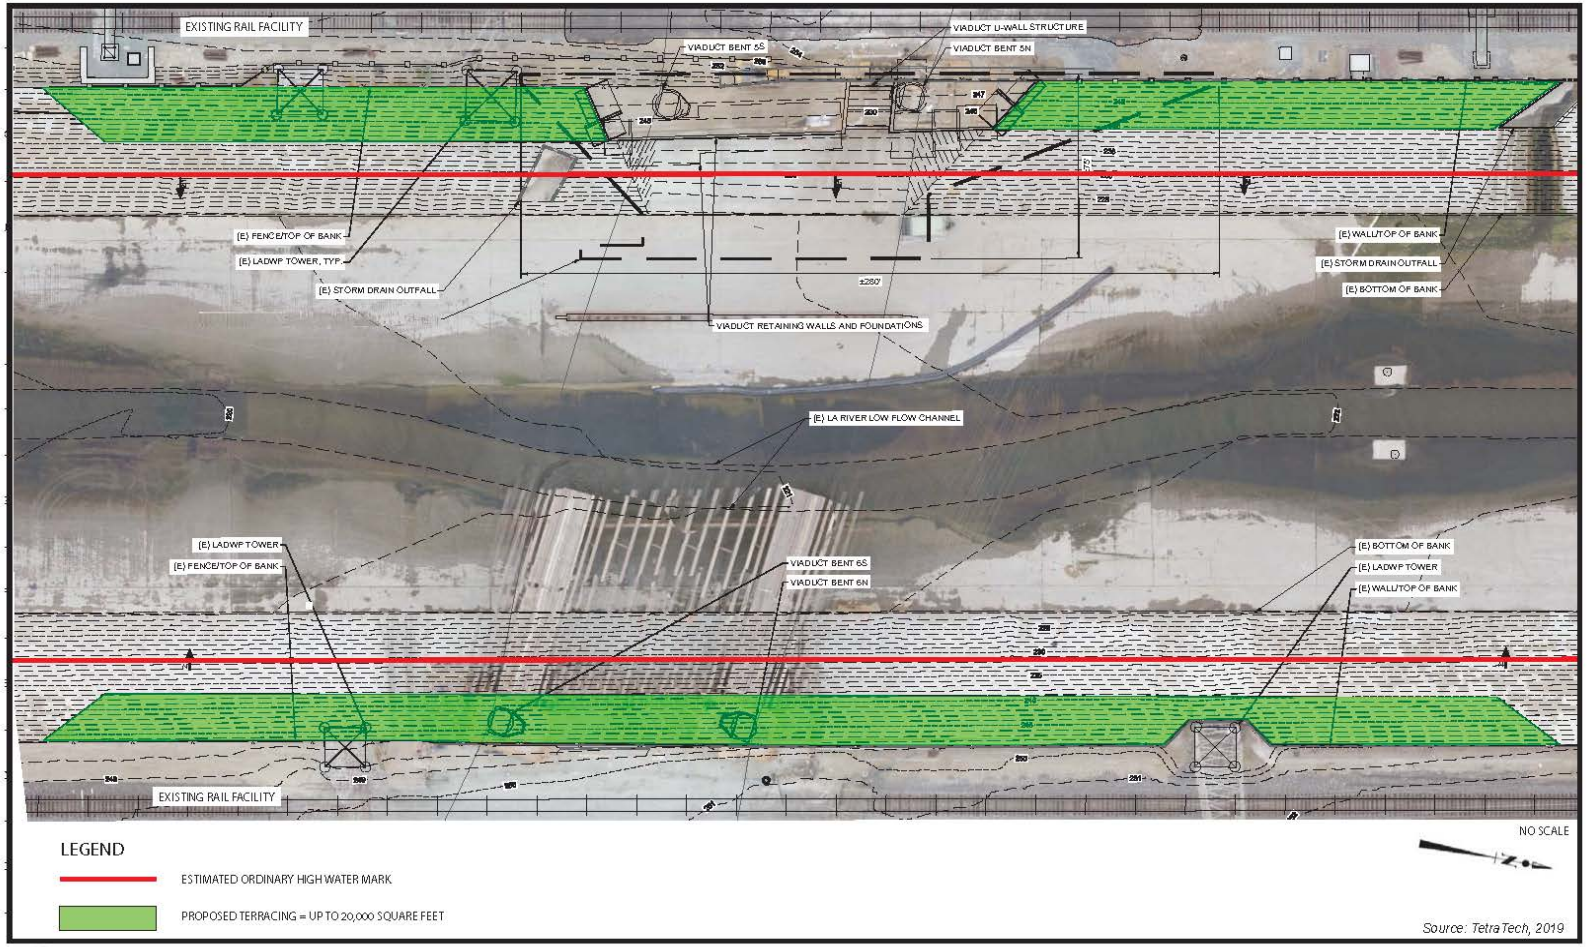

ENGINEERING
CITY OF LOS ANGELES

FIGURE 2-6. RIVER CHANNEL SITE PLAN
Sixth Street PARC Project

This page intentionally left blank.

2.5.3 Impervious Surface Areas

The proposed Project would remove approximately 2.1 acres of impervious surfaces, which includes any remaining asphalt or concrete pavement within the Project Site and the removal of existing roadway pavement and sidewalk for the street improvements. The proposed Project would result in a net increase of impervious surfaces due to the construction of hardscaping, sports courts, buildings, playgrounds, and other public amenities. When including the impervious surface area from the upcoming Viaduct overhead, the net increase in impervious surfaces as a result of the proposed Project would be approximately 1.4 acres. With implementation of the proposed Project, the Project Site would consist of approximately 8.9 acres (71%) of impervious surfaces (including the Viaduct overhead) and up to approximately 4.1 acres (29%) of pervious surfaces.

2.5.4 PARC Operations & Lighting

The proposed operation hours of the PARC would be between 5:00 a.m. and 10:30 p.m. in accordance with Los Angeles Municipal Code Section 63.44. Recreational lighting would largely be limited to the proposed operation hours and would be consistent with the City's Municipal Code and RIO Ordinance (Ordinance Number 183145). There would be higher light levels around the sports fields to help transition from the brighter fields to the typical paths. Lighting for security would be installed throughout the PARC to protect people and property, and illuminated in accordance with the Illuminating Engineering Society (IES) standards, *IES RP-33-14 Lighting for Exterior Environments* and IES G-1-03 *Security Lighting for People, Property and Public Spaces*, as updated by IES G-1-16 *Guide for Security Lighting for People, Property and Critical Infrastructure*. Luminaires with shielded optics would be used, and the PARC would be designed to infill lighting in areas where architectural and bridge elements could impede the flow of light.

2.6 Real Estate Acquisitions

No right-of-way (ROW) or temporary construction easements (TCE) would be required and no displacements or relocations would result from the proposed Project. However, a temporary "Permit to Enter" may be required from property owners at the boundaries of the Project Site that border adjacent private properties. In these areas, the contractor may need to enter private properties in order to complete construction work within the Project Site.

2.7 Project Schedule

The proposed Project would include two construction phases. Construction of Phase I would begin at or near the completion of the Viaduct Replacement Project. The Viaduct construction is expected to be completed by mid-2022 but is subject to change. The duration of construction for Phase I is expected to last approximately two years. Assuming Phase I construction starts in September 2022, construction is anticipated to be completed in 2024.

Phase II elements would be constructed independently of Phase I elements. The duration of Phase II is assumed to be 6 months. Phase II construction is anticipated to begin in 2025 or later but may proceed concurrently with Phase I. The timing of construction depends on a number of variables, such as

availability of funding for design and construction, as well as review and approval of LA River modifications from the United States Army Corps of Engineers (USACE). For purposes of this environmental review, Phase I and II construction activities are assumed to overlap.

2.8 Project Design Changes

The City prepared a Notice of Preparation/Initial Study (NOP/IS) for the proposed Project, dated April 13, 2017. Several proposed Project elements that were presented in the NOP/IS are no longer being considered because they have since been determined to be infeasible or cost prohibitive due to budgetary constraints, which include the following:

- Construction of a bikeway within the LA River channel bank adjacent to the proposed Arts Plaza, extending from Fourth Street to Seventh Street, with connections to the bridge structures. Metro is currently studying construction of a proposed bikeway in this area as part of the separate Los Angeles River Project. More details can be found here: https://www.metro.net/projects/lariverpath/
- Colored concrete pavement to delineate limits of all park areas.
- Stormwater capture and reuse.

In addition, work in the LA River channel would now occur at a separate phase (Phase II) from the remainder of the proposed West Park, Arts Plaza, and East Park (Phase I). This is due to the additional approvals and permits that would be needed for these activities.

2.9 Relationship to Other Projects

The proposed Project is located underneath and adjacent to the Viaduct Replacement Project. The City has completed the design to replace the Viaduct, and the Viaduct was demolished in 2016. Construction of the new Viaduct has begun, and it is anticipated to be substantially complete in 2022.

Other federally funded projects in proximity to the proposed Project have components which include intersection improvements for bicycles and pedestrians, landscaping features, and bicycle lanes in the proposed Project Area. Three separate projects that are associated with the proposed Project include Active Transportation Program (ATP) projects that are federally funded but administered through Metro. ATP-1: Sixth Street Viaduct Replacement Project Bicycle and Pedestrian Facilities (currently in design), ATP-2: Boyle Heights Pedestrian Linkages (currently in design), and ATP-3: Downtown LA Arts District Pedestrian and Cyclist Safety Project (currently in design) include improvements to the safety and accessibility of bicycle and pedestrian facilities in the vicinity of the proposed Project.

Other development projects in proximity to the Project Area are included in **Table 1-1** in Chapter 1 (see **Figure 1-2**, Development Projects)**.**

2.10 Responsible Agencies and Project Approvals

Table 2-2 includes a list of responsible agencies that were contacted regarding the proposed Project. Other public agencies in proximity to the Project Area were also contacted.

Table 2-2: Responsible Agencies

Responsible Agency	Anticipated Permits, Approvals, and Related Issues
Federal	
United States Army Corps of Engineers	Rivers and Harbors Act Section 408 Permit, includes National Environmental Quality Act (NEPA) approval Clean Water Act (CWA) Section 404 Permit
Federal Railroad Administration	Any applicable permits
Federal Transit Administration	Any applicable permits
State	
Department of Toxic Substances Control	Any applicable permits
California Department of Fish & Wildlife	Section 1602 Streambed Alteration Agreement
California State Historic Preservation Office	Section 106 consultation
Regional	
Regional Water Quality Control Board	CWA Section 401 Water Quality Certification National Pollutant Discharge Elimination System (NPDES) Permit
LA County Metropolitan Transportation Authority	Any applicable permits, coordination related to public transit and bikeways, and adjacent facilities
LA County Fire Department	Review and advise on site remediation plans
South Coast Air Quality Management District	Any applicable permits
Local	
City of Los Angeles Recreation and Parks Department	Responsible for operation and maintenance of portions of the park
City of Los Angeles Planning Department	Potential changes to land use designations or zoning, as well as street designations Any applicable permits
City of Los Angeles Department of Water and Power	Any applicable permits, coordination, and approval
LA Sanitation	LID Compliance, system design coordination (if applicable), system design approval (if applicable), and maintenance of a portion of stormwater infrastructure (if applicable)
City of Los Angeles Fire Department	Any applicable permits, coordination related to emergency access
City of Los Angeles Department of Transportation	Non-CEQA Transportation Assessment Guidelines Consistency Review

	Traffic management plans
City of Los Angeles Bureau of Street Lighting	Street lighting design and approval
City of Los Angeles Board of Public Works	Recommendations regarding Project approval and Environmental Impact Report (EIR) certification
Los Angeles City Council	Project approval and certification of EIR
City of Los Angeles Department of Building and Safety	Any applicable permits
City of Los Angeles Cultural Affairs Department	Any applicable permits and coordination related to public art
All railroad agencies owning and operating railroad tracks along both sides of the River	Railroad Maintenance Agreement for work within railroad ROW

Chapter 3
Environmental Impact Analysis

3.1 Aesthetics

This section describes the affected environment and regulatory setting for Aesthetics related to the Project Area and surrounding area. In addition, this section describes the potential impacts related to Aesthetics that would result from the implementation of the proposed Project. As noted in the analysis below, impacts associated with Aesthetics during construction or operation of the proposed Project would be less than significant and no mitigation measures are required.

The information in this section is based on the Visual Impact Assessment (VIA) prepared for the proposed Project (GPA Consulting, 2019), located in Appendix B.

3.1.1 Introduction

3.1.1.1 Defining Quality and Character of Visual Resources

Visual Character

Visual character is described by the topography, land use, form, color, line, texture, and natural resources depicted in the view. Assessment of visual character is intended to be descriptive rather than evaluative. Visual character is based on defined attributes, such as physical traits; pattern character traits; and the dominance, scale, and diversity or continuity of visual elements.

Visual Quality

Visual quality describes the aesthetics of a view. Determining visual quality can be subjective because it is partly based on the viewer's idea of what constitutes a quality setting. To provide a more objective framework, this assessment combines the evaluative criteria (i.e., vividness, intactness, and unity) and qualitative rankings (i.e., low, medium, and high) presented in the Federal Highway Administration's (FHWA) *Visual Impact Assessment for Highway Projects*, along with the *L.A. CEQA Thresholds Guide* criteria. Though FHWA's guidelines are the accepted standard for evaluating the visual effects associated with highway and railroad projects, the guidelines also apply to a wide range of non-transportation projects.

The three criteria for evaluating visual quality include:

- **Vividness:** The visual power or memorability of landscape components as they combine in distinctive visual patterns.
- **Intactness:** The visual integrity of the natural and human-built landscape and its freedom from encroaching elements. Intactness can occur in well-kept urban and rural landscapes, as well as in natural settings.
- **Unity:** The visual coherence and compositional harmony of the landscape considered as a whole. It frequently attests to the careful design of individual human-made components in the landscape.

Views of high quality often have topographic relief, a variety of vegetation, rich colors, impressive scenery, and unique natural and/or built features. The FHWA evaluates visual quality based on an average of the ranking scales for vividness, intactness, and unity.

Viewer Response

Viewer response includes viewer exposure and viewer sensitivity. The assessment of these elements predicts how the public might react to visual changes brought about by a development project.

Viewer exposure measures the number of viewers exposed to the resource change, type of viewer activity, duration of their view, speed at which the viewer moves, and position of the viewer. In areas with high viewer exposure, early consideration of design, art, and architecture become more important. Depending on distance or intervening structures, viewers may experience varying degrees of visibility to and from a project.

Viewer sensitivity includes the viewer's concern for scenic quality and the viewer's response to changes in the visual resources that make up the view. Viewer sensitivity varies based on local values and goals. The perception of visual quality and the sensitivity of viewers to changes in visual quality varies based on the viewer's familiarity with the view, their sense of ownership of the view, and the nature of the viewer's activity while receiving the view. For example, residential viewers typically have a high sensitivity to visual quality and changes in visual quality because of their familiarity with the view over a period of time, investment in the area (e.g., homeowners or long-time residents), and sense of ownership of the view. In contrast, commuting motorists that travel for the purposes of getting from one place to another for work or errands would have an average level of sensitivity. However, motorists traveling for pleasure would be more sensitive to their surroundings. The level of sensitivity changes depending on the degree of familiarity the viewer has with the visual setting and the viewer's concern for scenic quality.

Key Views

Because analyzing all of the potential views of the proposed Project would be infeasible, key viewpoints were selected at five locations within the Project Area to represent the visual effects of the proposed Project. These key views also represent the primary viewer groups that could be affected by the proposed Project. For the purposes of this analysis, a view is considered a key view if at least one of the following circumstances applies:

- Visual resources are present, regardless of the quality of the view. The sensitivity of the affected viewer group is medium or high, and the duration of the view is long-term.
- The quality of the view is medium or high, regardless of whether visual resources are present. The sensitivity of the viewer group is medium or high, and the duration of the view is long-term.
- The view is distinct, clear, and unobstructed from the street to adjacent businesses, and is viewed regularly by a large number of commuters. In this case, the viewer sensitivity is medium, and the view is long-term.

For the purposes of this EIR, key observation points (KOPs) are the key views that are most representative of the visual character and quality of the Project Area. The five KOPs in the Project Area,

which were determined in the VIA prepared for the proposed Project, are described in more detail in Section 3.1.3.1.

3.1.2 Regulatory Setting

3.1.2.1 City of Los Angeles Municipal Code

The City of Los Angeles Municipal Code (LAMC) includes regulations pertaining to aesthetics and visual quality. The following Municipal Code sections provide standards for the design, location, and arrangement of visual resources within a project area, including zoning and land uses, landscaping, street lighting systems, etc.

LAMC Chapter 1, Article 2, Section 12.04.05 – Open Space (OS) Zone

Open Space Zoning provides regulations for publicly owned land in order to implement the City's adopted General Plan, including the Open Space, Conservation and Public Recreation Elements. Implementation of the General Plan serves to protect and preserve natural resources and natural features of the environment; provide outdoor recreation opportunities and advance the public health and welfare; enhance environmental quality; encourage the management of public lands in a manner which protects environmental characteristics; and encourage the maintenance of open space uses on all publicly owned park and recreation land.

LAMC Chapter 1, Article 2, Section 12.42E2

All planting shall be coordinated with all signs and lighting on a project site, both upon installation of the planting and upon the planting reaching its maximum designed size. All shall be designed such that one will not interfere with the other, nor require excessive maintenance.

LAMC Chapter 1, Article 2, Sec. 12.21A5(k)

All lights used to illuminate a parking area shall be designed, located and arranged so as to reflect the light away from any streets and any adjacent premises.

LAMC Chapter 1, Article 3, Section 13.17A – River Improvement Overlay District

The purpose of a River Improvement Overlay (RIO) District is to:

- Support the goals of the Los Angeles River Revitalization Master Plan
- Contribute to the environmental and ecological health of the City's watersheds
- Establish a positive interface between river adjacent property and river parks and/or greenways
- Promote pedestrian, bicycle and other multi-modal connection between the river and its surrounding neighborhoods
- Provide an aesthetically pleasing environment for pedestrians and bicyclists accessing the river area
- Provide safe, convenient access to and circulation along the river
- Promote the river identity of river adjacent communities

LAMC Chapter 1, Article 3, Section 13.17F – River Improvement Overlay District

A Project shall conform to all of the following RIO district development regulations:

- Landscaping
    - Landscaping shall conform to the following regulations: 75 percent of any Project's newly landscaped area shall be planted with any combination of the following: native trees, plants and shrubs, or species defined as WatershedWise, or species listed in the Los Angeles County River Master Plan Landscaping Guidelines and Plant Palettes.
- Screening/Fencing
    - Electrical transformers, mechanical equipment, water meters and other equipment shall be screened from public view. The screening may be opaque or perforated, provided that not more than 50 percent of the face is open. The screen shall be at least 6 inches taller than the equipment and not more than 2 feet taller than the equipment.
- With the exception of single-family homes, all projects facing a street that cross the river or terminate at the river or a river frontage road shall have all fences within the front or side yards visible from said street consistent with the fence designs identified in the Los Angeles County River Master Plan Landscape Guidelines Exterior Site Lighting.
    - All site and building mounted lighting shall be designed such that it produces a maximum initial luminance value no greater than 0.20 horizontal and vertical foot candles at the site boundary, and no greater than 0.01 horizontal foot candles 15 feet beyond the site. No more than 5.0 percent of the total initial designed lumens shall be emitted at an angle of 90 degrees or higher from nadir (i.e., straight down).
    - All low-pressure sodium, high pressure sodium, metal halide, fluorescent, quartz, incandescent greater than 60 watts, mercury vapor, and halogen fixtures shall be fully shielded.
- Projects located partially or wholly within the Inner Core shall also conform to the following regulations
    - Landscape Buffer. All Projects shall provide a 10-foot landscape buffer as measured from the Project's property line adjacent to the river except where a roadway is located within that 10 feet. New building structures or parking shall not be permitted within the 10-foot landscape buffer.
    - Fence. All fences located within 10 feet of the river corridor or a river frontage road street or any adjacent street shall be consistent with the fence designs identified in the Los Angeles County River Master Plan Landscape Guidelines. With the exception of single-family homes, all Projects shall be required to maintain a visual connection between the river corridor and/or frontage road and the abutting property.
    - Fence Height. All fences located less than 10 feet from the river shall be no higher than 6 feet in height. All fences located at the 10-foot landscape buffer setback line shall not exceed 10 feet in height.

- Gates. All gates or fences located within 10 feet of the river or a river frontage road shall be consistent with the gate designs identified in the Los Angeles County River Master Plan Landscape Guidelines. The gate height shall be consistent with the adjacent fence height and the gate shall be designed so as not to encroach into either the river, street or public right-of-way when opened.
- River Access. With the exception of single-family homes, all river adjacent projects that partially or wholly abut the river shall have Americans with Disabilities Act compliant access gates from their property to the river. The gates shall also be accessible for bicycle entry. Access may be controlled and limited to residents, employees and/or visitors of the project.
- Riverfront Door. All projects located either adjacent to the river corridor or frontage road shall include a riverfront door visible to, and accessible from, the river corridor or frontage road.

LAMC Chapter 1, Article 7, Sec. 17.08C

Plans for street lighting system shall be submitted to and approved by the Bureau of Street Lighting.

LAMC Chapter 9, Article 3, Section 93.0117

No person shall construct, establish, create, or maintain any stationary exterior light source that may cause the following locations to be either illuminated by more than two foot-candles (21.5 lx) of lighting intensity or receive direct glare from the light source. Direct glare, as used in this subsection is a glare resulting from high luminance or insufficiently shielded light sources that is in the field of view.

- Any ground surface intended for use but not limited to recreation, barbecue, or lawn areas on any other property containing a residential unit or units

3.1.2.2 City of Los Angeles General Plan

As required by the State of California, the City's General Plan addresses goals, policies, and standards related to land use, circulation, housing, conservation, open space, noise, and safety (City of Los Angeles, 2017). To address goals that meet the unique needs of the City, the General Plan also includes elements related to health and wellness, air quality, historic preservation and cultural resources, and public facilities and services. Several of the General Plan elements are currently being updated. The General Plan elements that pertain to Aesthetics are described in more detail in the following sections.

Open Space Element

The Open Space Element of the City's General Plan provides information to guide decision makers and interested citizens regarding the identification, preservation, conservation, and acquisition of open space in the City (Los Angeles Department of City Planning, 1973). The Element aims to ensure that the City has sufficient open space to meet its recreational, environmental, health, and safety needs. In addition, the Element aims to conserve and preserve the City's environmental resources, as well as provide open spaces that contribute to the City's identity, form, and visual framework. Specific policies pertaining to Aesthetics include (a) consideration of aesthetics in grading plans, and (b) the establishment of scenic corridors. The following Open Space goals, objectives, and policies pertaining to aesthetics are applicable to the proposed Project:

Goals:

- Provide an open space system which provides identity, form, and a visual framework to the City.

Objectives:

- Identify the need and methods of providing for open space in proposed centers and impacted areas of the City. Impacted areas are generally characterized by factors including low incomes, high incidence of crime, and low educational achievement.

Policies:

- The amount of earth moved in grading operations within desirable open space areas should be limited and closely controlled. Aesthetic consideration should be incorporated into the City's approval of grading plans in these areas.
- Scenic corridors should be established where designated. Each corridor should be specifically "tailored" to the needs of the area and the scenic values to be preserved. Specific studies including implementing ordinances should be prepared for each scenic corridor.

Central City North Community Plan

The Central City North Community Plan summarizes the most significant land use issues and opportunities that the community faces (City of Los Angeles, 2000). Among these issues, the Community Plan includes goals, objectives, and policies related to provide park facilities and open space for the purposes of serving the recreational, environmental, and health needs of the community, as well as protecting environmental and aesthetic resources. The Central City North Community Plan is being updated, but the update is not anticipated to be complete before the public comment period for the Draft EIR Specific policies pertaining to Aesthetics within the Community Plan include: (a) ensuring that parks are adequately illuminated for safe use at night, and (b) providing a visual balance between open space and urban development within the Community Plan area. The following aesthetics-related planning goals, objectives, and policies are presented in the community plan:

<u>Recreation and Parks Facilities</u>

Goals:

- 4: Adequate recreation and park facilities which meet the needs of the residents in the Plan Area.

Objectives:

- 4-1: Conserve, maintain and better utilize existing recreation and park facilities which promote the recreational needs of the community.

Policies:

- 4-1.1: Preserve the existing recreational facilities and park space.

Open Space

Goals:

- 5: A community with sufficient open space in balance with development to serve the recreational, environmental and health needs of the community and to protect environmental and aesthetic resources.

Objectives:

- 5-1: Preserve existing open space resources and where possible develop new open space.
- 5-2: Ensure the accessibility, security and safety of parks by their users, particularly families with children and senior citizens.

Policies:

- 5-1.1: Encourage the retention of passive and visual open space which provides a balance to the urban development of the Plan Area.
- 5-2.1: Ensure that parks are adequately illuminated for safe use at night where appropriate.

Boyle Heights Community Plan

The Boyle Heights Community Plan sets forth goals, objectives, policies, and implementation programs that pertain to Boyle Heights. The Boyle Heights Community Plan is being updated, but the update is not anticipated to be complete before the public comment period for the Draft EIR. The following aesthetics-related planning goals, objectives, and policies are presented in the community plan (City of Los Angeles, 1998):

Objectives:

- Provide adequate recreation and park facilities which meet the needs of the residents in the community.
- Conserve, maintain, and better utilize existing recreation and park facilities which promote the recreational experience.

Policies:

- Preserve and improve the existing recreation and park facilities and park space.

The Boyle Heights Community Plan is currently being updated, with a Draft Boyle Heights Community Plan released in 2017.

3.1.2.3 Los Angeles River Revitalization Master Plan

The Los Angeles River Revitalization Master Plan (LARRMP) includes plans to construct a continuous river greenway, providing habitat restoration, open spaces, and pedestrian and bicycle paths along the Los Angeles River (City of Los Angeles, 2007). The Plan includes a 32-mile long and 1-mile wide planning area, with goals that include, but are not limited to, establishing guidelines for land use and development around the LA River; enhancing and improving communities adjacent to the river; improving public access to the river; and providing recreation and open space. The LARRMP includes requirements for landscaped areas, guidelines for improvements to the visibility of the LA River, and guidelines for

introducing art. The following goals and recommendations within the LARRMP are applicable to the visual quality and character of the Sixth Street PARC Project:

Goal 1: Create a continuous river greenway

- Establish a River Buffer area within, and adjacent to, the Los Angeles River that meets riparian or upland habitat requirements.
- Extend open space, bike paths, and multi-use trails into the tributaries.

Goal 2: Connect neighborhoods to the river

- Provide green arterial connections to the Los Angeles River. Where suitable, landscaped areas should be designed to meet upland habitat requirements.
- Create safe, non-motorized routes between the Los Angeles River and cultural institutions, parks, civic institutions, transit-oriented development, schools, transit hubs, and commercial and employment centers within one mile of the Los Angeles River.
- Increase direct pedestrian and visual access to the Los Angeles River.

Goal 3: Extend open space and water quality features into neighborhoods

- Increase open space throughout the Los Angeles River Corridor. Where suitable, landscaped areas should be designed to meet upland habitat requirements.
- Provide a diverse system of interconnected parks, recreational fields, and outdoor classrooms.
- Incorporate best management practices in streetscapes and all public landscapes.

Goal 4: Enhance river identity

- Identify physical opportunities to improve the visibility of the Los Angeles River Corridor.
- Identify opportunities to improve public perception of the Los Angeles River Corridor.
- Encourage local and diverse character within the Los Angeles River Corridor.

Goal 5: Incorporate public art along the river

- Identify physical opportunities to introduce art along the Los Angeles River.
- Create a River arts program that reflects and celebrates the history of the Los Angeles River and the diverse cultures of its surrounding neighborhoods.

3.1.2.4 Bureau of Street Lighting Design Standards and Guidelines

The Bureau of Street Lighting *Design Standards and Guidelines* manual provides standards for engineers with regards to designing street lighting systems (Bureau of Street Lighting, 2007). The manual provides approval requirements; illumination standards for various areas, roadways, and pedestrian walkways; design considerations; and equipment selection standards.

3.1.2.5 LA River Design Guidebook

The *LA River Design Guidebook* provides design recommendations that complement the Los Angeles River Revitalization Master Plan and the design guidelines associated with the RIO district (City of Los Angeles, 2016). The Guidebook is intended for use by the communities of Boyle Heights, Arts District, Lincoln Heights, and Chinatown East, and incorporates the input of residents, stakeholders, and representatives from these communities. The *LA River Design Guidebook* provides recommendations for improving and unifying the aesthetic quality of the LA River and surrounding communities.

3.1.2.6 Los Angeles County: LA River Master Plan

The *Los Angeles County LA River Master Plan* was originally published in 1996 to provide for the optimization and enhancement of aesthetic, recreational, flood control, and environmental values by creating a community resource, enriching the quality of life for residents, and recognizing the river's primary purpose for flood control (Los Angeles County Department of Public Works, 1996). The plan encompasses all 51-miles of the river, in addition to the Tujunga Wash, which is 9 miles long. The river touches 13 cities and 9 Los Angeles City Council Districts, all of which are addressed in the Master Plan document. The LA River Master Plan goals aim to:

- Ensure flood control and public safety needs are met.
- Improve the appearance of the river and the pride of local communities in it.
- Promote the river as an economic asset to the surrounding communities.
- Preserve, enhance, and restore environmental resources in and along the river.
- Consider stormwater management alternatives.
- Ensure public involvement and coordinate Master Plan development and implementation among jurisdictions.
- Provide a safe environment and a variety of recreational opportunities along the river.
- Ensure safe access to and compatibility between the river and other activity centers.

The LA River Master Plan is currently undergoing a comprehensive update that covers all 51 miles of the river. The update will not be complete prior to this project's Draft EIR being made available to the public.

3.1.3 Environmental Setting

The visual setting for the proposed Project is defined below in terms of (a) key views; (b) existing visual character and quality; (c) scenic resources, scenic vistas, and other visual resources.

3.1.3.1 Key Views

The Project Area includes three segments: West Park, Arts Plaza and River Gateway, and East Park. All Key Observation Points (KOP) have been assessed from the viewpoint of each segment. A KOP identifies key views that document the visual character and quality of the proposed Project in highly representative ways. The analysis identified five such specific views that would be altered to some degree by the

proposed Project. The following KOPs were chosen to represent the clearest display of visual effects of the Project Area at representative locations within its setting (See **Figure 3.1-1,** KOPs):

- KOP 1: Mateo Street and East Sixth Street (West Park) (See **Figure 3.1-2**, KOP 1 [View East from Mateo Street])
- KOP 2: Santa Fe Avenue and Mesquit Street (Arts Plaza and River Gateway) (See **Figure 3.1-3**, KOP 2 [View East from Santa Fe Avenue])
- KOP 3: East Sixth Street and South Mission Road (East Park) (See **Figure 3.1-4**, KOP 3 [View West from Mission Road])
- KOP 4: Anderson Street, between Sixth Street and Jesse Street (East Park) (See **Figure 3.1-5**, KOP 4 [View West from Anderson Street])
- KOP 5: Clarence Street, between Sixth Street and Jesse Street (East Park) (See **Figure 3.1-6**, KOP 5 [View West from Clarence Street] and **Figure 3.1-7**, KOP 5 Towards U.S. 101 Freeway [View East from Clarence Street])

3.1.3.2 Existing Visual Character and Quality

For all five KOPs, the existing visual character is the current construction site for the Viaduct Replacement Project, which is located in a heavily industrialized area of low visual quality, and low vividness and unity.

Figure 3.1-1: KOPs

Source: (GPA Consulting, 2019)

West Park

KOP 1: Mateo Street and Sixth Street Bridge

KOP 1 is located at the intersection of Mateo Street and East Sixth Street (at the western extent of the former Viaduct). This industrialized area was the location of the former Viaduct, which was demolished in 2016, and was also occupied by multiple warehouses and commercial storage facilities that were acquired as part of the Viaduct Replacement Project. The existing view from KOP 1 to the east is the construction site for the Viaduct Replacement Project, which includes fencing around an area of bare ground with staged construction equipment and materials (See **Figure 3.1-2**). KOP 1 includes views of neighboring industrial and commercial buildings to the west, north, and south, including stores, warehouses, and a gym.

Arts Plaza and River Gateway

KOP 2: Santa Fe Avenue and Mesquit Street

KOP 2 is located at the intersection of Santa Fe Avenue and Mesquit Street. This industrialized area was the location of the former Viaduct and was also occupied by multiple warehouses and commercial storage facilities that were acquired as part of the Viaduct Replacement Project. The existing view from KOP 2 includes the construction site for the Viaduct Replacement Project to the west and east, which includes fencing around an area of bare ground with staged construction equipment and materials (See **Figure 3.1-3**). To the northeast, a fenced construction site for a Los Angeles County Metropolitan Transportation Authority (Metro) maintenance facility is visible. KOP 2 also includes views of neighboring industrial and commercial buildings to north and south, including a gallery and warehouses. To the southeast, the Los Angeles Department of Water and Power River Switching Station, including power lines and transformers, is visible. There are several railway tracks further east, but their visibility is limited from KOP 2.

East Park

KOP 3: Sixth Street and South Mission Road

KOP 3 is located at the intersection of East Sixth Street and South Mission Road. This area was previously occupied by commercial warehouses and truck yards, as well as an empty space underneath the former Viaduct, which surrounding businesses used to park their vehicles. The existing view from KOP 3 consists of a construction site for the Viaduct Replacement Project to the west, east, and south, which includes fencing around an area of bare ground with staged construction equipment and materials (See **Figure 3.1-4**). Visible vertical elements include power poles and the support structures for the Viaduct Replacement Project. KOP 3 also features views of neighboring industrial and commercial buildings to the north and south, including several warehouses and commercial storage facilities. There are several railway tracks further west, but their visibility is limited from KOP 3.

KOP 4: Anderson Street, between Sixth Street and Jesse Street

KOP 4 is located at Anderson Street between East Sixth Street and Jesse Street. This area was previously occupied by commercial warehouses, industrial facilities, and on-street parking, as well as an empty space underneath the former Viaduct that was used by the surrounding businesses to park their personal vehicles. The existing view from KOP 4 includes the construction site for the Viaduct Replacement

Project, which includes fencing around an area of bare ground with staged construction equipment and materials (See **Figure 3.1-5**). KOP 4 also includes views of neighboring industrial and commercial buildings to the north and south, including several warehouses and commercial storage facilities. The Downtown LA skyline is visible to the west. A berm vegetated with shrubs, grasses, and palm trees adjacent to U.S. 101 is visible to the east.

KOP 5: Clarence Street, between Sixth Street and Jesse Street

KOP 5 is located at Clarence Street between East Sixth Street and Jesse Street (at the eastern extent of the former Viaduct). This area was previously occupied by commercial warehouses, industrial facilities, and on-street parking, as well as an empty space underneath the former Viaduct that was used by the surrounding businesses to park their personal vehicles. The existing view from KOP 5 includes the construction site for the Viaduct Replacement Project to the west and east, which includes fencing around an area of bare ground with staged construction equipment and materials (See **Figure 3.1-6** and **Figure 3.1-7**). KOP 5 also includes views of neighboring industrial and commercial structures to the north and south, including several various warehouses and commercial storage facilities. A berm vegetated with shrubs, grasses, and palm trees adjacent to U.S. 101 is visible to the east.

3.1.3.3 Scenic Resources, Scenic Vistas, and Other Visual Resources

There are no officially designated scenic vistas, resources, or highways that are within the Project Area or visible from the Project Area. Looking west, views of the Downtown LA skyline are visible from several of the KOPs within the Project Area. The Downtown LA skyline could be considered a valued landscape by residents, pedestrians, bicyclists, and motorists of the Central City North and Boyle Heights neighborhoods. The skyline consists of numerous buildings and skyscrapers of visual prominence, including the U.S. Bank Tower, the Wilshire Grand Center, the Wells Fargo Tower, the Aon Center, and the Gas Company Tower, and other structures in Downtown Los Angeles. No officially designated scenic resources, vistas, or corridors have been identified in the Project Area, or are visible from the Project Area.

3.1.4 Environmental Impact Analysis

3.1.4.1 Methodology

Screening criteria pertaining to aesthetics, existing features in the visual setting, effects on scenic resources, and obstruction of views from the *L.A. CEQA Thresholds Guide* (City of Los Angeles, 2006) and State CEQA Statute (Public Resources Code 21000-21189) and Guidelines (California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000-15387) provide the key analytical framework for this section, and guide the process for the proposed Project. This is augmented by the methodology developed by the Federal Highway Administration (FHWA), which has become the industry standard for performing visual impact assessments for local, non-highway related projects. The FHWA methodology calls for analysis of a project's viewshed (i.e., those areas that can be easily seen within a project's setting), using the criteria vividness, intactness, and visual unity captured in key views to assess the level of visual quality present, both before and after a project is implemented. A viewshed comprises all of the surface areas visible from an observer's viewpoint. The viewshed also accounts for the locations of viewers likely to be affected by visual changes brought about by the proposed Project. Within the evaluative framework,

changes to the quality and character of visual resources in the viewshed are assessed with respect to viewer response, as discussed in the following sections.

3.1.4.2 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the IS for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.1.4.3 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Aesthetics if it would:

I(a) Have a substantial adverse effect on a scenic vista.

I(c) Substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, conflicts with applicable zoning and other regulations governing scenic quality.

I(d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

A.4 Nighttime Illumination. The determination of significance shall be made on a case-by-case basis, considering the following factors:

- The change in ambient illumination levels as a result of project sources; and
- The extent to which project lighting would spill off the project site and affect adjacent light sensitive areas.

3.1.4.4 Construction Impacts

I(a): Have a substantial adverse effect on a scenic vista.

There are no officially designated scenic vistas, resources, or highways that are within the Project Area or visible from the Project Area. However, the Downtown LA skyline could be considered a valued viewshed by residents, pedestrians, bicyclists, and motorists of the Central City North and Boyle Heights neighborhoods.

Construction equipment (e.g., grading excavators, scrapers, dozers, tractors, loaders, backhoes, forklifts, and portable generators) would be temporarily present in the Project Area for a period extending up to approximately two years for Phase I and six months for Phase II. Construction activities would be short-term and would not have permanent effects on the Downtown LA skyline. In addition, construction equipment would not introduce new vertical elements because construction equipment is already present in the Project Area as part of the existing construction site for the Viaduct Replacement Project.

Therefore, views to the Downtown LA skyline would not change substantially when compared to existing conditions. Impacts would be less than significant and no mitigation is required.

I(c): Substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.

The Project Area is in an urbanized area that includes the following land use designations: Limited Industrial (zoned M1), Light Industrial (zoned M2), Heavy Industrial (zoned M3), Open Space (zoned OS) within the LA River, and Public Facilities (zoned PF). In addition, the entire Project Area west of U.S. 101 is zoned RIO. Los Angeles zoning code and regulations would not prohibit any of the proposed construction activities. Staging during construction of the proposed Project would be coordinated with the construction of the Viaduct Replacement Project; therefore, the proposed Project would not require the additional use or acquisition of public space for equipment and vehicles.

Short-term construction impacts to the existing scenic quality of the Project Site and its surrounding area would be temporary in nature and all construction equipment and machinery would be removed upon completion of the project. The construction area would be fenced to obscure views of construction activities, materials, and staged equipment. In addition, the Project Area currently contains equipment and machinery that are being used for the construction of the Viaduct Replacement Project. Therefore, construction of the proposed Project would not result in substantial visual changes that would conflict with applicable zoning and other regulations governing scenic quality. Impacts would be less than significant, and no mitigation is required.

Construction of the proposed Project would require the use of construction vehicles that would include cranes and drill rig trucks, among other vehicles and equipment, that may exceed 60 feet in height above ground elevation. However, shading from construction vehicles would be temporary due to the constant mobility of the vehicles throughout the Project Site. Therefore, construction equipment and vehicles related to the proposed Project would not result in a significant impact on shading in the project area, during the construction of the proposed Project. Impacts would be less than significant, and no mitigation is required.

I(d): Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

The proposed Project is in an urban area with many sources of ambient illumination, including light emitted from commercial and industrial properties and lampposts lining the streets surrounding the construction site, as well as from the headlights of vehicles traveling through the Project Area. The nearest sensitive receptors are residences near the intersection of South Clarence Street and Inez Street, located approximately 0.6 miles north of the nearest construction activities. The areas directly surrounding the proposed park are primarily vacant or occupied by industrial or commercial properties that would not be sensitive to spillover light. Therefore, impacts would be less than significant, and no mitigation is required.

Construction of the proposed Project would not create a substantial source of light or glare that would adversely affect daytime views in the area; however, nighttime views may be affected. During

construction of the proposed Project, perimeter lighting may be required on the construction site for security and safety purposes during nighttime. If nighttime lighting at the construction site is required, lighting would be directed downward, on-site, and away from surrounding land uses. Spillover light would be minimized to the greatest extent feasible so that it would not interfere with functions of adjacent properties including vision, sleep, privacy, and general enjoyment of the natural nighttime condition. Because the proposed Project would comply with the provisions in the City's Municipal Code, including; LAMC Chapter 1, Article 2, Sec. 12.21A5(k); LAMC Chapter 1, Article 7, Sec. 17.08C; and LAMC Chapter 9, Article 3, Section 93.0117, it is not expected to result in new sources of substantial light or glare.

3.1.4.5 Operational Impacts

I(a): Have a substantial adverse effect on a scenic vista.

There are no officially designated scenic vistas, resources, or highways that are within the Project Area or visible from the Project Area. However, the Downtown LA skyline could be considered a valued viewshed by residents, pedestrians, bicyclists, and motorists of the Central City North and Boyle Heights neighborhoods.

The proposed Project would not introduce vertical elements tall enough to obstruct views of the Downtown Los Angeles skyline. Approximately 5.8 acres of the 13-acres PARC would be under the Viaduct. The proposed Project would include design components that would occur primarily at ground level or underneath the Viaduct, including the addition of pedestrian walking trails, bike paths, sports fields and courts, performance lawns and stages, public seating areas, open grass areas and landscaping, and pet play areas. The addition of vertical structures, such as large vegetation, trees, public art pieces, and general site and sports field lighting would also be included; however, none of the proposed elements would have the potential to block any scenic vistas. The art pieces would be located within the West Park and potentially East Park and would be up to 30 feet tall. The art pieces would not be directly under the Viaduct and could therefore cause shade within the boundaries of the parks. However, the shade would be limited to the immediate vicinity of the art pieces and would not affect adjacent properties. In addition, the art pieces would not be tall enough to block views of the DTLA skyline, which would still be visible from other viewpoints. The skyline would continue to be visible to all motorists, residents, visitors, and pedestrians. Therefore, impacts would be less than significant, and no mitigation is required.

I(c): Substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality.

As discussed in Section 3.1.4.4, the Project Area is in an urbanized area that includes the following land use designations: Limited Industrial (zoned M1), Light Industrial (zoned M2), Heavy Industrial (zoned M3), Open Space (zoned OS) within the LA River, and Public Facilities (zoned PF). In addition, the entire Project Area west of U.S. 101 is zoned RIO. Once the necessary approvals are obtained, the proposed Project would be consistent with the zoning code and regulations governing the Project Area (see Section 3.10, Land Use and Planning, for additional information). The City's Bureau of Engineering (BOE) would work with the Los Angeles Department of City Planning to ensure that the proposed Project is consistent with any future zoning changes within the Project Area. The proposed Project was designed to be

consistent with the design guidelines established for the RIO District, which include the Los Angeles River Revitalization Master Plan and LA River Design Guidebook. In addition, lighting would be consistent with the regulations outlined in the LAMC and the Bureau of Street Lighting Design Standards.

The proposed Project would substantially improve the scenic quality of the Project Site with the addition of the West Park, Arts Plaza and River Gateway, and East Park in the neighborhoods of Central City North and Boyle Heights. **Figure 3.1-8** through **Figure 3.1-15** (see pages 3.1-21 through 3.1-24) demonstrate simulated operational views from KOPs within the Project Area.

Key components of the proposed Project would include sports fields, open grass areas, multipurpose sports courts, pedestrian and bicycle paths, performance stages, pet play areas, art pieces and associated interpretive exhibits. These proposed Project elements would result in a substantial aesthetic improvement from the existing construction site.

The proposed Project would increase the number of trees and provide new vegetation in the form of gardens, meadows, and lawns. The proposed Project would also include reinforced concrete planted terraces on the west and east banks of the LA River. These new elements would provide shade throughout the Project Site and would add a greater variation in natural texture, color, and landscape to the area, thereby improving the scenic quality of the area. Landscaping would be consistent with the design guidelines established for the RIO District.

When facing west, views of the Downtown Los Angeles skyline would continue to be visible from the Project Area. The proposed Project, with its series of natural landscaping, open space, and social and recreational areas, would be more vivid in appearance than the existing construction site and the industrialized portions of Central City North and Boyle Heights within the Project Area. The effects on the visual intactness and unity of the view would generally be positive and are expected to improve the scenic quality of the area.

Residents, pedestrians, local business employees, and commuters within and in proximity to the Project Area would have clear views of the new park and would most likely notice changes to the visual environment caused by the proposed Project from all of the KOPs. However, awareness of the changed area would diminish over time as the new facility becomes a familiar component within the overall viewshed. Therefore, the scenic quality of the Project Area is expected to improve as a result of the proposed Project. As such, the proposed Project would not conflict with applicable zoning and other regulations governing scenic quality. Therefore, impacts would be less than significant, and no mitigation is required.

Additionally, the proposed Project would not include any light-blocking structures that would exceed 60 feet in height above the ground elevation. Therefore, structures to the proposed Project would not result in a significant impact on shading in the project area, during operation of the proposed Project. Impacts would be less than significant, and no mitigation is required.

I(d): Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

The proposed Project is in an urban area with many sources of ambient illumination, including light emitted from commercial and industrial properties and lampposts lining the streets surrounding the construction site, as well as from the headlights of vehicles traveling through the Project Area. Because

the proposed Project is in an industrial area, there are few receptors in the Project Area, such as residences, that would be sensitive to spillover light. The nearest sensitive receptors are residences near the intersection of South Clarence Street and Inez Street, located approximately 0.6 mile north of the nearest lighting features. The areas directly surrounding the proposed park are primarily vacant or occupied by industrial or commercial properties that would not be sensitive to spillover light.

The proposed Project would introduce new lighting along the sidewalks, playgrounds, performance stages, and sports areas to increase public safety and visibility. Areas within the proposed Project Site that demonstrate a high need for nighttime lighting include the LA River Access Tunnel, restrooms, and the sports fields and performance areas.

Lighting for security would be installed throughout the Project Site to protect people and property and illuminated in accordance with the Illuminating Engineering Society (IES) standards, *IES RP-33-14 Lighting for Exterior Environments* and IES G-1-03 *Security Lighting for People, Property and Public Spaces*, as updated by IES G-1-16 *Guide for Security Lighting for People, Property and Critical Infrastructure*. Luminaires with shielded optics would be used, and the proposed Project would be designed to infill lighting in areas where architectural and bridge elements could impede the flow of light. Security lighting would not adversely affect daytime or nighttime views in the area.

The sports fields and performance areas would feature switchable and dimmable lights to reduce lighting when these facilities are not in use. Lighting would be directed on-site, and spillover light would be minimized to the greatest extent feasible so that it would not interfere with functions of adjacent properties including vision, sleep, privacy, and general enjoyment of the natural nighttime condition. Light levels would be gradually reduced when moving away from the high illuminance sports fields. In addition, the use of outdoor lighting for recreational activities would be limited to the proposed operating hours, between 5:00 a.m. and 10:30 p.m. in accordance with LAMC Sec. 63.44. In addition, the proposed Project would not include surfaces that would produce glare. Therefore, the proposed Project would not create new sources of substantial light or glare that would adversely affect daytime or nighttime views in the area.

The new walkway lighting would be compliant with all regulations set forth by the City's Bureau of Street Lighting *Design Standards and Guidelines* to ensure that the area receives lighting that meets national illumination standards for vehicular and pedestrian traffic, does not emit light pollution, and produces little glare (Bureau of Street Lighting, 2007). In addition, the lighting for the proposed sports fields and courts would operate in compliance with Los Angeles City Recreation and Parks (RAP) illuminance level standards for outdoor sports and recreational facilities. RAP illuminance level standards are measured in horizontal foot candles, which refer to the amount of light being received on a horizontal surface. Los Angeles City RAP standards for the proposed Project would include illumination levels of 30-foot candles average over the entire area of basketball courts and 30-foot candles average over soccer fields. With adherence to the City's *Design Standards and Guidelines*, the City's RAP illuminance standard levels, and the provisions in the City's Municipal Code, including LAMC Chapter 1, Article 2, Sec. 12.21A5(k); LAMC Chapter 1, Article 7, Sec. 17.08C; and LAMC Chapter 9, Article 3, Section 93.0117, the proposed Project would not result in substantial light or glare effects. Therefore, impacts would be less than significant, and no mitigation is required.

3.1.5 Best Management Practices

BMP-AES-1: Construction Lighting

If nighttime lighting at the construction site is required, lighting shall be directed downward, on-site, and away from surrounding land uses.

BMP-AES-2: Construction Staging and Construction Staging Area

Construction staging shall be coordinated with the construction of the Viaduct Replacement Project; therefore, additional use or acquisition of public space for equipment and vehicles will not be required. The construction area shall be fenced to obscure views of construction activities, materials, and staged equipment.

BMP-AES-3: Operational Lighting

Outdoor lighting for recreational activities shall be limited to the proposed operating hours.

BMP-AES-4: Regulatory Requirements for Lighting

- Proposed Project illumination shall comply with the provisions in the City's Municipal Code, including LAMC Chapter 1, Article 2, Sec. 12.21A5(k); LAMC Chapter 1, Article 7, Sec. 17.08C; and LAMC Chapter 9, Article 3, Section 93.0117.
- The new walkway lighting shall be compliant with all regulations set forth by the City's Bureau of Street Lighting Design Standards and Guidelines to ensure that the area receives lighting that meets national illumination standards for vehicular and pedestrian traffic, does not emit light pollution, and produces little glare.
- Lighting for sports fields and courts shall operate in compliance with Los Angeles City Recreation and Parks (RAP) illuminance level standards for outdoor sports and recreational facilities.
- Lighting for security shall be illuminated in accordance with the Illuminating Engineering Society (IES) standards, IES RP-33-14 *Lighting for Exterior Environments* and IES G-1-03 *Security Lighting for People, Property and Public Spaces*, as updated by IES G-1-16 *Guide for Security Lighting for People, Property and Critical Infrastructure*.

3.1.6 Mitigation Measures

Impacts related to Aesthetics would be less than significant; therefore, no mitigation measures are required.

3.1.7 Significant Unavoidable Adverse Impacts

There are no significant unavoidable adverse impacts on Aesthetics resulting from construction and operation of the proposed Project.

3.1.8 Cumulative Impacts

The cumulative study area for Aesthetics impacts includes the locations that have clear sightlines to the proposed Project. Of the projects included in **Table 1-1**, the only projects with clear sightlines to the

proposed Project are the Viaduct Replacement Project, 670 Mesquite Project, and Metro Arts District Rail Yard. The proposed Project is designed to complement the aesthetics of the Viaduct Replacement Project. The 670 Mesquite Project design approach is intended to complement the industrial character of the Arts District. The proposed building materials would include concrete, steel, and glass, reflecting materials prevalent in the neighborhood. The Metro Art District Rail Yard would involve the construction of a new Metro line that would include visual changes consistent with the existing setting and surrounding environment. All development projects would be evaluated on whether they are consistent with the City's design guidelines, policies, and development standards. Therefore, these projects are not expected to adversely affect visual character and quality or result in effects that are potentially cumulatively significant.

The proposed Project would be designed in compliance with the City's design guidelines, policies, and development standards and would result in less than significant impacts related to Aesthetics. Therefore, the proposed Project is not expected to contribute to significant cumulative impacts related to Aesthetics.

3.2 Air Quality

This section describes the affected environment and regulatory setting for Air Quality related to the Project Area. In addition, this section describes the potential impacts related to Air Quality that would result from the implementation of the proposed Project. As noted in the analysis below, impacts associated with Air Quality during construction and operation of the proposed Project would be less than significant with the incorporation of mitigation measures.

The information in this section is based on the *Air Quality and Greenhouse Gas Impact Assessment* (AMBIENT Air Quality & Noise Consulting, 2019) prepared for the proposed Project. Air quality and greenhouse gas emissions were generated for an opening year of 2021 (AMBIENT Air Quality & Noise Consulting, 2019). Due to project delays, it is now anticipated that the park will open in 2024. There is not anticipated to be a substantial difference in projected emissions from 2021 to 2024 and emissions in 2024 may be slightly lower due to continual improvement in vehicle and equipment emission standards.

3.2.1 Regulatory Setting

A review of the various federal, state, regional, and local government regulatory requirements was conducted to identify regulations that relate to Air Quality. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

3.2.1.1 Applicable Regulations

Federal

U.S. Environmental Protection Agency

At the federal level, the U.S. Environmental Protection Agency (U.S. EPA) oversees the implementation of national air quality programs by state, local, and tribal governments (U.S. Environmental Protection Agency, 2018c). The U.S. EPA's air quality mandates are drawn primarily from the Federal Clean Air Act (FCAA), which was signed into law in 1970. Congress substantially amended the FCAA in 1977 and again in 1990.

Federal Clean Air Act

For the protection of public health and welfare, the FCAA requires that the U.S. EPA establish National Ambient Air Quality Standards (NAAQS) for various pollutants and set deadlines for their attainment. These pollutants are referred to as "criteria" pollutants because the U.S. EPA publishes criteria documents to justify the choice of standards. These standards define the maximum amount of an air pollutant that can be present in ambient air. An ambient air quality standard is generally specified as a concentration averaged over a specific time period, such as one hour, eight hours, 24 hours, or one year. The different averaging times and concentrations are meant to protect against different exposure effects. Standards established for the protection of human health are referred to as primary standards; whereas, standards established for the prevention of environmental and property damage are called secondary standards. The FCAA allows states to adopt additional or more health-protective standards.

Two types of NAAQS have been established: (1) primary standards that protect public health, and (2) secondary standards that protect public welfare from non-health-related adverse effects, such as

visibility restrictions. NAAQS were established for the following criteria pollutants: lead (Pb), ozone (O_3), particulate matter (PM_{10}), carbon monoxide (CO), nitrogen dioxide (NO_2), and sulfur dioxide (SO_2), which are summarized in **Table 3.2-1**.

Table 3.2-1: Summary of Ambient Air Quality Standards and Attainment Designations

Pollutant	Averaging Time	CAAQS		NAAQS	
		Concentration	Attainment Status	Primary	Attainment Status
Ozone (O_3)	1-hour	0.09 ppm	Non-Attainment	–	Non-Attainment (Extreme)
	8-hour	0.070 ppm		0.070 ppm	
Particulate Matter (PM_{10})	AAM	20 µg/m^3	Non-Attainment	–	Attainment/ Maintenance
	24-hour	50 µg/m^3		150 µg/m^3	
Fine Particulate Matter ($PM_{2.5}$)	AAM	12 µg/m^3	Non-Attainment	12 µg/m^3	Non-Attainment (Serious)
	24-hour	No Standard		35 µg/m^3	
Carbon Monoxide (CO)	1-hour	20 ppm	Attainment	35 ppm	Attainment/ Maintenance
	8-hour	9 ppm		9 ppm	
Nitrogen Dioxide (NO_2)	AAM	0.030 ppm	Attainment	0.053 ppm	Unclassified/ Attainment
	1-hour	0.18 ppm		0.100 ppb[b]	
Sulfur Dioxide (SO_2)	AAM	–	Attainment	0.03 ppm	Unclassified/ Attainment
	24-hour	0.04 ppm		0.14 ppm	
	3-hour	–		--	
	1-hour	0.25 ppm		75 ppb	
Lead (Pb)	30-day Average	1.5 µg/m^3	Attainment	–	Non-Attainment (Partial)
	Calendar Quarter	–		1.5 µg/m^3	
	Rolling 3-Month Average	–		0.15 µg/m^3	
Sulfates	24-hour	25 µg/m^3	Attainment	No Federal Standards	

Pollutant	Averaging Time	CAAQS		NAAQS	
		Concentration	Attainment Status	Primary	Attainment Status
Hydrogen Sulfide	1-hour	0.03 ppm (42 µg/m^3)	Unclassified	No Federal Standards	
Vinyl Chloride	24-hour	0.01 ppm (26 µg/m3)	Attainment	No Federal Standards	
Visibility-Reducing Particle Matter	8-hour	Extinction coefficient: 0.23/kilometer-visibility of 10 miles or more (0.07-30 miles or more for Lake Tahoe) due to particles when the relative humidity is less than 70%.	Unclassified	No Federal Standards	

CAAQS = California Ambient Air Quality Standards; NAAQS = National Ambient Air Quality Standards; AAM = annual arithmetic mean; ppm = parts per million; ppb = parts per billion; µg/m^3 = microgram per cubic meter
Source: (South Coast Air Quality Management District, 2016)

The FCAA also requires each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The FCAA Amendments of 1990 added requirements for states with non-attainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. The SIP is periodically modified to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins as reported by their jurisdictional agencies. The U.S. EPA must review all SIPs to determine whether they conform to the mandates of the FCAA and the amendments thereof and to determine whether implementing them will achieve air quality goals. If the U.S. EPA determines a SIP to be inadequate, a Federal Implementation Plan that imposes additional control measures may be prepared for the non-attainment area. Failure to submit an approvable SIP or to implement the plan within the mandated time frame may cause sanctions to be applied to transportation funding and stationary air pollution sources in the air basin.

Toxic Substances Control Act

The Toxic Substances Control Act (TSCA) first authorized the U.S. EPA to regulate asbestos in schools and Public and Commercial buildings under Title II of the law, which is also known as the Asbestos Hazard Emergency Response Act (AHERA). AHERA requires Local Education Agencies to inspect their schools for asbestos-containing materials (ACM) and to prepare management plans to reduce the asbestos

hazard. The TSCA also established a program for the training and accreditation of individuals performing certain types of asbestos work.

National Emission Standards for Hazardous Air Pollutants

Pursuant to the FCAA, the U.S. EPA established the National Emission Standards for Hazardous Air Pollutants (NESHAP). NESHAP are technology-based source-specific regulations that limit allowable emissions of hazardous air pollutants and include asbestos-containing building material. NESHAPs pertain to the inspection, notification, handling, and disposal of asbestos-containing building material associated with the demolition and renovation of structures.

State

California Air Resources Board

The California Air Resources Board (CARB) is the agency responsible for coordination and oversight of State and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA) of 1988. Other CARB duties include monitoring air quality (in conjunction with air monitoring networks maintained by air pollution control districts and air quality management districts); establishing the California Ambient Air Quality Standards (CAAQS), which in many cases are more stringent than the NAAQS; and setting emissions standards for new motor vehicles. The CAAQS are summarized in **Table 3.2-1**. The emission standards established for motor vehicles differ depending on various factors including the model year, and the type of vehicle, fuel and engine used.

California Clean Air Act

The CCAA requires that all air districts in the State endeavor to achieve and maintain CAAQS for O_3, CO, SO_2, and NO_2 by the earliest practical date. The CCAA specifies that districts focus particular attention on reducing the emissions from transportation and area-wide emission sources, and the act provides districts with authority to regulate indirect sources. Each district plan is required to either (1) achieve a five percent annual reduction, averaged over consecutive 3-year periods, in district-wide emissions of each non-attainment pollutant or its precursors, or (2) to provide for implementation of all feasible measures to reduce emissions. Any planning effort for air quality attainment would thus need to consider both State and Federal planning requirements.

Assembly Bills 1807 & 2588 – Toxic Air Contaminants

Within California, Toxic Air Contaminants (TAC) are regulated primarily through AB 1807 (Tanner Air Toxics Act) and AB 2588 (Air Toxics Hot Spots Information and Assessment Act of 1987). The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. This includes research, public participation, and scientific peer review before CARB designates a substance as a TAC. Existing sources of TACs that are subject to the Air Toxics Hot Spots Information and Assessment Act are required to: (1) prepare a toxic emissions inventory; (2) prepare a risk assessment if emissions are significant; (3) notify the public of significant risk levels; and (4) prepare and implement risk reduction measures.

In-Use Off-Road Diesel Vehicle Regulation

On July 26, 2007, the CARB adopted the *In-Use Off-Road Diesel Fueled Fleets Regulation* to reduce diesel-exhaust particulate matter (DPM) and oxides of nitrogen (NO_x) emissions from in-use (existing) off-road

heavy-duty diesel vehicles in California (California Air Resources Board, 2019a). The regulation applies to self-propelled diesel-fueled vehicles that cannot be registered and licensed to drive on-road, as well as two-engine vehicles that drive on road, with the limited exception of two-engine sweepers. Examples include loaders, crawler tractors, skid steers, backhoes, forklifts, airport ground support equipment, water well drilling rigs, and two-engine cranes. Such vehicles are used in construction, mining, and industrial operations. The regulation does not apply to stationary equipment or portable equipment such as generators. The off-road vehicle regulation establishes emissions performance requirements, establishes reporting, disclosure, and labeling requirements for off-road vehicles, and limits unnecessary idling (California Air Resources Board, 2016).

Regional

South Coast Air Quality Management District

Because Southern California has one of the worst air quality problems in the Nation, the South Coast Air Quality Management District (SCAQMD) was created by the 1977 Lewis Air Quality Management Act (South Coast Air Quality Management District, 2005). Four county air pollution control agencies were merged into one regional district to better address the issue of improving air quality in Southern California (South Coast Air Quality Management District, 2005). Under the Lewis-Presley Air Quality Management Act, which revised the Lewis Air Quality Management Act, the SCAQMD is the agency principally responsible for comprehensive air pollution control in the South Coast Air Basin (SCAB). SCAB includes portions of Los Angeles, Riverside, and San Bernardino counties and all of Orange County. Specifically, the SCAQMD is responsible for monitoring air quality and planning, implementing, and enforcing programs designed to attain and maintain State and Federal ambient air quality standards in the SCAQMD. Programs developed include air quality rules and regulations that regulate stationary source emissions, including area and point sources and certain mobile source emissions. The SCAQMD is also responsible for establishing permitting requirements and issuing permits for stationary sources and ensuring that new, modified, or relocated stationary sources do not create net emissions increases. The SCAQMD enforces air quality rules and regulations through a variety of means, including inspections, educational and training programs, and fines.

Specific SCAQMD rules applicable to the construction of the proposed Project may include, but are not limited to:

- *Rule 401 – Visible Emissions*: A person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart, as published by the United States Bureau of Mines.
- *Rule 402 – Nuisance*: A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property. The provisions of this rule do not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.

- *Rule 403 – Fugitive Dust*: This rule is intended to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (man-made) fugitive dust sources by requiring actions to prevent, reduce, or mitigate fugitive dust emissions. Rule 403 applies to any activity or man-made condition capable of generating fugitive dust.
- *Rule 1113 – Architectural Coatings*: No person shall apply or solicit the application of any architectural coating within the SCAQMD, with a volatile organic compound (VOC) content in excess of the values specified in a table incorporated in the Rule.
- *Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil*. The rule sets requirements to control the emission of VOCs during the excavating, grading, handling, and/or treating of VOC-contaminated soil. Prior to these activities, an approved mitigation plan must be obtained from SCAQMD.
- *Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants*. This rule requires notification, monitoring, and record keeping for earth-moving activities of soil with applicable toxic air contaminant(s) of greater than 50 cubic yards at a site that has been designated and notified by the following: (A) U.S. EPA as a Superfund National Priorities List site; (B) DTSC as a Brownfield or Cleanup Program site; (C) the State Water Resources Control Board or RWQCB as a Site Cleanup Program site; (D) a county, local, or state regulatory agency as a Hazardous Material Release site, as defined in California Health and Safety Code Section 25260; or (E) the Executive Officer pursuant to subdivision (i).

The SCAQMD is also the lead agency in charge of developing the Air Quality Management Plan (AQMP), with input from the Southern California Association of Governments (SCAG) and CARB. The AQMP is a comprehensive plan that includes control strategies for stationary and area sources, as well as for on-road and off-road mobile sources. SCAG has the primary responsibility for providing future growth projections and the development and implementation of transportation control measures. CARB, in coordination with federal agencies, provides the control element for mobile sources.

Southern California Association of Governments

SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. Under federal law, SCAG is designated as a Metropolitan Planning Organization (MPO) and under State law as a Regional Transportation Planning Agency and a Council of Governments.

On September 3, 2020, SCAG adopted Connect SoCal: The 2020-2045 RTP/SCS (Southern California Association of Governments, 2020). The RTP is a long-range transportation plan that provides a vision for regional transportation investments over a period of 20 years or more. The SCS demonstrates the integration of land use, transportation strategies, and transportation investments within the Plan. SCAG is also responsible under the FCAA for determining federal air quality conformity of projects, plans, and programs within the SCAQMD.

The 2020-2045 RTP/SCS would also help to reduce vehicle delay and vehicle miles traveled (VMT) within the region. On a per capita basis, vehicle delay would be reduced by roughly 26 percent and heavy-duty truck delay on highways 24 percent. VMT per capita would be reduced by five percent and vehicle hours

traveled (VHT) would be reduced by approximately nine percent per capita (Southern California Association of Governments, 2020).

Air Quality Management Plan

The 2016 AQMP was adopted by the SCAQMD Governing Board on March 3, 2017 (South Coast Air Quality Management District, 2017). The 2016 AQMP seeks to achieve multiple goals in partnership with other entities to promote reductions of criteria air pollutants, greenhouse gases, and toxic air contaminants. The AQMP also promotes increased efficiencies in energy use, transportation, and goods movement. The 2016 AQMP also includes transportation control measures developed by SCAG from the 2016-2040 RTP/SCS. The 2016 AQMP includes the integrated strategies and measures necessary to demonstrate attainment of the 1-hr and 8-hr ozone NAAQS as well as the latest 24-hr and annual $PM_{2.5}$ standards.

Local

City of Los Angeles General Plan

The City has adopted the Air Quality Element of the General Plan to aid in attaining State and Federal ambient air quality standards at the earliest feasible date, while still maintaining economic growth and improving quality of life (City of Los Angeles, 1992). The Air Quality Element establishes the following goals that are intended to improve air quality throughout the City:

- Good air quality and mobility in an environment of continued population growth and healthy economic structure;
- Less reliance on single-occupant vehicles with fewer commute and non-work trips;
- Efficient management of transportation facilities and system infrastructure using cost- effective system management and innovative demand-management techniques;
- Minimal impact of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality;
- Energy efficiency through land use and transportation planning, the use of renewable resources and less-polluting fuels, and the implementation of conservation measures including passive methods such as site orientation and tree planting; and
- Citizen awareness of the linkages between personal behavior and air pollution, and participation in efforts to reduce air pollution.

3.2.1.2 Regulatory Attainment Designations

Under the CCAA, the CARB is required to designate areas of the State as attainment, nonattainment-transitional, nonattainment, or unclassified with respect to applicable standards. An "attainment" designation for an area signifies that pollutant concentrations did not violate the applicable standard in that area. A "nonattainment" designation indicates that a pollutant concentration violated the applicable standard at least once, excluding those occasions when a violation was caused by an exceptional event, as defined in the criteria. Depending on the frequency and severity of pollutants exceeding applicable standards, the nonattainment designation can be further classified as serious nonattainment, severe nonattainment, or extreme nonattainment, with extreme nonattainment being the most severe of the

classifications. An "unclassified" designation signifies that the data does not support either an attainment or nonattainment designation. The CCAA divides districts into moderate, serious, and severe air pollution categories, with increasingly stringent control requirements mandated for each category. In accordance with the FCAA, areas are designated attainment, nonattainment, or maintenance.

The U.S. EPA designates areas for ozone, CO, and NO_2 as "does not meet the primary standards," "cannot be classified," or "better than national standards." For SO_2, areas are designated as "does not meet the primary standards," "does not meet the secondary standards," "cannot be classified," or "better than national standards." However, the CARB terminology of attainment, nonattainment, and unclassified is more frequently used. The U.S. EPA uses the same sub-categories for nonattainment status: serious, severe, and extreme, as well as moderate and marginal. In 1991, U.S. EPA assigned new nonattainment designations to areas that had previously been classified as Group I, II, or III for PM_{10} based on the likelihood that they would violate national PM_{10} standards. All other areas are designated "unclassified."

The state and national attainment status designations for the SCAB are summarized in **Table 3.2-1**. The SCAB is currently designated as a nonattainment area with respect to the State ozone, PM_{10}, and $PM_{2.5}$ standards, as well as the national 8-hour ozone and $PM_{2.5}$ standards. In addition, based on monitoring data obtained near a lead acid battery reclamation facility, Los Angeles County is currently designated nonattainment for the Federal lead standard (South Coast Air Quality Management District, 2012). With the exception of Los Angeles County, the remainder of the SCAB is designated attainment for the lead standards. The SCAB is designated attainment or unclassified for the remaining State and Federal standards.

3.2.1.3 Relevant Air Pollutants

Criteria Air Pollutants

The following provides a summary discussion of the criteria air pollutants of primary concern:

Ozone (O_3)

O_3 is a reactive gas consisting of three atoms of oxygen. In the troposphere, it is a product of the photochemical process involving the sun's energy. It is a secondary pollutant that is formed when NO_x and VOCs, also referred to as reactive organic gases (ROG) react in the presence of sunlight. O_3 is a major component of smog. In the stratosphere, O_3 exists naturally and shields Earth from harmful incoming ultraviolet radiation.

High concentrations of ground level O_3 can adversely affect the human respiratory system and aggravate lung diseases (U.S. Environmental Protection Agency, 2018b). O_3 can also have negative impacts on ecosystems, including the loss of species diversity, changes to habitat quality, and changes to water and nutrient cycles (U.S. Environmental Protection Agency, 2017a).

Reactive Organic Gas

ROG is a reactive chemical gas, composed of hydrocarbon compounds that may contribute to the formation of smog by their involvement in atmospheric chemical reactions. No separate health standards exist for ROG as a group. Because some compounds that make up ROG are also toxic, like the carcinogen benzene, they are often evaluated as part of a toxic risk assessment. Total Organic Gases (TOGs) includes

all of the ROGs, in addition to low reactivity organic compounds like methane and acetone. ROGs and VOC are subsets of TOG.

VOCs are hydrocarbon compounds that exist in the ambient air. VOCs contribute to the formation of smog and may also have short- and long-term adverse health effects (U.S. Environmental Protection Agency, 2017d; U.S. Environmental Protection Agency, 2017e). VOC emissions are a major precursor to the formation of ozone. VOCs may also be odorous. VOCs are found in gasoline, alcohol, and in some paints.

Oxides of Nitrogen

NO_x are a family of gaseous nitrogen compounds and is a precursor to the formation of ozone and particulate matter. The major component of NO_x, NO_2, is a reddish-brown gas that is toxic at high concentrations. NO_x results primarily from the combustion of fossil fuels under high temperature and pressure. On-road and off-road motor vehicles and fuel combustion are the major sources of this air pollutant.

Particulate Matter

Particulate Matter (PM), also known as particle pollution, is a complex mixture of extremely small particles and liquid droplets. Particle pollution is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is causally linked to the potential for causing health problems. U.S. EPA is concerned about particles that are 10 micrometers in diameter or smaller because those are the particles that generally pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects (U.S. Environmental Protection Agency, 2018a). U.S. EPA groups particle pollution into three categories based on their size and where they are deposited:

- "Inhalable coarse particles ($PM_{2.5}$ - PM_{10})," such as those found near roadways and dusty industries, are between 2.5 and 10 micrometers in diameter. $PM_{2.5}$ - PM_{10} is deposited in the thoracic region of the lungs.
- "Fine particles ($PM_{2.5}$)," such as those found in smoke and haze, are 2.5 micrometers in diameter and smaller. These particles can be directly emitted from sources such as forest fires, or they can form when gases emitted from power plants, industries and automobiles react in the air. They penetrate deeply into the thoracic and alveolar regions of the lungs.
- "Ultrafine particles (UFP)," are very small particles less than 0.1 micrometers in diameter largely resulting from the combustion of fossils fuels, meat, wood, and other hydrocarbons. While UFP mass is a small portion of $PM_{2.5}$, its high surface area, deep lung penetration, and transfer into the bloodstream can result in disproportionate health impacts relative to their mass. (U.S. Environmental Protection Agency, 2017c)

PM_{10}, $PM_{2.5}$, and UFP include primary pollutants (emitted directly to the atmosphere) as well as secondary pollutants (formed in the atmosphere by chemical reactions among precursors). Generally speaking, $PM_{2.5}$ and UFP are emitted by combustion sources like vehicles, power generation, industrial processes, and wood burning, while PM_{10} sources include these same sources plus roads and farming activities. Fugitive windblown dust and other area sources also represent a source of airborne dust.

Numerous scientific studies have linked both long- and short-term particle pollution exposures to a variety of health problems. Long-term exposures, such as those experienced by people living for many years in areas with high particle levels, have been associated with problems such as reduced lung function and the development of chronic bronchitis, and even premature death. Short-term exposures to particles (hours or days) can aggravate lung disease, causing asthma attacks and also acute (short-term) bronchitis, and may also increase susceptibility to respiratory infections. In people with heart disease, short-term exposures have been linked to heart attacks and arrhythmias. Healthy children and adults have not been reported to suffer serious effects from short term exposures, although they may experience temporary minor irritation when particle levels are elevated. (U.S. Environmental Protection Agency, 2017b)

Carbon Monoxide

Carbon monoxide (CO) is an odorless, colorless gas that is highly toxic. It is formed by the incomplete combustion of fuels and is emitted directly into the air (unlike O_3). The main source of CO is on-road motor vehicles. Other CO sources include other mobile sources, miscellaneous processes, and fuel combustion from stationary sources. Because of the local nature of CO problems, CARB and U.S. EPA designate urban areas as CO nonattainment areas instead of the entire basin as with ozone and PM_{10}. Motor vehicles are by far the largest source of CO emissions. Emissions from motor vehicles have been declining since the mid-1970s, despite increases in vehicle miles traveled, with the introduction of new automotive emission controls and fleet turnover (California Air Resources Board, 2005b).

Sulfur Dioxide

Sulfur dioxide (SO_2), the most common sulfur oxide (SO_x), is a colorless, irritating gas with a "rotten egg" smell formed primarily by the combustion of sulfur-containing fossil fuels. Like airborne NO_x, suspended SO_x particles contribute to poor visibility. These SO_x particles can also combine with other pollutants to form $PM_{2.5}$. The prevalence of low-sulfur fuel use has minimized problems from this pollutant.

Lead

Lead (Pb) is a metal that is a natural constituent of air, water, and the biosphere. Lead is neither created nor destroyed in the environment, so it essentially persists forever. The health effects of lead poisoning include loss of appetite, weakness, and miscarriage (Centers for Disease Control and Prevention, 2018). Lead can also cause lesions of the neuromuscular system, circulatory system, brain, and gastrointestinal tract. Gasoline-powered automobile engines were a major source of airborne lead through the use of leaded fuels. The use of leaded fuel has been mostly phased out, with the result that ambient concentrations of lead have dropped dramatically (U.S. Environmental Protection Agency, 2013).

Hydrogen Sulfide

Hydrogen Sulfide (H_2S) is associated with geothermal activity, oil and gas production, refining, sewage treatment plants, and confined animal feeding operations. Hydrogen sulfide is extremely hazardous in high concentrations; especially in enclosed spaces (800 parts per million [ppm] can cause death) (Centers for Disease Control and Prevention, 2014). The Occupational Safety and Health Administration (OSHA) regulates workplace exposure to H_2S.

Other Pollutants

The State of California has established air quality standards for some pollutants not addressed by Federal standards. The CARB has established State standards for hydrogen sulfide, sulfates, vinyl chloride, and visibility reducing particles. The following section summarizes these pollutants and provides a description of the pollutants' physical properties, health and other effects, sources, and the extent of the problems.

Sulfates

Sulfates (SO_4^{2-}) are the fully oxidized ionic form of sulfur. Sulfates occur in combination with metal and/or hydrogen ions. In California, emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to SO_2 during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place comparatively rapidly and completely in urban areas of California due to regional meteorological features.

The CARB sulfates standard is designed to prevent aggravation of respiratory symptoms. Effects of sulfate exposure at levels above the standard include a decrease in ventilator function, aggravation of asthmatic symptoms, and an increased risk of cardio-pulmonary disease. Sulfates are particularly effective in degrading visibility, and, due to the fact that they are usually acidic, can harm ecosystems and damage materials and property.

Visibility Reducing Particles

Visibility reducing particles are a mixture of suspended particulate matter consisting of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. The standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

Vinyl Chloride

Vinyl Chloride (C_2H_3Cl or VCM) is a colorless gas that does not occur naturally. It is formed when other substances such as trichloroethane, trichloroethylene, and tetrachloroethylene are broken down. Vinyl chloride is used to make polyvinyl chloride which is used to make a variety of plastic products, including pipes, wire and cable coatings, and packaging materials.

Odors

Odors are generally regarded as an annoyance rather than a health hazard. However, manifestations of a person's reaction to foul odors can range from the psychological (i.e. irritation, anger, or anxiety) to the physiological, including circulatory and respiratory effects, nausea, vomiting, and headache.

The ability to detect odors varies considerably among the population and overall is quite subjective. Some individuals have the ability to smell very minute quantities of specific substances; others may not have the same sensitivity but may have sensitivities to odors of other substances. In addition, people may have different reactions to the same odor and in fact an odor that is offensive to one person may be perfectly acceptable to another (e.g., fast food restaurant). It is important to also note that an unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. This is because

of the phenomenon known as odor fatigue, in which a person can become desensitized to almost any odor and recognition, only occurs with an alteration in the intensity.

Quality and intensity are two properties present in any odor. The quality of an odor indicates the nature of the smell experience. For instance, if a person describes an odor as flowery or sweet, then the person is describing the quality of the odor. Intensity refers to the strength of the odor. For example, a person may use the word strong to describe the intensity of an odor. Odor intensity depends on the odorant concentration in the air. When an odorous sample is progressively diluted, the odorant concentration decreases. As this occurs, the odor intensity weakens and eventually becomes so low that the detection or recognition of the odor is quite difficult. At some point during dilution, the concentration of the odorant reaches a detection threshold. An odorant concentration below the detection threshold means that the concentration in the air is not detectable by the average human.

Toxic Air Contaminants

TACs are air pollutants that may cause or contribute to an increase in mortality or serious illness, or which may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air, but due to their high toxicity, they may pose a threat to public health even at very low concentrations. Because there is no threshold level below which adverse health impacts are not expected to occur, TACs differ from criteria pollutants for which acceptable levels of exposure can be determined and for which state and federal governments have set ambient air quality standards. TACs, therefore, are not considered "criteria pollutants" under either the FCAA or the CCAA and are thus not subject to NAAQS or CAAQS. Instead, the U.S. EPA and CARB regulate Hazardous Air Pollutants (HAPs) and TACs, respectively, through statutes and regulations that generally require the use of the maximum or best available control technology to limit emissions. In conjunction with District rules, these Federal and State statutes and regulations establish the regulatory framework for TACs. At the national levels, the U.S. EPA has established NESHAPs in accordance with the requirements of the FCAA and subsequent amendments. These are technology-based source-specific regulations that limit allowable emissions of HAPs.

Within California, TACs are regulated primarily through the Tanner Air Toxics Act (AB 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588). The Tanner Act sets forth a formal procedure for CARB to designate substances as TACs. This includes research, public participation, and scientific peer review before CARB designates a substance as a TAC. Existing sources of TACs that are subject to the Air Toxics Hot Spots Information and Assessment Act are required to: (1) prepare a toxic emissions inventory; (2) prepare a risk assessment if emissions are significant; (3) notify the public of significant risk levels; and (4) prepare and implement risk reduction measures.

At the state level, the CARB has authority for the regulation of emissions from motor vehicles, fuels, and consumer products. DPM was identified by the CARB as a TAC in 1998 and is the primary TAC of concern for mobile sources. Of all controlled TACs, emissions of DPM are estimated to be responsible for about 70 percent of the total ambient TAC risk. Health risks associated with DPM are primarily associated with potential cancer risks (California Air Resources Board, 2019b). The CARB has made the reduction of the public's exposure to DPM one of its highest priorities, with an aggressive plan to require cleaner diesel fuel and cleaner diesel engines and vehicles (California Air Resources Board, 2005a).

At the local level, air districts have the authority over stationary or industrial sources. All projects that require air quality permits from the SCAQMD are evaluated for TAC emissions. The SCAQMD limits

emissions and public exposure to TACs through a number of programs. The SCAQMD prioritizes TAC-emitting stationary sources, based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors. The SCAQMD requires a comprehensive health risk assessment for facilities that are classified in the significant-risk category, pursuant to AB 2588.

3.2.2 Environmental Setting

3.2.2.1 Geography

The City of Los Angeles is located in the SCAB (or Basin). The SCAB consists of an approximate 6,600-square mile area bound by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, in addition to the San Gorgonio Pass area of Riverside County. The Basin's terrain and geographical location (i.e., a coastal plain with connecting broad valleys and low hills) cause its distinctive climate.

3.2.2.2 Climate

The regional climate significantly influences the air quality in the Basin. Temperature, wind, humidity, precipitation and even the amount of sunshine influence the quality of the air. Within the SCAB, annual average temperatures, in degrees Fahrenheit (° F), generally range from the low to mid 60's. January is the coldest month throughout the Basin, with average minimum temperatures of 47° F in downtown Los Angeles and 36° F in San Bernardino. All portions of the Basin have recorded maximum temperatures above 100° F. The annual average relative humidity within SCAB generally ranges from 71 percent along the coast to 59 percent inland. More than 90 percent of the Basin's rainfall occurs between the months of November and April. Monthly and yearly rainfall totals are extremely variable within the SCAB. On average, annual rainfall varies from approximately nine inches in Riverside to 14 inches in downtown Los Angeles. The importance of wind to air pollution is considerable. The direction and speed of the wind determines the horizontal dispersion and transport of air pollutants. During the late autumn to early spring rainy season, the Basin is subjected to wind flows associated with traveling storms moving through the region from the northwest. (South Coast Air Quality Management District, 1980)

In the City of Los Angeles, average temperatures generally range from the upper 40's during winter months to the low 80's during the summer months. The warmest month of the year is August, with an average maximum temperature of 83° F; while the coldest month of the year is January, with an average minimum temperature of 48° F. The annual average precipitation in Los Angeles is 14.8 inches. The highest rainfall generally occurs between the months of November and April. (Western Regional Climate Center, 2018)

3.2.2.3 Temperature Inversions

Under normal meteorological conditions, the temperature of the atmosphere decreases with increased altitude. However, when the temperature of the atmosphere increases with altitude, the phenomenon is termed an inversion. These inversions can restrict the vertical mixing of air and pollutants, which can contribute to increased ground-level pollutant concentrations. (South Coast Air Quality Management District, 1980)

In the SCAB, two distinct temperature inversion types commonly occur. The first type of inversion typically occurs during the warmer summer months when high-pressure descending (subsiding) air is undercut by a shallow layer of cool marine air. The boundary between these two layers of air is a persistent marine subsidence/inversion. The second inversion type primarily occurs in the winter, when nights are longer and onshore airflow is weakest. This inversion occurs in conjunction with the nighttime drainage of cool air off the surrounding mountains followed by the seaward drift of this pool of cool air. In general, inversions in the Basin are lower before sunrise than during the daylight hours. As the day progresses, the mixing height normally increases as the warming of the ground heats the surface air layer. The breakup of inversion layers frequently occurs during mid- to late-afternoon on hot summer days. Winter inversions usually break up by mid-morning. (South Coast Air Quality Management District, 1980)

3.2.2.4 Ambient Air Quality and Local Health Risk

Criteria Air Pollutants

Air pollutant concentrations are measured at several monitoring stations in the SCAB. The Los Angeles-North Main Street monitoring station is the closest representative monitoring station with sufficient data to meet U.S. EPA and/or CARB criteria for quality assurance. The Los Angeles-North Main Street monitoring station monitors ambient concentrations of O_3, PM_{10}, $PM_{2.5}$, and NO_2. Ambient monitoring data were obtained for the last three years of available measurement data (i.e., 2014 through 2016) and are summarized in **Table 3.2-2**. As depicted, the State and Federal $PM_{2.5}$, as well as the State O_3 and PM_{10} standards were exceeded on numerous occasions during the past three years. State and Federal standards for NO_2 have not been exceeded during the last three years of available data.

Toxic Air Contaminants

As noted above, the Los Angeles region currently does not meet the State or Federal air quality standards for fine particulate matter ($PM_{2.5}$). In the Los Angeles area, mobile sources are a primary contributor to ambient PM concentrations, including DPM, which poses the most significant health risk. Major sources of DPM in the general vicinity of the Project Site (i.e., project footprint) include railroad operations at nearby railyards, including the Union Pacific Los Angeles Transportation Center (UP LATC) Railyard and the four Commerce Railyards, as well as heavy-duty vehicles on area freeways, including U.S. Route 101 (U.S. 101), Interstate 10 (I-10), and Interstate 5 (I-5).

UP LATC Railyard

The UP LATC Railyard is located at 750 Lamar Street in Los Angeles, California, roughly 1.2 miles north of the Project Site. Activities at the UP LATC Railyard include receiving inbound trains, switching cars, loading and unloading intermodal trains, storing in containers and chassis, building and departing outbound trains, and repairing freight cars and intermodal containers/chassis. The UP LATC Railyard emission sources include, but are not limited to, locomotives, cargo handling equipment, on-road diesel-fueled trucks, other vehicles and off-road equipment, and transport refrigeration units and refrigerated railcars (reefer cars). The facility operates 24 hours a day, 365 days a year.

Table 3.2-2: Summary of Ambient Air Quality Monitoring Data

Pollutant	Monitoring Year		
	2014	2015	2016
Ozone (O_3)			
Maximum concentration (1-hour/8-hour average)	0.113/0.004	0.104/0.074	0.103/0.078
Number of days state/national 1-hour standard exceeded	3/0	2/0	2/0
Number of days state/national 8-hour standard exceeded	7/6	6/6	4/4
Nitrogen Dioxide (NO_2)			
Maximum concentration (1-hour average)	82.1	79.1	64.7
Annual average	22	22	20
Number of days state/national standard exceeded	0/0	0/0	0/0
Suspended Particulate Matter ($PM_{2.5}$)			
Maximum concentration (national/state)	59.9/65.0	56.4/70.3	44.3/49.4
Annual Average (national/state)	NA/ NA	12.3/12.5	11.7/12.0
Number of days national standard exceeded (measured/calculated)	6/NA	7/8.4	2/2.1
Suspended Particulate Matter (PM_{10})			
Maximum concentration (national/state)	66.0/86.8	73.0/88.5	64.0/74.6
Annual Average (national/state)	30.6/30.2	27.1/27.0	25.8/NA
Number of days state standard exceeded (measured/calculated)	38/18.7	30/13.8	21/NA
Number of days national standard exceeded (measured/calculated)	0/0	0/0	0/0

ppm = parts per million by volume, µg/m3 = micrograms per cubic meter, NA=Not Available
1. Based on ambient concentrations obtained from the Los Angeles-North Main Street Monitoring Station.
2. Measured days are those days that an actual measurement was greater than the standard. Calculated days are estimated days that a measurement would have exceeded the standard had measurements been collected every day.
Source: (South Coast Air Quality Management District, 2016)

In 2007, the CARB conducted a health risk assessment to evaluate the impacts associated with toxic air contaminants emitted in and around UP LATC (California Air Resources Board, 2007a). Predicted carcinogenic risk isopleths for the UP LATC are depicted in **Figure 3.2-1,** Potential Estimated Regional Cancer Risks from the Union Pacific Los Angeles Transportation Center Railyard. The potential carcinogenic risk levels associated with the estimated DPM emissions at the UP LATC Railyard are displayed by isopleths, based on the 80th percentile breathing rate and 70-year exposure duration for residents. As shown in **Figure 3.2-1**, the Project Site is located between the predicted 10 and 25 in a million risk carcinogenic risk isopleth of the UP LATC Railyard.

Four Commerce Railyards

The four Commerce railyards are located approximately 2.0 miles south of the Project Site. The four Commerce railyards are operated by both UP Railroad and BNSF Railway (BNSF). These railyards are described below:

- The *UP Commerce Railyard* supports intermodal activities. It includes classification tracks, a gate complex for inbound and outbound intermodal truck traffic, intermodal loading and unloading tracks, a locomotive service track, a locomotive maintenance shop, a freight car repair shop, an on-site wastewater treatment plant, and various buildings and facilities supporting railroad and contractor operations.
- The *BNSF Hobart Railyard* is the largest intermodal railyard in the United States. It supports intermodal and classification activities with locomotive switching, locomotive line haul, cargo handling equipment, track maintenance equipment, portable engines, on-road fleet vehicles, on-road container trucks, transportation refrigeration units, and permitted stationary source activities. An adjacent mainline runs south of the Hobart railyard and supports freight trains and commuter lines for both Metrolink and Amtrak.
- The *BNSF Sheila Mechanical Railyard* is mainly a maintenance and repair shop serving mostly the BNSF Hobart Railyard. It consists of a locomotive fueling platform, diesel engine repair facility (operated by General Electric), railcar repair building, storage areas, equipment service areas, and an administration building. The main railway line runs south and west of the classification yard and includes freight and commuter (Amtrak and Metrolink) operations along the same lines.
- The *BNSF Commerce Eastern Railyard* is primarily a small intermodal facility with a focus on local domestic containers. It lies diagonally opposite and across from the BNSF Sheila Mechanical Railyard. The BNSF Commerce Eastern Railyard supports intermodal and a small amount of classification activities with very few trains loaded each day.

In 2007, the CARB conducted a health risk assessment to evaluate the health impacts associated with toxic air contaminants emitted in and around the four Commerce railyards (California Air Resources Board, 2007b). The predicted combined carcinogenic risk isopleths for the four Commerce railyards are depicted in **Figure 3.2-2,** Potential Estimated Regional Cancer Risks from the Four Commerce Railyards. As shown, the Project Site is located between the predicted 25 and 50 in a million carcinogenic risk isopleth of the four Commerce railyards.

Multiple Air Toxics Exposure Study IV Study

In May 2015, the SCAQMD released the Multiple Air Toxics Exposure Study IV (MATES IV) (South Coast Air Quality Management District, 2015). The study is a follow up to previous studies conducted by the SCAQMD for the purposes of evaluating air toxics exposure in the SCAB. The toxic emissions inventory in MATES IV includes point sources, area sources, on-road mobile sources, and off-road mobile sources. The study measured 37 substances, including PM_{10}, $PM_{2.5}$, several organic compounds (i.e., formaldehyde, benzene, toluene, PAHs), heavy metals (i.e., manganese, copper, lead, and nickel), and other compounds. Two additional substances, black carbon and ultrafine particles, were also included in the study.

Based on the exposure levels from the 10 monitoring sites used in the study, the average cancer risk from air toxics in the SCAB is 65 percent lower than the estimated risk identified in the previous MATES III time period (2004-2006). This risk refers to the expected number of additional cancers in a population of one million individuals if they were exposed to these levels over a 70-year lifetime. About 90 percent of the risk is attributed to emissions associated with mobile sources, with the remainder attributed to toxins emitted from stationary sources. The results indicate that DPM is the major contributor to air toxics risk, accounting on average for about 68 percent of the total estimated air toxics risk. This compares to about 84 percent in MATES III. Although the estimated carcinogenic risks have declined compared to the MATES III period, areas near the ports and near transportation corridors continue to show the highest air toxics risk. None of the annual averages of pollutants measured were above the chronic reference exposure levels for non-cancer health effects.

Predicted carcinogenic risks for the Los Angeles region, utilizing the most current Office of Environmental Health Hazard Assessment (OEHHA)-recommended methodologies, are depicted in **Figure 3.2-3,** Central Los Angeles MATES IV Simulated Air Toxic Cancer Risk (2012-2013). As shown, risks are generally higher in the central Los Angeles area due to the convergence of various major transportation corridors, as well as contributions from railyards, railroads, and stationary source operations. Based on current OEHHA-recommended methodologies, predicted carcinogenic risks in the central Los Angeles area are generally greater than 1,200 per million.

3.2.2.5 Sensitive Receptors

One of the most important reasons for air quality standards is the protection of those members of the population who are most sensitive to the adverse health effects of air pollution, termed "sensitive receptors." The term “sensitive receptors” refers to specific population groups, as well as the land uses where individuals would reside for long periods. Commonly identified sensitive population groups are children, the elderly, the acutely ill, and the chronically ill. Commonly identified sensitive land uses would include facilities that house or attract children, the elderly, people with illnesses, or others who are especially sensitive to the effects of air pollutants. Residential dwellings, schools, parks, playgrounds, childcare centers, convalescent homes, and hospitals are examples of sensitive land uses.

Existing land uses located to the north, south, and west of the Project Site consist predominantly of a mix of industrial and commercial uses. The nearest sensitive land uses in the vicinity of the proposed East Park are residential uses, located approximately 350 feet to the north of the Project Site, along South Clarence Street. The nearest sensitive land use in the vicinity of the proposed West Park is a residential development referred to as the “Brick Lofts,” which is located approximately 700 feet south of the Project

Based on the updated OEHHA methodology.
Not to scale. Locations are approximate.
Source: (South Coast Air Quality Management District, 2015)

Site, near the intersection of Mateo Street and Jesse Street. Additional residential land uses are located approximately 700 feet east of the proposed East Park, across U.S. 101.

3.2.2.6 Odors

No major sources of odors have been identified in the project area.

3.2.2.7 Naturally Occurring Asbestos

Naturally occurring asbestos (NOA) areas are identified based on the type of rock found in the area. Asbestos-containing rocks found in California are ultramafic rocks, including serpentine rocks. Asbestos has been designated a toxic air contaminant by the CARB. According to the California Geological Survey, the Project Site is not located in an area of NOA (California Geological Survey, 2011).

3.2.3 Environmental Impact Analysis

3.2.3.1 Methodology

Construction Emissions

Short-term emissions associated with construction activities are largely dependent on the type of development proposed, area of ground disturbance, amount of material to be imported and exported, equipment required, and construction schedules. Construction emissions of criteria air pollutants were calculated using the California Emissions Estimator Model (CalEEMod), version 2016.3.2 computer program. Modeling was conducted for the proposed Project based on estimated material to be imported and exported, off-road equipment usage, and construction schedules provided by the project engineers. Other construction modeling assumptions, including mobile-source emission factors and usage rates, were based on default parameters contained in the model for Los Angeles County. Emissions modeling assumptions and output files are provided in the *Air Quality and Greenhouse Gas Impact Assessment* (AMBIENT Air Quality & Noise Consulting, 2019) prepared for the proposed Project.

Increased exposure of sensitive land uses to localized pollutant concentrations were assessed in accordance with the methodology promulgated by SCAQMD in its Localized Significance Threshold (LST) Methodology for CEQA Evaluations (South Coast Air Quality Management District, 2008). Based on the estimated equipment usage and information provided by the project engineers, construction of the proposed Project would result in an estimated temporary disturbance of approximately 1.5 to 2 acres, or more, per day, during excavation and grading of the site. As previously noted, the nearest existing sensitive land uses include residential dwellings located approximately 350 feet (107 meters) north of the construction site. In accordance with SCAQMD's LST methodology, emissions of PM_{10} and $PM_{2.5}$ were evaluated based on a calculated area of disturbance of two acres/day and the distance to the nearest sensitive land uses (100 meters). Emissions of NO_x and CO were evaluated for nearby areas of potential short-term public exposure assuming this same potential area of disturbance and a distance of 25 meters. Emissions modeling assumptions and output files are provided in the *Air Quality and Greenhouse Gas Impact Assessment* (AMBIENT Air Quality & Noise Consulting, 2019) prepared for the proposed Project.

Operational Emissions

Long-term operational emissions of criteria air pollutants were calculated using the CalEEMod, version 2016.3.2, computer program. Modeling was conducted based on the estimated building square footage to be constructed and vehicle trip-generation rates identified in the *Traffic Impact Analysis* prepared for the proposed Project (Kimley-Horn and Associates, Inc., 2019a). Project and site enhancements that would contribute to reductions in mobile-source emissions were also accounted for in the analysis, based on methodologies contained in the California Air Pollution Control Officers Association's Quantifying Greenhouse Gas Mitigation Measures and the default emission reductions identified in CalEEMod. These measures included reductions associated with providing increased diversity (**LUT-3**), transit accessibility within 0.5 miles of the project site (**LUT-5**), and improvements to the existing pedestrian network (**SDT-1**). Increased exposure of sensitive land uses to localized pollutant concentrations were qualitatively assessed. Emissions modeling files are provided in the *Air Quality and Greenhouse Gas Impact Assessment* (AMBIENT Air Quality & Noise Consulting, 2019) prepared for the proposed Project.

Operational emissions associated with the existing industrial uses that were removed were also quantified based on the trip-generation rates identified in the traffic analysis prepared for this project and default energy usage, water usage, and waste-generation rates identified in CalEEMod. Project-generated emissions were compared to estimated emissions associated with the removed industrial uses for the determination of net changes in operational emissions. It is important to note that the analysis does not account for potential emissions from the onsite area or stationary sources that may have been associated with the operation of the existing industrial uses. As a result, net changes in operational emissions are conservatively estimated.

3.2.3.2 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the IS for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.2.3.3 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Air Quality if it would:

III(a) Conflict with or obstruct implementation of the applicable air quality plan.

B.3 Toxic Air Contaminants
The determination of significance shall be made on a case-by-case basis, considering the following factors:

- The regulatory framework for the toxic material(s) and process (es) involved;
- The proximity of the toxic air contaminants to sensitive receptors;
- The quantity, volume and toxicity of the contaminants expected to be emitted;

- The likelihood and potential level of exposure; and
- The degree to which project design will reduce the risk of exposure.

Regional Air Quality Impacts

Regional significance thresholds recommended by SCAQMD are summarized in **Table 3.2-3**.

Table 3.2-3: SCAQMD-Recommended CEQA Significance Thresholds

Pollutant	Construction Emissions (pounds/day)	Operational Emissions (pounds/day)
VOC	75	55
NO_x	100	55
CO	550	550
PM_{10}	150	150
$PM_{2.5}$	55	55
SO_x	150	150

Source: (South Coast Air Quality Management District, 2019)

Project-generated emissions that exceed these mass emissions thresholds would be considered to have a potentially significant impact, which could interfere with regional air quality attainment plans.

Exposure to Localized Pollutant Concentrations

In addition to the mass emissions thresholds identified above, the SCAQMD has established the following threshold criteria to determine if a project has the potential to contribute to a localized exceedance of the CAAQS in the immediate vicinity of the site:

- California State 1-hour CO standard of 20.0 parts per million (ppm)
- California State 8-hour CO standard of 9.0 ppm
- California State 1-hour NO_2 standard of 0.25 ppm
- SCAQMD 24-hour construction PM_{10} LST of 10.4 microgram per cubic meter ($\mu g/m^3$)
- SCAQMD 24-hour construction $PM_{2.5}$ LST of 10.4 $\mu g/m^3$
- SCAQMD 24-hour operational PM_{10} LST of 2.5 $\mu g/m^3$
- SCAQMD 24-hour operational $PM_{2.5}$ LST of 2.5 $\mu g/m^3$

The SCAQMD provides screening criteria that can be relied upon to determine if the daily emissions for proposed construction or operational activities would have a potential to exceed the LSTs. LSTs represent the maximum emissions at a project site that are not expected to cause or contribute to an exceedance of the most stringent Federal or State AAQS. LSTs are based on the ambient concentrations of that pollutant within the project area and the distance to the nearest sensitive receptor. An LST analysis for construction activities is applicable to projects five acres, or less, in size; but can be used to screen larger projects to determine whether or not dispersion modeling may be

required (South Coast Air Quality Management District, 2018). If calculated daily emissions are below the LST screening levels the project would be considered to have a less than significant impact.

In addition to the above criteria for evaluation of localized air quality impacts, projects that would result in emissions of carcinogenic or toxic contaminants that exceed the maximum individual cancer risk of 10 in one million or a hazard index of one would be considered to have a potentially significant impact.

III(b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

III(c) Expose sensitive receptors to substantial pollutant concentrations.

III(d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

3.2.3.4 Construction Impacts

III(a): Conflict with or obstruct implementation of the applicable air quality plan.

The AQMP is based on assumptions provided by CARB and SCAG related to the most recent motor vehicle and demographic information. The AQMP projections are based, in part, on land use designations and growth forecasts identified in land use plans from cities and counties located in the SCAB. Projects that would be considered to conflict with existing or future growth projections or that would exceed SCAQMD-recommended project-level significance thresholds would potentially conflict with the AQMP.

Construction-generated emissions were quantified using the CalEEMod, version 2016.3.2 computer program based on the estimated amount of material to be imported and exported, off-road equipment usage, and construction schedules provided by the project engineers. Other construction modeling assumptions, including mobile-source emission factors and usage rates, were based on default parameters contained in the model for Los Angeles County. Construction emissions are summarized in **Table 3.2-4**. Emissions modeling assumptions and results are included in the *Air Quality and Greenhouse Gas Impact Assessment for the Sixth Street PARC* (AMBIENT Air Quality & Noise Consulting, 2019) prepared for the proposed Project.

As noted in **Table 3.2-4**, construction of the proposed Project would generate maximum-daily emissions of approximately 17.3 pounds per day (lbs/day) of VOCs, 179.8 lbs/day of NO_x, 121.3 lbs/day of CO, 0.3 lbs/day of SO_X, 28.7 lbs/day of PM_{10}, and 17.7 lbs/day of $PM_{2.5}$. Construction-generated emissions of NO_x would exceed SCAQMD's significance threshold of 100 lbs/day. As a result, this impact would be considered potentially significant.

To reduce construction-generated emissions, measures related to NO_x emissions would be implemented (see **MM-AQ-1** and **MM-AQ-2** in Section 3.2.5). With the use of off-road equipment meeting Tier 4 emission standards, maximum daily emissions of NO_x would be reduced to approximately 28 lbs/day and would not exceed SCAQMD's daily significance threshold of 100 lbs/day (refer to **Table 3.2-5**).

Proposed construction would be required to comply with SCAQMD's Rule 402 (Nuisance) and Rule 403 (Fugitive Dust), which identify measures that would be implemented for the control of fugitive dust generated during onsite ground-disturbance activities (see **MM-AQ-3** in Section 3.2.5). Emissions generated during construction could potentially conflict with or obstruct air quality planning efforts.

Table 3.2-4: Construction Emissions without Mitigation

Construction Activity	Emissions (lbs/day)[1]					
	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Asphalt Demolition	2.9	28.8	22.6	0.0	1.7	1.4
Site Preparation & Material Export	5.5	54.5	31.8	0.1	9.0	5.5
Site Preparation & Material Import	8.3	87.5	51.5	0.1	17.1	10.4
Grading & Excavation	3.9	36.6	32.5	0.1	2.7	2.2

Utility Installation	1.6	14.9	14.2	0.0	1.2	1.0
Building Construction	3.7	18.7	18.4	0.0	1.1	0.8
In-River Terracing	3.5	37.8	38.0	0.1	2.6	1.8
Maximum Daily Emissions[2]:	17.3	**179.8**	121.3	0.3	28.7	17.7
SCAQMD Daily Significance Daily Thresholds:	75	100	550	150	150	55
Exceeds Daily Significance Thresholds?	No	**Yes**	No	No	No	No

1. Emissions were quantified using the CalEEMod, v2016.3.2, computer program. Includes onsite and offsite sources. Does not include reductions in fugitive dust associated with compliance with SCAQMD's Rule 403. VOC and ROG emissions were considered equivalent. Totals may not sum due to rounding.
2. Maximum daily emissions assume site preparation, material import and export, and in-river terracing could potentially occur simultaneously on any given day. Maximum daily emissions exceeding SCAQMD significance thresholds depicted in bold font.
lbs/day = pounds per day
Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for emissions modeling assumptions and results (AMBIENT Air Quality & Noise Consulting, 2019).

Table 3.2-5: Construction Emissions with Mitigation

Construction Activity	Emissions (lbs/day)[1]					
	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Asphalt Demolition	0.6	3.4	19.7	0.0	0.4	0.2

Maximum Daily[2]:	4.4	28.0	144.7	0.3	10.0	3.5
SCAQMD Significance Thresholds:	75	100	550	150	150	55
Exceeds Thresholds?	No	No	No	No	No	No

1. Emissions were quantified using the CalEEMod, v2016.3.2, computer program. Includes the use of off-road equipment meeting Tier 4 emissions standards and compliance with SCAQMD's Rule 403. VOC and ROG emissions were considered equivalent. Totals may not sum due to rounding.
2. Maximum daily emissions assume some activities, including site preparation, material import and export, and in-river terracing could potentially occur simultaneously on any given day.
Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for emissions modeling assumptions and results(AMBIENT Air Quality & Noise Consulting, 2019).

However, with the implementation of **MM-AQ-1** through **MM-AQ-3** and compliance with applicable SCAQMD permits, impacts would be reduced to less than significant.

III(b): Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

According to the SCAQMD, individual projects that would exceed recommended significance thresholds would also be considered to result in a cumulatively considerable increase in emissions for which the basin is designated non-attainment. As noted above, maximum-daily construction-generated emissions of NO_x would exceed SCAQMD's recommended significance thresholds. As a result, construction of the proposed Project could result in a cumulatively considerable net increase of ozone-precursor pollutants for which the region is designated non-attainment, particularly if other projects in the general vicinity of the project site are under construction during the same construction period. However, with the implementation of **MM-AQ-1** through **MM-AQ-3** and compliance with applicable SCAQMD permits, impacts would be reduced to less than significant.

III(c): Expose sensitive receptors to substantial pollutant concentrations.

Localized Pollutant Concentrations from Onsite Sources

Construction projects can result in short-term increases of TACs, as well as emissions of airborne fugitive dust. The SCAQMD has developed LSTs for the evaluation of short-term localized air quality impacts. The LSTs are based on CAAQS, which have been established to provide a margin of safety regarding the protection of public health and welfare.

Proposed Project-generated construction emissions in comparison to SCAQMD's LSTs are summarized in **Table 3.2-6**. Proposed Project-generated construction emissions would not exceed SCAQMD corresponding LSTs. Therefore, localized air quality impacts associated with the proposed Project would be less than significant.

Asbestos

As described in Section 3.2.2.7, the Project Site is not located in an area of naturally occurring asbestos. In addition, the proposed Project would not involve the demolition of structures having ACM. As a result, impacts associated with exposure to asbestos would be less than significant.

Diesel-Exhaust Particulate Matter

Health risks associated with DPM are primarily associated with potential cancer risks (California Air Resources Board, 2019b). The dose to which receptors are exposed is the primary factor used to determine carcinogenic health risks. Dose is a function of the concentration of a substance or substances in the environment and the duration of exposure to the substance. The calculation of cancer risk associated with exposure to TACs are typically calculated based on a 25- to 30-year period of exposure. However, such assessments should be limited to the period and duration during which exposure occurs.

Assuming that construction activities involving the use of diesel-fueled equipment would occur over an approximate thirty-month period, project-related construction activities would constitute less than eight percent of the typical exposure period. As a result, because the use of off-road heavy-duty diesel equipment would be temporary and episodic occurring over a relatively large area, and the highly

dispersive properties of DPM, project construction would not expose sensitive receptors to substantial emissions of DPM in excess of applicable thresholds. In addition, **MM-AQ-1** through **MM-AQ-3** would require the implementation of various measures that would significantly reduce construction-generated emissions, including the use of Tier 4 off-road equipment and newer on-road haul trucks, which would significantly reduce construction-generated DPM. Therefore, impacts would be less than significant.

Table 3.2-6: On-Site Construction Emissions

Construction Activity	Emissions (lbs/day)[1]					
	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Asphalt Demolition	0.4	1.7	18.5	0.0	0.1	0.1

Total PARC Project and Sixth Street Viaduct Construction Emissions:	18.8	137.2	214.6	0.3	13.6	8.5
SCAQMD Localized Significance Thresholds[2]:	None	108	827	None	43	10
PARC Project Construction Emissions Exceeds Thresholds?	-	No	No	-	No	No
Total PARC Project and Sixth Street Viaduct Project Construction Emissions Exceeds Thresholds?	-	Yes	No	-	No	No

1. Emissions were quantified using the CalEEMod, v2016.3.2 computer program. Includes use of Tier 4 heavy-duty off-road equipment and implementation of dust control measures in compliance with SCAQMD Rule 403. Totals may not sum due to rounding.
2. Maximum daily emissions assume some activities, such as material import and export, could occur simultaneously on any given day.
3. LSTs are based on a two-acre site with sensitive receptors located at 100 meters for PM_{10} and $PM_{2.5}$ and 25 meters for NO_x and CO.
4. Based on emissions estimates derived from the Sixth Street Viaduct Improvement Project Final Environmental Impact Report (2011). Includes construction of main spans, sidewalks, roadway surface road demolition and reconstruction.
Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for emissions modeling assumptions and results (AMBIENT Air Quality & Noise Consulting, 2019).

III(d): Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The occurrence and severity of odor impacts depends on numerous factors, including: the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of the receptors. While offensive odors rarely cause any physical harm, they still can be very unpleasant, leading to considerable distress among the public and often generating citizen complaints to local governments and regulatory agencies.

No major sources of odors have been identified in the project area. However, construction of the proposed Project would involve the use of a variety of gasoline or diesel-powered equipment that would emit exhaust fumes. Exhaust fumes, particularly diesel-exhaust, may be considered objectionable by some people. In addition, pavement coatings and architectural coatings used during project construction would also emit temporary odors. However, construction-generated emissions would occur intermittently throughout the workday and would dissipate rapidly within increasing distance from the source. As a result, short-term construction activities would not expose a substantial number of people to frequent odorous emissions. Therefore, impacts would be less than significant.

3.2.3.5 Operational Impacts

III(a): Conflict with or obstruct implementation of the applicable air quality plan.

As described Section 3.2.3.4, projects that would conflict with existing or future growth projections or that would exceed SCAQMD-recommended project-level significance thresholds would potentially conflict with the AQMP.

The proposed Project includes the creation of public recreational space on approximately 13 acres in areas underneath and adjacent to the Viaduct in the City of Los Angeles. The proposed Project would not result in overall increases in emissions of ozone-precursor pollutants (VOC and NO_x) or PM that would exceed SCAQMD's recommended significance thresholds. Long-term operational emissions associated with the proposed Project would be primarily associated with motor vehicle operations, energy use, and area sources. Operational emissions were quantified using the CalEEMod, version 2016.3.2 computer program and are summarized in **Table 3.2-7**.

As noted, the proposed Project would result in daily emissions of approximately 6.1 lbs/day of ROG, 29.5 lbs/day of NO_x, 74.3 lbs/day of CO, 0.3 lbs/day of SO_x, 32.7 lbs/day of PM_{10}, and 9.0 lbs/day of $PM_{2.5}$. In comparison to the existing industrial land uses removed, the proposed Project would result in an overall net increase in operational emissions of approximately 0.5 lbs/day of ROG, 26.1 lbs/day of NO_x, 65.5 lbs/day of CO, 0.2 lbs/day of SO_x, 30.9 lbs/day of PM_{10}, and 8.4 lbs/day of $PM_{2.5}$. The maximum-daily emissions identified in **Table 3.2-7** were conservatively estimated assuming all recreational activities and uses could potentially operate simultaneously on any given day. Emissions of criteria air pollutants would not exceed SCAQMD's significance thresholds.

When evaluated on an annual basis, considering the number of events anticipated to occur, the proposed Project would result in an overall emissions reduction when compared to the existing industrial uses that were removed. Estimated net changes in annual operational emissions are summarized in **Table 3.2-8**. As such, long-term operation of the proposed Project would not conflict with or obstruct air quality planning efforts. Therefore, impacts would be less than significant.

Table 3.2-7: Maximum Daily Operational Emissions without Mitigation

Land Use/Event (Capacity)	Emissions (lbs/day)[1]					
	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Special Events (1,000)	1.1	5.5	13.7	0.1	6.2	1.7
Special Events (2,000)	2.2	10.9	27.4	0.1	12.3	3.4
Special Events (3,250)	3.6	17.7	44.5	0.2	20.0	5.5
Special Events (5,000)	5.5	27.3	68.5	0.3	30.8	8.5
Soccer Fields	0.2	0.8	2.0	0.0	0.9	0.2
East & West Park Uses & Buildings	0.4	1.4	3.8	0.0	1.0	0.3
Peak Daily[2]:	6.1	29.5	74.3	0.3	32.7	9.0
Industrial Land Uses Removed:	5.9	4.7	12.2	0.1	3.3	1.1
Net Change:	0.5	26.1	65.5	0.2	30.9	8.4
SCAQMD Significance Thresholds:	55	55	550	150	150	55
Exceeds Thresholds?	No	No	No	No	No	No

1. Emissions were quantified using the CalEEMod, v2016.3.2, computer program. Totals may not sum due to rounding.
2. Peak daily emissions assumes use of soccer fields, park uses, on-site buildings, and maximum event (5,000 attendees) could occur simultaneously on the same day.
3. Mobile-source emissions were quantified based on trip-generation rates obtained from the traffic analysis prepared for this project and default assumptions contained in CalEEMod for Los Angeles County.
lbs/day = pounds per day
Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for emissions modeling assumptions and results (AMBIENT Air Quality & Noise Consulting, 2019).

Table 3.2-8: Annual Operational Emissions

Land Use/Event	Emissions (tons/year)[1,2]					
	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Special Events (1,000 Attendees)[3]	0.0	0.0	0.1	0.0	0.1	0.0
Special Events (2,000 Attendees)[3]	0.0	0.1	0.2	0.0	0.1	0.0
Special Events (3,250 Attendees)[3]	0.0	0.0	0.0	0.0	0.0	0.0
Special Events (5,000 Attendees)[3]	0.0	0.0	0.0	0.0	0.0	0.0
Soccer Fields	0.0	0.1	0.3	0.0	0.2	0.0
East & West Park Uses & Buildings	0.0	0.1	0.3	0.0	0.1	0.0
Total:	0.1	0.4	1.0	0.0	0.5	0.0
Industrial Land Uses Removed:	1.1	0.9	2.1	0.0	0.6	0.2
Net Change:	-1.0	-0.5	-1.1	0.0	-0.1	-0.2

1. Emissions were quantified using the CalEEMod, v2016.3.2, computer program. Totals may not sum due to rounding.
2. Mobile-source emissions were quantified based on trip-generation rates obtained from the traffic analysis prepared for this project and default assumptions contained in CalEEMod for Los Angeles County.
3. Assumes 24 days/year for events with a capacity of 1,000 attendees, 26 days/year for events with a capacity of 2,000 attendees, 2 days/year for events with a capacity of 3,250 attendees, and 1 day/year for events with a capacity of 5,000 attendees. Some smaller events may have higher annual emissions than larger events given their increased frequency.

Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for emissions modeling assumptions and results (AMBIENT Air Quality & Noise Consulting, 2019).

III(b): Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

According to the SCAQMD, individual projects that would exceed recommended significance thresholds would also be considered to result in a cumulatively considerable increase in emissions for which the basin is designated non-attainment. As noted above, operational emissions associated with the proposed Project would not exceed SCAQMD's recommended significance thresholds. Therefore, impacts would be less than significant.

III(c): Expose sensitive receptors to substantial pollutant concentrations.

Localized Pollutant Concentrations from Onsite Sources

The proposed Project is located in an area with relatively high background pollutant concentrations. Major emission sources in the Project Area include the UP LATC railyard and the Four Commerce Railyards. Background health risk from the UP LATC railyard and the Four Commerce Railyards is estimated to range from 10 and 50 in a million. In 2005, the CARB published the *Air Quality and Land Use Handbook: A Community Health Perspective*, which recommended that sensitive land uses be located approximately 500 feet from major freeways or urban roads having high heavy-duty truck volumes with overall traffic volumes of 100,000 vehicles per day. Major roadways in the Project Area include I-5, I-10, and U.S. 101. The CARB *Air Quality and Land Use Handbook* guidelines would not apply to the proposed Project because overall traffic volumes on the Viaduct and surrounding roadways would not exceed 100,000 vehicles per day, as shown in the EIR prepared for the Viaduct Replacement Project (California Department of Transportation and City of Los Angeles, 2011). Patrons of the park may be exposed to high background pollutant concentrations from nearby existing sources, including vehicle traffic on area roadways. However, the proposed Project would not include the installation of major stationary sources of emissions, nor would the proposed Project generate significant increases in diesel vehicle traffic that would contribute significantly to background pollutant concentrations.

Onsite emission sources associated with the proposed Project would be primarily associated with the operation of natural-gas fired water heaters, which would generate daily emissions of approximately 0.1 lbs/day of NO_x. Emissions of criteria air pollutants from other sources would be negligible. The SCAQMD has developed LSTs for the evaluation of long-term localized air quality impacts. The LSTs are based on CAAQS, which have been established to provide a margin of safety regarding the protection of public health and welfare. For emissions of NO_x, the SCAQMD's minimum LST is 103 lbs/day. Operational emissions would not exceed SCAQMD LSTs. Therefore, impacts related to localized onsite emissions associated with onsite operational activities would be less than significant.

Mobile-Source Carbon Monoxide

CO is the primary criteria air pollutant of local concern associated with the proposed Project. Under specific meteorological and operational conditions, such as near areas of heavily congested vehicle traffic, CO concentrations may reach unhealthy levels. Mobile-source emissions of CO are a direct function of traffic volume, speed, and delay. Under normal meteorological conditions, localized concentrations of CO disperse rapidly with increased distance from the source. For this reason, modeling of mobile-source CO concentrations is typically recommended for sensitive land uses located near signalized roadway

intersections that are projected to operate at unacceptable levels of service (LOS) (i.e., LOS E or F). Localized CO concentrations associated with the proposed Project would be considered a less-than-significant impact if (1) traffic generated by the proposed Project would not result in deterioration of a signalized intersection to a LOS E or F; or (2) the proposed Project would not contribute additional traffic to a signalized intersection that already operates at LOS of E or F.

Based on the *Traffic Impact Analysis* prepared for the proposed Project, existing signalized intersections in the Project Area operate at LOS D, or better (Kimley-Horn and Associates, Inc., 2019a). Under existing-plus-project conditions, signalized intersections primarily affected by the proposed Project would continue to operate at LOS D, or better. Under existing-plus-project event conditions, signalized intersections primarily affected by the proposed Project would also continue to operate at LOS D, or better.

Under future cumulative conditions, the intersections of Alameda Street at Seventh Street, Boyle Avenue at Whittier Boulevard, and Alameda Street at Fourth Street are projected to operate at unacceptable LOS during either AM or PM peak hours. With implementation of the proposed Project, the LOS at these intersections would not change. Furthermore, implementation of the proposed Project would be projected to result in slight improvements in overall volume-to-capacity ratios at these intersections. The proposed Project would not result in a degradation of LOS at primarily affected intersections that are projected to operate at unacceptable levels of service. Therefore, impacts related to the proposed Project's contribution to localized CO concentrations would be less than significant.

III(d): Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

No major sources of odors have been identified in the Project Area. In addition, the proposed Project would not include the installation of any major sources of odors. Therefore, impacts would be less than significant.

3.2.4 Best Management Practices

BMP-AQ-1: SCAQMD Rules and Regulations

The contractor shall implement measures to ensure that all construction activities are consistent with SCAQMD rules and regulations.

BMP-AQ-2: Construction Worker Incentives

The City shall offer ride-share and transit incentives for construction workers to reduce emissions associated with motor vehicle use.

BMP-AQ-3: Construction Equipment Maintenance

The contractor shall maintain construction equipment by conducting regular tune-ups according to the manufacturers' recommendations.

3.2.5 Mitigation Measures

MM-AQ-1: Newer/Tier 4 Engines in Haul Trucks and Construction Equipment

- Include in all construction contracts the requirement to use 2007 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export).
- Include in all construction contracts the requirement that all off-road diesel-fueled construction equipment greater than 50 horsepower shall meet Tier 4 off-road emission standards. In addition, if not already supplied with a factory-equipped diesel particulate filter, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. To the extent locally available, construction equipment shall incorporate emissions savings technology such as hybrid drives. In the event that any equipment required under this mitigation measure is not available, provide documentation as information becomes available. A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit at the time of mobilization of each applicable unit of equipment shall be provided.
- Maintain construction equipment by conducting regular tune-ups according to the manufacturers' recommendations.
- To the extent possible, the import and export of onsite materials shall be scheduled to minimize empty return trips.

MM-AQ-2: Construction Equipment Requirements

- All on- and off-road diesel-fueled equipment shall not idle for more than 5 minutes when not in use. The idling of diesel-fueled equipment and haul trucks within 1,000 feet of nearby residential land uses shall be prohibited. Signs shall be posted in the designated queuing areas and or job sites to remind drivers and operators of the 5-minute-idling limit.
- Staging and queuing areas shall be located at the furthest distance possible from nearby residential land uses.
- Use alternatively fueled (e.g., compressed natural gas, liquefied natural gas, propane), gasoline-fueled, or electrified construction equipment in place of diesel-fueled equipment to the extent locally available.

MM-AQ-3: Fugitive Dust Controls

- All active portions of the construction site shall be watered twice daily to prevent excessive amounts of dust.
- Non-toxic soil stabilizers shall be applied to all inactive construction areas (previously graded areas inactive for 20 days or more, assuming no rain) according to manufacturers' specifications.
- All excavating and grading operations shall be suspended when wind gusts (as instantaneous gust) exceed 25 miles per hour.

- On-site off-road equipment and on-road vehicles used on-site shall be limited to 15 miles per hour.
- All on-site roads shall be paved as soon as feasible, watered twice daily, or chemically stabilized.
- Visible dust beyond the property line which emanates from the project shall be prevented to the maximum extent feasible.
- All material transported off-site shall be either sufficiently watered or securely covered to prevent excessive amounts of dust prior to departing the job site.
- Track-out devices shall be used at all construction site access points.
- All delivery truck tires shall be watered down and/or scraped down prior to departing the job site.
- Streets shall be swept at the end of the day if visible soil material is carried onto adjacent paved public roads and use of SCAQMD Rule 1186 and 1186.1 certified street sweepers or roadway.
- Replace ground cover in disturbed areas as quickly as possible.
- All trucks that are to haul excavated or graded material on-site shall comply with State Vehicle Code Section 23114 (Spilling Loads on Highways), with special attention to Sections 23114(b)(F), (e)(4) as amended, regarding the prevention of such material spilling onto public streets and roads.
- Conduct continuous, direct-reading, near real-time ambient monitoring of PM_{10}. Install appropriate signage and notify the SCAQMD in accordance with Rule 1466, Control of Particulate Emissions from Soils with Toxic Air Contaminants, prior to conducting any earth-moving activities on any site meeting the applicability of the rule.

3.2.6 Significant Unavoidable Adverse Impacts

Because construction of the proposed Project would result in increased NO_x and fugitive dust emissions, the proposed Project would result in significant impacts related to Air Quality. However, with the implementation of **MM-AQ-1** and **MM-AQ-2** and consistency with SCAQMD rules and regulations (**MM-AQ-3**)**,** the proposed Project would not result in significant unavoidable adverse impacts.

3.2.7 Cumulative Impacts

As discussed in Sections 3.2.3.4 and 3.2.3.5, individual projects that would exceed recommended significance thresholds would also be considered to result in a cumulatively considerable increase in emissions for which the basin is designated non-attainment.

As noted in Section 3.2.3.4, maximum-daily construction-generated emissions of NO_x would exceed SCAQMD's recommended significance thresholds. With the implementation of **MM-AQ-1** through **MM-AQ-3**, impacts would be reduced to less than significant. However, construction of the proposed Project could result in a cumulatively considerable net increase of ozone-precursor pollutants for which the region is designated non-attainment, particularly if other projects in the general vicinity of the project site are under construction during the same construction period.

The 670 Mesquite Project may be under construction during the construction of the Project. It was anticipated to commence in 2019 and be completed as early as 2022, or as late as 2040; however, the 670 Mesquite Project has not commenced construction yet. 670 Mesquite would be constructed in one

phase and would increase emissions during construction, as well as potentially increase traffic and therefore increase emissions during the operational phase of the project.

In addition, some portions of the Viaduct Replacement Project may still be under construction during construction of the proposed Project. Construction activities associated with the Viaduct Replacement Project likely to occur during proposed Project construction include construction of the main spans, sidewalks, barriers, and railings, as well as roadway surface demolition and reconstruction. Based on the EIR prepared for the Viaduct Replacement Project, on-site construction emissions associated with these remaining activities would total approximately 15.8 lbs/day of ROG, 124.1 lbs/day of NO_x, 80.4 lbs/day of CO, 6.4 lbs/day of PM_{10}, and 5.7 lbs/day of $PM_{2.5}$ (California Department of Transportation and City of Los Angeles, 2011). Based on these estimates, and assuming that construction of the Viaduct Replacement Project and the proposed Project were to occur simultaneously, on-site emissions would total approximately 18.8 lbs/day of ROG, 137.2 lbs/day of NO_x, 214.6 lbs/day of CO, 13.6 lbs/day of PM_{10}, and 8.5 lbs/day of $PM_{2.5}$ (see **Table 3.2-9**). As indicated in **Table 3.2-9**, total emissions of NO_x would exceed SCAQMD's LST of 108 lbs/day. As a result, a more detailed analysis of localized air quality impacts was warranted.

Table 3.2-9: Cumulative On-Site Construction Emissions

Construction Activity	Emissions (lbs/day)[1]					
	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Total Proposed Project Construction Emissions[2]	3.0	13.1	134.2	0.3	7.2	2.8
Viaduct Construction Emissions[4]	15.8	124.1	80.4	-	6.4	5.7
Total Proposed Project and Viaduct Construction Emissions	18.8	137.2	214.6	0.3	13.6	8.5
SCAQMD Localized Significance Thresholds[3]	None	108	827	None	43	10
Proposed Project Construction Emissions Exceeds Thresholds?	-	No	No	-	No	No
Total Proposed Project and Viaduct Project Construction Emissions Exceeds Thresholds?	-	Yes	No	-	No	No

1. Emissions were quantified using the CalEEMod, v2016.3.2 computer program. Includes use of Tier 4 heavy-duty off-road equipment and implementation of dust control measures in compliance with SCAQMD Rule 403. Totals may not sum due to rounding.
2. Maximum daily emissions assume some activities, such as material import and export, could occur simultaneously on any given day.
3. LSTs are based on a two-acre site with sensitive receptors located at 100 meters for PM_{10} and $PM_{2.5}$ and 25 meters for NO_x and CO.
4. Based on emissions estimates derived from the Sixth Street Viaduct Improvement Project Final Environmental Impact Report (2011). Includes construction of main spans, sidewalks, and roadway surface road demolition and reconstruction.

Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for emissions modeling assumptions and results (AMBIENT Air Quality & Noise Consulting, 2019).

The analysis of predicted NO_2 concentrations at nearby receptors for the Viaduct Replacement Project was based on maximum daily on-site emissions of 331.9 lbs/day of NO_x, which were estimated to occur during the initial phase of the Viaduct Replacement Project. Subsequent phases of Viaduct construction, including those anticipated to overlap with construction of the proposed Project, were estimated to generate substantially less emissions.

Nonetheless, based on the results of the dispersion modeling conducted for the Viaduct Replacement Project, maximum predicted NO_2 concentrations at nearby land uses, when added to background ambient concentrations, were not found to violate applicable air quality standards. As noted in **Table 3.2-9**, the remaining Viaduct construction activities anticipated to potentially occur during construction of the proposed Project would total approximately 124.1 lbs/day of NO_x. Assuming that both the Viaduct Replacement Project and the proposed Project were to be constructed simultaneously, on-site emissions of NO_x would total 137.2 lbs/day, substantially less than the 331.9 lbs/day analyzed for the Viaduct Replacement Project. To reiterate, the dispersion modeling analysis prepared for the Viaduct Replacement Project, which was based on a much higher mass emissions level of 331.9 lbs/day of NO_x, concluded that localized construction-generated emissions would not exceed applicable ambient air quality standards. As a result, given that emissions for the proposed Project would be substantially less than what was previously analyzed, localized NO_2 concentrations would, likewise, not be anticipated to exceed applicable ambient air quality standards at nearby land uses.

With the implementation of dust control measures in accordance with SCAQMD rules (see **MM-AQ-3** in Section 3.2.5), emissions of PM_{10} and $PM_{2.5}$ are not predicted to exceed applicable standards. Assuming that construction of the remaining Viaduct construction activities and the proposed Project were to occur simultaneously, on-site emissions of PM_{10} and $PM_{2.5}$ would total approximately 13.6 and 8.5 lbs/day, respectively. Total on-site emissions of PM_{10} and $PM_{2.5}$ would not exceed SCAQMD's LSTs of 43 and 10 lbs/day, respectively. Therefore, localized air quality impacts associated with the construction of the proposed Project would be less than significant.

As discussed in Section 3.2.3.5, operational emissions associated with the proposed Project would not exceed SCAQMD's recommended significance thresholds. Therefore, impacts would be less than significant.

The proposed development projects listed in **Table 1-1** would be required to comply with all Federal and State regulations and be consistent with regional policies related to Air Quality, including the FCAA, CCAA, SCAQMD rules and regulations, and RTP/SCS. These projects would also be evaluated based on whether they exceed the SCAQMD's recommended significance thresholds. To reduce impacts related to Air Quality, these projects would be required to develop BMPs and mitigation measures. Therefore, the proposed Project would not result in cumulatively considerable impacts related to Air Quality.

3.3 Biological Resources

The affected environment and regulatory setting for Biological Resources related to the Project Area are described in this section. In addition, this section describes the potential impacts related to Biological Resources that would result from implementation of the proposed Project. As noted in the analysis below, impacts associated with Biological Resources during construction or operation of the proposed Project would be less than significant and no mitigation measures are required.

The information in this section is based on the *Biological Resources Report* (BRR) (GPA Consulting, 2019), the *Sixth Street Viaduct Replacement Project Supplemental Bat Survey Report* (GPA Consulting, 2015b), and the *Sixth Street Viaduct Replacement Project Bat and Nesting Bird Survey Repor*t (GPA Consulting, 2015a). Within this section, special-status species, nesting birds, raptor foraging activities, and bats will be discussed. Special-status species include plants and wildlife species that are listed under the California Department of Fish and Wildlife (CDFW) and the Federal Endangered Species Acts (FESA) (California Department of Fish and Wildlife, 2019); plant species designated by the California Native Plant Society (CNPS) with a California Rare Plant Rank (CRPR) or other plants of local concern (California Native Plant Society, 2019); and wildlife that is designated as a California Species of Special Concern, as defined by CDFW (California Department of Fish and Wildlife, 2019). Biological record searches were reconducted in April 2021.

3.3.1 Regulatory Setting

The following discussion provides a summary of state and federal laws and regulations pertaining to the proposed Project, environmental permits that are required for the proposed Project, and study methods that were undertaken as required by resource agencies and environmental laws.

3.3.1.1 Federal

Clean Water Act

The United States Army Corps of Engineers (USACE) regulates the placement of dredged and fill material into waters of the United States (U.S.), including wetlands, under Section 404 of the Clean Water Act (CWA). No discharge of dredged or fill material into jurisdictional features is permitted unless authorized under an USACE Nationwide Permit or Individual Permit. For all work subject to an USACE Section 404 permit, project proponents must obtain a Water Quality Certification from the applicable RWQCB under CWA Section 401 stating that the project would comply with applicable water quality regulations.

Waters of the United States

The USACE Regulatory Program regulates activities within federal wetlands and waters of the U.S. pursuant to Section 404 of the CWA. Waters of the U.S. are divided into several categories as defined by the Code of Federal Regulations (CFR). Under the CFR (33 CFR 328.3), waters of the U.S. include, but are not limited to:

- All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce (including sightseeing or hunting), including all waters subject to the ebb and flow of the tide;

- All interstate waters including interstate wetlands; and
- All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats; sand flats; wetlands; sloughs; prairie potholes; wet meadows; playa lakes; or natural ponds where the use, degradation, or destruction of which could affect interstate or foreign commerce. This includes any such waters which are or could be used by interstate or foreign travelers for recreational or other purposes, and from which fish or shellfish could be taken and sold in interstate or foreign commerce, or which are used or could be used for industrial purposes in interstate commerce.

In streams and rivers where adjacent wetlands are absent, the USACE jurisdiction extends to the ordinary high-water mark (OHWM). The OHWM is defined as "the line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (33 CFR 328.3[e]). If the OHWM is not readily distinguishable, the USACE jurisdiction within streams extends to the "bankfull discharge" elevation, which is the level at which water begins to leave the channel and move into the floodplain (Rosgen, 1996). This level is reached at a discharge which generally has a recurrence interval of approximately 1.5 to two years on the annual flood series (Leopold, 1994).

In 2015, the USACE and United States Environmental Protection Agency (U.S. EPA) published the Clean Water Rule, which more clearly defined waters of the U.S. The intent of the rule was to make the definition of waters of the U.S. easier to understand, more predictable, and more consistent with current science, while better protecting waters of the U.S. The rule went into effect on August 28, 2015; however, on October 9, 2015, the U.S. Court of Appeals for the Sixth Circuit stayed the Clean Water Rule nationwide pending further action of the court. In response, the USACE and U.S. EPA resumed using the prior regulations defining waters of the U.S. This report uses the current definition of waters of the U.S., provided above. On April 21, 2020, the U.S. EPA and USACE published the Navigable Waters Rule, which re-defined the scope of waters federally regulated under the Clean Water Act (85 FR 22250).

Federal wetlands are transitional areas between well-drained upland habitats and permanently flooded (deepwater) aquatic habitats and are defined differently by different resource agencies. The USACE and the EPA define adjacent wetlands as those areas that either abut a jurisdictional water; are inundated by flooding from a jurisdictional water; are physically separated from a jurisdictional water by a natural berm, bank, dune, or similar natural feature; or are physically separated from a jurisdictional water by an artificial dike, barrier, or similar artificial structure so long as that structure allows for a direct hydrologic surface connection between the wetlands and jurisdiction water in a typical year (33 CFR 328.3[b]).

Federal Endangered Species Act

The Federal Endangered Species Act (FESA) was established in 1973 to provide a framework to conserve and protect endangered and threatened species and their habitat. Section 10 of the FESA allows for the "incidental take" of endangered and threatened wildlife species by non-federal entities. Incidental take is defined by the FESA as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. The term "take" means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Section 10(a)(1)(B) of the FESA authorizes the taking of federally listed wildlife or fish through an incidental take permit. Section 10(a)(2)(A) of the FESA

requires an applicant for an incidental take permit to submit a conservation plan that specifies, among other things, the impacts likely to result from the taking of the species, and the measures the permit applicant will take to minimize and mitigate impacts on the species. Under FESA designated critical habitat is identified as specific areas containing physical or biological features essential to the existence of endangered or threatened species.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (50 CFR Part 10 and Part 21) protects migratory birds, their occupied nests, and their eggs from disturbance and/or destruction. "Migratory birds" under the MBTA include all bird species listed in 50 CFR Part 10.13, as updated in December 2013 (U.S. Fish and Wildlife Service, 2013). In accordance with the Migratory Bird Treaty Reform Act of 2004, the United States Fish and Wildlife Service (USFWS) included all species native to the United States (or United States territories) that are known to be present as a result of natural biological or ecological processes. In addition, the USFWS provided clarification that the MBTA does not apply to any nonnative species whose presence in the United States is solely the result of intentional or unintentional human-assisted introduction (U.S. Fish and Wildlife Service, 2018). Nonnative bird species not protected by the MBTA include, but are not limited to, the house sparrow (*Passer domesticus*), European starling (*Sturnus vulgaris*), and rock pigeon (*Columba livia*).

3.3.1.2 State

Porter-Cologne Act

The RWQCB also asserts authority over waters of the state under the Porter-Cologne Act, which establishes a regulatory program to protect water quality and to protect beneficial uses of state waters. The Porter-Cologne Act empowers the RWQCB to formulate and adopt a Water Quality Control Plan that designates beneficial uses and establishes water quality objectives that in its judgment would ensure reasonable protection of beneficial uses. Each RWQCB establishes water quality objectives that will ensure the reasonable protection of beneficial uses and the prevention of water quality degradation. Dredge or fill activities with the potential to affect water quality in these waters must comply with Waste Discharge Requirements (WDR) issued by the RWQCB. Waters of the state are defined by the Porter-Cologne Act as any surface or subsurface water or groundwater, including saline waters, within the boundaries of the state.

California Water Code

The term "waters of the state," under jurisdiction of the RWQCB, is defined by California Water Code as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code Section 13050(e)).

Currently, the RWQCB relies upon the definition used in the CWA to define wetlands. However, the State Water Resources Control Board (SWRCB) recently redefined wetlands as part of their *Procedures for Discharges of Dredged or Fill Material to Waters of the State* (State Water Resources Control Board, 2019). The new definition, which was adopted April 2, 2019, is "an area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause

anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation." This report uses the current definition of wetlands.

California Fish and Game Code

Section 1602 of the California Fish and Game Code governs construction activities that substantially divert or obstruct natural stream flow or substantially change the bed, channel, or bank of any river, stream, or lake under the jurisdiction of CDFW. Under the California Fish and Game Code, the limits of CDFW's jurisdiction within streams and other drainages extends from the top of the stream bank to the top of the opposite bank, to the outer drip line in areas containing riparian vegetation, and/or within the 100-year floodplain of a stream or river system containing fish or wildlife resources. Streams are defined in the California Code of Regulations (CCR) (14 CCR Section 1.72) as "a body of water that follows at least periodically or intermittently through a bed or channel having banks and that support fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation." Under Section 1602, a Streambed Alteration Agreement must be issued by the CDFW prior to the initiation of construction activities that may substantially divert or obstruct the natural flow of any river, stream, or lake; substantially change or use any material from the bed, channel, or bank, of any river, stream, or lake; or deposit debris, waste, or other materials that could pass into any river, stream, or lake under CDFW's jurisdiction.

The CDFW has jurisdictional authority over waters of the State, including wetlands. In practice, CDFW follows the USFWS' definition of wetlands in Cowardin's *Classification of Wetlands and Deepwater Habitats of the United States*: "Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water. For purposes of this classification, wetlands must have one or more of the following three attributes: 1) at least periodically, the land supports hydrophytes; 2) the substrate is predominantly undrained hydric soil; and 3) the substrate is non-soil and is saturated with water or covered by shallow water at some time during the growing season of each year" (Cowardin, Carter, Golet, & LaRoe, 1979).

Section 2126 of the California Fish and Game Code states that it is unlawful for any person to take any mammal that is identified in Section 2118, including all species of bats.

Sections 3503, 3513, and 3800 of the California Fish and Game Code prohibits the take of birds protected under the MBTA and protects their occupied nests. In addition, Section 3503.5 of the California Fish and Game Code prohibits the take of any birds in the order Falconiformes or Strigiformes (birds-of-prey) and protects their occupied nests. Pursuant to Section 3801 and 3800, the only species authorized for take without prior authorization from the CDFW is the house sparrow and European starling.

State-listed species and those petitioned for listing by the CDFW are fully protected under the California Endangered Species Act (CESA). Under Section 2081, if a project would result in take of a species that is state-only listed as threatened or endangered, then an incidental take permit from the CDFW is required. However, under Section 2080.1 of the California Fish and Game Code, if a project would result in take of a species that is both federally and state listed, a consistency determination with the findings of the FESA determination may be completed in lieu of undergoing separate consultation.

Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code prohibit the take or possession of 37 fully protected bird, mammal, reptile, amphibian, and fish species. Each of the statutes states that

no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to "take" the species, and states that no previously issued permit or licenses for take of the species "shall have any force or effect" for authorizing take or possession. The CDFW will not authorize incidental take of fully protected species when activities are proposed in areas inhabited by those species.

3.3.1.3 Local

City of Los Angeles

Every county and city is required by California State Law to adopt a General Plan. The City of Los Angeles General Plan (General Plan) is a document that has several elements which consist of the plans for the City's 35 Community Plan Areas. The General Plan was approved by the City Planning Commission in July 1995 and adopted by the City Council in December 1996 (City of Los Angeles, 2019).

Conservation Element

The Conservation Element of the General Plan addresses conservation, protection, development, utilization, and reclamation of natural resources (City of Los Angeles, 2001). The Conservation Element includes the following goals, objectives, and policies that are relevant to the proposed Project:

Goals

- A city that preserves, protects, and enhances its existing natural and related resources.

Objectives

- Protect and promote restoration, to the greatest extent practical, of sensitive plant and animal species and their habitats; and
- Preserve, protect, restore and enhance natural plant and wildlife diversity, habitats, corridors and linkages so as to enable the healthy propagation and survival of native species, especially those species that are endangered, sensitive, threatened or species of special concern.

Policies

- Continue to require evaluation, avoidance, and minimization of potential significant impacts, as well as mitigation of unavoidable significant impacts on sensitive animal and plant species and their habitats and habitat corridors relative to land development activities;
- Continue to administer city-owned and managed properties so as to protect and/or enhance the survival of sensitive plant and animal species to the greatest practical extent;
- Continue to support legislation that encourages and facilitates protection of endangered, threatened, sensitive and rare species and their habitats and habitats and habitat corridors;
- Continue to identify significant habitat areas, corridors and buffer and to take measures to protect, enhance and/or restore them;
- Continue to protect, restore and/or enhance habitat areas, linkages and corridor segments, to the greatest extent practical, within city owned or managed sites;
- Continue to work cooperatively with other agencies and entities in protecting local habitats and endangered, threatened, sensitive and rare species; and,

- Continue to support legislation that encourages and facilitates protection of local native plant and animal habitats.

3.3.2 Environmental Setting

This section describes the environmental setting or conditions related to Biological Resources and jurisdictional areas within the Project Area. This information is intended to assist in the evaluation and conclusions of the impact analysis provided below and in the formation of BMPs.

As noted in the BRR, two bat surveys were completed in 2015 for the Sixth Street Viaduct Replacement Project (Viaduct Replacement Project), and a site visit was completed for the proposed Project on November 7, 2017, to assess current conditions.

3.3.2.1 Vegetation/Land Use Types

The Project Area is located under and adjacent to the Viaduct Replacement Project area. The Project Area is surrounded by industrial and commercial land uses. The vegetation surrounding the Project Area is mostly comprised of ornamental and weedy plant species.

3.3.2.2 Plants

During the site visit, non-native weedy species were observed in and around the Project Area in disturbed areas, including tree tobacco (*Nicotiana glauca*), Mexican fan palm (*Washingtonia robusta*), crimson fountain grass (*Pennisetum setaceum*), and other herbaceous plants and grasses. There are no natural vegetation communities in the Project Area.

3.3.2.3 Wildlife

Several wildlife species were observed within the Project Area in the 2015 pre-construction surveys for the Viaduct Replacement Project and subsequent construction monitoring surveys, including two bat species and eighteen bird species. The bat species recorded were Yuma myotis (*Myotis yumanensis*) and Mexican free-tailed bat (*Tadarida brasiliensis*). The bird species observed were barn swallow (*Hirundo rustica*), cliff swallow (*Petrochelidon pyrrhonota*), American crow (*Corvus brachyrhynchos*), common raven (*Corvus corax*), red-tailed hawk (*Buteo jamaicensis*), osprey (*Pandion haliaetus*), northern rough-winged swallow (*Stelgidopteryx serripennis*), black necked stilt (*Himantopus mexicanus*), least sandpiper (*Calidris minutilla*), Canada goose (*Branta canadensis*), mallard duck (*Anas platyrhynchos*), great egret (*Ardea alba*), snowy egret (*Egretta thula*), black phoebe (*Sayornis nigricans*), killdeer (*Charadrius vociferous*), great blue heron (*Ardea herodias*), California gull (*Larus californicus*), and rock pigeon. However, due to the level of disturbance and extremely limited amount of vegetated areas, the biological diversity of animals within the Project Area and surrounding areas is low.

3.3.2.4 Federal and State Jurisdictional Aquatic Resources

The Los Angeles River (LA River) is under jurisdiction of the USACE and RWQCB and is designated as waters of the United States and the State. The LA River is also under CDFW jurisdiction. The jurisdiction of the CDFW includes the LA River from the top of the east bank to the top of the west bank. There is no riparian corridor associated with the LA River in the Project Area and there are no existing wetlands in the Project Area.

3.3.2.5 Special-Status Species

Special-status species are plants and animals that are legally protected under the FESA, the CESA, or other regulations, as well as species considered sufficiently rare by the scientific community to qualify for such listing. A list of special-status species, their critical habitats, and sensitive vegetation communities with the potential to be in the Project Area based on geographical location was obtained using the California Natural Diversity Database (CNDDB). A list of special-status plants was obtained from the California Native Plant Society (CNPS) Inventory of Rare and Endangered Vascular Plants of California, which was developed and is maintained by the CNPS Rare Plant Program. A list of special-status species with potential to be in the Project Area based on geographical location was obtained using the USFWS Information for Planning and Conservation (IPaC) System (U.S. Fish and Wildlife Service, 2019). A list of special-status fish species with the potential to be in the Project Area based on geographical location was obtained using the National Marine Fisheries Service (NMFS) California Species List Tool (National Marine Fisheries Service, 2019). The CNDDB, CNPS, USFWS IPaC, and NMFS species lists are included in the BRR prepared for the proposed Project (GPA Consulting, 2019). Biological record searches were reconducted in April 2021.

Special-Status Plants and Sensitive Vegetation Communities

A total of 33 special-status plant species were evaluated for their potential to be within the Project Area, eight of which are identified as federally and/or state threatened and endangered plant species. Survey results, range, and habitat information was used to determine the likelihood for these species to be within the Project Area. Special-status plant species were not observed; therefore, special-status plant species are not anticipated to be in the Project Area.

According to the USFWS, there are no USFWS-designated critical habitats found within the Project Area.

According to the CNDDB search, three sensitive vegetation communities have the potential to be within the Project Area. These sensitive vegetation communities include California Walnut Woodland, Southern Sycamore Alder Riparian Woodlands, and Walnut Forest. None of the sensitive communities were observed, or have the potential to be, within the Project Area.

Special-Status Wildlife

A total of 22 special-status wildlife species were evaluated for their potential to be within the Project Area. Six of which are identified as federally and/or state threatened and endangered wildlife species. Survey results, range, and habitat information was used to determine the likelihood for these species to be within the Project Area. Because the entire Project Area lacks suitable habitat, is disturbed, and is surrounded by industrial and commercial land uses, most of these wildlife species are not anticipated to be in the Project Area. However, the Yuma myotis, a state Species of Special Concern, was recorded in the Project Area during the 2015 Viaduct Replacement Project survey and has a potential to roost or forage in the project area. Bridges and other structures within the project area would provide roosting and nesting habitat for special-status birds and bats. The LA River and other open areas provide foraging habitat for special-status osprey, great egret, and snowy egret. Special-status wildlife such as Yuma myotis, osprey, great egret, and snowy egret have the potential to be within the vicinity of the Project Area.

No USFWS-designated critical habitat for federally threatened and/or endangered wildlife species is designated in the Project Area, and there is no essential fish habitat known to be in the Project Area.

3.3.2.6 Bats

The Fourth Street Bridge and the Seventh Street Bridge contain suitable habitat for bat roosting. As a component of The Sixth Street Viaduct Replacement Project, permanent bat design features will be constructed on the new Sixth Street Viaduct with over the LA River. These habitat features may be occupied by bats prior to the implementation of this proposed Project. Therefore, this EIR also evaluates the potential for bats to be in the newly placed permanent bat design features and any new buildings that provide roosting habitat.

Two bat species, Yuma myotis and the Mexican free-tailed bat, were detected in the Project Area during the bat surveys conducted for the Viaduct Replacement Project in May of 2015, and bats have been detected during subsequent monitoring of the Fourth Street Viaduct. Other special-status bats also have potential to be in the Project Area.

3.3.2.7 Birds

Nesting Birds

The Project Area contains limited suitable nesting habitat for nesting birds, since the entire Project Area is disturbed and is surrounded by industrial and commercial land uses. There is suitable nesting habitat in the Project Area for bird species that frequently nest in and on structures, trees, or other vegetation in developed areas, and are tolerant of disturbance. Several bird species including barn swallows, cliff swallows, American crows, common ravens, and rock pigeons were observed nesting on the Sixth Street Viaduct during a May 2015 survey (GPA Consulting, 2015a).

Raptor Foraging Activities

The Project Area was evaluated for its potential to support raptor foraging activities. Raptors could nest within the Project Area; however, there is limited open area and the foraging habitat is low quality. The Project Area provides limited foraging opportunities for raptor species that are habituated to developed areas.

3.3.2.8 Wildlife Corridors

According to the CDFW Biogeographic Information and Observation System (BIOS), there are no essential wildlife connectivity areas found within the Project Area (California Department of Fish and Wildlife, 2018). The Project Area is within a developed area with minimal habitat for wildlife and is not likely used as a wildlife corridor. However, the Project Area may be used for local foraging and movement by local wildlife species from the surrounding areas.

3.3.3 Environmental Impact Analysis

3.3.3.1 Methodology

Potential significant impacts associated with the proposed Project were gathered from the BRR (October 2019). This report presented findings, conclusions, and recommendations concerning the proposed

Project. The results were based on an analysis of the existing biological resources and jurisdictional areas contained within the Project Area which could be affected by the proposed Project during construction and operation.

Direct impacts result when sensitive biological resources are altered by project implementation, such as through vegetation removal, habitat modifications, and injury or death of wildlife species. Indirect impacts may result from elevated levels of noise or lighting, changes in surface water hydrology, or increased erosion or sedimentation. These types of indirect impacts can affect vegetation communities or their potential use by sensitive wildlife species.

The discussion below identifies potential impacts resulting from the proposed Project, and the BMPs that would be required to reduce impact levels to less than significant.

3.3.3.2 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the Initial Study for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.3.3.3 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Biological Resources if it would:

IV(a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

IV(c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marshes, vernal pools, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

3.3.3.4 Construction Impacts

IV(a): Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS?

The analysis below addresses potential impacts on biological resources including FESA and CESA species, related to the temporary and short-term, direct and indirect impacts on sensitive biological resources anticipated during construction of the proposed Project. As noted below, the proposed Project would result in less than significant impacts on vegetation, wildlife, and special-status plants or wildlife; therefore, no mitigation is required.

Special-Status Plants

Special-status plants species are not expected to be in the Project Area; therefore, mitigation measures are not required.

Special-Status Wildlife

Bats and birds are known to use the bridges over the LA River for roosting and nesting, and raptors could forage in the area. Removal of habitat and increased noise, vibration, night lighting, carbon dioxide, and human activity could impact special-status wildlife, including but not limited to, Yuma myotis, osprey, great egret, and snowy egret. Special-status wildlife could be nesting or roosting with in the Project Area. However, the following BMPs would be implemented to reduce construction-related impacts on wildlife (see Section 3.3.4 and 3.3.5 for additional information):

- Pre-construction wildlife surveys would be completed by a qualified biologist.
- All trash and construction debris would be removed from the LA River on a daily basis.
- No work for the proposed Project would be conducted on or under the Fourth Street Bridge or Seventh Street Bridge structures.
- The LA River Access Tunnel would be surveyed by a qualified biologist to assess the presence of bats or potential bat-roosting habitat. If bats or bat-roosting in the tunnel are identified, then during the non-breeding and active season (typically October), bats would be safely evicted, to the extent feasible, under the direction of a qualified biologist. Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices would be installed and maintained where appropriate to prevent bats from roosting in these cavities prior to construction.
- In the event that a maternal colony of bats is found, no work would be conducted within 100 feet of the maternal roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by a qualified biologist. The site would be designated as a sensitive area and protected as such until the bats have left the site. No activities would be authorized adjacent to the roosting site. Combustion equipment, such as generators, pumps, and vehicles, would not to be parked nor operated under or adjacent to the roosting site. Construction personnel would not be authorized to enter areas beneath the colony, especially during the evening exodus.
- Work on existing structures for the proposed Project (e.g. the LA River Access Tunnel), or within 100 feet of the Sixth Street Viaduct, would be conducted outside of the bat maternity season (typically April-September), if feasible.
- In the event that all bats are not able to be excluded from affected roosting habitat, a qualified biologist would monitor LA River Access Tunnel alterations and tree removals. If bats are disturbed, work would be safely suspended until all bats leave the vicinity on their own, or alternative measures can be identified under the direction of a qualified biologist. Work would resume only once the bats have left the site and/or approval to resume work is given by a qualified biologist.
- If vegetation trimming or clearing is conducted during the nesting season (typically February 15 through September 15), a qualified biologist would conduct a nesting bird survey.

- For construction required during the bird nesting season, for birds protected under the MBTA and California Fish and Game Code Sections, nesting bird surveys would be completed no more than 48 hours prior to construction activities to determine if nesting birds/raptors or active nests are within 300 feet (500 feet for potential raptor nests) of the project area. Surveys would be repeated if construction activities are suspended for five days or more.

With implementation of these BMPs, impacts on wildlife would be less than significant, and mitigation is not required.

IV(c): Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

The proposed Project would include changes to the LA River concrete lining and banks outside of the OHWM, which would include terracing and concrete planters. The LA River is under jurisdiction of the Regional Water Quality Control Board as waters of the State. The LA River is also under jurisdiction of the California Department of Fish and Wildlife (CDFW). A WDR from the RWQCB, and California Fish and Game Code Section 1602 Streambed Alteration Agreement would be required for temporary activities and fill. In addition, the following BMPs would be implemented to avoid impacts by staying out of the OHWM. (see Section 3.3.4 for additional information):

- All trash and construction debris would be removed from the LA River construction areas on a daily basis;
- Appropriate hazardous material BMPs would be implemented to reduce the potential for chemical spills or contaminant releases into the LA River, including any non-stormwater discharge; and
- All equipment refueling and maintenance would be conducted in the staging area, which would be confined to the proposed Project Site in areas outside of the LA River.

With implementation of these BMPs, impacts on aquatic resources would be less than significant, and no mitigation is required.

3.3.3.5 Operational Impacts

IV(a): Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW, USFWS, or NOAA Fisheries?

The analysis below addresses potential impacts on biological resources including CESA and FESA species, related to the permanent and long-term, direct, and indirect impacts on sensitive biological resources anticipated during operation of the proposed Project. As noted below, no impacts on vegetation, wildlife, and special-status plants or wildlife would occur; therefore, no mitigation is required. In addition, the proposed Project would result in less than significant impacts on bats, nesting birds, and raptor foraging habitat, and no mitigation is required.

Special-Status Plants

Special-status plants species are not expected to be in the Project Area; therefore, there would be no impact on special-status plant species and mitigation is not required.

Special-Status Wildlife

Increased lighting, noise, human activity, and regular maintenance of vegetated areas to the Project Area could result in minor impacts on special-status wildlife, including bats, birds, and raptors; however, because there is already a high level of human activity, night lighting, and noise in the Project Area, the proposed Project would not be expected to deter wildlife from using existing habitat. In addition, the terracing within the LA Riverbank with vegetated planters, buildings, meadow, and a nature walk path are anticipated to include trees, and other natural and artificial substrates that would potentially create additional nesting and roosting habitat for special-status birds and bats. Therefore, impacts on special-status wildlife would be less than significant, and mitigation is not required.

IV(c): Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

There are no wetlands in the Project Area; therefore, there would be no operational impacts on wetlands. The proposed Project would include permanent changes to the LA River concrete lining and banks, which may include terracing and concrete planters. The LA River is currently concrete lined, and the addition of these features would not result in a substantial change to the ecological function of the LA River. Therefore, impacts on jurisdictional resources would be less than significant, and mitigation is not required. A WDR from the RWQCB and California Fish and Game Code Section 1602 Streambed Alteration Agreement would be required for permanent fill in the LA River.

3.3.4 Best Management Practices

Impacts on Biological Resources would be avoided or minimized by implementing the following BMPs, which are subject to applicable regulatory agency approval:

BMP-BIO-1: Pre-Construction Wildlife Surveys

Pre-construction wildlife surveys shall be completed by a qualified biologist no more than 48 hours prior to clearing, grubbing, or other construction activities to determine the presence/absence of wildlife species, including special-status species, within 100 feet of the construction area. Special attention will be focused on any existing burrowing, roosting, and nesting habitat within the Project Area. Surveys shall be repeated if construction activities are suspended for five days or more. If any wildlife species are identified, appropriate BMPs shall be developed and implemented to reduce potential impacts on these species, in consultation with regulatory agencies where appropriate.

BMP-BIO-2: Trash and Construction Debris Removal

All trash and construction debris shall be removed from the LA River construction areas on a daily basis. All water quality BMP materials shall be properly maintained during project construction and removed upon completion of construction activities. After completion of proposed construction activities, all construction equipment and materials shall be removed from the Project Area, and the Project Area shall be returned to pre-project conditions.

BMP-BIO-3: Work Area Limitations

No work for the proposed Project shall be conducted on the Fourth Street Bridge or Seventh Street Bridge structures.

BMP-BIO-4: Nesting Bird Survey

If vegetation trimming or clearing is conducted during the nesting season (typically February 15 through September 15), nesting bird surveys shall be completed by a qualified biologist within 300 feet of potential bird-nesting areas and 500 feet of potential raptor-nesting areas no more than 48 hours prior to trimming/removal activities to determine if nesting birds are within the affected vegetation. Surveys shall be repeated if trimming or removal activities are suspended for five days or more.

BMP-BIO-5: Nesting Bird Buffer

If nesting birds protected under the MBTA and California Fish and Game Code Sections are found in the Project Area, appropriate buffer consisting of orange flagging/fencing or similar (typically up to 300 feet for songbirds and 500 feet for raptors shall be installed and maintained until nesting activity has ended, as determined in coordination with the project biologist and regulatory agencies, as appropriate, to ensure that nesting birds and active nests are not harmed.

BMP-BIO-6: Hazardous Material BMPs

Appropriate hazardous material BMPs shall be implemented to reduce the potential for chemical spills or contaminant releases into the LA River, including any non-stormwater discharge.

BMP-BIO-7: Equipment Maintenance

All equipment refueling and maintenance shall be conducted in the staging area. In addition, vehicles and equipment shall be checked daily for fluid and fuel leaks, and drip pans shall be placed under all equipment that is parked and not in operation.

BMP-BIO-8: Regulatory Permits

The City shall consult with the appropriate responsible resource agency (e.g., CDFW and RWQCB) to determine permanent and temporary impact areas. Prior to undertaking ground-disturbing activities within or immediately adjacent to any aquatic resource areas, the City and/or their consultant shall obtain a CWA Section 401 Water Quality Certification, and California Fish and Game Code Section 1602 Streambed Alteration Agreement.

BMP-BIO-9: Pre-Construction Bat Surveys

At least 30 days prior to construction, alterations to the LA River Access Tunnel shall be surveyed by a qualified biologist to assess the presence of bats or potential bat-roosting cavities. If bats or bat-roosting cavities are identified, then during the non-breeding and active season (typically October), bats shall be safely evicted, to the extent feasible, under the direction of a qualified biologist. Once it has been determined that all roosting bats have been safely evicted from roosting cavities, exclusionary devices shall be installed and maintained where appropriate to prevent bats from roosting in these cavities prior to construction.

BMP-BIO-10: Monitoring During LA River Access Tunnel Alteration

In the event that all bats are not able to be excluded from affected roosting habitat, a qualified biologist shall monitor LA River Access Tunnel alterations. If bats are disturbed, work shall be safely suspended until all bats leave the vicinity on their own, or alternative measures can be identified under the direction of a qualified biologist. Work shall resume only once the bats have left the site and/or approval to resume work is given by a qualified biologist.

BMP-BIO-11: Bat Monitoring

In the event that all bats are not able to be excluded from affected roosting habitat, a qualified biologist shall monitor structure alteration activities. If bats are disturbed, work shall be safely suspended until all bats leave the vicinity of the LA River Access Tunnel on their own, or alternative measures shall be identified under the direction of a qualified biologist. Work shall resume only once the bats have left the site and/or approval to resume work is given by a qualified biologist.

Surveys and exclusion measures are expected to prevent maternal colonies from becoming established in structures to be removed or altered. In the event that a maternal colony of bats is found, no work shall be conducted within 100 feet of the maternal roosting site until the maternal season is over or the bats have left the site, or as otherwise directed by a qualified biologist. The site shall be designated as a sensitive area and protected as such until the bats have left the site. No activities shall be authorized adjacent to the roosting site. Combustion equipment, such as generators, pumps, and vehicles, shall not be parked or operated under or adjacent to the roosting site. Construction personnel shall not be authorized to enter areas beneath the colony, especially during the evening exodus.

3.3.5 Mitigation Measures

Impacts on Biological Resources would be less than significant; therefore, mitigation measures are not required.

3.3.6 Significant Unavoidable Adverse Impacts

There are no significant unavoidable adverse impacts on Biological Resources resulting from construction and operation of the proposed Project.

3.3.7 Cumulative Impacts

Biological Resources in the Project Area have been removed or extrapolated due to urbanization and the Project Area is located under and adjacent to the Viaduct Replacement Project area, which is currently an active construction site. Project level impacts on Biological Resources are not likely to result in or have significant cumulative impacts on Biological Resources in relation to other projects in the vicinity of the proposed Project. With implementation of the BMPs described in Section 3.3.4, the proposed Project is not expected to result in significant impacts on Biological Resources. In addition, other projects in the vicinity of the proposed Project (see **Table 1-1**) would be required to comply with all federal and state regulations and be consistent with local policies related to Biological Resources, and to develop BMPs and mitigation measures. Therefore, the proposed Project would not result in cumulatively considerable impacts related to Biological Resources.

3.4 Cultural Resources

This section identifies known cultural resources, including archaeological, tribal cultural resources, and historical, present within the Project Area, evaluates the potential project-related impacts on those resources; and provides mitigation measures, as applicable. The identification of impacts to cultural resources was conducted under the provisions of Section 15064.5 of the California Environmental Quality Act (CEQA) Guidelines. The environmental setting and analysis in this section rely on information from the Project's Historical Resources Evaluation Report (GPA Consulting, 2019) and the Archaeological Assessment (Applied EarthWorks, 2019).

As noted in the analysis below, direct and indirect impacts associated with cultural resources during construction and operation would be less than significant and no mitigation measures are required.

3.4.1 Regulatory Setting

Cultural resources fall within the jurisdiction of several levels of government. Federal, state, and local jurisdictions provide the framework for the identification, documentation, and protection of such resources. As described below, the National Historic Preservation Act (NHPA), California Environmental Quality Act (CEQA), and City of Los Angeles Cultural Heritage Ordinance (Los Angeles Administrative Code Section 22.171) are the primary laws applicable to the proposed Project that govern and affect the preservation of cultural resources of national, state, and local levels of government.

3.4.1.1 Federal

National Historic Preservation Act

The NHPA of 1966, as amended, sets forth national policy and procedures for historic properties, defined as districts, sites, buildings, structures, and objects included in or eligible for listing in the National Register of Historic Places (National Register). Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and to allow the Advisory Council on Historic Preservation (ACHP) the opportunity to comment on those undertakings, following regulations issued by the ACHP (36 CFR Part 800).

National Register of Historic Places

The National Register is "an authoritative guide to be used by federal, state, and local governments, private groups, and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment (Title 36 Code of Federal Regulations Part 60.2)." The National Register recognizes properties that are significant at the national, state, and/or local levels.

Criteria

To be eligible for listing in the National Register, a property must be at least 50 years of age (unless the property is of "exceptional importance") and possess significance in American history and culture, architecture, or archaeology. A property of potential significance must meet one or more of the following four established criteria (Title 36 Code of Federal Regulations Part 60.4):

A. Associated with events that have made a significant contribution to the broad patterns of our history;

B. Associated with the lives of persons significant in our past;

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Yield, or may be likely to yield, information important in prehistory or history.

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. *National Register Bulletin #15* states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning...is made clear" (National Park Service, 1990). A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to possessing significance within a historic context, to be eligible for listing in the National Register a property must have integrity. Integrity is defined in *National Register Bulletin #15* as "the ability of a property to convey its significance" (National Park Service, 1990). Within the concept of integrity, the National Register recognizes the following seven aspects or qualities that in various combinations define integrity: feeling, association, workmanship, location, design, setting, and materials. Integrity is based on significance: why, where, and when a property is important. Thus, the significance of the property must be fully established before the integrity is analyzed.

3.4.1.2 State

California Environmental Quality Act

CEQA requires the consideration of historical resources and tribal cultural resources, as well as "unique" archaeological resources. For the purposes of CEQA, a historical resource is a cultural resource listed in, or determined eligible for listing in, the California Register of Historical Resources (CRHR) (Public Resources Code [PRC] Section 21084.1). Properties listed in, or formally determined eligible for listing in, the NRHP are automatically listed in the CRHR (14 California Code of Regulations Section 4851 [a][1]). Therefore, cultural resources that are "historic properties" under the NHPA are also "historical resources" under CEQA. In addition, cultural resources included in a local register of historical resources or identified as significant in a qualified historical resource survey are also presumed to be historical resources for CEQA.

In 2014, Assembly Bill 52 (AB 52) added the term "tribal cultural resources" to CEQA, and AB 52 is commonly referenced instead of CEQA when discussing the process to identify tribal cultural resources (as well as identifying measures to avoid, preserve, or mitigate effects to them). Defined in PRC Section 21074(a), a tribal cultural resource is a CRHR or local register eligible site, feature, place, cultural landscape, or object which has a cultural value to a California Native American tribe. Tribal

cultural resources must also meet the definition of a historical resource. Unique archaeological resources are referenced in PRC Section 21083.2.

California Register of Historical Resources

The California Register is an authoritative guide used by state and local agencies, private groups, and citizens to identify historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse impacts (PRC Section 5024.1[a]).

The California Register consists of properties that are listed automatically as well as those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register and those formally Determined Eligible for the National Register;
- State Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (SOHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register (PRC Section 5024.1[d]).

Criteria and Integrity

For those properties not automatically listed, the criteria for eligibility of listing in the California Register are based upon National Register criteria, but are identified as 1-4 instead of A-D. To be eligible for listing in the California Register, a property generally must be at least 50 years of age and must possess significance at the local, state, or national level, under one or more of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California, or national history; or
3. It embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important in the prehistory or history of the local area, California, or the nation.

Properties eligible for listing in the California Register may include buildings, sites, structures, objects, and historic districts. A property less than 50 years of age may be eligible if it can be demonstrated that sufficient time has passed to understand its historical importance. While the enabling legislation for the California Register is less rigorous with regard to the issue of integrity, there is the expectation that properties reflect their appearance during their period of significance (PRC Section 4852).

The California Register may also include properties identified during historic resource surveys. However, the survey must meet all of the following criteria (PRC Section 5024.1):

1. The survey has been or will be included in the State Historic Resources Inventory;
2. The survey and the survey documentation were prepared in accordance with office [SOHP] procedures and requirements;
3. The resource is evaluated and determined by the office [SOHP] to have a significance rating of Category 1 to 5 on a DPR Form 523; and
4. If the survey is five or more years old at the time of its nomination for inclusion in the California Register, the survey is updated to identify historical resources that have become eligible or ineligible due to changed circumstances or further documentation and those that have been demolished or altered in a manner that substantially diminishes the significance of the resource.

State Health and Safety Code, Section 7050.5/California Public Resources Code, Section 5097.9

State Health and Safety Code (HSC) Section 7050.5 and PRC Section 5097.9 contain provisions for the treatment of human remains contained in archaeological sites. Under HSC Section 7050.5, if human remains are discovered during any project activity, the county coroner must be notified immediately. If human remains are exposed, HSC Section 7050.5 states that no further disturbance shall occur until the county coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98. Construction must halt in the area of the discovery of human remains, the area of the discovery shall be protected, and consultation and treatment shall occur as prescribed by law. If the remains are determined by the coroner to be Native American, the coroner is responsible for contacting the Native American Heritage Commission (NAHC) within 24 hours.

NAHC, pursuant to PRC Section 5097.98, will immediately notify those persons it believes to be most likely descended from the deceased person so they can inspect the burial site and make recommendations for treatment or disposal.

3.4.1.3 Local

City of Los Angeles Cultural Heritage Ordinance

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and amended it in 2007 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission and criteria for designating Historic-Cultural Monuments (HCM). The Commission is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The four criteria for HCM designation are stated below:

1. The proposed HCM reflects the broad cultural, economic, or social history of the nation, state or community; or
2. The proposed HCM is identified with historic personages or with important events in the main currents of national, state, or local history; or
3. The proposed HCM embodies the characteristics of an architectural type specimen inherently valuable for a study of a period, style, or method of construction; or

4. The proposed HCM is the notable work of a master builder, designer, or architect whose individual genius influenced his or her age (Los Angeles Administrative Code Section 22.171.7).

Unlike the National and California Registers, the Ordinance makes no mention of concepts such as physical integrity or period of significance. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

City of Los Angeles Conservation Element

The Conservation Element of the City of Los Angeles General Plan (adopted September 2001) primarily addresses preservation, conservation, protection, and enhancement of the city's natural resources. The Conservation Element specifically addresses archaeological resources in Section 3 of Chapter 2. Cultural and historical resources are addressed in Section 5 of the same chapter.

With regard to archaeological resources, the Conservation Element contains the following objective with an associated policy and program:

- **Objective:** protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.
- **Policy:** continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition, or property modification activities.
- **Program:** permit processing, monitoring, enforcement, and periodic revision of regulations and procedures.
- **Responsibility:** departments of Building and Safety, City Planning and Cultural Affairs, and/or the lead agency responsible for project implementation.

The Conservation element also includes the following objective, policy, and programs for cultural and historic resources:

- **Objective:** protect important cultural and historical sites and resources for historical, cultural, research, and community educational purposes.
- **Policy:** continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities.
- **Program 1:** development permit processing, monitoring, enforcement and periodic revision of regulations and procedures.
- **Responsibility:** departments of Building and Safety, City Planning, Cultural Affairs and Community Redevelopment Agency and/or the lead agency responsible for project implementation.
- **Program 2:** prepare the Historic Preservation and Cultural Resources Element of the general plan.
- **Responsibility:** departments of City Planning and Cultural Affairs.
- **Program 3:** continue to survey buildings and structures of any age in neighborhoods throughout the city in order to develop a record that can be used in the present and future for evaluating their

historic and cultural value as individual structures and within the context of surrounding structures.

- **Responsibility**: departments of Building and Safety, City Planning, and Cultural Affairs and the Community Redevelopment Agency.

3.4.2 Environmental Setting

The Project Area is a fully developed, mixed-use urban setting, bisected by the channelized Los Angeles River (see **Figure 2-2**, Project Area). Land uses along the east and west sides of the River are predominantly industrial and commercial. The built environment in the vicinity of the Project Area is characterized by the width of the streets and their grid-like arrangement; railroad rights-of-way and the placement of spur tracks to the rear of parcels; the size of parcels and the corresponding footprint and height of the buildings erected; extensive surface parking areas, often designed to accommodate large trucks; evidence of former rail lines (such as remnant tracks and a rail stop); remnant granite infrastructure (including curbs, swales, and rail beds); and the lack of street trees or other landscaping. The area is characterized by industrial building types that vary widely in size, from modest industrial buildings to massive warehouses spanning full city blocks. Buildings in the area were constructed primarily between 1900 and 1940 and are predominantly vernacular or utilitarian in form and style.

Railroad corridors exist along the east and west banks of the LA River. The Los Angeles River is contained within a trapezoidal concrete-lined channel. There are two extant bridges within the Project Area: the Fourth Street Viaduct (Bridge No. 53C0044) and the Seventh Street Viaduct (Bridge No. 53C1321). The Fourth Street Viaduct is a concrete arch bridge over the Los Angeles River, located along Fourth Street. The Seventh Street Viaduct is a reinforced concrete arch bridge is located along Seventh Street over the Los Angeles River. The Sixth Street Viaduct Replacement is currently under construction within the Project Area.

3.4.2.1 Geological Setting

The Project Area is generally situated within a broad valley of the Los Angeles Basin. This broad, level expanse of land comprises more than 800 square miles extending from Cahuenga Peak southward to the Pacific Coast, and from the Topanga Canyon southeast to the vicinity of Aliso Creek. The Los Angeles Basin is traversed by several large watercourses. The Project Area is surrounded by the Santa Monica Mountains to the northwest and north; the San Gabriel Mountains to the north and northeast; and the Baldwin Hills to the south. The soils are alluvium and colluvium underlain by Miocene marine sedimentary deposits. Geological faulting and folding of the crust in the area have trapped oil deposits beneath the surface (Mayuga, M.N., 1970). The geologic formation underlying the Project Area is tentatively identified as sand, silt, and gravel as well as alluvial fans and streambeds.

3.4.2.2 Prehistoric Background

The sediments and soils within the Project Area date from periods ranging from Holocene to Late Pleistocene. Within the Project Area, most deposits are derived from the Los Angeles River and are unlikely to preserve fossil material because of their recent nature. Remnants of Valley Grassland and Coastal Sage-Scrub zones cover much of the Los Angeles Basin and adjacent hill slopes. Few

stands of native biotic communities remain today within the Los Angeles Basin, with present-day plant communities primarily being landscaped and introduced species.

3.4.2.3 Ethnographic Background

The Project Area lies within the territory of the Gabrieleño Native American people. It is believed that the total Gabrieleño territory covered more than 1,500 square miles and included the watersheds of the Los Angeles River, San Gabriel River, Santa Ana River, and Rio Hondo. The Gabrieleño also occupied the islands of Santa Catalina, San Clemente, and San Nicolas. Within this large territory were more than 50 residential communities with populations that ranged from approximately 50 to 150 individuals.

A typical Gabrieleño settlement contained a variety of structures used for religious, residential, and recreational purposes. This wealth of natural resources, coupled with effective technology and a well-developed trade and ritual system, resulted in a society that was among one of the most materially wealthy and culturally sophisticated cultural groups in California (McCawley, 1996). Trade was an important element of the Gabrieleño economy. In general, the Gabrieleño cultivated alliances with other groups, including a Chumash-Salinan- Gabrieleño alliance (Bean, 1976), and also maintained cult or ritual centers (such as the village Povongna, presumed to be located in the vicinity of Long Beach). Mission San Gabriel was founded on September 8, 1771, at a location near the Whittier Narrows. After this, the traditional Gabrieleño communities were depopulated and epidemics caused by the introduction of European diseases greatly reduced the population.

The ethnographic evidence suggests that several Gabrieleño settlements were located on the Los Angeles plain. Archaeologist Chester King identified several areas where archaeological remains of village sites dating to the ethnohistoric contact period may be located (Applied EarthWorks, 2019). Two of these vaguely defined areas include Ha'utnga in the Lynwood/South Gate/Watts area and Amupunga near the Rancho San Pedro (Dominguez) Adobe. A third village area known as Yaanga (or Yaangna), is believed to have been located on the west bank of the Los Angeles River slightly south of the old Spanish Plaza of Pueblo de Los Angeles in the vicinity of Union Station, north of the Project Area.

3.4.2.4 Historic Background

The Project Area was first utilized as agricultural land by inhabitants of the Pueblo that later became Los Angeles. The area on the east side of the Los Angeles River was used for cattle ranching until the 1830s. The west side of the River was a vineyard in the 1830s. The 1849 Gold Rush brought a large demand for citrus fruit, which was used to protect against scurvy, a common malady of miners. Oranges and grapefruit quickly overtook grapes as the area's primary crops. The fruit industry proved to be the saving grace of the regional economy when a drought in 1862 decimated the cattle industry. In 1858, Andrew Aloysius Boyle purchased a large section of the east side of the River and planted a vineyard. Despite its proximity to the center of Los Angeles, Boyle's land remained pastoral and was generally perceived as unfit for development at the time, due to its geographic isolation from the rest of the city because of the Los Angeles River. The agrarian character of the areas around the River was redefined with the arrival of the railroads in the late nineteenth century.

The development of Los Angeles was heavily dependent on evolving transportation systems for the delivery of raw materials and the moving of finished goods. Until the 1870s, only local rail lines ran through Los Angeles. The Los Angeles and San Pedro Railroad (LA & SP) was incorporated in 1868. The

LA & SP built a local line connecting the port of Wilmington with the inland City of Los Angeles. LA & SP was consolidated with the Southern Pacific in 1874 as part of the arrangement to bring the transcontinental Southern Pacific to Los Angeles. In 1876, Southern Pacific opened the line connecting Los Angeles to San Francisco, linking Los Angeles with the transcontinental railroad. The completion of a transcontinental rail line to Southern California in 1885 and a subsequent fare "war" between the Southern Pacific and Santa Fe railroads brought scores of newcomers to Los Angeles, which in turn produced a surge of land speculation and development activity across the region.

As the railroads increased mobility, Los Angeles ceased to be simply a market for manufactured goods produced in San Francisco and the East and began to support local industries as well. Similarly, as agricultural activities in other areas of the city supplanted those near the city center, the city center evolved from simply a shipping hub to a processing and manufacturing center. This was particularly true of the areas adjacent to the Los Angeles River where transcontinental railroads laid their tracks (Southern Pacific Railroad on the west side of the Los Angeles River and later the Atchison, Topeka & Santa Fe Railway on the east side). Streetcars crossed through the area, facilitating the movement of workers and encouraging development along the spine of the River. By 1901, seven streetcar lines traversed the River, linking downtown Los Angeles on the west with Boyle Heights on the east. These areas evolved into the City's first industrial district.

Industrial development was diverse and included freight houses and freight yards developed by the railroads in addition to warehouses, manufacturing facilities, and salvage yards. Construction-related industries expanded rapidly beginning in the 1880s when the regional real estate boom spurred residential and commercial construction. Industrial development in the area did not begin in earnest until the subdivision of two substantial tracts specifically dedicated for industrial use: the Industrial Tract, recorded in 1903 by the Industrial Realty Company; and the Industrial Center Tract, recorded in 1904. These tracts defined the southwestern section of the Project Area, terminating at Seventh Street. In the early decades of the twentieth century, many of the area's industrial buildings were one of two types: manufacturing or processing facilities and warehouses. A 1909 map of the area notes the considerable number of warehouses and storage facilities which had been constructed in just a few years, as well as a wide variety of processing and manufacturing operations – including lumber yards, freight yards, ice, and cold storage, slaughterhouses, meatpackers, produce companies and canneries, and blacksmiths, among others (Historic Resources Group, 2016). Many of the area's industrial buildings were constructed directly on a rail spur; these buildings often display curved facades that follow the tracks, with docks and large bay doors set several feet above the ground (to the height of a boxcar), to facilitate the loading and unloading of goods. Warehouses were built either as general storage facilities – with space that could be rented by a variety of companies or operators – or were purpose-built facilities associated with a particular company.

As new local industries established themselves, processing and manufacturing operations in the area continued to expand. Two industries flourished during this period: ice and cold storage, and food processing and packaging. Cold storage emerged in response to the demand for fresh products in urban areas and provided a critical link between agricultural goods from farms, fisheries, and ranches and their distribution to fresh produce markets and food processors. Construction of cold storage warehouses was initially linked with that of ice-making plants, with both frequently located within the same facility. Food processing industries represented some of the earliest industrial development in Los Angeles, but the

industry exploded in operation during the 1910s and 1920s as companies began to embrace mechanization to meet the demands of new chain stores. Food processing eventually became one of the dominant industries in the area.

The character of the industrial areas adjacent to the River remains largely a function of the redevelopment of Union Pacific's former railroad facilities during the 1920s. In response to the strong demand for industrial space arising from the economic growth of the Los Angeles region in the 1910s, Union Pacific, on the east side of the River, began removing many of its facilities near the Los Angeles River and dividing its properties into industrial sites. A major incentive attracting business to this industrial district was the Union Pacific spur tracks interlaced among the streets, providing industries with easy access to a national freight rail network. This ushered in a wave of industrial development on the east side of the River.

By the 1920s, the east and west sides of the River were fully established as an industrial hub. This was aided in part by the pattern of development occurring outside the central city. As the City of Los Angeles continued to annex existing communities as well as available land in the San Fernando Valley, zoning was amended to eliminate residential development and accommodate the construction of more offices, retail, and manufacturing facilities in the downtown area. Boyle Heights, just east of the Union Pacific industrial zone along the River, had become a densely populated residential suburb.

The east side of the Los Angeles River and Boyle Heights benefited tremendously from the Viaduct Bond Act of 1923, which set into motion an ambitious and far-reaching bridge building program across the city. The sale of bonds financed the construction of a series of monumental concrete viaducts that spanned both the Los Angeles River and the rail lines that ran adjacent to the riverbed; seven of these viaducts, at Macy (now Cesar Chavez), First, Fourth, Whittier/Sixth, Seventh, Ninth (now Olympic), and Washington Streets, were routed into Boyle Heights and were completed between 1925 and 1933. The Whittier/Sixth Street Bridge built in 1933 (now demolished) was the last bridge built as part of the bond measures. These bridges replaced several existing wood and metal truss bridges, which were susceptible to flood damage and lacked the capacity to accommodate traffic that had been generated by the area's rapid growth.

Industrial development in the area declined following World War II. After the Interstate Highway System was launched in the 1950s, the trucking industry became the preferred mode of transportation for industrial activity and the railroads declined. Locating factories and warehouses in districts with spur track access became less important. At the same time, many pre-war industrial districts had become highly congested urban areas that were less convenient for truck access, unlike newly-built factories and warehouses on the outskirts of cities and in suburbs. The construction of an expansive freeway network throughout Southern California also drastically altered the configuration and physical character of the Project Area. Five freeways and the multi-level East Los Angeles Interchange were routed through Boyle Heights between 1948 and 1965.

While industries evolved over time, the area maintained its character as an industrial center, with one processing or manufacturing operation replacing another. Over the course of the twentieth century, a single manufacturing facility might house the production of everything from dog food to pie. In the 1950s, the area was home to automotive manufacturing, trucking and transport, furniture manufacturing and storage, paint and chemical manufacturing, and paper and plastic production – as well as historically dominant industries such as food processing and lumber and woodworking operations.

By the 1960s, however, the character of the area was evolving away from that of an industrial center. Local industries and manufacturers struggled to adapt to the competition brought on by containerization and other modern technologies. Outlying fledgling industrial centers such as Vernon and the City of Commerce were comparatively undeveloped and offered plentiful land at lower prices, presenting many companies with an opportunity to relocate and construct newer and more efficient facilities. As a result, many buildings in the industrial district were vacant by the 1970s.

The use of the area's industrial buildings evolved as artists and other creative types began to congregate amidst the vacant buildings and empty lots. Priced out of established artists' colonies in neighborhoods such as Venice and Hollywood, Los Angeles' industrial district provided many with an opportunity to live and work inexpensively in vast warehouse buildings. Many of the area's most prominent industrial buildings found new life as gallery space and underground hangouts for a burgeoning art and music scene. By the 1980s, the area was home to several avant-garde art galleries, giving rise to the group of early artists now called the "Young Turks" (Miller, 2014). In 1981, the City of Los Angeles implemented the Artist-in-Residence Program, which legalized the residential use of formerly industrial buildings for artists, legitimizing their efforts. In the mid-1990s, the area was officially designated as the Arts District by the City. A subsequent wave of development began in 1999 with the passage of the Adaptive Reuse Ordinance, which relaxed zoning codes and allowed for the conversion of pre-1974 commercial and industrial buildings into residences for artists and non-artists alike. The area continues to attract new commercial and residential development, as existing facilities are adapted to meet the needs of the growing community.

3.4.3 Identification and Evaluation of Cultural Resources

3.4.3.1 Methodology

Archaeological Resources

Record searches for previous documentation of identified archaeological resources were conducted. A reconnaissance-level archaeological survey of the Project Area was conducted on January 11, 2018. The purpose of the survey was to assess the current conditions of the Project Site (i.e., the footprint of the proposed Project) to examine any exposed native sediments that may be present. In addition, an attempt was made to re-identify the two archaeological sites that had been previously recorded in the Project Site west of the River. At the time of the survey, much of the proposed Project Site was under construction for the Sixth Street Viaduct Seismic Improvement Project. Due to safety concerns and access issues, only the Project Site, and not the area encompassing the Los Angeles River and railroad rights-of-way, was examined by the archaeologist during the reconnaissance survey.

Tribal Cultural Resources

On November 3, 2017, NAHC recommended that local Native American tribes be contacted for information on Native American resources within the Project Area. Applied EarthWorks sent a letter via electronic mail on January 18, 2018, to these groups. A second attempt at correspondence was made on February 7, 2018. Only one response was received, from the Gabrieleño Indians of California Tribal Council. The City is currently consulting with the Gabrieleño Indians of California Tribal Council in accordance with AB 52.

Historical Resources

The study area was defined as roughly a two-parcel radius to the north and south of East Sixth Street and Whittier Boulevard from Interstate 5 on the east to Mill Street on the west. The Project Area also included a segment of the Los Angeles River, adjacent railroad rights-of-way, and two bridges located at East Fourth Street to the north and East Seventh Street to the south. In order to identify and evaluate historical resources, a multi-step methodology was utilized. Record searches for previous documentation of identified historic resources were conducted, including listings in the NRHP, determinations of eligibility for NRHP listings, and the City of Los Angeles' historic resource inventories. Prior historical resource surveys involving the Project Area were also reviewed, including the 6th Street Viaduct Seismic Improvement Project Historical Resources Evaluation Report (Parsons, 2007), Adelante Eastside Redevelopment Project Intensive Historic Resources Survey (PCR Services Corporation, 2008), and SurveyLA (Historic Resources Group, 2016). An intensive survey, including photography and background research, was then made of the study area.

3.4.3.2 Survey Results

Archaeological Resources

Within the Project Area, many of the buildings and structures that were previously located along Whittier Boulevard and Sixth Street have been demolished by the Sixth Street Viaduct Seismic Improvement Project. In the portion of the Project Area east of the Los Angeles River, a series of bridge support columns have been constructed along Whittier Boulevard running in a southeast-to-northwest direction. At the time of the site visit (January 11, 2018), bridge support columns had not yet been installed west of the River, but portions of the west abutment immediately west of Mateo Street were under construction. An inspection of exposed sediments revealed a high level of ground disturbance throughout the Project Area. Examination of the Los Angeles River and adjacent railyards from the public right-of-way indicates that the entire APE is developed with few to no areas of exposed ground.

An archaeological monitor from Duke CRM was on-site at the time of the site visit to observe ground-disturbing activities associated with the Sixth Street Viaduct Seismic Improvement Project. Archaeological monitoring for the Sixth Street Viaduct Seismic Improvement Project had been ongoing since at least August 2017. The archaeological monitor noted that in the portion of the Project Area west of the Los Angeles River, existing ground disturbance extended approximately five or six feet in depth. Although no prehistoric artifacts had been encountered during the monitoring activities, the archaeological monitor stated that various historical ceramic and glass fragments have been recovered throughout the area. She noted that several small stone spheres, which likely date to the historic period, were recovered near the Sixth Street and Mateo Street intersection.

The recorded locations of 19-004192 and 19-004193 were revisited during the reconnaissance survey. An examination of the ground surface in these areas revealed the area had been extensively disturbed and recently graded. Site 19-004192 consists of a historic-period refuse scatter. The site measures 50 by 25 feet in area and is located west of the Los Angeles River and east of Santa Fe Street under the Sixth Street Bridge. The scatter consists of 13 pieces of brick and 2 glass bottle fragments. The site was initially recorded within a proposed maintenance and storage facility for the Westside Subway Extension Project; the resource was previously determined ineligible for listing on either the NRHP or the CRHR (Sikes,

2012). Site 19-004193 consists of an early twentieth-century road remnant. The site measures 3.5 by 2.5 feet in area and is located near the foundation of the Sixth Street Bridge. No artifacts were found in association with the exposed road surface. The site is located within a proposed maintenance and storage facility for the Westside Subway Extension Project; the resource was previously determined ineligible for listing on either the NRHP or the CRHR (Sikes, 2012). No surface evidence was found for the previously documented historical refuse deposit (19-004192) or historical road (19-004193) (Applied EarthWorks, 2019).

Tribal Cultural Resources

NAHC indicated in a letter sent to Applied EarthWorks on November 3, 2017, that Native American resources were recorded in the Project Area. The NAHC recommended that local Native American groups be contacted to elicit specific information on Native American resources. Applied Earthworks sent a letter via electronic mail to these individuals on January 18, 2018.

Individuals/organizations contacted at the request of the NAHC are listed below:

- Charles Alvarez, Gabrieleño Tribe
- Robert Dorame, Chairperson of the Gabrieleño Indians of California Tribal Council
- Sandonne Goad, Chairperson of the Gabrieleño Nation
- Anthony Morales, Chairperson of the Gabrieleño San Gabriel Band of Mission Indians
- Andrew Salas, Chairperson of the Gabrieleño Band of Mission Indians-Kitz Nation

One response was received. Robert Dorame, Chairperson of the Gabrieleño Indians of California Tribal Council, stated that historic-period archaeological materials, as well as abalone shell, had been recovered outside of the Project Area but just north of the Project Area, along the west bank of the Los Angeles River. He also noted that the Los Angeles River's course had fluctuated through time and at one point it had covered much of the Project Area. Because of the proximity of the Project Area to both known archaeological remains and the Los Angeles River, Mr. Dorame stated that the Project Area is sensitive for prehistoric Native American remains. He requested that a Native American monitor affiliated with the Gabrieleño Indians of California Tribal Council observe all ground-disturbing activities (including bore holes and asphalt removal) associated with the proposed Project.

Historical Resources

Within the Project Area, there are no NRHP-listed properties. After research and field survey, it was determined that there are four historical resources as defined by CEQA in the Project Area:

- The Fourth Street Viaduct (LAHCM #904 and Bridge No. 53C0044) is a designated Los Angeles Historic-Cultural Monument and determined eligible for listing in the National and California Registers (Status Code 2S2).
- The Seventh Street Viaduct (LAHCM #906 and Bridge No. 53C1321) is a designated Los Angeles Historic-Cultural Monument and determined eligible for listing in the National and California Registers (Status Code 2S2).

- For the purposes of CEQA review, the segment of the Los Angeles River Channel within the Project Area is presumed to be a historical resource. Segments of the Los Angeles River outside of the Project Area were previously identified as eligible for listing under NRHP Criterion A and CRHR Criterion 1 as a contributing element of the larger, 51-mile linear resource (GPA Consulting, 2019). The river is presumed eligible for its association with flood control in the region and for facilitating the continued development of river-adjacent areas during and after World War II.
- The Downtown Los Angeles Industrial Historic District is a historic district identified as eligible for federal, state, and local historic designation through SurveyLA, a citywide historical resource survey conducted by the City of Los Angeles. The district is significant for its role in the industrial development of Los Angeles; this area served as the city's primary industrial district from the late-nineteenth century through World War II. It was identified as eligible for listing under NRHP Criterion A and CRHR and LAHCM Criterion 1. Five buildings within the Project Area were evaluated as non-contributors to the Downtown Los Angeles Industrial Historic District by SurveyLA. As non-contributors, these buildings do not add to the historic architectural qualities, historic association, or historic patterns for which the District is significant. In accordance with Section 15064.5(a)(2)-(3) of the CEQA Guidelines, these five buildings are not considered historical resources for the purposes of CEQA compliance; however, the District as a whole is considered a historical resource.

GPA Consulting re-surveyed the Project Area and did not identify any potential historical resources that were not already identified by SurveyLA (Historic Resources Group, 2016) and other recent historical resource surveys of the 6th Street Viaduct Seismic Improvement Project Area (Parsons, 2007) and Adelante Eastside Redevelopment Project Area (PCR Services Corporation, 2008). It is unlikely that further research would reveal previously unidentified historic associations and the properties in the Study Area were unlikely to meet the criteria for significance. Due to alterations, most of the properties were too altered to retain integrity to convey significance.

3.4.4 Environmental Impact Analysis

This section outlines the methodology, evaluation, and impacts for archaeological, tribal cultural, and historical resources. It is intended to assist in the evaluation and conclusions of the impact analysis provided below and in the formation of required mitigation measures.

3.4.4.1 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the Initial Study for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.4.4.2 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Cultural Resources if it would:

V(a) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5.

D.3 *Historical Resources.* A project would normally have a significant impact on historical resources if it would result in a substantial adverse change in the significance of a historical resource. A substantial adverse change in significance occurs if the project involves:

- Demolition of a significant resource;
- Relocation that does not maintain the integrity and significance of a significant resource;
- Conversion, rehabilitation, or alteration of a significant resource that does not conform to the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings; or
- Construction that reduces the integrity or significance of important resources on the site or in the vicinity.

V(b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5

V(c) Disturb any human remains, including those interred outside of formal cemeteries?

According to Appendix G of the CEQA Guidelines, a project would have a significant impact related to tribal cultural resources if it would:

XVIII Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:

(a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k).

(b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.

3.4.4.3 Construction Impacts

The analysis below describes the potential temporary and permanent impacts on cultural resources for the proposed Project during construction.

V(a): Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

The proposed Project includes the construction of public recreational space on approximately 13 acres in areas underneath and adjacent to the Sixth Street Viaduct Replacement. The proposed Project is organized into three areas, referred to as the West Park, Arts Plaza and River Gateway, and the East Park. The River Gateway would involve permanent alterations to an existing pedestrian and maintenance tunnel (LA River Access Tunnel) that connects the Arts Plaza site with the west bank of the Los Angeles River. In addition, reinforced concrete planted terraces would be constructed on the west and east banks of the LA River channel. Four historical resources were

identified within the Project Area: Fourth Street Viaduct, Seventh Street Viaduct, the Los Angeles River, and the Downtown Los Angeles Industrial Historic District.

The Fourth Street Viaduct and Seventh Street Viaduct (the viaducts) are significant for their method of construction and innovative design. None of the activities associated with the construction phase of the proposed Project would physically impact the viaducts. The construction phase of the proposed Project would not result in a substantial adverse change in the significance of the viaducts.

The Los Angeles River is significant for its association with flood control in the region, for facilitating the continued development of river-adjacent areas during and after World War II, and for its method of construction. The construction phase of the proposed Project includes alterations to LA River Access Tunnel, which include widening the tunnel opening; resurfacing the entryway, pavement, and tunnel floor; painting; installing lighting; and installing safety features, including removable bollards or gate and warning devices. In addition, reinforced concrete planted terraces would be constructed on up to approximately 20,000 square feet of the west and east banks of the LA River channel. The proposed improvements would be compatible with the size, scale and proportion, and massing of the existing concrete channel. The historical resource would not be materially impaired; therefore, the activities associated with the construction phase of the proposed Project would not result in a substantial adverse change in the significance of the River.

The Downtown Los Angeles Industrial Historic District (District) is significant for its role as the City's primary industrial district from the late nineteenth century through World War II. The proposed Project Site is located outside the District boundaries. None of the activities associated with the construction phase of the proposed Project would physically or indirectly impact the District's contributing buildings or its other distinctive features. The construction phase of the proposed Project would not result in a substantial adverse change in the significance of the District.

The historic associations, design elements, and character defining features that convey the significance of the four historical resources in the Project Area would not be affected by the activities associated with the construction phase of the proposed Project. Therefore, impacts during construction would be less than significant and no mitigation measures are required.

V(b): Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Results of the archaeological assessment indicate there are no significant archaeological resources that would be affected by the proposed Project. However, the archaeological sensitivity model created for the proposed Project indicates that undisturbed native sediments throughout much of the Project Site have a moderate potential for buried archaeological deposits dating to the prehistoric period. Within the Los Angeles River and railroad rights-of-way, the potential of encountering prehistoric and historic archaeological remains is considered relatively low.

The development of the West Park and East Park portions of the Project Site has the potential to disturb deeply buried and intact prehistoric and historic archaeological resources. Archaeological monitoring would be conducted in the West Park and East Park for excavations at depths greater than five feet (see **BMP-CUL-1**). In the unlikely event that previously undisturbed archaeological resources are encountered during construction, all work in the vicinity would stop until a qualified

archaeologist can visit the site of discovery and assess the significance of the archaeological resource (see **BMP-CUL-4**). Therefore, the project would not cause a substantial adverse change in the significance of an archaeological resource.

V(c): Would the project disturb any human remains, including those interred outside of formal cemeteries?

No human remains are known to exist in the Project Site, and the location does not encompass any formal cemeteries. However, the Gabrieleño Indians of California Tribal Council have indicated that the Project Area is sensitive for prehistoric Native American remains. Health and Safety Code Section 7050.5, Section15064.5(e) of the CEQA Guidelines, and PRC Section 5097.98 mandate the process to be followed in the unlikely event of an accidental discovery of any human remains in a location other than a dedicated cemetery (see **BMP-CUL-5**). Specifically, the Los Angeles County Coroner must be notified within 24 hours of the discovery of potentially human remains. The Coroner must then determine within two working days of being notified if the remains are subject to his or her authority. If the Coroner recognizes the remains to be Native American, he or she must contact the NAHC by phone within 24 hours. The NAHC then designates a Most Likely Descendant (MLD) with respect to the human remains within 48 hours of notification. The MLD will then have the opportunity to recommend to the Project proponent means for treating or disposing of, with appropriate dignity, the human remains and associated grave goods within 24 hours of notification.

XVIII: Cause a substantial adverse change in the significance of a site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American Tribe that is listed or determined eligible for listing on the California Register of Historical Resources, listed on a local historical register, or otherwise determined by the lead agency to be a tribal cultural resource?

The Gabrieleño Indians of California Tribal Council has indicated that the Project Area is sensitive for prehistoric Native American remains. Chairperson Dorame requested that a Native American monitor affiliated with the Gabrieleño Indians of California Tribal Council observe all ground-disturbing activities (including bore holes and asphalt removal) associated with the proposed Project. It is anticipated that a qualified tribal cultural resource monitor may be present during excavation activities in the proposed Arts Plaza (see **BMP-CUL-3**). In addition, a tribal cultural resources sensitivity training session would be held for the construction contractor prior to construction activities (see **BMP-CUL-2**). The City will continue working with the tribe in accordance with the requirements of AB 52. Because no tribal cultural resources were observed in the Project Area, impacts would be less than significant and no mitigation measures are required.

3.4.4.4 Operational Impacts

The analysis below describes the temporary and permanent impacts on cultural resources anticipated as a result of the proposed Project during operation. The analysis below evaluates potential impacts, based upon the applicable threshold of significance.

V(a): Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

Operation of the proposed Project would involve the use and maintenance of public recreational space on approximately 13 acres in areas underneath and adjacent to the Sixth Street Viaduct. As described above, four historical resources were identified within the Project Area: Fourth Street Viaduct, Seventh Street Viaduct, the Los Angeles River, and the Downtown Los Angeles Industrial Historic District.

The Fourth Street Viaduct and Seventh Street Viaduct (the viaducts) are significant for their method of construction and innovative design. Operation of the proposed Project would not involve activities that could result in the demolition, relocation, conversion, rehabilitation, or alteration of the viaducts. Therefore, the operations phase of the proposed Project would not result in a substantial adverse change in the significance of the viaducts.

The Los Angeles River is significant for its association with flood control in the region; for facilitating the continued development of river-adjacent areas during and after World War II; and for its method of construction. During the operation of the proposed Project, existing access to the River via the LA River Access Tunnel on the west bank would be maintained. In addition, the west and east banks of the LA River channel would include reinforced concrete planted terraces on up to approximately 20,000 square feet of the west and east LA River banks. The proposed improvements are compatible with the size, scale and proportion, and massing of the existing concrete channel. The historical resource would not be materially impaired; therefore, the proposed Project would not cause a substantial adverse change in the significance of the LA River.

The Downtown Los Angeles Industrial Historic District (District) is significant for its role as the City's primary industrial district from the late nineteenth century through World War II. The Project Site is located outside the District boundaries. Though the proposed Project would introduce a new visual element to the area southeast of the District, the impact would be less than significant. Given the Project Site's location outside of the District, the proposed Project would not substantially change the spatial relationships between the District's significant components. As the Project would not materially impair the District, it would not result in a substantial adverse change to the historical resource.

The historic associations and character defining features that convey the significance of the four historical resources in the Project Area would not be affected by the activities associated with the operations phase of the proposed Project. Therefore, impacts during operation would be less than significant and no mitigation measures are required.

V(b): Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Operation of the proposed Project would not involve any ground-disturbing activities. Therefore, there would be no potential to disturb, damage, or degrade an archaeological resource or its setting. No operational impacts on archeological resources would occur and no mitigation measures are required.

V(c): Disturb any human remains, including those interred outside of formal cemeteries?

Operation of the proposed Project would not involve any ground-disturbing activities. Therefore, there would be no potential to disturb any human remains. Because operation of the proposed Project would not involve any ground-disturbing activities, no operational impacts on human remains would occur and no mitigation measures are required.

XVIII: Cause a substantial adverse change in the significance of a site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American Tribe that is listed or determined eligible for listing on the California Register of Historical Resources, listed on a local historical register, or otherwise determined by the lead agency to be a tribal cultural resource?

Operation of the proposed Project would not involve ground disturbing activities; therefore, operation of the proposed Project would not disturb prehistoric Native American remains nor cause an adverse change in the significance of a site, feature, place, cultural landscape, sacred place, or object with cultural value to a California Native American Tribe. Because operation of the proposed Project would not involve any ground-disturbing activities, no operational impacts on sites, features, places, cultural landscapes, sacred places, or objects with cultural value to a California Native American Tribe would occur and no mitigation measures are required.

3.4.5 Best Management Practices

BMP-CUL-1: Archaeological Monitoring During Excavation

A qualified archaeological monitor shall conduct archaeological monitoring in the West Park and East Park for excavations at depths greater than 5 feet. Monitoring efforts may be reduced or eliminated for those portions of the Project Area shown to have been recently disturbed by construction activities associated with the Sixth Street Viaduct Project.

BMP-CUL-2: Tribal Cultural Resources Sensitivity Training

The City shall invite a qualified tribal representative from the Gabrieleño Band of Mission Indians to a pre-construction meeting to provide a training session to the construction contractor regarding potential tribal resources that could be encountered during construction activities and procedures to follow should a tribal resource be encountered.

BMP-CUL-3: Tribal Cultural Resources Monitoring During Excavation

The City shall retain and compensate for the services of a Tribal monitor who is both approved by the Gabrieleño Band of Mission Indians-Kizh Nation Tribal Government and is listed under the NAHC's Tribal Contact list for the Project Area. The Tribal monitor shall only be present on-site during the construction phases that involve ground-disturbing activities in the proposed Arts Plaza. Monitoring efforts may further be reduced or eliminated for those portions of the proposed Arts Plaza that (1) are underlain with artificial fill of known origin, (2) require superficial scraping of land at depths less than five feet, or (3) are demonstrated to have been recently disturbed by construction activities associated with the Sixth Street Viaduct Project. The on-site monitoring shall cease when the grading and excavation activities in the proposed Arts Plaza are completed, or when the Tribal representatives and monitor have indicated that the site has a low potential for impacting tribal cultural resources.

BMP-CUL-4: Unanticipated Discovery of Archaeological and Tribal Cultural Resources

In the event that potentially significant buried archaeological materials are encountered within the Project Area, all work in the vicinity must stop until the archaeological and Tribal monitor can visit the site and assess the significance of the resource. If the resources are Native American in origin, the Gabrieleño Band of Mission Indians-Kizh Nation shall coordinate with the City regarding treatment and curation of these resources. Work may continue on other parts of the Project Area while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5 [f]).

BMP-CUL-5: Unanticipated Discovery of Human Remains

Health and Safety Code Section 7050.5, Section 15064.5(e) of the CEQA Guidelines, and PRC Section 5097.98 mandate the process to be followed in the unlikely event of an unanticipated discovery of human remains in a location other than a dedicated cemetery. The Los Angeles County Coroner must be notified within 24 hours of the discovery of potentially human remains. The Coroner must then determine within two working days of being notified if the remains are subject to his or her authority.

If the Coroner recognizes the human remains (including bone fragments and funerary objects) to be Native American, he or she must contact the NAHC by phone within 24 hours. The NAHC then designates a Most Likely Descendant (MLD) with respect to the human remains within 48 hours of notification. The MLD will then have the opportunity to recommend to the Project proponent means for treating or disposing of, with appropriate dignity, the human remains and associated grave goods within 24 hours of notification.

3.4.6 Mitigation Measures

Impacts on Cultural Resources would be less than significant; therefore, mitigation measures are not required.

3.4.7 Significant Unavoidable Adverse Impacts

There are no significant unavoidable adverse impacts on archaeological, historical, or tribal cultural resources resulting from construction and operation of the proposed Project.

3.4.8 Cumulative Impacts

3.4.8.1 Historical Resources

Potential impacts to the four historical resources in the Project Area (Fourth Street Viaduct, Seventh Street Viaduct, the Los Angeles River, and the Downtown Los Angeles Industrial Historic District) would be less than significant. Only one resource, the Los Angeles River, would be directly affected. A previously approved project, the Sixth Street Viaduct Replacement Project, is currently underway and involves replacement with the historic Sixth Street Viaduct over the Los Angeles River with a new bridge. No impacts on the historic properties of the Los Angeles River were identified in the EIR prepared for the Sixth Street Viaduct Replacement Project. A foreseeable future project, the Los Angeles River Bike Path Gap Closure Project, would involve an extension of existing segments of the 32-mile greenway proposed in the Los Angeles River Revitalization Master Plan. This future project would take place along the Los Angeles River from Elysian Valley through Downtown Los Angeles

to the City of Vernon. The bike path improvements proposed by the Gap Closure Project would impact the Los Angeles River in a manner similar to the improvements proposed by the PARC Project. Therefore, the impact of the Gap Closure Project to the Los Angeles River is expected to be less than significant. In addition, it is expected that the Gap Closure Project would also be required to comply with applicable regulatory requirements and include similar best management practices. Therefore, cumulative impacts to historical resources would be less than significant and would not be cumulatively considerable.

3.4.8.2 Archaeological Resources

Archaeological monitoring would be conducted in the West Park and East Park for excavations at depths greater than five feet. In the event that potentially significant buried archaeological materials are encountered within the Project Area, all work in the vicinity must be halted until a qualified archaeologist can visit the site of discovery and assess the significance of the archaeological resource. In addition, the City will continue working with the tribe in accordance with the requirements of AB 52. Impacts to archaeological resources would be less than significant. It is expected that related projects and other future development would also be required to comply with applicable regulatory requirements and include similar best management practices. Therefore, cumulative impacts to archaeological resources would be less than significant and would not be cumulatively considerable.

3.4.8.3 Tribal Cultural Resources

The Project Site is sensitive for prehistoric Native American remains. The City will continue working with the tribe in accordance with the requirements of AB 52. Impacts to Tribal Cultural Resources would be less than significant. It is expected that related projects and other future development would also be required to comply with applicable regulatory requirements and include similar best management practices. Therefore, cumulative impacts to tribal cultural resources would be less than significant and would not be cumulatively considerable.

3.5 Energy

This section describes the affected environment and regulatory setting for Energy related to the Project Area. In addition, this section describes the potential impacts related to Energy that would result from the implementation of the proposed Project. As noted in the analysis below, impacts associated with Energy during construction and operation of the proposed Project would be less than significant and no mitigation measures are required.

3.5.1 Regulatory Setting

A review of the various federal, state, regional, and local government regulatory requirements was conducted to identify regulations that relate to Energy. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

3.5.1.1 State

California Environmental Quality Act

Appendix F of the California Environmental Quality Act (CEQA) stipulates that Environmental Impact Reports (EIR) include a discussion of the potential energy impacts of a proposed project, with emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy (Sections 21083 and 21087, Public Resources Code). EIRs may include, but are not limited to, discussions of energy consuming equipment and processes used during construction and operation of a project; the energy intensiveness of materials and equipment required for the project; the effects of a project on local and regional energy supplies; and the degree to which a project complies with existing energy standards.

California Long-Term Energy Efficiency Strategic Plan

The California Public Utilities Commission adopted the California Long-Term Energy Efficiency Strategic Plan on September 18, 2008 (California Public Utilities Commission, 2008). The purpose of the strategic plan is to provide a roadmap for achieving maximum energy savings across all major sectors in California. The strategic plan identifies specific short- and long-term strategies to assist in achieving long-term vision goals for energy efficiency.

California Energy Commission

The California Energy Commission (CEC) was established by the Warren-Alquist Act in 1974 (California Energy Commission, 2014). Public Resources Code Sections 25402 subdivisions (a)-(b) and 25402.1 require the CEC to establish performance standards in the form of an "energy budget," which is determined based on the energy consumption per square foot of floor space. In 2014, the CEC developed a strategic plan that established goals for making energy public policy recommendations, collecting and providing energy data to policy makers, developing programs to promote energy investments and solutions, adopting building energy efficiency standards, developing energy-efficient transportation technology, and promoting renewable energy in California (California Energy Commission, 2014).

California Building Standards Code

The California Building Standards Code is contained in Title 24 of the California Code of Regulations (CCR). The code is comprised of building standards to address California's ever-changing conditions and particular concerns, including standards that have been adopted and adapted from national building codes. All occupancies in California are subject to the California Building Standards Code.

2016 Building Energy Efficiency Standards for Residential and Nonresidential Buildings

The 2019 Building Energy Efficiency Standards (or California Energy Code), contained in Title 24, Part 6, of the CCR, were adopted by the CEC in 1976 and are updated approximately every three years (California Energy Commission, 2018). These standards apply to all residential and non-residential buildings, with a few exceptions (hospitals, nursing homes, and jails), and apply to new and existing buildings. The California Energy Code regulates a building's "energy budget" for consuming hydro-carbon fuel and electricity. The California Energy Code also contains energy and water efficiency requirements for newly constructed buildings and alterations to existing buildings. In addition, the California Energy Code provides requirements for manufacturing, construction, and installation of building components.

California Green Building Standards Code

The California Green Building Standards Code (or CALGreen) is contained in Title 24, Part 11 of the CCR. The purpose of CALGreen is to improve public health and safety using building design and construction concepts that result in positive environmental impacts. CALGreen encourages sustainable construction practices in the following categories: planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality.

3.5.1.2 Local

2016 Power Integrated Resource Plan

The 2016 Power Integrated Resource Plan guides the Los Angeles Department of Water and Power's (LADWP) efforts to supply reliable electricity in an environmentally responsible and cost effective manner (Los Angeles Department of Water and Power, 2016). The 2016 Power Integrated Resource Plan analyzes the economic and environmental impact of increased local solar, energy storage, and transportation electrification and recommends strategies to meet the future electric needs of the City. A primary strategy of the Integrated Resource Plan is to improve energy efficiency through reducing greenhouse gas emissions, with a goal of increasing the renewable portfolio standard to 55 percent by 2030 and 65 percent by 2036.

2017 Los Angeles Green Building Code

The Los Angeles Green Building Code (LAGBC), codified in the City's Green Building Ordinance (Los Angeles Municipal Code, Chapter IX, Article 9), is based on CALGreen. The LAGBC applies to the following types of projects: all new buildings (residential and non-residential); all additions (residential and non-residential); alterations with building valuations of $200,000 or more (residential and nonresidential); and residential alterations that increase the building's conditioned volume. Like CALGreen, the LAGBC includes mandatory measures and standards for achieving energy efficiency.

Sustainable City pLAn

The City developed the *Sustainable City pLAn* (Plan) in 2015, and an updated annual report was published in 2019, titled L.A.'s Green New Deal (Office of the Los Angeles Mayor, 2019). The plan consists of 47 targets with milestones and initiatives for a cleaner environment and stronger economy. The plan describes the City's vision for increasing energy efficiency, with targets of reducing building energy use per square foot for all building types by 34% by 2035.

Green LA and ClimateLA

In May 2007, the City published *Green LA: An Action Plan to Lead the Nation in Fighting Global Warming*, which included more than fifty specific climate mitigation actions designed to reduce the City's contributions to climate change, and to prepare a response to the changes that have already begun to occur (City of Los Angeles, 2007). City departments worked together to respond to the recommendations set forth in the *Green LA* action plan, resulting in *ClimateLA*. *ClimateLA* is an implementation program that provides detailed information about each action item discussed in the *Green LA* framework, as well as adaptation measures and mitigation. Some of the adaptive action items recommended include making Los Angeles a worldwide leader in green buildings, reducing water consumption, utilizing renewable energy sources, and converting the City's fleet to cleaner and more efficient models. *Green LA* and *ClimateLA* were established with the goal of reducing greenhouse gas emissions; however, these efforts would result in the added benefit of decreasing energy consumption in the City.

City of Los Angeles General Plan

As required by the State of California, the City's General Plan addresses goals, policies, and standards related to land use, circulation, housing, conservation, open space, noise, and safety (City of Los Angeles, 2017). To address goals that meet the unique needs of the City, the General Plan also includes elements related to health and wellness, air quality, historic preservation and cultural resources, and public facilities and services. Several of the General Plan elements are currently undergoing revision. The General Plan elements that pertain to Energy include Plan for a Healthy Los Angeles, Air Quality, Mobility Plan 2035, and Conservation, which establish the following applicable policies:

Healthy Building Design and Construction Element

- Policy 2.2: Promote a healthy built environment through constructing buildings designed to reduce energy costs, promoting green building standards, and increasing energy efficiency.

Air Quality Element

- Policy 5.1.2: Effect a reduction in energy consumption and shift to non-polluting sources of energy in its buildings and operations.

Mobility Plan 2035

- Objective SF-12: Continue to refront existing street lighting infrastructure with energy-efficient LEDs.

Conservation Element

- Policy 1: Continue to encourage energy conservation and petroleum product reuse.

3.5.2 Environmental Setting

The CEC California Energy Consumption Database reports energy consumption data for various utilities, agencies, counties, and planning areas. In 2019, the total electricity consumption in Los Angeles County was 46,556 gigawatt hours (GWh) for non-residential sectors and 19,562 GWh for residential sectors, for a total of 66,118 GWh. Gas consumption in Los Angeles County was 1,813 million therms for non-residential uses and 1,236 million therms for residential uses, for a total of 3,048 million therms (California Energy Commission, 2019).

Electricity is supplied to the Project Area by the LADWP. LADWP operates 34 generation plants with a total capacity of approximately 8,009 megawatts. The department's energy supply comes from a variety of energy sources, including renewable sources, natural gas, nuclear, hydroelectric, and coal (Los Angeles Department of Water and Power, 2019).

LADWP serves over 4 million residents covering an area of 465 square miles (Los Angeles Department of Water and Power, 2019). LADWP energy sources for the 2016 calendar year are summarized in **Table 3.5-1**. LADWP's electric capacity is approximately 7,880 megawatts and the record instantaneous peak demand for electricity was 6,502 megawatts, which was reached on August 31, 2017. LADWP electricity usage for various sectors in 2017 is summarized in **Table 3.5-2**.

The Southern California Gas Company (SoCalGas) provides natural gas to the City. SoCalGas is the nation's largest distributor of natural gas, serving 21.6 million consumers over 20,000 square miles throughout Central and Southern California (Southern California Gas Company, n.d.).

Transportation accounted for approximately 40 percent of the energy consumption in California in 2016. In the same year, California consumed approximately 3,116 trillion British thermal units (BTU) for the transportation sector energy, from natural gas, petroleum, and electricity sources. In 2017, California consumed approximately 350,604 thousand barrels of gasoline, or approximately 1,772 trillion BTU, for the transportation sector. In the same year, California consumed approximately 82,842 thousand barrels of diesel, or 477 trillion BTU, for the transportation sector (U.S. Energy Information Administration, 2018).

Table 3.5-1: LADWP Energy Sources (Calendar Year 2019)

Energy Source	Percent
Renewable Energy[1]	34%
Natural Gas	27%
Nuclear	14%
Large Hydroelectric	3%
Coal	21%
Other/Unspecified Sources of Power	0%

1. Renewable energy sources include biomass and waste (0%), geothermal (9%), eligible hydroelectric (3%), solar (12%), and wind (10%).
Source: (Los Angeles Department of Water and Power, 2019)

Table 3.5-2: 2019 LADWP Electricity Consumption

Sector	Electricity Consumption (GWh)
Agriculture & Water Pump	21.6
Commercial Building	11,115.8
Commercial Other	937.8
Industry	11,780.9
Mining & Construction	273.3
Residential	7,388.6
Streetlight	106
Total Usage	21,624

Source: (California Energy Commission, 2019)

The existing energy usage in the Project Area was quantified using the California Emissions Estimator Model (CalEEMod) v2016.3.2 computer program, using the assumption that the existing land use is classified as "General Heavy Industry." Existing energy use is summarized in **Table 3.5-3** and detailed calculations are provided in **Appendix B-14**.

Table 3.5-3: Existing Energy Use in the Project Area

Energy Source	Annual Energy Consumption	Annual MMBTU
Electricity	2,485,290 kWh	8,480
Natural Gas	4,052,590 kBTU	4,053
Mobile Fuel (Diesel)	30,098 gallons	4,135
Mobile Fuel (Gasoline)	47,797 gallons	5,756
Water Conveyance & Treatment	52 million gallons	2,300
	Total	24,724

Energy calculations were quantified using the CalEEMod, v2016.3.2, computer program, using the assumption that the existing land use is classified as "General Heavy Industry."
MMBTU = million British thermal units; kWh = kilowatt hours; kBTU = kilo-British thermal unit
Source: (Ambient Air Quality & Noise Consulting, 2019)

3.5.3 Environmental Impact Analysis

3.5.3.1 Methodology

Construction

Regarding energy use (e.g., fuel use) during construction, it is assumed that only diesel fuel would be used in construction equipment. On-road vehicles for hauling materials and worker commute trips assumed a mix of diesel and gasoline fuel use. Construction schedules, equipment numbers, horsepower ratings, and load factors were used to calculate construction-related fuel use, based on default assumptions contained in the CalEEMod. Diesel fuel used for off-road equipment was estimated based on a factor of 0.05 gallons of diesel fuel per brake-horsepower hour derived from the South Coast Air Quality Management District's (SCAQMD) CEQA Air Quality Handbook (South Coast Air Quality Management District, 1993). Average fuel usage rates by vehicle class, fuel type (e.g., diesel, gasoline, electric, and natural gas), and average vehicle trip distances for on-road vehicles were obtained from the California Air Resources Board's (CARB) EMFAC2017 mobile-source emissions inventory for Los Angeles County. In addition, to aid in the comparison of energy use associated with the various categories evaluated, total energy use was converted to BTU, which are reported in units of one million BTU (MMBTU).

Operation

Proposed Project operation would include the consumption of diesel and gasoline fuel from on-road vehicles. Transportation fuel-use estimates were calculated by applying average fuel usage rates per vehicle mile to vehicle miles traveled (VMT) data associated with the proposed Project. Vehicle miles traveled was derived from the CalEEMod modeling conducted for the proposed Project. Daily VMT for special events were adjusted to annual VMT based on the estimated number of annual events. Average fuel usage rates by vehicle class, fuel type (e.g., diesel, gasoline, electric, and natural gas), and average

vehicle trip distances were obtained from CARB's EMFAC2017 mobile-source emissions inventory for Los Angeles County. Building energy use was estimated using CalEEMod, version 2016.3.2.

Energy use was calculated for both existing and proposed land uses. CalEEMod includes 63 different land use types for which trip rates have been established. The existing land use was classified as General Heavy Industry. Proposed land uses that would occur at the Project Site were classified as the following: City Park (1.45 Acre Park), City Park (5.71 Acre Park) Fast Food Restaurant without Drive Thru (700 square foot café), Health Club (2,000 square foot building), City Park (two soccer fields), City Park (one acre park special events). To aid in the comparison of energy use associated with the various categories evaluated, total energy use was converted to BTU, which are reported in units of MMBTU.

3.5.3.2 Thresholds of Significance

According to Appendix G of the State CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Energy if it would:

VI(a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

VI(b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

3.5.3.3 Construction Impacts

VI(a): Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

During the construction period, equipment and vehicles would primarily be powered by diesel fuel and would likely require minimal electricity. Estimated construction-period fuel use is summarized in **Table 3.5-4** and detailed calculations are provided in **Appendix B-14**. As shown in **Table 3.5-4**, construction-period fuel use would be 23,681 MMBTU over the entire construction period, or approximately 789 MMBTU when amortized over the anticipated 30-year life of the project.[i]

Construction-period energy use includes the energy that would be used for haul trips, equipment use, and worker commute trips.

[i] Construction-period energy consumption was divided over the anticipated 30-year life of the proposed Project, which is consistent with the methodology for estimating greenhouse gas emissions (see Section 3.7). Although construction would occur over a period of approximately two years for Phase I and six months for Phase II, this method is intended to apportion the upfront energy consumption over the life of the proposed Project.

Table 3.5-4: Estimated Construction-Period Fuel Use

	Diesel Fuel Use (gallons)	Gasoline Fuel Use (gallons)	MMBTU
Overall Construction Energy Use	157,403	17,080	23,681
Amortized Construction Energy Use[1]	5,237	569	789

Energy calculations were quantified using the CalEEMod, v2016.3.2, computer program.
1. Construction energy use was amortized over an assumed 30-year project life.
MMBTU = million British thermal units
Source: (Ambient Air Quality & Noise Consulting, 2019)

The fuel consumption from construction vehicles and equipment would be temporary and would represent a negligible increase in regional energy consumption. Best management practices (BMP) and mitigation measures to reduce air quality and greenhouse gas emissions would be implemented during the construction period, which would contribute to reductions in energy consumption (see Sections 3.2 and 3.7). These measures include complying with SCAQMD rules and regulations, implementing idling limitations, using equipment that meets Tier 4 off-road emission standards, and offering ride-share and transit incentives for construction workers. As such, the proposed Project would not result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction. Therefore, impacts would be less than significant and no further mitigation is required.

VI(b): Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Applicable plans related to renewable energy or energy efficiency include the California Long-Term Energy Efficiency Strategic Plan, LADWP 2016 Power Integrated Resource Plan, *Sustainable City pLAn*, *Green LA*, and *ClimateLA*, which are described in Section 3.5.1. As discussed under **VI(a)** above, the fuel consumption from construction vehicles and equipment would be temporary and would represent a negligible increase in regional energy consumption. In addition, the proposed Project includes various air quality and greenhouse gas BMPs and mitigation measures that would reduce energy consumption associated with the use of construction equipment. Therefore, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and the impacts would be less than significant.

3.5.3.4 Operational Impacts

VI(a): Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

Proposed Project features, such as park lighting, WiFi, security cameras, on-site buildings (café, concessions area, restrooms, and office), and electric vehicle charging station, would require electricity or natural gas for energy. Special events could require electricity to power sound and lighting equipment. In addition, proposed Project operation would include the consumption of diesel and gasoline fuel from on-road vehicles traveling to the Project Site.

Estimated operational energy use is summarized in **Table 3.5-5** and detailed calculations are provided in **Appendix B-14**. As shown in **Table 3.5-5**, the proposed Project would result in a net reduction in

energy consumption of approximately 15,015 MMBTU, or a decrease of approximately 61 percent, when compared with the energy consumption associated with the existing industrial land use.

Table 3.5-5: Estimated Operational Energy Use

Energy Source	Annual Energy Consumption	Annual MMBTU
Electricity	192,751 kWh	658
Natural Gas	197,732 kBTU	198
Mobile Fuel (Diesel)	25,628 gallons	3,521
Mobile Fuel (Gasoline)	40,698 gallons	4,901
Water Conveyance & Treatment	11 million gallons	432
	Total	9,709
	Total Existing Energy Use	24,724
	Net Change Compared to Existing Energy Use	-15,015 (-61%)

Energy calculations were quantified using the CalEEMod, v2016.3.2, computer program. The existing land use was classified as General Heavy Industry and the proposed land uses at the Project Site include the following: City Park (1.45 acre park), City Park (5.71 acre park) Fast Food Restaurant without Drive Thru (700 square foot café), Health Club (2,000 square foot buildings), City Park (two soccer fields), and City Park (one acre park special events).
MMBTU = million British thermal units; kWh = kilowatt hours; kBTU = kilo-British thermal unit
Source: (Ambient Air Quality & Noise Consulting, 2019)

The proposed Project would include improvements to active transportation options; design features that reduce energy use, water use, and waste generation (i.e., low-flow water fixtures, water-efficient irrigation systems, and high-efficiency lighting); and the conversion of industrial uses to open space uses, which would contribute to reductions in energy consumption. In addition, the proposed buildings would conform to the California Building Standards Code and Los Angeles Green Building Code to meet energy efficiency requirements. As such, the proposed Project would not result in a potentially significant impact due to wasteful, inefficient, or unnecessary consumption of energy features during operation. Therefore, impacts would be less than significant, and no mitigation is required.

VI(b): Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Applicable plans related to renewable energy or energy efficiency include the California Long-Term Energy Efficiency Strategic Plan, LADWP 2016 Power Integrated Resource Plan, *Sustainable City pLAn*, and *Green LA* and *ClimateLA*, which are described in Section 3.5.1. In comparison to the existing industrial uses that were removed, the proposed Project would result in an overall net reduction of long-term operational energy use of roughly 15,015 MMBTU, or 61 percent (see **Table 3.5-5**). Proposed Project features, including improvements to active transportation options; design features that reduce energy use, water use, and waste generation (i.e., low-flow water fixtures, water-efficient irrigation systems, and high-efficiency lighting); and the conversion of industrial uses to open space uses, would contribute to reductions in energy consumption. As a result of these energy-saving features, the proposed Project would be consistent with the goals outlined in state and local energy plans. Therefore, the project would

not conflict with or obstruct a state or local plan for renewable energy or energy efficiency and impacts would be less than significant.

3.5.4 Best Management Practices

There are no proposed BMPs specifically for Energy. With implementation of the BMPs identified in Section 3.2.4 (Air Quality) and Section 3.7.4 (Greenhouse Gas Emissions), construction-related energy use would be minimized to the greatest extent feasible.

3.5.5 Mitigation Measures

There are no proposed mitigation measures specifically for Energy. Implementation of the mitigation measures identified in Section 3.2.4 (Air Quality), would reduce impacts related to construction-related energy use. Impacts related to Energy would be less than significant.

3.5.6 Significant Unavoidable Adverse Impacts

There are no significant unavoidable adverse impacts on Energy resulting from implementation of the proposed Project.

3.5.7 Cumulative Impacts

Fuel consumption from construction activities would represent a negligible increase in regional energy consumption, while operation of the proposed Project would result in an overall net reduction of long-term energy use when compared to the existing industrial land use. Therefore, it is anticipated that existing energy service providers have adequate capacity to serve the energy demands of the proposed Project.

Growth and development in the Project Area are anticipated to contribute to increased demand for electricity, natural gas, and transportation energy. However, based on the 2016 Power Integrated Resource Plan, the City's increased energy demands are anticipated to be met with increased use of renewable energy sources, such as solar, wind, and geothermal power. In addition, increased transportation fuel demands would be minimized with improvements to the vehicle fuel economy pursuant to federal and state regulations and trends toward improving active transportation infrastructure (see Section 3.7, Greenhouse Gas Emissions for additional information). Like the proposed Project, other future transportation and development projects would be expected to incorporate energy conservation features, comply with applicable regulations related to energy use and efficiency, and incorporate BMPs and/or mitigation measures to reduce impacts related to energy. Therefore, the proposed Project would not result in cumulative impacts related to energy.

3.6 Geology and Soils

This section describes the affected environment and regulatory setting for Geology and Soils related to the Project Area. In addition, this section describes the potential impacts related to Geology and Soils that would result from the implementation of the proposed Project. As noted in the analysis below, impacts associated with Geology and Soils during the construction and operation of the proposed Project would be less than significant and no mitigation measures are required.

The analysis in this section is based on the Geotechnical Site Investigation report (Hushmand Associates, Inc., 2018) prepared for the proposed Project, which also incorporates findings from the *Foundation Report* prepared for the Viaduct Replacement Project (Earth Mechanics, Inc., 2016). In addition, the environmental setting and analysis in this section rely on information from the Paleontological Resource Assessment (Applied EarthWorks, 2019).

3.6.1 Regulatory Setting

A review of the various federal, state, regional, and local government regulatory requirements was conducted to identify regulations that relate to Geology and Soils. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

3.6.1.1 Federal

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act (PRC Section 2621.5) was passed to mitigate hazards of surface faulting on structures built for human occupancy (California Department of Conservation, 2018). The Alquist-Priolo Earthquake Fault Zoning Act's main purpose is preventing the construction of buildings used for human occupancy in active fault zones.

3.6.1.2 State

California Building Standards Code

The 2016 California Building Standards Code (CCR, Title 24), which went into effect on January 1, 2017, is included in the City's Municipal Code. The California Building Standards Code is based on the federal Uniform Building Code but has been modified to reflect the seismic and environmental conditions of California. The California Building Standards Code includes guidelines for building design and construction, and includes the following components: California Building, Residential, Electrical, Mechanical, Plumbing, Energy, Historical Building, Fire, Existing Building, and Green Building Codes.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (PRC Section 2690-2699.6) requires the identification and mapping of areas that are prone to liquefaction, earthquake-induced landslides, and amplified ground shaking (California Geological Survey, 2003b). The Seismic Hazards Mapping Act aims to minimize the loss of life and property by identifying seismic hazards and mitigation for these hazards.

3.6.1.3 Local

City of Los Angeles General Plan

As required by the State of California, the City's General Plan addresses goals, policies, and standards related to land use, circulation, housing, conservation, open space, noise, and safety (City of Los Angeles, 2017). To address goals that meet the unique needs of the City, the General Plan also includes elements related to health and wellness, air quality, historic preservation and cultural resources, and public facilities and services. Several of the General Plan elements are currently undergoing revision. The General Plan element that pertains to Geology and Soils is described in more detail in the following section.

Safety Element

The Safety Element of the City's General Plan addresses the protection of people from risks associated with natural disasters (City of Los Angeles, 1996). The Safety Element includes goals, objectives, and policies that guide the City's Emergency Operations Organization, which is the City's department responsible for emergency planning, training, and mitigation, as well as response and recovery operations. Chapter IV of the Safety Element describes areas within the City that are susceptible to fault rupture, liquefaction, and landslides, and includes standards related to seismic hazards. Specific policies pertaining to Geology and Soils include:

Hazard Mitigation

- **Policy 1.1.5**: Risk Reduction. Reduce potential risk hazards due to natural disaster to the greatest extent feasible within the resources available, including provision of information and training.

Conservation Element

The Conservation Element of the City of Los Angeles General Plan (adopted September 2001) primarily addresses preservation, conservation, protection and enhancement of the city's natural resources. The Conservation Element specifically addresses paleontological resources in Section 3 of Chapter 2.

With regard to paleontological resources, the Conservation Element contains the following objective with an associated policy and program:

- **Objective:** protect the city's archaeological and paleontological resources for historical, cultural, research and/or educational purposes.
- **Policy:** continue to identify and protect significant archaeological and paleontological sites and/or resources known to exist or that are identified during land development, demolition or property modification activities.
- **Program:** permit processing, monitoring, enforcement and periodic revision of regulations and procedures.
- **Responsibility:** departments of Building and Safety, City Planning and Cultural Affairs and/or the lead agency responsible for project implementation.

City of Los Angeles Building Code

The Los Angeles Building Code is a component of the City's Municipal Code (Chapter IX, Article 1). The Building Code aims to protect public health and property through regulating the design, construction, quality of materials, use and occupancy, and location and maintenance of buildings and structures proposed for development within the City. The Building Code includes requirements regarding the transport of material, excavation, fill materials, erosion control, and general construction activities.

3.6.2 Environmental Setting

3.6.2.1 Regional Geology

The Project Area is in the northern margin of the Los Angeles Basin (Basin), an actively subsiding basin bound by the Santa Monica Mountains and the Elysian, Repetto, and Puente Hills to the north, and the Santa Ana Mountains and San Joaquin Hills to the east and southeast (U.S. Geological Survey, 1965). The Basin is an alluviated lowland that gently slopes south towards the ocean and is interrupted by hills and mesas. The Basin is a northwest-trending structural depression and is filled with sedimentary formations of Tertiary and Cretaceous origin, overlain with Pleistocene and Holocene age alluvium.

3.6.2.2 Local Geologic Setting

According to the California Geological Survey (CGS) Seismic Hazard Zone Report for the Los Angeles 7.5-Minute Quadrangle (California Geological Survey, 1998), the Project Area is located in a region with Holocene age Quaternary alluvial deposits fan consisting of sand, silt, and gravel (Hushmand Associates, Inc., 2018). Based on the Foundation Report for the Viaduct Replacement Project (Earth Mechanics, Inc., 2016), the Project Area is underlain with:

- **Artificial Fill**: Generally, consists of disturbed and reworked alluvial sands, silts, and gravels, varying up to 15 feet thick in the Project Area, due to recent construction along the Los Angeles River.
- **Quaternary Alluvium**: Holocene to Pleistocene age alluvium consisting of active stream channel and unconsolidated floodplain deposits of gravel, sand, silt, and hardened remnants of older deposits.
- **Fernando Formation, Upper (Pico) and Lower (Repetto) Members**: Pliocene-age marine deposits consisting of tan to olive brown, semi-friable sandstone and conglomerate, in addition to gray to greenish gray, soft, poorly bedded marine claystone and siltstone.

3.6.2.3 Faulting, Seismicity, and Ground Shaking

The Project Area is located within a seismically active region, where several active faults could produce substantial shaking (California Department of Transportation and City of Los Angeles, 2011). There are no faults within the Project Area, but nearby active faults include Elysian Park (Lower CFM), Elysian Park (Upper), Puente Hills (LA), Hollywood, Raymond, Verdugo-Eagle Rock, Newport-Inglewood Fault Zone, and Elsinore Fault Zone (Whittier section), which range from 1.5 to 10.3 miles from the Project Area (Hushmand Associates, Inc., 2018).

According to the most recent Alquist-Priolo Earthquake Fault Zoning Map, there are no potentially active faults that pass through the Project Area (California Department of Conservation, 1977). There is no known surface expression of active faults within the Project Area. Therefore, the potential for a fault rupture through the Project Area is considered very low (Hushmand Associates, Inc., 2018).

According to California Geological Survey maps showing the earthquake shaking potential in California, there is a medium intensity of ground shaking and damage in the Project Area from anticipated future earthquakes (California Geological Survey, 2003a).

3.6.2.4 Subsurface Soils

Based on the borehole investigation, subsurface conditions consisted of about 5 to 20 feet of fill soils consisting of loose to medium dense silty sand to poorly graded sand with silt. The fill is underlain by generally dense to very dense coarse-grained materials comprising of sands, silty sands, gravelly sands, sandy gravels, cobbles, and possibly boulders (Hushmand Associates, Inc., 2018).

3.6.2.5 Expansive Soil

Expansive soil is soil that is prone to large volume changes (swelling and shrinking) that are directly related to changes in water content — with higher moisture levels, the soils will swell, and with lower moisture levels, the soils will shrink. According to Table 18-1-B of the California Building Code, a special foundation design is required if the Expansion Index (which predicts the swelling potential of compacted soils) is higher than 20. Based on a 1989 United States Geological Survey (USGS) map, the proposed Project is located in an area where data is insufficient to indicate the clay content and/or swelling potential of clay (U.S. Geological Survey, 1989). The Geotechnical Site Investigation did not include laboratory testing for expansive soils. However, the soils that were observed in the borehole investigation, as described in Section 3.6.2.4, are predominately gravels, sands, and cobbles, which tend to have a low potential for expansive soils. Clayey soils, on the other hand, can have a high expansion potential, but were not observed during borehole investigations (Hushmand Associates, Inc., 2018). Therefore, the potential for expansive soils in the Project Area is expected to be low.

3.6.2.6 Groundwater

Based on the Foundation Report for the Viaduct Replacement Project, measured groundwater elevations varied significantly throughout the Project Area and ranged from 170.9 to 228 feet below ground surface (bgs) (Earth Mechanics, Inc., 2015). Groundwater was not encountered in any of the boreholes performed during the investigations for the proposed Project (Hushmand Associates, Inc., 2018). This is likely because soil boring depths for the Viaduct Replacement Project, which varied from 3 to 200 feet bgs, were deeper than the boring depths for the proposed Project, which vary from 5.67 to 39.08 feet bgs (Earth Mechanics, Inc., 2015; Hushmand Associates, Inc., 2018). In addition, groundwater may fluctuate due to factors such as seasonal variation, nearby construction, irrigation, or other man-made and natural influences (Earth Mechanics, Inc., 2015).

3.6.2.7 Liquefaction Potential

Soil liquefaction occurs when a saturated or partially saturated soil substantially loses strength and stiffness in response to an applied stress, usually earthquake shaking or other sudden change in stress

condition, causing it to behave like a liquid. Other types of ground failure resulting from seismic activities include collapsible soils, subsidence (the gradual caving in or sinking of an area of land), landslides, and lateral spreading (landslides that commonly form on gentle slopes and that have rapid fluid-like flow movement). According to the most recent seismic hazards zones map, the proposed Project is not located in a liquefaction zone (see **Figure 3.6-1**, Seismic Hazards) (California Department of Conservation, 1999).

3.6.2.8 Paleontological Resources

To determine the paleontological sensitivity of geologic units underlying the Project Area, published geologic maps were reviewed. In November 2017, a records search was conducted by the Los Angeles County Museum of Natural History of known fossil localities in the area. Published reports on the regional geology and paleontology of the area were also reviewed (Norris & Webb, 1976; Springer et al., 2009; Yerkes & Campbell, 2005; U.S. Geological Survey, 1965).

Based on the literature review and museum records search results, the paleontological sensitivity was determined for the Project Area in accordance with the Society of Vertebrate Paleontology (SVP) (2010) sensitivity scale (Society of Vertebrate Paleontology, 2010). The near-surface Holocene-age alluvial deposits in the Project Area are likely too young to contain fossilized material. As such, these deposits are determined to have a low paleontological resource potential. Therefore, shallow excavations are unlikely to impact paleontological resources and further paleontological resource management is not recommended.

However, should Project-related ground-disturbance extend deeper into sensitive Pleistocene alluvial deposits or Pliocene rock formations buried at unknown depths within the Project Area and exposed at the ground surface nearby, further paleontological resource consultation may be required.

3.6.3 Environmental Impact Analysis

3.6.3.1 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the Initial Study for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.6.3.2 Thresholds of Significance

According to Appendix G of the State CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Geology and Soils if it would:

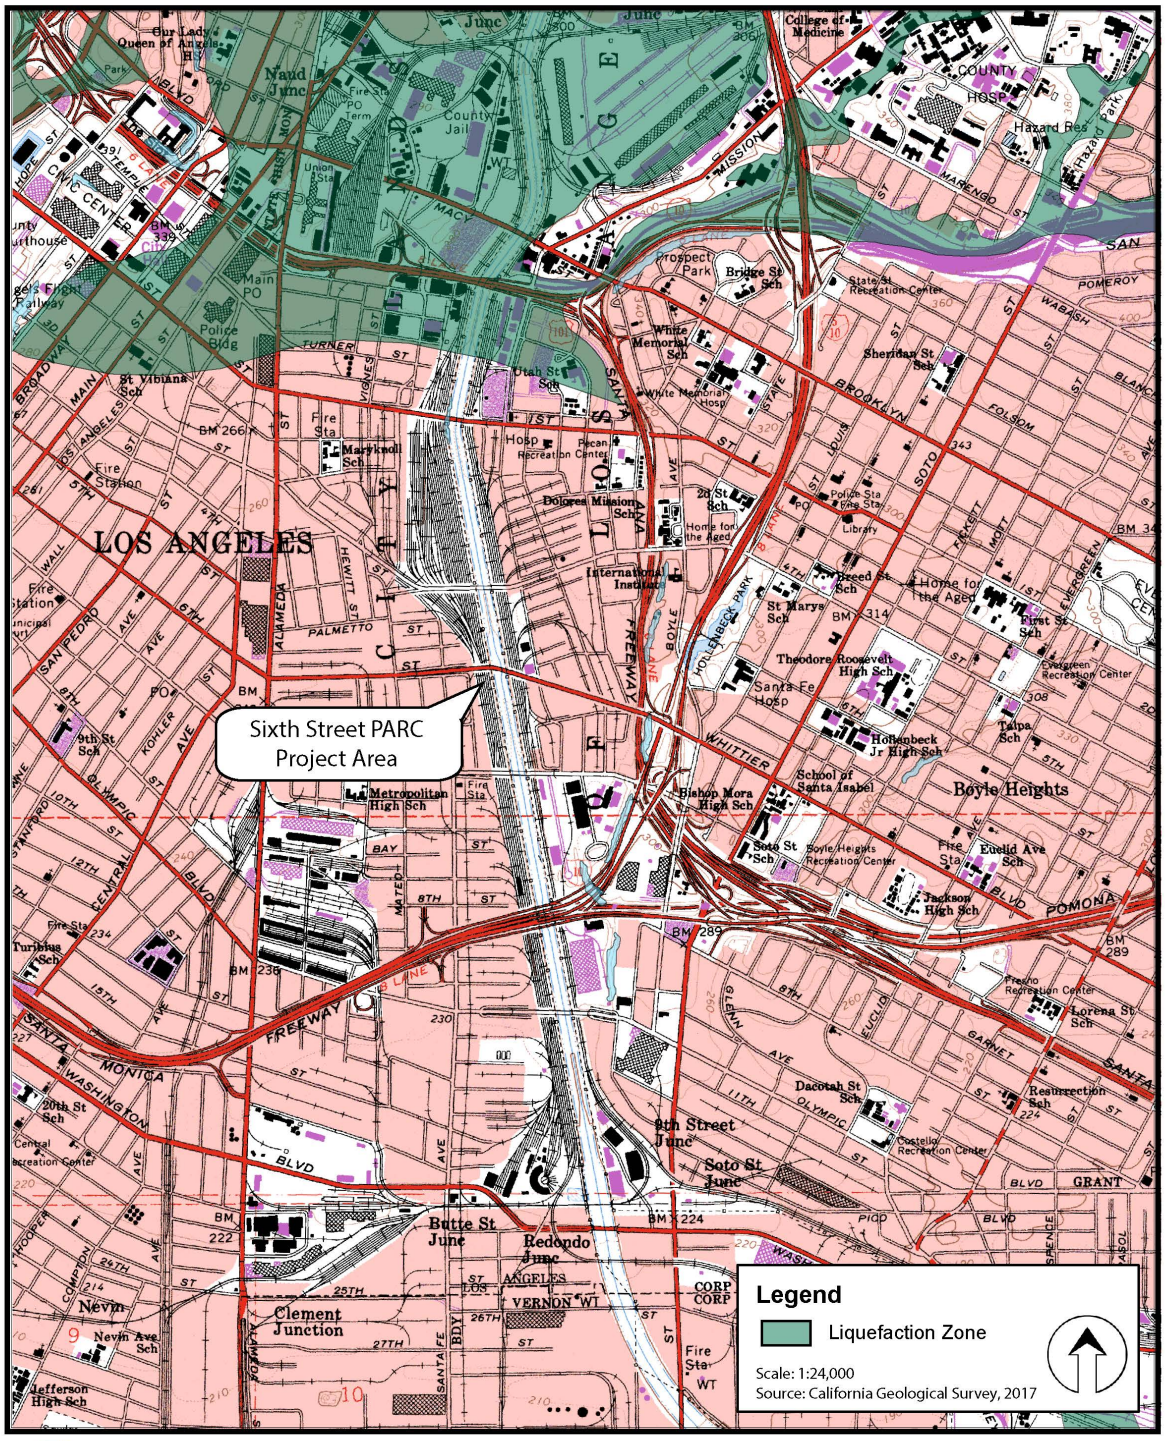
VII(b) Result in substantial soil erosion or the loss of topsoil.

VII(c) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

VII(f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

This page has been intentionally left blank.

Figure 3.6-1: Seismic Hazards



ENGINEERING
CITY OF LOS ANGELES

FIGURE 3.6-1. SEISMIC HAZARDS
Sixth Street PARC Project

D.1 *Paleontological Resources.* The determination of significance shall be made on a case-by-case basis, considering the following factors:

- Whether, or the degree to which, the project might result in the permanent loss of, or loss of access to, a paleontological resource; and
- Whether the paleontological resource is of regional or statewide significance.

3.6.3.3 Construction Impacts

VII(b): Would the project result in substantial soil erosion or the loss of topsoil?

Soil excavation would be required during the construction of the proposed Project. Throughout the Project Area, excavation depths are expected to range up to 5 feet for general earthwork, 10 feet for construction of retaining walls, 15 feet for utility trenching, and 22 feet for the removal of portions of the existing LA River Access Tunnel and existing Viaduct foundations. Because artificial fill makes up the top 5 to 20 feet of topsoil, as described in the Geotechnical Site Investigation, a substantial loss of topsoil is not expected to occur.

During site preparation and other construction activities, the proposed Project could result in soil erosion. Standard Best Management Practices (BMPs), such as fiber rolls and silt fencing, would be implemented during construction to ensure that substantial erosion or the loss of topsoil would not occur, and that construction activities would not result in impacts to the LA River. All grading activities would comply with permits from the Department of Building and Safety, and with the provisions of the City's Building Code (Municipal Code Chapter IX, Article 1). With implementation of BMPs, impacts would be less than significant and no mitigation is required.

VII(c): Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Because the proposed Project is located in an area with little or no swelling clay, substantial risks to life or property are not anticipated. However, the Project Area is underlain with fill material which could expand when saturated. Hazards would be reduced by following standard engineering practices, as well as the recommendations identified in the Geotechnical Site Investigation (Hushmand Associates, Inc., 2018). The report recommends that backfill soils would be moisture-conditioned and recompacted to meet American Section of the International Association for Testing Materials (ASTM) standards to counteract the potential adverse effects of soil expansiveness. In addition, the report recommends that if import soils are used, the import soil should not exhibit an Expansion Index greater than 20 or contain more than 35 percent fines (i.e., fine-grained soils), and should be screened by the geotechnical engineer to meet ASTM International standards (Hushmand Associates, Inc., 2018). By following these recommendations, impacts would be less than significant and no mitigation is required.

VII(f): Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Results of the paleontological assessment indicate there are no significant resources that would be affected by the construction of the Project as presently proposed.

In the event that an unanticipated fossil discovery is made during proposed Project construction, in accordance with SVP (2010) guidelines, a qualified professional Paleontologist should be retained to examine the find and to determine if further paleontological resources mitigation is warranted (Society of Vertebrate Paleontology, 2010). The following management recommendation measures have been used by professional paleontologists for many years and have proven to be effective in reducing or eliminating adverse impacts to paleontological resources to a less than significant level pursuant to the requirements of CEQA. Prior to the start of construction within a given development site within the Project Area, all field personnel should be briefed regarding the types of fossils that could be found and the procedures to follow should paleontological resources be encountered. Specifically, the training should provide a description of the fossil resources that may be encountered, outline steps to follow when a fossil discovery is made and provide contact information for the Qualified Paleontologist and on-site monitor(s). The training should be developed by the Qualified Paleontologist and provided as hand-outs or a Power Point Presentation that can be presented concurrently with other environmental training (e.g., cultural and natural resources awareness training, safety training, etc.). As determined by the Qualified Paleontologist, construction Monitoring would not be required in the Project Area because of previous disturbance or the shallow, younger alluvial deposits.

With compliance with SVP (2010) guidelines (see **BMP-PAL-1** and **BMP-PAL-2**), impacts to paleontological resources would be less than significant and no mitigation measures are required.

3.6.3.4 Operational Impacts

VII(b): Would the project result in substantial soil erosion or the loss of topsoil?

The proposed Project would feature changes in elevation; however much of the 13-acre site would be a mix of vegetation, hardscape and park amenities. In the LA River channel, reinforced concrete planted terraces would be anchored into the existing slope liner on the west and east banks. Because the topography of the Project Area is relatively flat, and open spaces would be landscaped or hardscaped, substantial soil erosion and loss of topsoil are not anticipated. Therefore, impacts would be less than significant and no mitigation is required.

VII(c): Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

See Section 3.6.3.3 above for a discussion of impacts related to expansive soils.

VII(f): Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Operation of the proposed Project would not involve any ground-disturbing activities. Therefore, there would be no potential to disturb, damage, or degrade a paleontological resource or its setting. No operational impacts on paleontological resources would occur and no mitigation measures are required.

3.6.4 Best Management Practices

BMP-GEO-1: Erosion Control

The contractor shall implement standard BMPs, such as the use of fiber rolls and silt fencing, to reduce the amount of dust and dirt from leaving the construction area.

BMP-GEO-2: Geotechnical Site Investigation Recommendations

The Geotechnical Site Investigation report for the proposed Project includes recommendations to ensure that the Project Area is suitable for construction, and to ensure that appropriate measures are taken to reduce impacts during earthwork, excavation, utility trenching, backfilling, and other construction activities (Hushmand Associates, Inc., 2018). Backfill soils shall be moisture-conditioned and recompacted to meet ASTM International standards to counteract the potential adverse effects of soil expansiveness. If import soils are used, the import soil shall not exhibit an Expansion Index greater than 20 or contain more than 35 percent fines (i.e., fine-grained soils), and shall be screened by the geotechnical engineer to meet ASTM International standards.

BMP-PAL-1: Paleontological Sensitivity Training

Prior to the start of construction, all field personnel shall be briefed regarding the types of fossils that could be found and the procedures to follow should paleontological resources be encountered. Specifically, the training shall provide a description of the fossil resources that may be encountered, outline steps to follow when a fossil discovery is made, and provide contact information for a qualified paleontologist. The training shall be developed by a qualified paleontologist and provided as hand-outs or a PowerPoint Presentation that may be presented concurrently with other pre-construction training.

BMP-PAL-2: Unanticipated Paleontological Resource Discoveries

In the event that an unanticipated fossil discovery is made during construction, a qualified professional paleontologist shall be retained to examine the find and to determine whether further paleontological resource mitigation is warranted in accordance with SVP (2010) guidelines.

3.6.5 Mitigation Measures

Impacts related to Geology and Soils would be less than significant; therefore, mitigation measures are not required.

3.6.6 Significant Unavoidable Adverse Impacts

There are no significant unavoidable adverse impacts on Geology and Soils resulting from the implementation of the proposed Project.

3.6.7 Cumulative Impacts

Impacts related to Geology and Soils would be localized to the Project Area. Construction of other development projects in the Project Area listed in **Table 1-1**, could result in Geology and Soils impacts; however, these impacts are not expected to be cumulative because they would be site-specific.

The proposed Project and related projects would not change the geologic properties of the area and would not increase seismic or other geologic risks in the region. Like the proposed Project, all proposed development projects would be subject to seismic standards, safety requirements, standard design practices, and BMPs to minimize potential risks from seismic or other geologic hazards. Projects would also be required to implement standard engineering practices and BMPs to minimize the potential for erosion or loss of topsoil. In addition, all grading activities would be required to comply with the LA City Department of Building and Safety Permits, which would include the provisions of the City's Building Code. Therefore, the proposed Project would not result in cumulative impacts related to Geology and Soils.

In the event that potentially significant buried paleontological materials are encountered within the Project Area, all work in the vicinity must be halted until a qualified paleontologist can visit the site of discovery and assess the significance of the paleontological resource. Impacts to paleontological resources would be less than significant. It is expected that related projects and other future development would also be required to comply with applicable regulatory requirements and include similar best management practices. Therefore, the proposed Project would not result in cumulative impacts on paleontological resources.

3.7 Greenhouse Gas Emissions

This section describes the affected environment and regulatory setting for greenhouse gas (GHG) emissions related to the Project Area. In addition, this section describes the potential impacts related to GHG emissions that would result from the implementation of the proposed Project. As noted in the analysis below, impacts associated with GHG emissions during the construction and operation of the proposed Project would be less than significant.

The information in this section is based on the *Air Quality and Greenhouse Gas Impact Assessment* (Ambient Air Quality & Noise Consulting, 2019) prepared for the proposed Project. Air quality and greenhouse gas emissions were generated for an opening year of 2021 (Ambient Air Quality & Noise Consulting, 2019). Due to project delays, it is now anticipated that the park will open in 2024. There is not anticipated to be a substantial difference in projected emissions from 2021 to 2024 and emissions in 2024 may be slightly lower in 2024 due to continual improvement in vehicle and equipment emission standards.

3.7.1 Regulatory Setting

A review of the various federal, state, regional, and local government regulatory requirements was conducted to identify regulations that relate to GHG emissions. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

3.7.1.1 Federal

Executive Order 13514

Executive Order 13514 is focused on reducing GHG emissions internally in federal agency missions, programs, and operations. In addition, the executive order directs federal agencies to participate in the Interagency Climate Change Adaptation Task Force, which is engaged in developing a national strategy for adaptation to climate change.

On April 2, 2007, in Massachusetts v. U.S. Environmental Protection Agency (U.S. EPA), 549 U.S. 497 (2007), the Supreme Court found that GHGs are air pollutants covered by the Federal Clean Air Act (FCAA) and that the U.S. EPA has the authority to regulate GHG. The Court held that the U.S. EPA Administrator must determine whether or not emissions of GHGs from new motor vehicles cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision.

On December 7, 2009, the U.S. EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the FCAA:

- Endangerment Finding: The Administrator found that the current and projected concentrations of the six key well-mixed GHGs (carbon dioxide [CO_2], methane [CH_4], nitrous oxide [N_2O], hydrofluorocarbons [HFC], perfluorocarbons [PFC], and sulfur hexafluoride [SF_6]) in the atmosphere threaten the public health and welfare of current and future generations.

- Cause or Contribute Finding: The Administrator found that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare.

Although these findings did not themselves impose any requirements on industry or other entities, this action was a prerequisite to finalizing the U.S. EPA's Proposed Greenhouse Gas Emission Standards for Light-Duty Vehicles, which was published on September 15, 2009. On May 7, 2010, the final Light-Duty Vehicle Greenhouse Gas Emissions Standards and Corporate Average Fuel Economy Standards were published in the Federal Register.

U.S. EPA and the National Highway Traffic Safety Administration (NHTSA) are taking coordinated steps to enable the production of a new generation of clean vehicles with reduced GHG emissions and improved fuel efficiency from on-road vehicles and engines. These next steps include developing the first-ever GHG regulations for heavy-duty engines and vehicles, as well as additional light-duty vehicle GHG regulations. These steps were outlined by President Obama in a Presidential Memorandum on May 21, 2010.

The final combined U.S. EPA and NHTSA standards that make up the first phase of this national program apply to passenger cars, light-duty trucks, and medium-duty passenger vehicles, covering model years 2012 through 2016. The standards require these vehicles to meet an estimated combined average emissions level of 250 grams of CO_2 per mile (the equivalent to 35.5 miles per gallon if the automobile industry were to meet this CO_2 level solely through fuel economy improvements). Together, these standards will cut GHG emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012-2016). On August 28, 2012, U.S. EPA and NHTSA issued their joint rule to extend this national program of coordinated GHG and fuel economy standards to model years 2017 through 2025 passenger vehicles.

3.7.1.2 State

Assembly Bill 1493

Assembly Bill (AB) 1493 (Pavley) of 2002 (Health and Safety Code Sections 42823 and 43018.5) requires the California Air Resources Board (CARB) to develop and adopt the nation's first GHG emission standards for automobiles. These standards are also known as Pavley I. The California Legislature declared in AB 1493 that global warming is a matter of increasing concern for public health and the environment. It cites several risks that California faces from climate change, including a reduction in the State's water supply, an increase in air pollution caused by higher temperatures, harm to agriculture, an increase in wildfires, damage to the coastline, and economic losses caused by higher food, water, energy, and insurance prices. The bill also states that technological solutions to reduce GHG emissions would stimulate California's economy and provide jobs. In 2004, the State of California submitted a request for a waiver from federal clean air regulations, as the State is authorized to do under the FCAA, to allow the State to require reduced tailpipe emissions of CO_2. In late 2007, the U.S. EPA denied California's waiver request and declined to promulgate adequate federal regulations limiting GHG emissions. In early 2008, the State brought suit against the U.S. EPA related to this denial.

In January 2009, President Obama instructed the U.S. EPA to reconsider the Bush Administration's denial of California's and 13 other states' requests to implement global warming pollution standards for cars

and trucks. In June 2009, the U.S. EPA granted California's waiver request, enabling the State to enforce its GHG emissions standards for new motor vehicles beginning with the current model year.

In 2009, President Obama also announced a national policy aimed at both increasing fuel economy and reducing GHG pollution for all new cars and trucks sold in the United States. The new standards would cover model years 2012 to 2016 and would raise passenger vehicle fuel economy to a fleet average of 35.5 miles per gallon by 2016. California has committed to allowing automakers who show compliance with the national program to also be deemed in compliance with State requirements. California is committed to further strengthening these standards beginning in 2017 to obtain a 45 percent GHG reduction from the 2020 model year vehicles in comparison to the 2009 model year.

Executive Order No. S-3-05

Executive Order S-3-05 (State of California) proclaims that California is vulnerable to the impacts of climate change. It declares that increased temperatures could reduce the Sierra's snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea levels. To combat those concerns, the Executive Order established total GHG emission targets. Specifically, emissions are to be reduced to the 2000 level by 2010, to the 1990 level by 2020, and to 80 percent below the 1990 level by 2050.

The Executive Order directed the secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce GHG emissions to the target levels. The secretary will also submit biannual reports to the governor and State legislature describing (1) progress made toward reaching the emission targets, (2) impacts of global warming on California's resources, and (3) mitigation and adaptation plans to combat these impacts. To comply with the Executive Order, the secretary of CalEPA created a Climate Action Team made up of members from various state agencies and commissions. The Climate Action Team released its first report in March 2006 and continues to release periodic reports on progress. The report proposed to achieve the targets by building on voluntary actions of California businesses, local government and community actions, as well as through State incentive and regulatory programs.

Assembly Bill 32 – California Global Warming Solutions Act of 2006

AB 32 (Health and Safety Code Sections 38500, 38501, 28510, 38530, 38550, 38560, 38561–38565, 38570, 38571, 38574, 38580, 38590, 38592–38599) requires that Statewide GHG emissions be reduced to 1990 levels by the year 2020. The gases that are regulated by AB 32 include CO_2, CH_4, N_2O, HFCs, PFCs, nitrogen trifluoride (NF_3), and SF_6. The reduction to 1990 levels will be accomplished through an enforceable statewide cap on GHG emissions that were phased in starting in 2012. To effectively implement the cap, AB 32 directs CARB to develop and implement regulations to reduce Statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then CARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires that CARB adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrives at the cap, institute a schedule to meet the emissions cap, and develop tracking, reporting, and enforcement mechanisms to ensure that the State achieves reductions in GHG

emissions necessary to meet the cap. AB 32 also includes guidance to institute emissions reductions in an economically efficient manner and conditions to ensure that businesses and consumers are not unfairly affected by the reductions.

Climate Change Scoping Plan

In October 2008, CARB published its Climate Change Proposed Scoping Plan, which is the State's plan to achieve GHG reductions in California required by AB 32. This initial Scoping Plan contained the main strategies to be implemented in order to achieve the target emission levels identified in AB 32. The Scoping Plan included CARB-recommended GHG reductions for each emissions sector of the State's GHG inventory. The largest proposed GHG reduction recommendations were associated with improving emissions standards for light-duty vehicles, implementing the Low Carbon Fuel Standard program, incorporating energy efficiency measures in buildings and appliances and the widespread development of combined heat and power systems, and developing a renewable portfolio standard for electricity production.

The Scoping Plan states that land use planning and urban growth decisions will play important roles in the State's GHG reductions because local governments have primary authority to plan, zone, approve, and permit how land is developed to accommodate population growth and the changing needs of their jurisdictions. CARB further acknowledges that decisions on how land is used will have large impacts on the GHG emissions that will result from the transportation, housing, industry, forestry, water, agriculture, electricity, and natural gas emissions sectors. With regard to land use planning, the Scoping Plan expects approximately 5.0 million metric tons of carbon dioxide equivalents ($MMTCO_2e$) will be achieved associated with implementation of Senate Bill 375, which is discussed further below.

The initial Scoping Plan was first approved by CARB on December 11, 2008, and is updated every five years. The first update of the Scoping Plan was approved by the CARB on May 22, 2014, which looked past 2020 to set mid-term goals (2030-2035) on the road to reaching the 2050 goals. The most recent update released by CARB is the 2017 Climate Change Scoping Plan, which was released in November 2017. The 2017 Climate Change Scoping Plan incorporates strategies for achieving the 2030 GHG-reduction target established in Senate Bill (SB) 32 and Executive Order B-30-15.

California Renewables Portfolio Standards (Senate Bill 1078 and Governor's Order S-14-08)

SB 1078 (Public Utilities Code Sections 387, 390.1, 399.25 and Article 16) addresses electricity supply and requires that retail sellers of electricity, including investor-owned utilities and community choice aggregators, provide a minimum 20 percent of their supply from renewable sources by 2017. This Senate Bill will affect Statewide GHG emissions associated with electricity generation. In 2008, Governor Schwarzenegger signed Executive Order S-14-08, which set the Renewables Portfolio Standard target to 33 percent by 2020. It directed state government agencies and retail sellers of electricity to take all appropriate actions to implement this target. Executive Order S-14-08 was later superseded by Executive Order S-21-09 on September 15, 2009. Executive Order S-21-09 directed the CARB to adopt regulations requiring 33 percent of electricity sold in the State come from renewable energy by 2020. Statute SB X1-2 superseded this Executive Order in 2011, which obligates all California electricity providers, including investor-owned utilities and publicly owned utilities, to obtain at least 33 percent of their energy from renewable electrical generation facilities by 2020.

CARB is required by current law, AB 32 of 2006, to regulate sources of GHGs to meet a State goal of reducing GHG emissions to 1990 levels by 2020 and an 80 percent reduction of 1990 levels by 2050. The California Energy Commission and California Public Utilities Commission serve in advisory roles to help CARB develop the regulations to administer the 33 percent by 2020 requirement. CARB is also authorized to increase the target and accelerate and expand the time frame.

SB 350 (Chapter 547, Statues of 2015) further increased the Renewables Portfolio Standard to 50 percent by 2030. The legislation also included interim targets of 40 percent by 2024 and 45 percent by 2027. SB 350 was signed into law on October 7, 2015.

Mandatory Reporting of GHG Emissions

The California Global Warming Solutions Act (AB 32, 2006) requires reporting of GHGs by major sources to the CARB. Major sources required to report GHG emissions include industrial facilities, suppliers of transportation fuels, natural gas, natural gas liquids, liquefied petroleum gas, and carbon dioxide, operators of petroleum and natural gas systems, and electricity retail providers and marketers.

Cap-and-Trade Regulation

The cap-and-trade regulation is a key element in California's climate plan. It sets a statewide limit on sources responsible for 85 percent of California's GHG emissions and establishes a price signal needed to drive long-term investment in cleaner fuels and more efficient use of energy. The cap-and-trade rules came into effect on January 1, 2013, and apply to large electric power plants and large industrial plants. In 2015, fuel distributors, including distributors of heating and transportation fuels, also became subject to cap-and-trade. At that stage, the program was predicted to encompass around 360 businesses throughout California and nearly 85 percent of the State's total GHG emissions.

Under the cap-and-trade regulation, companies must hold enough emission allowances to cover their emissions and are free to buy and sell allowances on the open market. California held its first auction of GHG allowances on November 14, 2012, which was followed by seven jurisdiction-specific quarterly GHG allowance auctions until August 18, 2014. The first joint auction with Québec's Ministry of Sustainable Development, Environment and the Fight against Climate Change was held on November 25, 2014. California's GHG cap-and-trade system is projected to reduce GHG emissions to 1990 levels by the year 2020 and would achieve an approximate 80 percent reduction from 1990 levels by 2050.

Senate Bill 32

SB 32 was signed by Governor Brown on September 8, 2016. SB 32 effectively extends California's GHG emission-reduction goals from year 2020 to year 2030. This new emission-reduction target of 40 percent below 1990 levels by 2030 is intended to promote further GHG-reductions in support of the State's ultimate goal of reducing GHG emissions by 80 percent below 1990 levels by 2050. SB 32 also directs the CARB to update the Climate Change Scoping Plan to address this interim 2030 emission-reduction target.

Senate Bill 375

SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a sustainable communities strategy (SCS) or alternative planning strategy (APS) that will address land use allocation in that MPOs regional transportation plan. CARB, in consultation with MPOs, establishes regional reduction targets for GHGs emitted by passenger cars and light trucks for the years 2020 and 2035. These reduction targets

are scheduled to be updated every eight years but can be updated every four years if advancements in emissions technologies affect the reduction strategies to achieve the targets. CARB is also charged with reviewing each MPO's SCS or APS for consistency with its assigned targets. If MPOs do not meet the GHG reduction targets, funding for transportation projects may be withheld.

California Building Code

The California Building Code (CBC) contains standards that regulate the method of use, properties, performance, or types of materials used in the construction, alteration, improvement, repair, or rehabilitation of a building or other improvement to real property. The CBC is adopted every three years by the Building Standards Commission (BSC). In the interim, the BSC also adopts annual updates to make necessary mid-term corrections. The CBC standards apply statewide; however, a local jurisdiction may amend a CBC standard if it makes a finding that the amendment is reasonably necessary due to local climatic, geological, or topographical conditions.

Green Building Standards

In essence, green buildings standards are indistinguishable from any other building standards. Both standards are contained in the CBC and regulate the construction of new buildings and improvements. The only practical distinction between the two is that whereas the focus of traditional building standards has been protecting public health and safety, the focus of green building standards is to improve environmental performance.

AB 32, which mandates the reduction in GHG emissions in California to 1990 levels by 2020, increased the urgency around the adoption of green building standards. In its scoping plan for the implementation of AB 32, CARB identified energy use as the second largest contributor to California's GHG emissions, constituting roughly 25 percent of all such emissions. In recommending a green building strategy as one element of the scoping plan, CARB estimated that green building standards would reduce GHG emissions by approximately 26 $MMTCO_2e$ by 2020. The green buildings standards were most recently updated in 2016.

Senate Bill 97

SB 97 was enacted in 2007. SB 97 required OPR to develop, and the Natural Resources Agency to adopt, amendments to the CEQA Guidelines addressing the analysis and mitigation of GHG emissions. Those CEQA Guidelines amendments clarified several points, including the following:

- Lead agencies must analyze the GHG emissions of proposed projects and must reach a conclusion regarding the significance of those emissions.
- When a project's GHG emissions may be significant, lead agencies must consider a range of potential mitigation measures to reduce those emissions.
- Lead agencies must analyze potentially significant impacts associated with placing projects in hazardous locations, including locations potentially affected by climate change.
- Lead agencies may significantly streamline the analysis of GHGs on a project level by using a programmatic GHG emissions reduction plan meeting certain criteria.

- CEQA mandates analysis of a proposed project's potential energy use (including transportation-related energy), sources of energy supply, and ways to reduce energy demand, including through the use of efficient transportation alternatives.

As part of the administrative rulemaking process, the California Natural Resources Agency developed a Final Statement of Reasons explaining the legal and factual bases, intent, and purpose of the CEQA Guidelines amendments. The amendments to the CEQA Guidelines implementing SB 97 became effective on March 18, 2010.

Short-Lived Climate Pollutant Reduction Strategy

In March 2017, the CARB adopted the Short-Lived Climate Pollutant Reduction Strategy (SLCP Strategy), establishing a path to decrease GHG emissions and displace fossil-based natural gas use. Strategies include avoiding landfill methane emissions by reducing the disposal of organics through edible food recovery, composting, in-vessel digestion, and other processes; and recovering methane from wastewater treatment facilities, and manure methane at dairies, and using the methane as a renewable source of natural gas to fuel vehicles or generate electricity. The SLCP Strategy also identifies steps to reduce natural gas leaks from oil and gas wells, pipelines, valves, and pumps to improve safety, avoid energy losses, and reduce methane emissions associated with natural gas use. The SLCP Strategy identifies measures that can reduce HFC emissions at national and international levels. Lastly, the SLCP identifies State-level actions, including an incentive program to encourage the use of low-Global Warming Potential (GWP) refrigerants and limitations on the use of high-GWP refrigerants in new refrigeration and air-conditioning equipment (California Air Resources Board, 2017a).

3.7.1.3 Regional

Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. Under federal law, SCAG is designated as a MPO and under State law as a Regional Transportation Planning Agency and a Council of Governments.

On September 3, 2020, SCAG adopted Connect SoCal: The 2020-2045 RTP/SCS (Southern California Association of Governments, 2020). The RTP is a long-range transportation plan that provides a vision for regional transportation investments over a period of 20 years or more. The SCS is an element of the RTP that demonstrates the integration of land use, transportation strategies, and transportation investments within the Plan. This requirement was put in place by the passage of SB 375, with the goal of ensuring that the SCAG region can meet its regional GHG reduction targets set by the CARB. In comparison to year 2005 levels, the SCS would result in an eight percent reduction in GHG emissions per capita by 2020, an 18 percent reduction by 2035, and a 21 percent reduction by 2040. This meets or exceeds the State's mandated reductions, which are eight percent by 2020 and 13 percent by 2035. SCAG is also responsible under the FCAA for determining federal air quality conformity of projects, plans, and programs within the South Coast Air Quality Management District (SCAQMD).

The 2020-2045 RTP/SCS would also help to reduce vehicle delay and vehicle miles traveled (VMT) within the region. On a per capita basis, vehicle delay would be reduced by roughly 26 percent, and heavy-duty

truck delay on highways 24 percent. VMT per capita would be reduced by five percent and vehicle hours traveled (VHT) would be reduced by approximately nine percent per capita (Southern California Association of Governments, 2020).

South Coast Air Quality Management District

The SCAQMD is the agency responsible for regulating air pollution in the South Coast Air Basin, which includes the Greater Los Angeles Region. The SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. More recently, in 2008, the Climate Change Policy was approved by the SCAQMD's Governing Board. The Climate Change Policy directs the agency's efforts on the reduction of GHG emissions and also established the SCAQMD's role in emerging GHG-reduction programs. Complementary to the Climate Change Policy, the Governing Board approved a Green Policy in 2009. The Green Policy is intended to help reduce the agency's carbon footprint from building operations, purchases, and employee work-related activities. The Green Policy also established a "Green Team" to evaluate potential practices, purchases, and other actions that can help to further reduce GHG emissions.

3.7.1.4 Local

City of Los Angeles

Green LA and *ClimateLA*

In May 2007, the City published *Green LA: An Action Plan to Lead the Nation in Fighting Global Warming*, which included more than fifty specific climate mitigation actions designed to reduce the City's contributions to climate change, and to prepare a response to the changes that have already begun to occur (City of Los Angeles, 2007). City departments worked together to respond to the recommendations set forth in the *Green LA* action plan, resulting in *ClimateLA*. *ClimateLA* is an implementation program that provides detailed information about each action item discussed in the *Green LA* framework. While the *ClimateLA* program focuses on mitigation, many of the adaptation measures addressed in *ClimateLA* are considered in this report, such as managing urban heat. Some of the adaptive action items recommended include making Los Angeles a worldwide leader in green buildings, decreasing per-capita water use, and implementing a city-wide climate change education program. Information about proposed and/or ongoing programs, opportunities for achieving the City's goals, specific challenges, and a list of milestones is provided for each action item. In the near future, the City aims to prioritize adaptation to climate change and include adaptation goals in departmental action plans.

City of Los Angeles Green Building Code

To achieve goals outlined in *Green LA*, in April 2008, the City adopted the Green Building Program Ordinance to address the impact on climate change from new development, which was amended for consistency with the CalGreen Building Code in 2011. As of January 1, 2011, all new buildings (residential and non-residential) would be subject to the Los Angeles Green Building Code (LAGBC), which is based on the 2013 CalGreen Standards to increase energy efficiency and reduce waste (City of LA Department of Building and Safety, 2017).

Sustainable City pLAn

In April 2015, Mayor Eric Garcetti introduced the Sustainable City pLAn. An updated annual report, titled L.A.'s Green New Deal, was released in 2019 (Office of the Los Angeles Mayor, 2019). The plan consists of 47 targets with milestones and initiatives for a cleaner environment and a stronger economy. These target categories include renewable energy, local water, clean and healthy buildings, housing and development, mobility and public transit, zero emission vehicles, industrial emissions and air quality monitoring, waste and resource recovery, food systems, urban ecosystems and resilience, environmental justice, prosperity, and green jobs, and lead by example.

3.7.2 Environmental Setting

To fully understand global climate change, it is important to recognize the naturally occurring "greenhouse effect" and to define the GHGs that contribute to this phenomenon. Various gases in the earth's atmosphere, classified as atmospheric GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space and a portion of the radiation is absorbed by the earth's surface. The earth emits this radiation back toward space, but the properties of the radiation change from high-frequency solar radiation to lower-frequency infrared radiation. GHGs, which are transparent to solar radiation, are effective in absorbing infrared radiation. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This phenomenon is known as the greenhouse effect. Among the prominent GHGs contributing to the greenhouse effect are carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride.

GWP was developed to compare global warming impacts associated with various gases. GWP is the measure of the total energy that one ton of gas absorbs over a particular period of time (usually 100 years), compared to one ton of CO_2 (U.S. Environmental Protection Agency, 2017). Primary GHGs attributed to global climate change, are discussed, as follows:

- **Carbon Dioxide:** CO_2 is a colorless, odorless gas. CO_2 is emitted in a number of ways, both naturally and through human activities. The largest source of CO_2 emissions globally is the combustion of fossil fuels such as coal, oil, and gas in power plants, automobiles, industrial facilities, and other sources. A number of specialized industrial production processes and product uses such as mineral production, metal production, and the use of petroleum-based products can also lead to CO_2 emissions. The atmospheric lifetime of CO_2 is variable because it is so readily exchanged in the atmosphere (U.S. Environmental Protection Agency, 2019).
- **Methane:** CH_4 is a colorless, odorless gas that is not flammable under most circumstances. CH_4 is the major component of natural gas, about 87 percent by volume. It is also formed and released into the atmosphere by biological processes occurring in anaerobic environments. Methane is emitted from a variety of both human-related and natural sources. Human-related sources include fossil fuel production, animal husbandry (enteric fermentation in livestock and manure management), rice cultivation, biomass burning, and waste management. These activities release significant quantities of methane into the atmosphere. Natural sources of methane include wetlands, gas hydrates, permafrost, termites, oceans, freshwater bodies, non-wetland soils, and other sources

such as wildfires. Methane's atmospheric lifetime is about 12 years (U.S. Environmental Protection Agency, 2019).

- **Nitrous Oxide:** N_2O is a clear, colorless gas with a slightly sweet odor. N_2O is produced by both natural and human-related sources. Primary human-related sources of N_2O are agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuels, adipic acid production, and nitric acid production. N_2O is also produced naturally from a wide variety of biological sources in soil and water, particularly microbial action in wet tropical forests. The atmospheric lifetime of N_2O is approximately 114 years (U.S. Environmental Protection Agency, 2019).
- **Hydrofluorocarbons:** HFCs are man-made chemicals, many of which have been developed as alternatives to ozone-depleting substances for industrial, commercial, and consumer products. The only significant emissions of HFCs before 1990 were of the chemical HFC-23, which is generated as a byproduct of the production of HCFC-22 (or Freon 22, used in air conditioning applications). The atmospheric lifetime for HFCs varies from just over a year for HFC-152a to 270 years for HFC-23. Most of the commercially used HFCs have atmospheric lifetimes of less than 15 years (e.g., HFC-134a, which is used in automobile air conditioning and refrigeration, has an atmospheric life of 14 years) (U.S. Environmental Protection Agency, 2019).
- **Perfluorocarbons:** PFCs are colorless, highly dense, chemically inert, and nontoxic. There are seven PFC gases: perfluoro methane (CF_4), perfluoro ethane (C_2F_6), perfluoro propane (C_3F_8), perfluoro butane (C_4F_{10}), perfluorocyclobutane (C_4F_8), perfluoro pentane (C_5F_{12}), and perfluoro hexane (C_6F_{14}). Natural geological emissions have been responsible for the PFCs that have accumulated in the atmosphere in the past; however, the largest current source is aluminum production, which releases CF_4 and C_2F_6 as byproducts. The estimated atmospheric lifetimes for PFCs range from 2,500 to 50,000 years (U.S. Environmental Protection Agency, 2019).
- **Nitrogen Trifluoride:** NF_3 is an inorganic, colorless, odorless, toxic, nonflammable gas used as an etchant in microelectronics. Nitrogen trifluoride is predominantly employed in the cleaning of the plasma-enhanced chemical vapor deposition chambers in the production of liquid crystal displays and silicon-based thin film solar cells. It has a GWP of 16,100 carbon dioxide equivalents (CO_2e). While NF_3 may have a lower GWP than other chemical etchants, it is still a potent GHG. In 2009, NF_3 was listed by California as a high GWP GHG to be listed and regulated under AB 32 (Section 38505 Health and Safety Code).
- **Sulfur Hexafluoride:** SF_6 is an inorganic compound that is colorless, odorless, nontoxic, and generally nonflammable. SF_6 is primarily used as an electrical insulator in high voltage equipment. The electric power industry uses roughly 80 percent of all SF_6 produced worldwide. Leaks of SF_6 occur from aging equipment and during equipment maintenance and servicing. SF_6 has an atmospheric life of 3,200 years (U.S. Environmental Protection Agency, 2019).
- **Black Carbon:** Black carbon is the strongest light-absorbing component of particulate matter (PM) emitted from burning fuels such as coal, diesel, and biomass. Black carbon contributes to climate change both directly by absorbing sunlight and indirectly by depositing on snow and by interacting with clouds and affecting cloud formation. Black carbon is considered a short-lived species, which can vary spatially and, consequently, it is very difficult to quantify associated global-warming

potentials. The main sources of black carbon in California are wildfires, off-road vehicles (locomotives, marine vessels, tractors, excavators, dozers, etc.), on-road vehicles (cars, trucks, and buses), fireplaces, agricultural waste burning, and prescribed burning (planned burns of forest or wildlands) (Climate & Clean Air Coalition, n.d.; U.S. Environmental Protection Agency, 2019).

Each GHG differs in its ability to absorb heat in the atmosphere based on the lifetime, or persistence, of the gas molecule in the atmosphere. Often, estimates of GHG emissions are presented in CO_2e, which weight each gas by its GWP. Expressing GHG emissions in CO_2e takes the contribution of all GHG emissions to the greenhouse effect and converts them to a single unit equivalent to the effect that would occur if only CO_2 were being emitted. **Table 3.7-1** provides a summary of the GWP for GHG emissions of typical concern with regard to community development projects, based on a 100-year time horizon. As indicated, CH_4 traps over 25 times more heat per molecule than CO_2, and N_2O absorbs roughly 298 times more heat per molecule than CO_2. Additional GHG with high GWP include NF_3, SF_6, PFCs, and black carbon.

Table 3.7-1: Global Warming Potential for Greenhouse Gases

Greenhouse Gas	Global Warming Potential (100-Year)
Carbon Dioxide (CO_2)	1
Methane (CH_4)	28-36
Nitrous Oxide (N_2O)	265-298

Source: (U.S. Environmental Protection Agency, 2017)

3.7.2.1 Sources of GHG Emissions

On a global scale, GHG emissions are predominantly associated with activities related to energy production; changes in land use, such as deforestation and land clearing; industrial sources; agricultural activities; transportation; waste and wastewater generation; and commercial and residential land uses. Worldwide, energy production including the burning of coal, natural gas, and oil for electricity and heat is the largest single source of global GHG emissions (U.S. Environmental Protection Agency, 2019).

In 2016, GHG emissions within California totaled 429 million metric tons (MMT) of CO_2e. GHG emissions, by sector, are summarized in **Figure 3.7-1,** California GHG Emissions Inventory by Scoping Plan Sector. Within California, the transportation sector is the largest contributor, accounting for approximately 39 percent of the total statewide GHG emissions. Emissions associated with industrial uses are the second largest contributor, totaling roughly 21 percent. Electricity generation totaled roughly 16 percent (California Air Resources Board, 2018b).

Short-Lived Climate Pollutants

Short-lived climate pollutants (SLCPs), such as black carbon, fluorinated gases, and methane also have a dramatic effect on climate change. Though short lived, these pollutants create a warming influence on the climate that is many times more potent than that of carbon dioxide.

As part of the CARB's efforts to address SLCPs, the CARB has developed a statewide emission inventory for black carbon. The black carbon inventory will help support implementation of the SLCP Strategy, but it is not part of the State's GHG Inventory that tracks progress towards the State's climate targets. The

most recent inventory for year 2013 conditions is depicted in **Figure 3.7-2**, California Black Carbon Emissions Inventory (Year 2013). Off-road mobile sources account for a majority of black carbon emissions, totaling roughly 36 percent of the inventory. Other major anthropogenic sources of black carbon include on-road transportation, residential wood burning, fuel combustion, and industrial processes (Climate & Clean Air Coalition, n.d.).

Source: (California Air Resources Board, 2017a)

3.7.2.2 Effects of Global Climate Change

There are uncertainties as to exactly what the climate changes will be in various local areas of the earth. There are also uncertainties associated with the magnitude and timing of other consequences of a warmer planet: sea level rise, spread of certain diseases out of their usual geographic range, the effect on

agricultural production, water supply, sustainability of ecosystems, increased strength and frequency of storms, extreme heat events, increased air pollution episodes, and the consequence of these effects on the economy.

Within California, climate changes would likely alter the ecological characteristics of many ecosystems throughout the State. Such alterations would likely include increases in surface temperatures and changes in the form, timing, and intensity of precipitation. For instance, historical records are depicting an increasing trend toward earlier snowmelt in the Sierra Nevada. This snow pack is a principal supply of water for the State, providing roughly 50 percent of the State's annual runoff. If this trend continues, some areas of the State may experience an increased danger of floods during the winter months and possible exhaustion of the snowpack during spring and summer months. An earlier snowmelt would also impact the State's energy resources. Currently, approximately 13.53 percent of California's electricity comes from hydropower (California Energy Commission, 2019). An early exhaustion of the Sierra snowpack may force electricity producers to switch to more costly or non-renewable forms of electricity generation during spring and summer months. A changing climate may also impact agricultural crop yields, coastal structures, and biodiversity. Therefore, climate change will likely have detrimental effects on some of California's largest industries, including agriculture, wine, tourism, skiing, recreational and commercial fishing, and forestry (Planning and Conservation League, n.d.).

3.7.3 Environmental Impact Analysis

3.7.3.1 Methodology

Construction

Short-term emissions associated with construction activities largely depend on the type of development proposed, the amount of material to be imported and exported, equipment required, and construction schedules. Construction emissions of GHGs were calculated using the California Emissions Estimator Model (CalEEMod), version 2016.3.2 computer program. Modeling was conducted for the proposed Project based on estimated material to be imported and exported, off-road equipment usage, and construction schedules provided by the Project engineers. Other construction modeling assumptions, including mobile-source emission factors and usage rates, were based on default parameters contained in the model for Los Angeles County. In accordance with SCAQMD recommendations, construction-generated GHG emissions were amortized over an assumed 30-year Project life for Year 2021 and year 2030 conditions. Emissions modeling assumptions and output files are provided in the *Air Quality and Greenhouse Gas Impact Assessment* prepared for the proposed Project (Ambient Air Quality & Noise Consulting, 2019).

Operation

Long-term operational emissions of GHGs were also calculated using the CalEEMod, version 2016.3.2, computer program for Year 2021 and year 2030 conditions. Modeling was conducted based on the estimated building square footage to be constructed and vehicle trip-generation rates identified in the *Traffic Impact Analysis* prepared for the proposed Project (Kimley-Horn and Associates, Inc., 2019) . The quantification of Project-generated GHG emissions takes into account compliance with current building standards, such as the use of low-flow water fixtures and water-efficient irrigation systems. Proposed

Project and site enhancements that would contribute to reductions in mobile-source emissions were also accounted for in the analysis, based on methodologies contained in California Air Pollution Control Officers Association's (CAPCOA) Quantifying Greenhouse Gas Mitigation Measures and the default emission reductions identified in CalEEMod. These measures included reductions associated with providing increased diversity (LUT-3), transit accessibility within 0.5 mile of the Project Site (LUT-5), and improvements to the existing pedestrian network (SDT-1).

GHG emissions associated with the existing industrial uses that were removed were also quantified, based on the trip-generation rates identified in the traffic analysis prepared for this project and default energy usage, water usage, and waste-generation rates identified in CalEEMod. Project-generated GHG emissions were compared to estimated emissions associated with the removed industrial uses for determination of net changes in GHGs. The analysis does not account for potential emissions from onsite area or stationary sources that may have been associated with operation of the existing industrial uses. As a result, net changes in operational GHG emissions are conservatively estimated.

For comparison purposes, Project-generated emissions were also quantified for business-as-usual (BAU) conditions. The BAU scenario does not account for measures that would reduce Project-related energy or water use, per current building code requirements, or site enhancements that would contribute to reductions in mobile-source emissions. The BAU scenario includes GHG-reductions expected to be in force by 2020, including reductions associated with implementation of Pavley I vehicle standards, low-carbon fuel standards, and the State's Renewables Portfolio Standards.

3.7.3.2 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the IS for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.7.3.3 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on GHG emissions if it would:

VIII(a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

VIII(b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

The City of Los Angeles has not formally adopted quantitative significance thresholds for determination of whether or not a project would have a significant impact on the environment or conflict with an applicable GHG-reduction plan, policy, or regulation. However, various other entities have identified recommended GHG-significance thresholds, as discussed below:

State of California

By enacting SB 97, California's lawmakers expressly recognized the need to analyze GHG emissions as a part of the CEQA process. SB 97 required OPR to develop, and the Natural Resources Agency to adopt, amendments to the CEQA Guidelines addressing the analysis and mitigation of GHG emissions. The amendments to the CEQA Guidelines implementing SB 97 became effective on March 18, 2010. These amendments, however, do not establish a threshold of significance for the assessment of GHG impacts. Lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including looking to thresholds developed by other public agencies, or suggested by other experts (i.e., CAPCOA and SCAQMD), so long as any threshold chosen is supported by substantial evidence. The California Natural Resources Agency has also clarified that the amendments recognized the cumulative effects of GHG emissions as they relate to climate change and that GHG impacts should be analyzed in the context of CEQA's requirements for the assessment of cumulative impacts.

California Air Pollution Control Officers Association (CAPCOA)

In its January 2008 "CEQA and Climate Change" white paper, CAPCOA identified a number of potential approaches for determining the significance of GHG emissions in CEQA documents. In its white paper, CAPCOA suggests making significance determinations "on a case-by-case basis in the context of the project at the time it comes forward" when no significance thresholds have been formally adopted by a lead agency. The CAPCOA white paper suggested a bright-line threshold of 900 $MTCO_2e$/year. As proposed, projects generating emissions exceeding this threshold would be considered to have a potentially significant impact. This threshold reflects the amount of emissions that ninety percent of development projects surveyed in four cities within California would generate, which included the cities of Los Angeles, Pleasanton, Dublin, and Livermore.

South Coast Air Quality Management District (SCAQMD)

At present time, the SCAQMD has not adopted a quantitative project-level GHG significance threshold for land use development projects (e.g., residential/commercial projects) subject to CEQA review. However, the SCAQMD did form a *GHG Significance Threshold Working Group* for the purpose of evaluating potential GHG significance thresholds. In October 2008, SCAQMD released a draft guidance document regarding interim CEQA GHG significance thresholds. Within this document, the SCAQMD proposed interim CEQA GHG indicators of significance using a tiered approach. Accordingly, under Tier 1, projects that would be considered exempt from CEQA would also be considered to have a less-than-significant GHG impact. Under Tier 2, projects that would be consistent with an adopted GHG-reduction plan would be considered to have a less-than-significant GHG impact. Under Tier 3, all non-industrial land use projects that would emit 3,000 $MTCO_2e$ per year, or less, would be considered to have a less-than-significant GHG impact. Under Tier 4, projects that achieve an identified GHG-percent reduction below BAU conditions would also be considered to have a less-than-significant GHG impact. This recommended Tier 4 standard was subsequently amended in November 2009 and September 2010 to include a recommended service population metric for commercial/residential projects that emit greater than 3,000 $MTCO_2e$ per year. Projects that would not exceed these thresholds would be considered to have a less-than-significant impact on the environment and would not conflict with GHG-reduction planning efforts.

For land use development projects, the SCAQMD has not adopted any of the above-discussed GHG significance thresholds recommended by the *GHG Significance Threshold Working Group*. The *GHG*

Significance Threshold Working Group has been inactive since 2011. However, in December 2008, the SCAQMD Governing Board adopted an interim GHG significance threshold of 10,000 $MTCO_2e$ for stationary source/industrial projects where the SCAQMD is the lead agency. This threshold, however, does not apply to the proposed Project given that the project would not include the installation of permitted stationary sources.

3.7.3.4 Construction Impacts

VIII(a): Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

Short-term annual GHG emissions for the proposed Project are summarized in **Table 3.7-2**. Based on the modeling conducted, the highest annual GHG emissions associated with construction of the proposed Project would total approximately 1,022 $MTCO_2e$. In total, construction activities over the 30-month period would generate approximately 1,386 $MTCO_2e$. A small amount of GHG emissions from waste would also be generated during construction; however, this amount is speculative. Construction emissions, when amortized over the life of the proposed Project, defined as 30 years, would average approximately 46 $MTCO_2e$ per year. Amortized construction-generated GHG emissions were included in the operational GHG emissions inventory for evaluation of Project-generated GHG emissions in comparison to GHG significance thresholds (see Section 3.7.3.4).

Table 3.7-2: Short-Term Construction-Generated GHG Emissions

Year	Total GHG Emissions ($MTCO_2e$)
Construction Year 1	1,022
Construction Year 2	172
Construction Year 3	192
Total:	1,386
Amortized Emissions:	46

Based on CalEEMod computer modeling. Amortized emissions assume an average project life of 30 years. Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project for modeling results and assumptions. Source: (Ambient Air Quality & Noise Consulting, 2019)

Construction of the proposed Project includes various measures that would reduce short-term emissions from off-road equipment. Such measures include the use of off-road equipment meeting Tier 4 emission standards, idling limitations, and the use of newer, more efficient on-road haul trucks. Implementation of these measures would significantly reduce emissions of black carbon associated with short-term construction activities. For instance, with the use of Tier 4 off-road equipment, construction-generated emissions of black carbon diesel exhaust would be reduced by upwards of approximately 80 percent, compared to statewide fleet averages. With incorporation of measures to reduce short-term emissions from off-road equipment, impacts would be less than significant.

VIII(b): Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Applicable plans for the reduction of GHGs include the *2017 Climate Change Scoping Plan*, *2016-2040 RTP/SCS*, the *Green LA* action plan, and the *Sustainable City pLAn*, which are discussed in Section 3.7.1 (California Air Resources Board, 2017b; Southern California Association of Governments, 2016; City of Los Angeles, 2007; Office of the Los Angeles Mayor, 2019). As discussed under **GHG-1** above, construction of the proposed Project includes various BMPs that would reduce short-term emissions from off-road equipment. Therefore, impacts would be less than significant.

3.7.3.5 Operational Impacts

VIII(a): Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

The proposed Project is an infill development within an existing urbanized area and located within 0.5 mile of existing transit services. The proposed Project would provide increased localized access to recreational uses and improved pedestrian and bicycle connectivity. The proposed Project would incorporate water-saving landscape irrigation features, energy-efficient lighting, and use of low-flow water fixtures per current California building code requirements.

Estimated long-term operational GHG emissions are summarized in **Table 3.7-3**. Based on the modeling conducted, operational GHG emissions would total approximately 497 MTCO2e/year during the initial year of operation (Year 2021) and 466 MTCO2e/year in year 2030. During the initial year of proposed Project operations, a majority of the GHG emissions emitted, roughly 73 percent, would be associated with motor vehicle use. Electricity and water use would constitute approximately 14 and 10 percent, respectively. The remaining approximately three percent of GHG emissions would be associated with natural gas use and waste generation (see **Figure 3.7-3**, Annual Operational GHG Emissions Source Contribution [Year 2021]). By year 2030, the electricity and water use would constitute roughly 11 and 8 percent of the proposed Project's GHG emissions inventory and motor vehicle use would constitute roughly 78 percent of total GHG emissions (see **Figure 3.7-4**, Annual Operational GHG Emissions Source Contribution [Year 2030]).

In comparison to BAU conditions (without GHG-reduction measures), the proposed Project would result in GHG reductions of approximately 8.6 percent. A majority of the GHG reductions would be associated with anticipated reductions in onsite electricity consumption and projected reductions in vehicle emission standards.

Development of the proposed Project would be required to comply with current 2016 building standards. For non-residential projects, these newer building standards are approximately 5 percent more efficient than the 2013 building standards and roughly 35 percent more efficient than the 2010 standards. In comparison to BAU conditions, mobile-source emissions would be reduced by approximately 8 percent.

In comparison to the emissions generated by the proposed Project, the industrial land uses that were removed would have generated substantially higher GHG emissions totaling approximately 2,411 $MTCO_2e$ in Year 2021 and approximately 1,945 $MTCO_2e$ in year 2030. Taking into account these removed GHG emissions and with the inclusion of amortized construction-generated GHG emissions, the proposed Project would result in overall net reductions of approximately -1,868 $MTCO_2e$ in Year 2021 and -1,432

$MTCO_2e$ in 2030. The proposed Project would not generate GHG emissions that would result in a net increase in GHG emissions; therefore, impacts would be less than significant.

Table 3.7-3: Summary of Annual Operational GHG Emissions

Land Use/Event (Capacity)	Emissions ($MTCO_2e$)[1]	
	Year 2021	Year 2030
Special Events (1,000)[2]	44	44
Special Events (2,000)[2]	96	96
Special Events (3,250)[2]	7	7
Special Events (5,000) [2]	6	6
Soccer Fields	156	151
Park Uses & Buildings	188	163
Total:	497	466
Business-As-Usual (BAU)[4]:	544	510
Reduction Compared to BAU:	-47 (-8.6%)	-44 (-9.4%)
Total with Amortized Construction Emissions[3]:	543	512
Less Industrial Uses Removed[5]:	-2,411	-1,945
Net Change Compared to Industrial Uses Removed:	-1,868 (-78%)	-1,432 (-74%)

1. Totals may not sum due to rounding. Emissions were quantified using the CalEEMod computer program based on trip-generation rates derived from the Traffic Impact Analysis (Kimley-Horn and Associates, Inc., 2019) prepared for the proposed Project. Refer to the Air Quality and Greenhouse Gas Impact Assessment prepared for the proposed Project (Ambient Air Quality & Noise Consulting, 2019) for emissions modeling assumptions and results. Project emissions include compliance with current building standards, including use of low-flow water fixtures, use of water-efficient irrigation systems, and improved neighborhood connectivity.

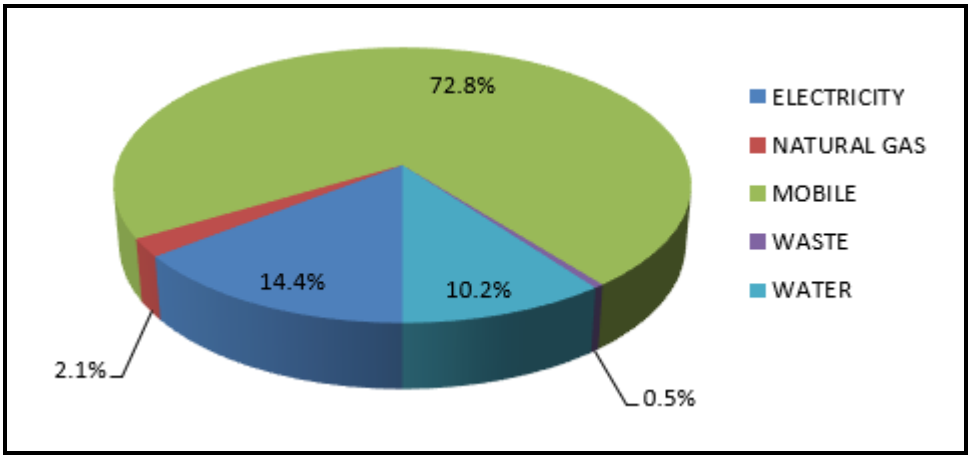
2. Assumes 24 days/year for events with a capacity of 1,000 attendees, 26 days/year for events with a capacity of 2,000 attendees, 2 days/year for events with a capacity of 3,250 attendees, and 1 day/year for events with a capacity of 5,000 attendees.

3. Construction-generated emissions were amortized over an estimated 30-year project life.

4. Business-as-usual excludes compliance with current building standards, including use of low-flow water fixtures, use of water-efficient irrigation systems, and improved neighborhood connectivity.

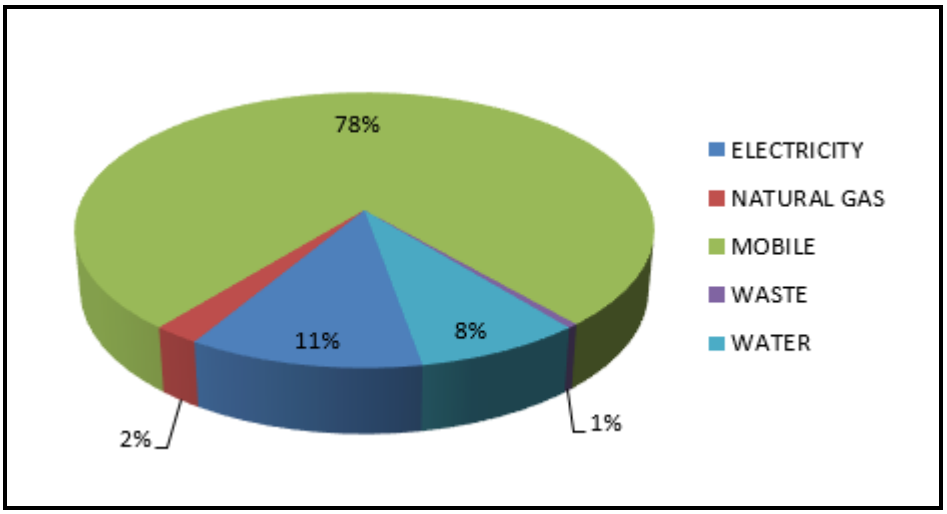
5. Existing industrial uses assumes 223,900 square feet of industrial uses. Vehicle trip-generation rates were derived from the Traffic Impact Analysis prepared for the proposed Project. Excludes stationary-source and off-road equipment emissions.

Figure 3.7-3: Annual Operational GHG Emissions Source Contribution (Year 2021)



Source: Ambient Air Quality & Noise Consulting, 2019

Figure 3.7-4: Annual Operational GHG Emissions Source Contribution (Year 2030)



Source: Ambient Air Quality & Noise Consulting, 2019

VIII(b): Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Applicable plans for the reduction of GHGs include the *2017 Climate Change Scoping Plan*, *2016-2040 RTP/SCS*, the *Green LA* action plan, and the *Sustainable City pLAn*, which are discussed in Section 3.7.1 (California Air Resources Board, 2017b; Southern California Association of Governments, 2016; City of Los Angeles, 2007; Office of the Los Angeles Mayor, 2019). The proposed Project is an infill development project that would provide increased connectivity between existing land uses, including increased pedestrian and biking infrastructure that would improve active transportation options and transit access within the area. Improvements in active transportation options within the area and increased access to local recreational uses would help to reduce overall GHG emissions associated with motor vehicle use. It is estimated that these improvements would reduce mobile-source GHG emissions by a minimum of approximately 8 percent, when compared to conditions without active transportation options.

The proposed Project would also be designed to reduce emissions associated with energy use, water use, and waste generation per current building code requirements. Such measures would include the use of low-flow water fixtures, water-efficient irrigation systems, and high-efficiency lighting, which would reduce related GHG emissions by approximately 15 percent, compared to BAU conditions.

Furthermore, the proposed Project would result in an overall net reduction of long-term operational GHG emissions in comparison to the existing industrial uses that were removed. In comparison to the existing industrial uses that were removed, the proposed Project would result in an overall net GHG reduction of roughly 78 percent in Year 2021 and 74 percent in year 2030 (see **Table 3.7-3**). The proposed Project would also help to reduce urban heat island effect (i.e., built up areas that have higher temperatures compared to nearby rural areas).

Proposed Project features, including improvements to active transportation options; design features that reduce energy use, water use, and waste generation; and the conversion of industrial uses to open space uses, would contribute to reductions in GHG emissions. Therefore, the proposed Project would be consistent with and would not conflict with applicable GHG-reduction plans.

3.7.4 Best Management Practices

BMP-GHG-1: Off-Road Equipment Construction Requirements

Idling shall be limited for vehicles and off-road equipment. Off-road equipment shall meet Tier 4 emission standards and newer. Efficient on-road haul trucks shall be used, where practicable.

3.7.5 Mitigation Measures

Impacts related to GHG emissions would be less than significant; therefore, mitigation measures are not required.

3.7.6 Significant Unavoidable Adverse Impacts

There are no significant unavoidable adverse impacts on GHG emissions resulting from implementation of the proposed Project.

3.7.7 Cumulative Impacts

GHG emissions from a single project would be relatively small in comparison to State or global GHG emissions. A single project would not generate enough GHG emissions to result in climate change; rather, the accumulation of GHG in the atmosphere resulting from many projects may result in global climate change, which can cause significant environmental effects. Therefore, impacts related to GHG emissions are exclusively cumulative.

The analysis in Sections 3.7.3.4 and 3.7.3.5 take cumulative conditions and effects into account. As discussed in Sections 3.7.3.4 and 3.7.3.5, construction of the proposed Project would not generate GHG emissions that would significantly impact the environment and operation of the proposed Project is anticipated to reduce GHG emissions when compared to the existing industrial land use. In addition, the proposed Project would not conflict with GHG emissions reductions plans and policies. Therefore, the proposed Project would not result in cumulative impacts related to GHG emissions.

3.8 Hazards and Hazardous Materials

This section describes the affected environment and regulatory setting for Hazards and Hazardous Materials related to the Project Area and surrounding area. In addition, this section describes the potential impacts related to Hazards and Hazardous Materials that would result from the implementation of the proposed Project. As noted in the analysis below, impacts associated with Hazards and Hazardous Materials during construction or operation of the proposed Project would be less than significant with mitigation measures.

The information in this section is based on the Phase II Environmental Site Assessment (ESA) (Hushmand Associates, Inc., 2019) and the Human Health Risk Assessment (HHRA) (The Fehling Group, LLC, 2019) prepared for the proposed Project.

3.8.1 Regulatory Setting

A review of the various federal, state, regional, and local government regulatory requirements was conducted to identify regulations that relate to Hazards and Hazardous Materials. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

3.8.1.1 Federal

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) establishes the framework for regulating hazardous and non-hazardous solid wastes (42 U.S.C. 6901 et seq.). Solids, liquids, and contained gaseous material that are discarded may be considered solid waste. RCRA provides "cradle-to-grave" controls and management requirements on generators and transporters of hazardous waste. Subtitle C of RCRA establishes standards for the transportation, treatment, storage, and disposal of hazardous waste. Congress has granted the United States Environmental Protection Agency (U.S. EPA) authority to develop the RCRA to implement policies that ensure safe management and cleanup of solid and hazardous waste (Environmental Protection Agency, 2018a). The U.S. EPA regulates hazardous waste under Subtitle C of the RCRA. The U.S. EPA has delegated responsibility to California Department of Toxic Substance Control to enforce and implement RCRA requirements. Under RCRA, the transportation of hazardous wastes and materials on public roads, highways, rails, and waterways is regulated by United States Department of Transportation (U.S. DOT) regulations.

The Comprehensive Environmental Response, Compensation, and Liability Act

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or "Superfund" of 1980 aims to identify and clean up abandoned hazardous-waste sites, as well as accidents, spills, and other contaminants that are released into the environment (42 U.S.C. 9601 et seq.). Through CERCLA, U.S. EPA has been granted authority to seek out parties responsible for any release and assure their cooperation to clean up the contaminants. Superfund site identification, monitoring, and response activities are coordinated through the state environmental protection or waste management agencies (Environmental Protection Agency, 2018b).

The Emergency Planning and Community-Right-to-Know Act

The Emergency Planning and Community Right-to-Know Act (EPCRA) of 1986 in response to concerns regarding environmental and safety hazards resulting from the storage and handling of toxic chemicals. EPCRA was created to help communities plan for chemical emergencies. EPCRA requires the reporting of storage, use, and releases of hazardous substances to the federal, state, and local governments.

Toxic Substances Control Act

The Toxic Substances Control Act (TSCA) of 1976 is administered by the U.S. EPA and applies to the manufacture, process, distribution, use, or disposal of TSCA-substances. TSCA regulates the testing, reporting, and record keeping for chemical substances and mixtures that pose an unreasonable risk to human health or the environment. It also identifies special chemical substances, which include polychlorinated biphenyls, asbestos, radon, lead, mercury, and formaldehyde.

Federal Insecticide, Fungicide, and Rodenticide Act

The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) govern the registration, distribution, sale, and use of pesticides in the United States (7 U.S.C. 136 et seq.). Before a pesticide may be sold or distributed in the United States, it must be licensed with the U.S. EPA. Section 13 of FIFRA addresses U.S. EPA's authority to issue a "stop sale", use, or removal order whenever a pesticide or device is found to be in violation of FIFRA requirements. To enforce FIFRA requirements, U.S. EPA conducts producer establishment inspections, marketplace surveillance, and pesticide sampling analysis (Environmental Protection Agency, 2018c).

Occupational Safety and Health Act

The Occupational Safety and Health Act (OSHA) of 1970 is a United States labor law which governs occupational health and safety in the private sector and federal government. OSHA aims to ensure that employers provide employees with an environment that is free from hazards, such as exposure to toxic chemicals, excessive noise levels, mechanical dangers, heat or cold stress, or unsanitary conditions (US Department of Labor, n.d.)

Section 402 of the Clean Water Act: National Pollutant Discharge Elimination System Permits

Section 402 establishes the National Pollutant Discharge Elimination System (NPDES), a permitting system for the discharges (except for dredge or fill material) of any pollutant into waters of the U.S. Regional Water Quality Control Boards (RWQCB) administer this permitting program in California. Section 402(p) requires permits for discharges of stormwater from industrial/construction and municipal separate storm sewer systems (MS4s). In addition, construction sites on an acre or greater of land are required to obtain an NPDES permit.

U.S. Environmental Protection Agency Human Health Risk Assessment Guidance

The U.S. EPA developed guidance for conducting HHRAs, which include the following steps (U.S. Environmental Protection Agency, 2016):

- **Planning:** Guidance for identifying at-risk populations, environmental hazards of concern, sources of environmental hazards, pathways of exposure, health effects, and duration of toxic effects.

- **Hazard Identification:** Guidance for determining whether exposure to a stressor can cause an increase in the incidence of specific health effects.
- **Dose-Response:** Guidance for determining the likelihood and severity of adverse health effects in response to the amount and condition of exposure to an agent.
- **Exposure Assessment:** Guidance for measuring or estimating the magnitude, frequency, and duration of human exposure to an agent in the environment or estimating future exposures for an agent that has not yet been released.
- **Risk Characterization:** Guidance for determining the nature and presence or absence of risks, describing how the risk was assessed, and disclosing where uncertainties still exist.

3.8.1.2 State

California Environmental Protection Agency Unified Program

The California Environmental Protection Agency (CalEPA) oversees the implementation of the Unified Program to protect residents of the State from hazardous waste and materials. The Unified Program establishes consistency throughout the State in regard to administrative requirements, permits, inspections, and enforcement of the following environmental and emergency management programs:

- Aboveground Petroleum Storage Act Program
- Area Plans for Hazardous Materials Emergencies
- California Accidental Release Prevention Program
- Hazardous Materials Release Response Plans and Inventories
- Hazardous Material Management Plan and Hazardous Material Inventory Statements (California Fire Code)
- Hazardous Waste Generator and Onsite Hazardous Waste Treatment (tiered permitting) Programs
- Underground Storage Tank Program

Under the Unified Program, CalEPA oversees 81 certified local government agencies, known as Certified Unified Program Agencies (CUPAs), which apply regulatory standards established by CalEPA, the Department of Toxic Substances Control (DTSC), Governor's Office of Emergency Services, California Department of Forestry and Fire Protection - Office of the State Fire Marshal, and the State Water Resources Control Board.

California Environmental Protection Agency Human Health Risk Assessment Guidance

The CalEPA Preliminary Endangerment Assessment (PEA) Guidance Manual provides guidance on determining whether a release of hazardous substances to the environment presents a risk to human health or the environment (California Environmental Protection Agency, 2015). The PEA is the first step in identifying whether a release or threatened release of a hazardous waste, substance, or material has occurred; estimating the potential risk to public health and the environment; evaluating whether immediate response would be needed to reduce the risk; and determining whether further action or investigation would be needed.

CalEPA also released Human Health Risk Assessment Notes, which cover topics such as exposure factors, soil remedial goals for specific types of compounds, recommended screening levels for various constituents, and methodology for conducting screening-level HHRAs (California Department of Toxic Substances Control, 2018).

Department of Toxic Substances Control Environmental Health Standards for the Management of Hazardous Waste

The DTSC Environmental Health Standards for the Management of Hazardous Waste is included in California Code of Regulations (CCR), Title 22, Division 4.5. All hazardous waste generators must comply with the guidelines, which are enforced by DTSC, for identifying, labeling, accumulating, preparing, and preventing outcomes related to hazardous waste. Title 22, Article 3 highlights the procedures of identifying hazardous waste into these 4 categories: ignitable, corrosive, reactive, and toxic. Article 5 categorizes hazardous waste into acutely hazardous waste, extremely hazardous waste, non-RCRA hazardous waste, RCRA hazardous waste, special waste, and universal waste. Title 22 of the CCR also underscores the guidelines for managing hazardous waste, which includes storing, housekeeping, record keeping, and inspecting waste.

Cortese List

Government Code 65962.5 requires CalEPA to develop a hazardous waste and substances site list (Cortese List). The Cortese List complies with the CEQA requirements in providing information about the location of hazardous materials release sites. California Government Code 65962.5 requires CalEPA to annually update the Cortese List (California Department of Toxic Substances Control, 2010).

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act restricts the disposal of wastes or any other activity that may degrade waters of the state. The Act requires cleanup of wastes that are below hazardous concentrations but could impact ground and surface water quality (Section 13002). The Act established nine Region and State Water Boards, which are primarily responsible for protecting water quality in California. The Regional Water Boards regulate discharges by issuing permits through NPDES for waste discharge requirements for non-point source discharges. Anyone discharging materials or proposing to discharge materials that could affect water quality must file a report of waste discharge unless the discharge would be into a community sewer system (California State Water Resources Control Board, 2014).

3.8.1.3 Regional

South Coast Air Quality Management District

The South Coast Air Quality Management District (SCAQMD) enforces air quality rules and regulations through a variety of means, including inspections, educational and training programs, and fines. Specific SCAQMD rules applicable to the construction of the proposed Project may include, but are not limited to the following:

- *Rule 401 – Visible Emissions*: A person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three

minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart, as published by the United States Bureau of Mines.

- *Rule 402 – Nuisance*: A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause injury or damage to business or property. The provisions of this rule do not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.
- *Rule 403 – Fugitive Dust*: This rule is intended to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (man-made) fugitive dust sources by requiring actions to prevent, reduce, or mitigate fugitive dust emissions. Rule 403 applies to any activity or man-made condition capable of generating fugitive dust.
- *Rule 1113 – Architectural Coatings*: No person shall apply or solicit the application of any architectural coating within the SCAQMD, with a volatile organic compound (VOC) content in excess of the values specified in a table incorporated in the Rule.
- *Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil*: The rule sets requirements to control the emission of VOCs during the excavating, grading, handling, and/or treating of VOC-contaminated soil. Prior to these activities, an approved mitigation plan must be obtained from SCAQMD.
- *Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities:* This rule specifies work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.
- *Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants:* This rule requires notification, monitoring, and record keeping for earth-moving activities of soil with applicable toxic air contaminant(s) of greater than 50 cubic yards at a site that has been designated and notified by the following: (A) U.S. EPA as a Superfund National Priorities List site; (B) DTSC as a Brownfield or Cleanup Program site; (C) the State Water Resources Control Board or RWQCB as a Site Cleanup Program site; (D) a county, local, or state regulatory agency as a Hazardous Material Release site, as defined in California Health and Safety Code Section 25260; or (E) the Executive Officer pursuant to subdivision (i).

3.8.1.4 Local

Los Angeles County Fire Department, Site Mitigation Unit

The Site Mitigation Unit (SMU) of the Health Hazardous Materials Division, Los Angeles County Fire Department (LACoFD) provides corrective action and voluntary oversight for remediation of contaminated sites and approval of closure plans within the jurisdiction of the Los Angeles County Unified Program Agency (LACoCUPA). This service is provided to ensure the protection of public health and the environment, and to facilitate completion of site cleanup by the property owner intending to obtain site closure with agency oversight in the LACoCUPA jurisdiction: RWQCB and the DTSC. DTSC amended CCR Title 22 Chapter 45, Section 67450.7 and adopted Title 22, Chapter 50, Section 68400.11–

.16 in August 2006, to delegate Corrective Action (CA) authority to the CUPAs. DTSC has determined that Los Angeles County CUPA is qualified at the Tier 2 level (highest Tier) to implement and enforce environmental assessment and corrective action conducted pursuant to Health and Safety Code, §25200.3(c)(3), 25187, 25187.1, 25200.10, and 2500.14 and in accordance with the requirement of CCR Title 22, §68400.11 et seq. (County of Los Angeles Fire Department, 2009).

Los Angeles Fire Department, Hazardous Materials Division

The Hazardous Materials Division of the Los Angeles Fire Department (LAFD) oversees the proper handling, storage, and disposal of hazardous substances. Regulations regarding the storage and disposal of hazardous wastes are contained within the California Health & Safety Code, Division 20, Chapter 6.5; CR, Division 4.5, Title 22; Unified Program Ordinance, LA County Code Chapter 12.50; and the City's Municipal Code, Article 7 of Chapter V, Divisions 8, and 14.

City of Los Angeles Methane Gas Ordinance

Division 71 of Chapter IX, Article 1, of the Los Angeles Municipal Code (LAMC) establishes that all new buildings and paved areas located in a Methane Zone or Methane Buffer Zone shall comply with the General Methane Mitigation Requirements and the Methane Mitigation Standards established by the Superintendent of Building. LAMC Table 71 (Minimum Methane Mitigation Requirements of the Methane Seepage Regulations) prescribes the minimum methane mitigation systems for a site, based on the appropriate Site Design Level. The Site Design Level is based on the measured concentration and pressure of methane gas determined during site testing. The Site Design Level ranges from Level I through V, with higher levels corresponding with increased mitigation system requirements. Adopted in 2004, Ordinance 175790 amended Division 71 to establish citywide methane mitigation requirements and include more current construction standards to control methane intrusion into buildings.

3.8.2 Environmental Setting

3.8.2.1 Hazardous Materials and Wastes

The Project Site is in an urban area with industrial and commercial land uses. The Project Site is currently being used for the construction of the Sixth Street Viaduct. The Project Site is surrounded by several commercial buildings to the west and east, open lots, and connecting and underlying roadways. Based on historic sources, the Project Site vicinity has remained the same since the 1980s. The Los Angeles River and the rail lines have been present since the 1890s (Earth Mechanics, Inc., 2014).

For the purposes of the Phase II ESA and HHRA, the Project Site was divided into various PARC Area Designations, which include PARC Area 1A, 1B, 2A, 2B, 2C, 3, 4A, 5, 6, 7, 8, 9, and 10 (see **Figure 3.8-1a** and **Figure 3.8-1b**, Soil Boring Locations; **Figure 3.8-2a** and **Figure 3.8-2b**, Methane and Methane Buffer Zones; and **Figure 3.8-3**a and **Figure 3.8-3b**, Areas of Concern with Contamination). The existing contamination at each PARC Area was determined based on previous site investigations for the Viaduct Replacement Project, and investigations performed for the proposed Project in the Phase II ESA and HHRA. The existing contamination for the Project Site is described in the sections below.

Previous Site Investigations

Previous site investigations were completed at the Project Site by Hushmand Associates, Inc. (2015 and 2016), Earth Mechanics, Inc. (2013 and 2014), and Rincon (2015 and 2016) for the proposed Project and Viaduct Replacement Project. The results of the review and screening indicate six zones with soil contamination classifying the soil as California (Non-RCRA) Hazardous Waste or RCRA Hazardous Waste, and two zones with soil gas contamination (see **Figure 3.8-1a** and **Figure 3.8-1b**). The soil contamination is primarily total petroleum hydrocarbons in the diesel range organics (TPH DRO) and lead. These findings were evaluated in the HHRA for potential risks to human health. In addition, two areas, PARC Area 1A and 7, are within the Methane Zone or had methane detected and are subject to methane mitigation requirements established by the Los Angeles Department of Building and Safety (LADBS) (see **Figure 3.8-2a** and **Figure 3.8-2b**).

Based on the previous site investigations, the Phase II ESA identified the following hazardous materials issues at the Project Area (i.e., area of direct and indirect impacts resulting from construction and operation of the proposed Project):

- Parcel 18.1 at 631 South Anderson Street and Parcel 18.2 at 625 South Anderson Street: The parcels are within PARC Area Designation 6 shown on **Figure 3.8-1b** and underlie the proposed East Park. The City previously filed a RCRA Subtitle C Site Identification Form to notify the CalEPA/DTSC of hazardous levels of heavy metals in the soil. The removal and disposal of the stockpile of soil for Parcel 18.1 was under CalEPA Hazardous Waste Identification (ID) Number CAR000266684.
- Metro 20 (prior Butterfield Property) site at 590 South Santa Fe Avenue: The site is just north of PARC Area Designation 2A shown on **Figure 3.8-1a** and is in proximity to the proposed Arts Plaza. This site is in the process of implementing remediation of groundwater and deep soil contamination plumes that extend under the City's Sixth Street right of way (ROW). The work is being performed under a Voluntary Cleanup Agreement between Metro and U.S. EPA/DTSC.
- Parcel 32: The site is within PARC Area Designation 2B shown on **Figure 3.8-1a**. The site includes a Remedial Action Order by the CalEPA/DTSC that was issued to Amtrak for past operations on the property. The investigation performed in August and September 2015 concluded that VOCs in soil gas exceed DTSC screening levels. This site underlies the proposed Arts Plaza.

In addition to the sites identified in the Phase II ESA, the DTSC identified the following hazardous materials issue at the Project Area:

- AT Mateo Site at 555 Mateo Street: The site is just north of PARC Area Designation 2A shown on Figure 3.8-1a and is in proximity to the proposed Arts Plaza. The site has undergone remediation under DTSC oversight and is currently certified for unrestricted land use.

Database Review

As described in the Initial Study for the proposed Project, the following data sources were reviewed for information on hazardous materials sites in the Project Area (California Environmental Protection Agency, 2012):

- **Cortese List**: There are 27 hazardous waste and substances sites in the City, but none are located within the Project Area.

- **EnviroStor Database**: The Project Area includes the site of a former paint manufacturing facility located southeast of the intersection of South Santa Fe Avenue and Willow Street on the west side of the River. The facility is listed as a voluntary cleanup site and has been active as of December 7, 2012 (Department of Toxic Substances Control, 2007). The site is underlain with contaminated soil and groundwater, and includes metals, petroleum, polynuclear aromatic hydrocarbons, and VOCs as potential contaminants.
- **GeoTracker Database**: There are no active Leaking Underground Storage Tank (LUST) sites in the Project Area. The former paint manufacturing facility site located southeast of the intersection of South Santa Fe Avenue and Willow Street is also listed on the GeoTracker Database as an active Waste Discharge Requirements (WDR) site as of May 27, 2016 (State Water Resources Control Board, 2015).

Phase II Site Investigation

A site investigation was completed as part of the Phase II ESA prepared for the proposed Project. The sampling area consisted of 13 acres of land. A total of 33 locations were drilled to obtain soil samples and install vapor probes for obtaining soil vapor samples at specific depths (see **Figure 3.8-1a** and **Figure 3.8-1b**). Soil samples from the shallow soil borings were analyzed for the compounds of concern, which may include heavy metals (i.e., arsenic, barium, cadmium, chromium, copper, lead, mercury, and zinc), diesel, and oil range petroleum hydrocarbons, and VOCs in soil gas.

The Phase II ESA concluded that the types and extent of contamination (e.g., heavy metals and hydrocarbons in near surface soils) is typical for areas with industrial and commercial land uses, with the exception of the areas adjacent to the Metro 20 site and two zones with soils classified as RCRA Hazardous Waste due to heavy metal contamination (Hushmand Associates, Inc., 2019). Soils contaminated with heavy metals and soil gases were found at a few sample sites in the Project Area (Hushmand Associates, Inc., 2019). The results of the soil sampling performed for the Phase II ESA are summarized in **Table 3.8-1** (see **Figure 3.8-3a** and **Figure 3.8-3b**).

As indicated in **Table 3.8-1**, the hazards and hazardous materials of concern in the Project Site are included below:

- **Title 22 Heavy Metals:** Title 22 of the CCR provides a list of heavy metals including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc, and hexavalent chromium, which are considered hazardous wastes if their concentration in milligrams per kilogram (mg/kg) exceeds the listed threshold limit concentration.
- **Polychlorinated Biphenyls:** Polychlorinated Biphenyls (PCBs) are a type of toxic chemical regulated by the TSCA. PCBs are most commonly found in electrical transformers and capacitors, air conditioning equipment, and lighting ballasts.
- **Volatile Organic Compounds:** VOCs are emitted gases that are typically released from burning fuel, oil and gas fields, diesel exhaust, or manufacturing processes. Many VOCs are considered hazardous air pollutants because they may have short-term and long-term adverse health effects.

- **Total Petroleum Hydrocarbons:** Total petroleum hydrocarbons (TPH) include chemical compounds that originate from crude oil and other petroleum products. Sources of TPH include gasoline pumps, spilled oil, and commercially used chemicals.
- **Lead and Aerially Deposited Lead:** Elevated lead concentrations exist in soils along older roadways as a result of aerially deposited lead (ADL) from the historical use of leaded gasoline. A Soil Management Agreement for Aerially Deposited Lead-Contaminated Soils (Agreement) was established between the California Department of Transportation (Caltrans) and DTSC. The Agreement applies to soils with elevated lead derived from leaded fuel tailpipe emissions found on the state highway system.
- **Methane:** Methane is a combustible natural gas that may be found in soil gas. LADBS developed the Methane Zone Map based on locations of historical crude oil and natural gas extraction wells.

Human Health Risk Assessment

The HHRA was conducted in accordance with U.S. EPA and CalEPA guidance described in Section 3.8.1. The HHRA evaluated long-term cancer risks, measured as the incremental lifetime cancer risk (ILCR), and toxicity, measured as the Hazard Index (HI), to construction workers and residential users (e.g. unrestricted land use) resulting from the proposed Project. Of the PARC Area Designations in **Table 3.8-1**, the HHRA included PARC Areas 1A, 2A, 2B, 2C, 5, 6, 7, and 8 because prior investigations indicated that these areas had chemicals of potential concern (COPCs) in soil or soil gas. PARC Area 3 was not analyzed because construction activities would not expose soils at the depth where an exceedance occurred. In addition, PARC Area 4 was not analyzed because construction activities are no longer proposed there. Based on the assumption that sensitive receptors would only come into contact with shallow soils, the HHRA incorporates the soil data collected in the upper ten feet of each PARC Area from the Phase II ESA.

The HHRA identified the following chemicals of potential concern (COPC) that contribute to the overall Project Site risk (The Fehling Group, LLC, 2019):

- **Arsenic:** Arsenic has an established regional background threshold value (BTV) for Southern California of 12 mg/kg, which is the level of arsenic that does not exceed background levels of arsenic typically found in soils. The maximum arsenic concentrations were below the arsenic BTV for PARC Areas 1A, 2A, 2B, 2C, 5, 7, and 8, but above the arsenic BTV for PARC Area 6 (26 mg/kg). Therefore, arsenic is a COPC in PARC Area 6.
- **Lead:** CalEPA has an established blood lead model to determine safe levels of lead in soil at residential and industrial sites. The screening level for residential soils is 80 mg/kg, meaning that lead concentrations above this level may pose an adverse health risk to residential receptors. Since the maximum value in each area exceeds 80 mg/kg, lead is considered a COPC for all PARC areas that the HHRA evaluated.
- **Other Metals:** In addition to arsenic and lead, soil samples were analyzed for 15 other metals. Based on the HHRA, antimony, barium, cadmium, copper, mercury, nickel, selenium, silver, and zinc were determined to be COPCs for at least one PARC Area. Eleven different COPCs were found at PARC Area 6, which had the most metal COPCs than any other PARC Area.

Table 3.8-1: Phase II ESA Findings

PARC Area Designation[1]	Location	Tested Contaminants	Findings
1A	Proposed West Park	Title 22 Heavy Metals (Cadmium and Lead)	Heavy metals concentrations exceeded DTSC screening level; Hexavalent chromium non-detect (ND) and below DTSC screening levels; Soluble Lead Concentrations (STLC) exceeded DTSC levels; and Leachable Lead Concentrations (TCLP) below RCRA levels. Soil classified as Non-RCRA or California Hazardous Waste.
		Total Petroleum Hydrocarbons (TPH)	Detected but not at levels approaching screening values
		Volatile Organic Compounds (VOC)	ND in all samples tested except for the area where an ongoing groundwater and deep soil cleanup action is ongoing
		Semi-Volatile Organic Compounds (SVOC)	ND
		Polychlorinated Biphenyls (PCB)	ND, except a type of PCB (Aroclor 1260) was detected at a concentration below the exposure limits of concern for humans
		Organochlorine Pesticides	ND or below the DTSC screening levels
1B	Proposed West Park	Title 22 Heavy Metals	Below DTSC screening levels
2A, 2B, 2C	Proposed Arts Plaza	Title 22 Metals, VOCs and SVOCs	ND or below DTSC screening levels, except for two samples
		TPH	Exceeded the DTSC screening level in one sample. Soils classify as Non-RCRA or California Hazardous Waste
		PCBs	ND
		Organochlorine Pesticides	ND

PARC Area Designation[1]	Location	Tested Contaminants	Findings
		Organophosphorus Pesticides	ND
		Chlorinated Herbicides	ND
		VOCs in Soil Gas	Widespread (Human Health Risk Assessment found VOCs do not exceed acceptable risk criteria)
3	Proposed River Gateway (River Access Tunnel)	Title 22 Metals	Below DTSC screening levels, except one sample with a cadmium concentration that exceeded the DTSC screening level at a depth of 50 feet below ground surface
		TPH	ND
		VOCs	ND
4A	Proposed River Gateway (West Bank of LA River Channel) [2]	Heavy Metals (Arsenic and Cadmium)	Exceeded DTSC screening levels. Soils classified as non-RCRA or California Hazardous Waste
		TPH and VOCs	ND, except very low concentration of gasoline detected
5	Proposed East Park	Total Lead	Exceeded DTSC screening level. Soils classified as non-RCRA or California Hazardous Waste
		Diesel Range TPH	Below DTSC screening level
6	Proposed East Park	Title 22 Metals	Some samples at non-RCRA and RCRA levels
		VOCs	Soils classified as RCRA Hazardous waste
7	Proposed East Park	Heavy Metals	Soils classified as non-RCRA or California Hazardous Waste
		Soil Gas	Soil gas contaminants exceed DTSC screening levels. Human Health Risk Assessment found that soil gas concentrations of PCE and TPH-DPO exceeded health risk criteria.
8	Proposed East Park	Lead	Exceeded DTSC screening levels

PARC Area Designation[1]	Location	Tested Contaminants	Findings
		TCLP	Soils classified as non-RCRA or California Hazardous Waste
		VOCs in Soil Gas	Exceeded DTSC screening levels
9	Proposed East Park (California Department of Transportation ROW)	Aerially Deposited Lead (ADL)	Dataset meets the criteria for a minimum of one foot of clean soil cover or pavement structure. Waste soils not classified as RCRA hazardous. Offsite disposal may be required.

1. *Refer to **Figures 3.8-3a** and **3.8-3b** for locations of PARC Area Designations*
2. Construction activities are no longer proposed in PARC Area 4A
Source: (Hushmand Associates, Inc., 2019)

- **Non-Metals:** Non-metal COPCs, including TPHs, VOCs, semi-volatile organic compounds, PCBs, and organochlorine pesticides (OCP), were found in all PARC Areas, particularly 6 and 7. Soil gas COPCs were most prevalent in PARC Area 2, but were also found in PARC Areas 6, 7, and 8.

In summary, the soil risk values and the maximum indoor and trench air risk values were identified. The HHRA found the following:

- The ILCR values slightly exceed the risk benchmark level for the residential receptor in PARC Areas 6, 7, and 8. The maximum ILCR value for PARC Area 7 is within the risk management range. The risk-driving COPCs are Aroclor 1260, a type of PCB, in soil (PARC Area 5) and tetrachloroethylene (PCE) in soil gas (PARC Areas 7 and 8).
- The HI values exceed the benchmark level for the residential receptor in all PARC Areas except PARC Area 8. The HI values exceed the benchmark level for the construction worker receptor in PARC Area 6 and 7 due to total petroleum hydrocarbons, diesel range organics (TPH-DRO).
- Lead exceeds the residential screening level in PARC Areas 1A, 5, 6, and 8 and exceeds the construction worker screening level in PARC Area 1A and 6.
- TPH-DRO and lead are the primary risk-driving COPCs.
- Residential indoor air risk values and construction worker trench air risk values associated with soil gas contamination did not exceed the ILCR or HI benchmark levels in PARC Area 2. Therefore, PARC Area 2 is not an area of concern for soil gas contamination, and the remediation proposed in the Phase II ESA is no longer recommended at this site.

The final step of the HHRA was the risk characterization, which estimated the potential risks to human health based on the assumed exposure to the COPCs described above. The HHRA employed a conservative approach by using the residential scenario (e.g., unrestricted land use) for park users and construction worker scenario.

3.8.2.2 Sensitive Receptors

Sensitive receptors are those members of the population that are most sensitive to exposure to hazardous materials, and they can be found in areas that include residences, hospitals, elder-care facilities, rehabilitation centers, elementary schools, daycare centers, and parks (see **Table 3.8-2**). The Project Area is primarily surrounded by industrial and commercial land uses immediately adjacent to the north, south, and west. However, residences, schools, and hospitals are located east and further north of the Project Area, and additional residences are located to the west and south of the Project Area.

The nearest residences in the vicinity of the proposed East Park are the Pico Gardens residences approximately 350 feet northeast of the Project Site, along South Clarence Street. The nearest residences in the vicinity of the proposed West Park is a residential development referred to as the "Brick Lofts," which is approximately 700 feet south of the Project Site, near the intersection of Mateo Street and Jesse Street. Additional residences in the vicinity of the proposed Project are included in **Table 3.8-2** and proposed residences are included in **Table 1-1** (see **Figure 1-2**).

Table 3.8-2: Sensitive Receptors

Property Name	Address	Approximate Distance from Project Area
Residences		
Pico Gardens	Housing community bordered by Fourth St. to the north, U.S. 101 to the east, South Clarence St. to the west, and Inez St. to the south	Less than 0.1 mile northeast of Project Area
Coronel Village	935 S Boyle Ave. Los Angeles, CA 90023	Less than 0.1 mile south of Project Area
Brick Lofts LLC	652 Mateo St. Los Angeles, CA 90021	Less than 0.1 mile south of Project Area
Toy Factory Lofts	1855 Industrial St. Los Angeles, CA 90021	Less than 0.1 mile south of Project Area
Joint Living and Working Quarters	East Fourth St. and Anderson St.	0.1 mile east of Project Area
AMP Lofts	695 South Santa Fe Ave. Los Angeles, CA 90021	0.2 mile south of Project Area
One Santa Fe	300 South Santa Fe Ave. Los Angeles, CA 90013	0.2 mile north of Project Area
Telacu Pico Aliso	1450 East First St. Los Angeles, CA 90033	0.3 mile northeast of Project Area
Pueblo del Sol	1400 Gabriel Garcia Marquez St. Los Angeles, CA 90033	0.6 mile north of Project Area
670 Mesquit	670 Mesquit St.	Less than 0.1 miles south of the Project Area
Hospitals

3.8.3 Environmental Impact Analysis

3.8.3.1 Methodology

Potential significant impacts associated with the proposed Project were determined based on the Phase II ESA, which presented the findings of the subsurface investigation, recommendations for handling potential hazardous materials, and recommendations for additional testing (Hushmand Associates, Inc., 2019). Potential significant impacts were also determined based on the HHRA, which quantified potential health risks for construction workers and future on-site sensitive receptors due to chemicals in soil and soil gas (i.e., vapor) and evaluated whether the potential health risks warrant mitigation (The Fehling Group, LLC, 2019).

Phase II ESA Methodology

As described in Section 3.8.2, the locations of borings and soil vapor probes from prior investigations and this investigation are shown on **Figure 3.8-1a** and **Figure 3.8-1b**. In the Phase II ESA, the data from the prior site environmental investigations and from this investigation on soil and soil gas contaminants were screened against the CalEPA DTSC Screening Levels for the Residential Scenario, RCRA and non-RCRA hazardous material classifications, and Caltrans criteria for the re-use of soils containing lead (for the samples from borings designated as ADL borings). The Phase II ESA presents screening results for soil, soil gas and ambient air, methane, and ADL; findings and recommendations for shallow soil, ADL, and soil gas conditions; recommendations for handling groundwater during construction; and remediation alternatives.

HHRA Methodology

A HHRA involves examining issues regarding site-related contaminants, or COPCs. These issues include characterizing environmental fate and transport, determining if sampling is sufficient to characterize COPCs, and assessing the exposure of COPCs to human receptors. These evaluations comply with CalEPA and U.S. EPA risk assessment guidance (California Environmental Protection Agency, 2015; U.S. Environmental Protection Agency, 1991; U.S. Environmental Protection Agency, 1989).

For the proposed Project, the receptors evaluated in the HHRA include a construction worker and a residential child and adult. These receptors are assessed using the reasonable maximum exposure (RME) approach, which is defined by the U.S. EPA as the "highest exposure that is reasonably expected to occur," by applicable exposure routes (i.e., through inhalation, ingestion, or skin contact) (California Department of Toxic Substances Control, 2014). The assumption of potential exposure represents a conservative approach, which is recommended by U.S. EPA and CalEPA risk assessment guidance to make the HHRA sufficiently protective of the potential receptors (The Fehling Group, LLC, 2019).

The HHRA process consists of four primary components as the basis for identifying potential health risks posed to current and/or future receptors at a Site (The Fehling Group, LLC, 2019). These HHRA components are described in the following sections.

Data Evaluation/Chemicals of Potential Concern

This section evaluated data collected from previous investigations conducted by Earth Mechanics, Inc. (2014) and Hushmand Associates, Inc. (2017) for usability in HHRA. The methods used for selecting COPCs were also presented.

Toxicity Assessment

Relevant toxicity endpoints and criteria are identified for each COPC, which are used to evaluate potential chronic (i.e., greater than seven years) carcinogenic and noncarcinogenic health impacts from oral, dermal, and inhalation exposure routes.

Exposure Assessment

Exposure assessment is the process of measuring or estimating the intensity, frequency, and duration of human exposure. Potential human receptors and the routes through which potential exposure to COPCs may occur are identified. The magnitude and duration of exposure was estimated for each receptor.

Exposure assessment can be quantified using risk-based concentration (RBC) and exposure point concentration (EPC), which are used to calculate risk. RBC is the chemical-specific concentration that corresponds to a target risk level. The HHRA calculated the RBC for the residential receptor and the construction worker receptor. EPC represents a conservative estimate of the chemical concentration from a particular medium or route of exposure. The HHRA included EPCs for indoor air and construction trench air.

Risk Characterization

The HHRA was conducted in accordance with CalEPA and U.S. EPA guidance described in Section 3.8.1.1 and 3.8.1.2. As recommended by the LACoFD, potential health risks associated with a residential (i.e., unrestricted land use) scenario and a construction scenario were quantified. The results of the toxicity assessment and exposure assessment are used to estimate the ILCR and the noncancer HI for each receptor. The thresholds for carcinogenic and noncarcinogenic health risks are as follows:

- Carcinogenic Health Risk: Based on the CalEPA Vapor Intrusion Mitigation Advisory, incremental lifetime cancer risk ILCR is categorized as follows:
    - If the vapor intrusion risk is less than 1E-06, no further action is required.
    - If the vapor intrusion risk is greater than 1E-06, but less than 1E-04, the need for action (e.g., additional data collection or risk characterization, monitoring, vapor intrusion mitigation, or source remediation) must be evaluated.
    - If the risk is greater than 1E-04, then action, such as vapor intrusion mitigation or source remediation, is required (California Environmental Protection Agency, 2011).
- Noncarcinogenic Health Risk: The noncancer HI approximates the effect of substances on a target organ. An HI below 1.0 denotes that would likely not result in adverse non-cancer health effects over a lifetime of exposure and would ordinarily be considered acceptable. An HI equal to or greater than 1.0 does not necessarily suggest a likelihood of adverse effects; however adverse health effects are possible (U.S. Environmental Protection Agency, 2018).

3.8.3.2 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the IS for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in **Appendix A**.

3.8.3.3 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Hazards and Hazardous Materials if it would:

IX(a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

*F.2 Human Health Hazards***:** The determination of significance shall be made on a case-by-case basis, considering the following factors:

- The regulatory framework for the health hazard;
- The probable frequency and severity of consequences to people from exposure to the health hazard; and
- The degree to which project design would reduce the frequency of exposure or severity of consequences of exposure to the health hazard.

IX(d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment. (See *LA CEQA Thresholds Guide* Section F.2)

3.8.3.4 Construction Impacts

IX(a): Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Proposed Project construction would require the removal of contaminated soils and the use of construction materials that could be hazardous, such as paints, sealants, and cement. The transport, use, and disposal of these materials would be conducted in compliance with applicable federal, state, and local laws pertaining to the safe handling, transport, and disposal of hazardous materials. These laws include RCRA, which includes requirements for hazardous solid waste management; SCAQMD Rules; the DTSC Environmental Health Standards for the Management of Hazardous Waste (California Code of Regulations, Title 22, Division 4.5), which include standards for generators and transporters of hazardous waste; and the provisions of the LAFD, Hazardous Materials Unit, which include requirements for the use and storage of hazardous materials. In addition, the transportation of hazardous wastes and materials would be conducted in compliance with U.S. DOT hazardous materials regulations. A Stormwater Pollution Prevention Plan (SWPPP) would also be developed in accordance with NPDES

permitting requirements and would include construction best management practices (BMP) to prevent spills or leaks of toxic or hazardous materials.

The project area would be remediated to the standards and the requirements of the regulating agencies prior to beginning construction. Based on the Phase II ESA, remediation recommendations were proposed for the handling and disposing of hazardous materials identified in different PARC Area Designations (see **Figure 3.8-3a** and **Figure 3.8-3b**, Areas of Concern with Contamination). **Table 3.8-3** summarizes the remediation recommendations and corresponding mitigation measures for the sample areas. With incorporation of mitigation measures **MM-HAZ-1** through **MM-HAZ-6** (see Section 3.8.5 for additional information), the Project Site would be remediated to standards acceptable by LACoFD and other regulatory agencies as required prior to construction. Under these standards, the concentrations of contaminants of concern would not pose health risks to construction workers or the public.

Potential health risks associated with a construction scenario were quantified and evaluated based on the carcinogenic health risk (ILCR) and noncarcinogenic health risk (HI) thresholds described in Section 3.8.3.1. A summary of the findings from the HHRA is included in **Table 3.8-4**.

Table 3.8-3: Remediation Recommendations

Recommendation Category	PARC Area Designation[1]	Estimated Depth of Contamination (feet bgs)	Summary of Recommendation	Mitigation Measure[2]
Category 1A (RCRA Level Heavy Metals, PCB or TPH DRO Only)	6 (around boring 6-3)	4.0	Remediation by Excavation and Disposal of the Soil at Class 1 Hazardous Waste Landfill (approximately 5,859 cubic yards)	**MM-HAZ-1**
	6 (around boring Parcel 18.1)	4.5		
	6 (around Parcel 18.2)	3.5		
Category 2A (Heavy Metals and/or TPH DRO at Non-RCRA Levels Only)	1A West Portion	3.5	Excavate and Dispose of Soil at Class 2 Landfill as Non-RCRA Hazardous Waste (approximately 7,279 cubic yards)	**MM-HAZ-2**
	1A Central Portion	1.0		
	1A East Portion	1.5		
	2A NE Corner	6.0		
	5 Central Portion	4.0		
	6 (around boring 6-2)	0.75		
	6 (around borings 6-4 and 6-5)	2.0		

Recommendation Category	PARC Area Designation[1]	Estimated Depth of Contamination (feet bgs)	Summary of Recommendation	Mitigation Measure[2]
Category 2B (Heavy Metals and/or TPH DRO at Non-RCRA Levels and VOCs in Soil Gas)	7 North Central	2.0	Excavate and Dispose of Soil at Class 2 Landfill as Non-RCRA Hazardous Waste (approximately 3,267 cubic yards), and Install SVE System and Optional Perimeter Vertical Barrier/Liner, as required by regulating agency	**MM-HAZ-2**
	7 Central Portion	2.0		
	8 West Portion	4.0		
Category 3 (VOCs in Soil Gas but No Heavy Metals or TPH DRO in Soil)	7 North Portion	15.0	Three options are proposed: Option 1 – Excavate and Dispose of Soil as RCRA Hazardous Waste at Class 1 Landfill and Install Liner and/or SVE System; Option 2 – Installation and Operation of SVE System and Optional Perimeter Vertical Barrier/Liner; or Option 3 – Design and Installation of Subsurface Gas Mitigation Systems for Proposed Development Facilities	**MM-HAZ-3**
	7 East Portion	15.0		
	8 East Portion	15.0		
Category 4 (Soil with ADL Only)	9	1.0	Provide Clean Soil Cover or Pavement Cover per the Caltrans/DTSC ADL Agreement (up to approximately 14,949 square feet)[3]	**MM-HAZ-4**
Methane Zone	1A (Paved area near existing building), 7	N/A	Implement Methane Mitigation and Complete Methane Testing	**MM-HAZ-6**

*1. Refer to **Figure 3.8-3a and Figure 3.8-3b** for locations of PARC Area Designations*
2. See Section 3.8.5 for a description of mitigation measures.
3. The results indicate that the soils above a depth of approximately 2.9 feet bgs would require one foot of clean soil cover to remain on site per the Caltrans/DTSC ADL Agreement
bgs = below ground surface
Source: (Hushmand Associates, Inc., 2019)

As shown in **Table 3.8-4**, the ILCR in all PARC Areas was below the CalEPA and U.S. EPA *de minimis* risk target of 1E-06 or within the commonly-applied risk management range (1E-06 to 1E-04). Based on these findings, the HHRA concluded that carcinogenic health impacts would be less than significant and neither mitigation nor remedial actions would be required. The noncancer HI exceeded the regulatory benchmark of 1.0 in PARC Areas 6 (1.0) and 7 (4.0) primarily due to TPH-DRO (see **Table 3.8-4**). In addition, lead exceeded the screening level in PARC Areas 1A and 6 (see **Table 3.8-4**). Based on these findings, the HHRA preliminarily recommended mitigation and/or corrective action at these locations.

Table 3.8-4: Summary of HHRA Findings for Construction Worker Receptor

PARC Area[1]	ILCR (unitless)[2]			HI (unitless)[3]			Lead Soil EPC (mg/kg)[4]	Comments	Recommendations
	Soil	Soil Gas (Indoor Air)	Total	Soil	Soil Gas (Indoor Air)	Total			
1A	3E-09	-	3E-09	3E-01	-	3E-01	**389**	Lead exceeds screening level	Implement **MM-HAZ-2**
2A, 2B, and 2C	0E+00	2E-08	2E-08	7E-02	2E-01	3E-01	28	-	Soil gas remediation not needed; Implement **MM-HAZ-2** for PARC Area 2A
5	0E+00	-	0E+00	3E-01	-	3E-01	81	-	Implement **MM-HAZ-2**
6	8E-08	-	8E-08	**1E+00**	-	**1E+00**	**1839**	Soil HI driven by TPH-DRO; lead exceeds screening level	Implement **MM-HAZ-1**, **MM-HAZ-2**, and **MM-HAZ-5**
7	2E-10	1E-07	1E-07	**2E+00**	**2E+00**	**4E+00**	58	Soil HI driven by TPH-DRO; soil gas trench air HI driven by TPH-DRO	Implement **MM-HAZ-2** and **MM-HAZ-3**
8	0E+00	2E-08	2E-08	1E-01	1E-02	2E-01	130	-	Implement **MM-HAZ-2** and **MM-HAZ-3**

1. *Refer to **Figure 3.8-3a** and **Figure 3.8-3b** for locations of PARC Area Designations*
*2. Values in **bold** indicate ILCR values that exceed CalEPA and U.S. EPA de minimis risk target of 1E-6 and the commonly applied risk management range of 1E-04 to 1E-06.*
*3. Values in **bold** indicate HI values that exceed the regulatory benchmark of 1.0.*
*4. Values in **bold** indicate lead soil EPC values that exceed the construction worker screening level of 160 mg/kg.*
5. PARC Areas 1A, 2A, 2B, 2C, 5, 6, 7, and 8 are addressed because a review of the environmental data collected over the last several years indicated that these parcels likely pose the greatest potential health risks for the proposed Project.
ILCR = incremental lifetime cancer risk; HI = noncancer hazard index (HI); EPC = exposure point concentration; TPH-DRO = total petroleum hydrocarbons, diesel range organics
Source: (The Fehling Group, LLC, 2019)

However, the TPH-DRO and lead exceedances are commonly driven by a limited number of samples within limited areas. The HHRA indicated that additional site characterization may increase the sample size such that CalEPA and U.S. EPA thresholds are no longer exceeded in some PARC Areas. Proposed remedial actions are conservatively estimated, additional site characterization may reduce the need for remediation in some of the PARC Areas.

With implementation of the remediation recommendations from the Phase II ESA and HHRA (**MM-HAZ-1** through **MM-HAZ-6**), the Project Site would be remediated to standards acceptable by LACoFD and other regulatory agencies as required prior to construction. With remediation, health risks to construction workers during construction activities (i.e., excavating, trenching, and transporting soil) would be reduced below CalEPA and U.S. EPA thresholds. During construction activities, the City will coordinate with regulatory agencies (i.e., Metro, U.S. EPA, and DTSC) overseeing ongoing cleanup actions in the Project Area (**BMP-HAZ-1**) and the contractor will comply with all SCAQMD rules and regulations (**BMP-HAZ-2**). Therefore, adverse health effects to construction workers, the public, and the environment are not expected to occur. With implementation of **MM-HAZ-1** through **MM-HAZ-6**, impacts would be less than significant with mitigation.

IX(d): Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

As described in Section 3.8.2.1, there are no Hazardous Waste and Substances Sites in the Project Area that are included on the Cortese List (Government Code Section 65962.5). However, the site investigation from the Phase II ESA found contaminated soil and groundwater plumes in the Project Site (i.e., heavy metals, lead, TPH, VOCs, and soil gas). Although the Metro 20 site is not within the boundaries of the proposed Project Site, soils within the Project Site (south of the Metro 20 site) were found to be contaminated with VOCs. A groundwater and deep soil cleanup action is ongoing at this location under a Voluntary Cleanup Agreement between Metro, U.S. EPA, and DTSC. The City would coordinate with these agencies during construction activities to minimize risks to the public or the environment.

Although the At Mateo site is outside the boundaries of the proposed Project Site, the AT Mateo site is another area of concern. This site has undergone remediation under DTSC oversight, and is currently certified for unrestricted land use. However, there is potential for previously unidentified contamination to be discovered. The City would coordinate with DTSC during construction activities to minimize risks to the public or the environment.

Although the site investigation identified areas within the Project Site with soils that could potentially classify as RCRA hazardous waste, implementation of mitigation measures **MM-HAZ-1** through **MM-HAZ-6** (see Section 3.8.5 for additional information) would remediate the Project Site to standards acceptable by LACoFD and other regulatory agencies as required prior to construction (Hushmand Associates, Inc., 2019). Under these standards, the concentrations of contaminants of concern would not pose health risks to construction workers or the public (see **HAZ-3** below for further discussion on human health risks). Therefore, with implementation of **MM-HAZ-1** through **MM-HAZ-6** impacts would be less than significant.

As shown on **Figure 3.8-2a** and **Figure 3.8-2b**, portions of the proposed Project would be located within the City's Methane and Methane Buffer Zone. As such, the construction of facilities (e.g., buildings,

underground vaults with access, and certain paved areas) in these zones must meet the requirements of City Ordinance 175790 and Division 71, Methane Seepage Regulations. Based on sampling and evaluation conducted as part of the Phase II ESA, methane mitigation would be required in PARC Area 1A, which is in the Methane Zone, and PARC Area 7, where soil gases were detected and impervious surfaces would be constructed adjacent to existing buildings.

Any buildings constructed in PARC Area 1A would include methane mitigation systems meeting Division 71 requirements, unless additional testing indicates no subsurface gas pressure and lower methane concentrations. In addition, paved surfaces that are over 5,000 square feet in area and within 15 feet of the exterior wall of a commercial, industrial, institutional building would be vented in accordance with the Methane Mitigation Standards, design Level II, unless additional testing indicates no subsurface gas pressure and lower methane concentrations (see **MM-HAZ-6** in Section 3.8.5 for additional information). With implementation of **MM-HAZ-6**, methane in soil gas would not create a significant hazard to the public or the environment and impacts would be less than significant with mitigation.

3.8.3.5 Operational Impacts

IX(a): Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

The proposed Project may require the use of hazardous materials during operation, such as paint for the sports field(s), pesticides and fertilizers for the landscaping, and other materials used for maintenance of the facilities. Hazardous materials would be properly handled, contained, transported, and disposed of in compliance with applicable laws and regulations, which may include the RCRA, the DTSC Environmental Health Standards for the Management of Hazardous Waste, the provisions of the LAFD Hazardous Materials Unit, OSHA and the California Division of Occupational Safety and Health (Cal/OSHA) safety standards, and U.S. DOT hazardous materials regulations.

Potential health risks associated with a residential scenario (i.e., unrestricted land use) for a park user were quantified and evaluated based on the carcinogenic health risk (ILCR) and noncarcinogenic health risk (HI) thresholds described in Section 3.8.3.1. A summary of the findings from the HHRA is included in **Table 3.8-5**.

As shown in **Table 3.8-5**, ILCR values slightly exceed the CalEPA and U.S. EPA *de minimis* risk target of 1E-06 for the residential receptor (i.e., park user) in PARC Area 6 (1.1E-06), PARC Area 7 (5E-06), and PARC Area 8 (2E-06). For PARC Area 7, the exceedances are within the risk management range of 1E-04 to 1E-06. Due to the lack of soil gas data for the area, soil gas sampling would be conducted in PARC Area 6 (see **MM-HAZ-5**). If soil gas samples in PARC Area 6 yield ILCR values below the *de minimis* risk target or within the risk management range, carcinogenic health impacts would be less than significant and mitigation and/or remedial actions would not be required. If ILCR values are above the risk management range, then additional remedial actions would be required.

As shown in **Table 3.8-5**, the HI exceeds the regulatory benchmark of 1.0 in all areas except PARC Area 8, primarily due to TPH-DRO. In addition, lead exceeded its screening level in PARC Areas 1A, 5, 6, and 8. As described in Section 3.8.3.4, the TPH-DRO and lead exceedances are commonly driven by a limited number of samples within limited areas. The health risks were conservatively estimated,

Table 3.8-5: Summary of HHRA Findings for Residential Receptor

PARC Area[1]	ILCR (unitless)[2]			HI (unitless)[3]			Lead Soil EPC (mg/kg)[4]	Comments	Recommendations
	Soil	Soil Gas (Indoor Air)	Total	Soil	Soil Gas (Indoor Air)	Total			
1A	8E-08	-	8E-08	**2E+00**	-	**2E+00**	**389**	Soil HI driven by TPH-DRO; lead exceeds screening level	Implement **MM-HAZ-2**
2A, 2B, and 2C	0E+00	9E-07	9E-07	**1E+00**	3E-01	**2E+00**	28	Soil HI driven by TPH-DRO and mercury; target organ assessment indicates no adverse noncancer health effect	Soil gas remediation not needed; Implement **MM-HAZ-2** for PARC Area 2A
5	0E+00	-	0E+00	**3E+00**	-	**3E+00**	**81**	Soil HI driven by TPH-DRO; lead slightly exceeds screening level	Implement **MM-HAZ-2**
6	**1E-06**	-	**1E-06**	**1E+01**	-	**1E+01**	**1839**	Soil ILCR driven by Aroclor 1260; soil HI driven by TPH-DRO; lead exceeds screening level	Implement **MM-HAZ-1**, **MM-HAZ-2**, and **MM-HAZ-5**
7	2E-8	**5E-06**	**5E-06**	**2E+01**	**3E+00**	**2E+01**	58	Soil gas indoor air ILCR driven by PCE; soil HI driven by TPH-DRO; soil gas indoor air HI driven by TPH-DRO	Implement **MM-HAZ-2** and **MM-HAZ-3**
8	0E+00	**2E-06**	**2E-06**	9E-02	4E-02	1E-01	**130**	Soil gas indoor air driven by PCE; lead exceeds screening level	Implement **MM-HAZ-2** and **MM-HAZ-3**

1. *Refer to **Figure 3.8-3a** and **Figure 3.8-3b** for locations of PARC Area Designations*
*2. Values in **bold** indicate ILCR values that exceed CalEPA and U.S. EPA de minimis risk target of 1E-06 and the commonly applied risk management range of 1E-04 to 1E-06.*
*3. Values in **bold** indicate HI values that exceed the regulatory benchmark of 1.0.*
*4. Values in **bold** indicate lead soil EPC values that exceed the residential screening level of 80 mg/kg.*
5. HHRA addresses PARC Areas 1A, 2A, 2B, 2C, 5, 6, 7, and 8 as review of environmental data collected over the last several years indicated that these parcels likely pose the greatest potential health risks
ILCR = incremental lifetime cancer risk; HI = noncancer hazard index; EPC = exposure point concentration; TPH-DRO = total petroleum hydrocarbons, diesel range organics; PCE = tetrachloroethylene
Source: (The Fehling Group, LLC, 2019)

additional site characterization may further reduce health risks below CalEPA and U.S. EPA thresholds such that the need for remediation in some of the PARC Areas may be reduced.

With implementation of the remediation recommendations from the Phase II ESA and HHRA (**MM-HAZ-1** through **MM-HAZ-6**), the Project Site would be remediated to standards acceptable by LACoFD and other regulatory agencies as required prior to construction. Following remediation, health risks to residential receptors (i.e., park users) associated with COPCs would be reduced below CalEPA and U.S. EPA thresholds. Therefore, adverse health effects to residential receptors (i.e., park users) are not expected to occur. With implementation of **MM-HAZ-1** through **MM-HAZ-6**, impacts would be less than significant.

IX(d): Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

See response to **IX(d)** under Section 3.8.3.4 above. The Project Site is underlain with contaminated soil and groundwater plumes and portions of the Project Site are located in the City's Methane Zone and Methane Buffer Zone. With implementation of mitigation measures **MM-HAZ-1** through **MM-HAZ-6** (see Section 3.8.5 for additional information), the proposed Project would not create a significant hazard to the public or the environment. Therefore, impacts would be less than significant.

3.8.4 Best Management Practices

BMP-HAZ-1: Coordination with Regulatory Agencies

The City shall coordinate with Metro, U.S. EPA, and DTSC during construction activities to minimize health risks to the public or the environment associated with ongoing cleanup actions within the Project Area.

BMP-HAZ-2: Compliance with SCAQMD Rules and Regulations

The contractor shall implement measures to ensure that all construction activities are consistent with SCAQMD rules and regulations, including Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil and Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants.

3.8.5 Mitigation Measures

MM-HAZ-1: Remediation Category 1A

The City shall be required to implement the following measures in areas where RCRA Level Heavy Metals, PCBs, or TPH DRO will be excavated and disposed of at Class 1 Hazardous Waste Landfills:

- Soils will be excavated as needed up to a maximum depth of 4.5 feet below ground surface (bgs), consistent with the limits designated on **Figure 3.8-3a** and **Figure 3.8-3b**, Areas of Concern with Contamination.
- The transport and disposal of RCRA hazardous waste will be accompanied with a Hazardous Waste Manifest (i.e., documentation accompanying the transport, treatment, storage and disposal of hazardous waste) completed by a licensed transporter. A site-specific CalEPA Hazardous Waste

Generator Identification Number will be obtained for each RCRA hazardous waste. Additional sampling and testing will likely be required by the facility accepting the soil for disposal.

- For excavations deeper than 4 feet, shoring or other approved means will be required to maintain stability of the excavation walls.
- During excavation activities, dust and runoff controls will be implemented to prevent windborne or surface waterborne migration of the soil from the Project Site. The soils will be directly loaded into the transport trucks, which will require tarps to prevent spillage or windblown loss of soil during transport. These controls will be verified and monitored by an independent third party.
- A site-specific Health and Safety Plan (HASP) will be prepared and implemented during all proposed construction activities, including full time perimeter sampling and testing of particulates and dust from the Project Site.
- All onsite workers and supervisors will complete a 40-hour OSHA Hazardous Waste Operations and Emergency Response (HAZWOPER) training course and be equipped with the appropriate personal protective equipment.
- Excavated areas will be backfilled with certified clean soil.

MM-HAZ-2: Remediation Category 2A

The City shall be required to implement the following measures in areas where soils contaminated with Heavy Metals and/or TPH DRO that are classified as non-RCRA hazardous waste will be excavated. These contaminated soils shall be disposed at Class 2 Landfills:

- Soils will be excavated as needed up to a maximum depth of 6 feet bgs, consistent with the limits designated on **Figure 3.8-3a** and **Figure 3.8-3b,** Areas of Concern with Contamination.
- The transport and disposal of non-RCRA hazardous waste will be accompanied with a Hazardous Waste Manifest completed by a licensed transporter. A CalEPA Non-RCRA Hazardous Waste Generator Identification Number will be obtained. Additional sampling and testing will likely be required by the facility accepting the soil for disposal.
- For excavations deeper than four feet, shoring or other approved means shall be required to maintain stability of the excavation walls.
- During excavation activities, dust and runoff controls will be implemented to prevent windborne or surface waterborne migration of the soil from the Project Site. The soils will be directly loaded into the transport trucks, which will require tarps to prevent spillage or windblown loss of soil during transport. These controls will be verified and monitored by an independent third party.
- A site-specific HASP will be prepared and implemented during all proposed construction activities, including full time perimeter sampling and testing of particulates and dust from the Project Site.
- All onsite workers and supervisors will complete a 40-hour OSHA HAZWOPER training course and be equipped with the appropriate personal protective equipment.
- Excavated areas will be backfilled with certified clean soil.

Remediation Category 2B

In addition to the measures above, the following measures shall be implemented in areas where VOCs were observed in soil gases:

- Emission controls will be used to clear the area of emitting VOCs (i.e., spraying water or applying foam agents to all exposed soil surfaces and/or using large, spark-free fans). Full-time monitoring will be required to verify that the emission controls are effective in preventing the VOCs from impacting workers or the public. Monitoring will comply with SCAQMD Rule 1166.
- A detailed HASP will be prepared and implemented during the excavation and transport of contaminated soils.
- The excavation, transport, and disposal of contaminated soils will require permitting and approval by the CUPA, CalEPA/DTSC, and SCAQMD. A detailed Work Plan/Remedial Action Plan will be prepared and submitted to these agencies for review and approval. Under Rule 1166, a Mitigation Management Plan for potential VOC emissions during excavation will be submitted to SCAQMD and subject to SCAQMD approval. A site-specific CalEPA Hazardous Waste Generator Identification Number will be obtained and manifests completed by the licensed transporter.
- A soil vapor extraction (SVE) system will be designed and installed to remove and treat VOCs in the soil gases. If Health Risk Assessments indicate the need, a vertical barrier/line will be installed around the perimeter of the area to prevent soil gases with VOCs from migrating back into the area. Gases migrating from below the clean backfill or deeper depths will be extracted through the SVE slotted wells and treated by the SVE treatment system. Treatment for VOCs typically involves carbon filtration unless hydrogen sulfide is detected in the gas stream. Operating and maintenance procedures for the SVE system and permit applications will be prepared and approved by the oversight agency and SCAQMD.
- If the City determines it is necessary, a "Pilot Study" will be designed and implemented to evaluate the sustainable flow rate and concentration of VOCs in the soil gas stream and to determine the size of the final SVE system components.
- Design of the SVE system, preparation of a Design Report and Work Plan/Remedial Action Plan (including HASP) will be submitted to and subject to approval by the CUPA and LACoFD Site Mitigation Unit.
- The SVE will be implemented and monitored. This may require several months to over a year.
- The City shall provide documentation to the CUPA, LACoFD Site Mitigation Unit, and SCAQMD when the SVE has reached the specified cleanup goals.
- Excavated areas will be backfilled with certified clean soil.

MM-HAZ-3: Remediation Category 3: The City shall be required to implement one of the following three options in areas where no heavy metals were observed, but VOCs were observed in soil gas:

- Option 1: This alternative will involve the same measures as described under Category 2b above. Contaminated soils will be removed to a depth of up to 15 feet or more and shoring of the excavation walls will be necessary. A liner will be installed on the bottom of the excavation area to

prevent contaminated soil gas from re-entering the backfill soils. Gas migration from the side walls will be mitigated by either installation of a vertical liner placed on the side walls of the excavation or SVE wells installed vertically outside the limits of the excavation after backfilling is done. The backfill soil will be certified clean fill and placement will need to meet the geotechnical specifications of the proposed Project design. During the process, the site will require strict emissions controls and monitoring.

- Option 2: This alternative, the SVE treatment method, utilizes extraction and monitoring wells (In Situ Method) or excavation and encapsulation of impacted soils in above ground piles with horizontal slotted piping (On Site Method), a vacuum pump or pumps, and carbon filtration units to extract and remove VOCs from the soil gas. The process will require several steps as follows:
  1. Design and implementation of a "Pilot Study" to evaluate the sustainable flow rate and concentration of VOCs in the soil gas stream and to size the final SVE system components.
  2. Design of the SVE system, preparation of a Design Report and Work Plan/Remedial Action Plan (including HASP) for submittal to and approval by the CUPA and CalEPA/DTSC.
  3. Solicitation of bids for construction and implementation of the remediation.
  4. Implementation and monitoring of the SVE. This may require several months to over a year.
  5. Reporting to the agencies with documentation that the SVE has reached the specified clean up goals.
- Option 3: This alternative will mitigate the impact of the VOCs and/or methane and hydrogen sulfide by precluding soil gases migration from the subsurface soil and intrusion into structures or other facilities and surface emissions. Depending on the type of soil gases and pressure in the soil gas, the systems can include several of the following components:
  - Shallow excavation (three to four feet bgs) to allow installation of the mitigation components (some of the soil will be used to backfill trenches)
  - Gravel layers and slotted piping for gas collection
  - Liner installation above the slotted piping and extending side wide
  - Vacuum pumps for gas extraction or air injection blowers
  - Filtration systems to remove VOCs and/or hydrogen sulfide from the gas stream
  - Geomembrane barriers placed beneath concrete slabs and/or foundations or fill areas
  - Installation of automated and/or manual monitoring systems

MM-HAZ-4: Remediation Category 4

The City shall be required to implement the following measures in areas within Caltrans ROW where soil contains ADL:

- In accordance with the Caltrans/DTSC ADL Agreement, soils above a depth of approximately 2.9 feet bgs will require one foot of clean soil cover to remain on site per the Caltrans/DTSC ADL Agreement.

MM-HAZ-5: Soil Gas Sampling

Additional soil gas sampling and testing is recommended for completion in PARC Areas 1A, 5, 6, 7, and 8. The additional sampling could potentially eliminate or reduce the need for soil gas remediation.

Ambient air and soil gas samples shall be tested for VOCs. If soil gas samples in PARC Area 6 yield ILCR values below the *de minimis* risk target or within the risk management range, no further mitigation and/or remedial actions will be required. If ILCR values are above the *de minimis* risk target, additional remedial actions will be taken to lower values to within the risk management range, such as applying SVE to a maximum depth of 15 to 20 feet bgs.

MM-HAZ-6: Methane Mitigation and Testing

Methane mitigation applies to PARC Area 1A, which is located within the Methane Zone, and portions of PARC Area 7, where soil gases were detected and impervious surfaces are to be constructed adjacent to existing buildings. Any buildings (except naturally vented) to be constructed in Area 1A shall have methane mitigation systems meeting Level II requirements involving membrane and passive venter per Table 71, unless additional testing indicates no subsurface gas pressure and lower methane concentrations. In addition, paved areas that are over 5,000 square feet in area and within 15 feet of the exterior wall of a commercial, industrial, institutional building, shall be vented in accordance with the Methane Mitigation Standards, design Level II, unless additional testing indicates no subsurface gas pressure and lower methane concentrations.

Additional testing for methane concentrations and subsurface pressure shall be completed in accordance with the Division 71 Methane Seepage Regulations testing requirements should any buildings or paved areas over 5,000 square feet be proposed in PARC Area 1A and in PARC Area 7 where methane was detected.

3.8.6 Significant Unavoidable Adverse Impacts

With implementation of **MM-HAZ-1** through **MM-HAZ-6** described above, the proposed Project would not result in significant unavoidable adverse impacts.

3.8.7 Cumulative Impacts

Project level impacts related to Hazards and Hazardous Materials are not likely to result in or have significant cumulative impacts to Hazards and Hazardous Materials in relation to other projects in the vicinity of the proposed Project. As described in this section, there is a Remedial Action Order at Parcel 32 and there is ongoing cleanup activity at Metro 20, In addition, the City has filed RCRA Subtitle C Site Identification Form to notify the CalEPA/DTSC of hazardous levels of heavy metals in the soil at Parcels 18.1 and 18.2. With implementation of the mitigation measures described in Section 3.8.5, the proposed Project is not expected to result in any significant impacts on Hazards and Hazardous Materials. Other projects in the vicinity of the proposed Project (see **Table 1-1**) would be required to comply with all federal and state regulations and be consistent with local policies related to Hazards and Hazardous Materials, including RCRA, the DTSC Environmental Health Standards for the Management of Hazardous Waste, SCAQMD Rules, the provisions of the LAFD Hazardous Materials Unit, OSHA and Cal/OSHA safety standards, and U.S. DOT hazardous materials regulations. In addition, other projects would be required

to develop avoidance, minimization, and mitigation measures. Therefore, the proposed Project would not result in cumulatively considerable impacts related to Hazards and Hazardous Materials.

3.9 Hydrology and Water Quality

This section describes the affected environment and regulatory setting for Hydrology and Water Quality related to the Project Area. In addition, this section describes the potential impacts related to Hydrology and Water Quality that would result from implementing the proposed Project. As noted in the analysis below, impacts associated with Hydrology and Water Quality during construction and operation of the proposed Project would be less than significant and no mitigation measures are required.

The analysis in this section is based on the *Preliminary Hydrology and Hydraulics Report* (Tetra Tech, 2018a), the *Conceptual Low Impact Development Report* (Tetra Tech, 2018b), and the *Geotechnical Site Investigation* report (Hushmand Associates, Inc., 2018) prepared for the proposed Project.

3.9.1 Regulatory Setting

A review of the various federal, state, regional, and local government regulatory requirements was conducted to identify regulations that relate to Hydrology and Water Quality. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

3.9.1.1 Federal

Clean Water Act

The Federal Water Pollution Control Act, commonly referred to as the Clean Water Act (CWA) of 1972, regulates the discharge of pollutants into waters of the United States. As defined in 40 CFR 230.3(s), waters of the United States include:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters including interstate wetlands;
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:
    a. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
    b. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
    c. Which are used or could be used for industrial purposes by industries in interstate commerce;
4. All impoundments of waters otherwise defined as waters of the United States under this definition;
5. Tributaries of waters identified in paragraphs (s)(1) through (4) of this section;

6. The territorial sea; and
7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (s)(1) through (6) of this section; waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the United States.

Under the CWA, the U.S. Environmental Protection Agency (U.S. EPA) implements pollution control and water quality standards for surface waters.

Section 303: Impaired Water Bodies (303[d] list) and Total Maximum Daily Loads

Section 303(d) requires states to identify impaired water bodies that do not meet state water quality standards. Within California, the State Water Resources Control Board (SWRCB) and Regional Water Quality Control Boards (RWQCB) assess water quality monitoring data for surface waters every two years to determine whether water bodies contain levels of pollutants that exceed the water quality standards (i.e., impaired water bodies). A state's list of impaired or threatened water bodies is referred to as a 303(d) list. States are required to develop total maximum daily loads (TMDL) for 303(d) listed impaired water bodies, which are the greatest amount of a pollutant that a water body can receive while still meeting water quality standards. States must then implement programs to remediate and control pollutants to meet the TMDLs. TMDLs specify allowable pollutant loads from all sources (point, non-point, and natural) for a given watershed. TMDLs are used to develop National Pollutant Discharge Elimination System (NPDES) permit limits for stormwater discharges (NPDES permits are discussed further below), which may trigger additional monitoring and reporting.

Section 401: Water Quality Certification

Under Section 401 of the CWA, any project requiring a federal license or permit that may result in a discharge to a water of the United States must obtain a State Water Quality Certification, which certifies that the project will be in compliance with state water quality standards. The most common federal permits triggering 401 Certification are CWA Section 404 permits issued by the United States Army Corps of Engineers (USACE) (see below for a description). The 401 permit certifications are obtained from the appropriate RWQCB, dependent on the project location, and are required before the USACE issues a 404 permit.

In some cases, the RWQCB may have specific concerns with discharges associated with a project. As a result, the RWQCB may issue a set of requirements, known as waste discharge requirements (WDR), under the State Water Code (Porter-Cologne Act) that define activities, such as the inclusion of specific features, effluent limitations, monitoring, and plan submittals that are to be implemented for protecting or benefiting water quality. WDRs can be issued to address both permanent and temporary discharges of a project.

Section 402: National Pollutant Discharge Elimination System Permits

Section 402 establishes the NPDES, a permitting system for the discharges (except for dredge or fill material) of any pollutant into waters of the United States. RWQCBs administer this permitting program in California. Section 402(p) requires permits for discharges of stormwater from industrial/construction and municipal separate storm sewer systems (MS4s).

Section 404: Permits for Dredged or Fill Material

Section 404 establishes a permit program for the discharge of dredge or fill material into waters of the United States (U.S. Environmental Protection Agency, 2019). This permit program is administered by the USACE. Activities that are regulated under this program include fill for development, water resource projects, infrastructure development, and mining projects. Under the permit program, no discharge of dredge or fill material is permitted if (1) a practicable alternative that is less damaging to the aquatic environment exists or (2) the nation's waters would be significantly degraded. The permit requires that steps to avoid or minimize impacts to wetlands, streams, and other aquatic resources are shown, and compensation is provided for unavoidable impacts.

Section 10 of Rivers and Harbors Act of 1899

Section 10 of the Rivers and Harbors Act of 1899 requires that activities conducted below the ordinary high water elevation of navigable waters of the United States be approved and permitted by the USACE. Regulated activities may include the placement or removal of structures; the dredging or disposal of dredged material; and the filling, excavation, or disturbance of soils and sediments, or the modification of a navigable waterway. Navigable waters of the United States are "waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce" (33 CFR 329.4).

Section 14 of Rivers and Harbors Act of 1899/Section 408

Section 14 of the Rivers and Harbors Act of 1899, codified as 33 USC 408 (Section 408) requires that any alteration of a public work (e.g., sea wall, bulkhead, jetty, dike, levee, wharf, pier, or other work) built by the United States not be injurious to the public interest and not impair the usefulness of the work. A Section 408 permit allowing such alterations must be obtained from USACE prior to Section 10/404 decisions.

Federal Executive Order 11988 – Floodplain Management

Executive Order 11988 requires federal agencies to avoid long- and short-term adverse impacts related to the occupancy and modification of flood plains to the greatest extent possible (42 FR 26951, 3 CFR, 1977 Comp., p. 117). In addition, federal agencies are required to avoid supporting the development of floodplains unless it is the only practicable alternative. Federal agencies are expected to take action in ways that reduce the risk of flood loss, minimize impacts of floods on human safety and health, and restore and preserve the values and functions of flood plains. USACE must consider the requirements of Executive Order 11988 when determining whether or not to issue a Department of Army permit (i.e., permit required for the discharge of dredged or fill material into waters of the United States).

National Flood Insurance Act and Flood Disaster Protection Act

The National Flood Insurance Act of 1968 led to the creation of the Federal Insurance Administration, and made flood insurance available for the first time (Federal Emergency Management Agency, 1997). The Flood Disaster Protection Act of 1973 required the purchase of flood insurance for properties located in Special Flood Hazard Areas. Both the National Flood Insurance Act and the Flood Disaster Protection Act aim to restrict development in floodplains to limit costs associated with disaster relief and reduce the need for flood protection structures.

3.9.1.2 State

Porter-Cologne Act

The RWQCB also asserts authority over waters of the state under the Porter-Cologne Act, which establishes a regulatory program to protect water quality and to protect beneficial uses of state waters. The Porter-Cologne Act empowers the RWQCB to formulate and adopt a Water Quality Control Plan that designates beneficial uses and establishes water quality objectives that in its judgment would ensure reasonable protection of beneficial uses. Each RWQCB establishes water quality objectives that will ensure the reasonable protection of beneficial uses and the prevention of water quality degradation. Dredge or fill activities with the potential to affect water quality in these waters must comply with Waste Discharge Requirements (WDR) issued by the RWQCB.

California Water Code

The term "waters of the state," under jurisdiction of the RWQCB, is defined by California Water Code as "any surface water or groundwater, including saline waters, within the boundaries of the state" (California Water Code Section 13050(e)). This definition is broader than waters of the United States.

The State Water Resources Control Board (SWRCB) redefined wetlands as part of *Procedures for Discharges of Dredged or Fill Material to Waters of the State* (State Water Resources Control Board 2016). In April 2019, the Board adopted a new common, statewide definition and procedures for wetlands, which became effective on May 28, 2020. The USACE and U.S. EPA definition of wetlands are defined by hydrology, soils, and vegetation. The Board's definition refers to the same three factors, but also allows unvegetated areas (e.g., desert playas) to be classified as wetlands.

National Pollutant Discharge Elimination System

Section 402 of the Clean Water Act requires that a discharge of any pollutant or combination of pollutants to surface waters that are deemed waters of the United States be regulated by a NPDES permit. The NPDES permitting requirements are implemented, monitored, and enforced by the SWRCB and RWQCB. Programs to reduce pollutants carried by stormwater runoff into waters of the United States are to be developed for all communities with populations over 50,000. State or regional general permits regulating discharges are developed and implemented by the SWRCB and RWQCB. These permits aid in the enforcement of the program. Individual NPDES permits can be issued by the SWRCB and RWQCB to cover individual discharges and general permits can be issued to cover a group of discharges. The SWRCB can issue general permits on a statewide basis and the RWQCB can issue general permits on a regional basis.

Construction General Permit

In accordance with CWA Section 402(p) and similar to the goals of the Porter-Cologne Water Quality Control Act, a statewide NPDES General Permit for Stormwater Discharges Associated with Construction Activity (Order No. 2009-0009-DWQ, NPDES No. CAS000002, as amended by Order 2010-0014-DWQ and 2012-006-DWQ) (Construction General Permit) was issued by the SWRCB. Required coverage under this Construction General Permit occurs when a construction project disturbs more than one acre of land or that is part of a common plan of development or sale disturbing more than one acre of land. The landowner or applicable entity is required to file a Notice of Intent (NOI), Stormwater Pollution

Prevention Plan (SWPPP), and mail the permit fee to the SWRCB to obtain coverage by the Construction General Permit.

The Project site is more than one acre; therefore, the NPDES Construction General Permit (Order No. 2009-0009-DWQ, NPDES No. CAS000002) does apply.

Municipal General Permit

Permits for municipal stormwater discharges are mandated by CWA Section 402 and are regulated under the NPDES General Permit for MS4 Permits. Medium municipalities (serving between 100,000 and 250,000 people) and large municipalities (serving more than 250,000 people) are covered by Phase I MS4 Permit regulations. Small municipalities (serving less than 100,000 people) are covered by Phase II MS4 Permit regulations. These facilities include public campuses, military bases, and hospital and prison complexes.

To reduce the discharge of pollutants into stormwater to the maximum extent possible, programs and measures are developed and implemented by cities and counties as required by the MS4 Permits. Some of these include best management practices (BMP), control techniques, system designs, and engineering methods. These permit holders have created stormwater management plans for their individual locations as a part of the permit compliance. The plans lay out the framework for the requirements for construction sites, municipal operations, commercial and industrial businesses, and planning and land development. For specific projects under this program, the project applicants must follow the guidance outlined in the stormwater management plan per the permit holder of that location.

In California, SWRCB recommends the use of Low Impact Development (LID) to adhere to the municipal stormwater permits. To manage stormwater to sustain a site's predeveloped runoff rates and volumes, LID has incorporated site design which includes the use of retention basins and the minimizations of impervious surfaces.

The City of Los Angeles is a permittee under the current MS4 Permit for Los Angeles County (Order No. R4-2012-0175), as described further under Section 3.9.1.3, Los Angeles County Municipal Stormwater NPDES Permit (MS4 Permit).

3.9.1.3 Local

Los Angeles Basin Water Quality Control Plan (Basin Plan)

The California Water Code (Section 13240), as required by the CWA, requires the preparation and adoption of water quality control plans (Basin Plans). CWA Section 303 requires states to implement water quality standards that "consist of the designated uses of the navigable waters involved and the water quality criteria for such waters base upon such uses." California Water Code (Section 13050) states that Basin Plans consists of a list of beneficial uses to be protected, water quality objectives to protect those uses, and a program of operation needed for completing the water quality objectives within a specific area. The Basin Plans are regulatory references used to meet the state and federal requirements for water quality control. All inland surface waters, enclosed bays, and estuaries (including wetlands) in the Region are specified in the Basin Plan. The Basin Plan is currently undergoing a triennial review.

Water Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles

The General Waste Discharge Requirements for Discharge of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties (Order No. R4-2013-0095, NPDES No. CAG994004) is a regional general permit for groundwater discharge produced from dewatering operations or other wastewaters discharges that must be removed from a work location in order to proceed with construction.

The waste from construction dewatering (except stormwater) is regulated as a low-threat discharge to surface waters. To comply with this General Permit, an NOI and Report of Waste Discharge must be submitted to the Los Angeles RWQCB. Based on the depth of the groundwater, the proposed Project may require groundwater dewatering during construction and would be subject to the requirements of this General Permit.

Los Angeles County Municipal Stormwater NPDES Permit (MS4 Permit)

The current MS4 Permit for Los Angeles County (Order No. R4-2012-0175) was adopted on November 8, 2012, became effective December 28, 2012, and expired on December 28, 2017. Although this permit is expired, the permit states "if a new order is not adopted by the expiration date above, then the Permittees shall continue to implement the requirements of this Order until a new one is adopted" (Los Angeles Regional Water Quality Control Board, 2016). Los Angeles County Flood Control District, County of Los Angeles, and 84 incorporated cities within the watershed (including the city of Los Angeles and excluding the city of Long Beach) are included in Order No. R4-2012-0175 of the stormwater permit for the MS4s in the Los Angeles Region. As required by the permit, in order to reduce the discharge of pollutants from stormwater to the maximum extent possible (MEP), effectively prohibit non-stormwater discharges, and protect receiving waters, runoff must be addressed during the major phases of urban development. In order to reduce discharge of pollutants from stormwater to the MEP, protect receiving waters, and effectively prohibit non-stormwater discharges, runoff must be addressed during major phases of urban development.

For all "new development" and "redevelopment" projects that meet criteria as specified in the permit, the permit requires that prior to project completion, the design and implementation of specific post-construction controls to mitigate stormwater pollution. The permit bans non-stormwater discharges to the MEP during the operation of new or redevelopment. As identified in the Los Angeles Basin Water Quality Control Plan (Basin Plan), stormwater waste must meet water quality-based effluent limitations (WQBELs) or water quality standards for discharge and must not contribute to the exceedance of water quality standards for receiving waters. Each permittee is required to develop a Planning and Land Development Program for all new development, which requires permittees to:

1. Minimize the impacts on water quality from development by using smart growth practices such as safeguarding environmentally sensitive areas and directing development towards existing communities via infill or redevelopment.
2. Decrease the adverse impacts from stormwater runoff on the biological integrity of Natural Drainage Systems and the beneficial uses of water bodies in line with the requirements under CEQA (California Public Resources Code Section 21000 et seq.).

3. Decrease the impervious surfaces on land developments by minimizing soil compaction during construction, implementing project designs that minimize the impervious area footprint, and using the LID design principles to mirror pre-development hydrology via infiltration, evapotranspiration, and rainfall harvest and use.
4. Maintain and enhance riparian buffers when possible.
5. Decrease pollutant loadings from impervious structures through the use of appropriate BMPs, LIDs, and treatment control BMPs.
6. Properly select, design, and maintain LID and hydromodification control BMPs to address pollutants that are likely to be generated, reduce changes to pre-development hydrology, and assure long-term function.

Organize the selection of BMPs to remove stormwater pollutants, reduce stormwater runoff volume, and beneficially use stormwater to support an integrated approach to protecting water quality and managing water resources.

City of Los Angeles Development Construction Model Program

NPDES Phase II requirements on construction sites within incorporated city lands are addressed by the City of Los Angeles (City) Development Construction Model Program. The City's Reference Guide for Stormwater Best Practices includes BMPs for construction (City of Los Angeles Bureau of Sanitation, 2004). The BMPs are in line with those created by the state and county and include site management practices, erosion and sedimentation control measures, materials and waste management, and general preventative maintenance and inspection.

City of Los Angeles Low Impact Development Ordinance and Handbook

Ordinance Number 181899 in the City's Municipal Code imposes rainwater Low Impact Development (LID) strategies on projects that require building permits. The purpose of the ordinance is to:

- Promote rainwater harvesting
- Promote stormwater runoff management
- Promote water conservation
- Improve water quality
- Provide groundwater recharge
- Promote recycled water reuse and grey water use

The City's *Planning and Land Development Handbook for Low Impact Development* was created to assist developers in complying with the requirements of the City's Stormwater Program. The handbook reflects the latest LID requirements as defined by the NPDES Permit (NPDES No. CASOO4001) and the City's Municipal Code. The handbook summarizes the City's project review and permitting process, identifies stormwater mitigation measures, and references source and treatment control BMP information (City of Los Angeles, 2016).

3.9.2 Environmental Setting

3.9.2.1 Watershed

The Project Area is within the Los Angeles River Watershed, which covers approximately 834 square miles, equivalent to 533,760 acres (LA Stormwater, n.d.). The watershed is bounded by the Santa Monica, Santa Susana, and San Gabriel mountains to the north and west. The majority of the watershed is highly developed with residential, open space, agricultural, commercial, industrial, and transportation land uses. Much of the southern portion of the watershed captures runoff from urbanized areas, and approximately one-third of the watershed is covered with impervious surfaces.

3.9.2.2 Surface Waters and Local Hydrology

The LA River is the only major surface water that runs through the Project Area. The LA River is approximately 51 miles long, originating in the San Fernando Valley, and emptying into the San Pedro Bay near Long Beach (LA Stormwater, n.d.). Much of the LA River and its tributaries are channelized for flood protection. Within the Project Area, the USACE operates and maintains the flood control channel (U.S. Army Corps of Engineers, n.d.). The LA River flows south through the Project Area.

Water Quality and Beneficial Uses

The Project Area includes Los Angeles River Reach 2, which extends approximately 18.8 miles from Carson to Figueroa Street, and is included on the Final 2016 303(d) List of Impaired Waterbodies (California State Water Resources Control Board, 2019). The water quality impairments for Los Angeles River Reach 2 (Carson to Figueroa Street) are shown in **Table 3.9-1**.

Beneficial uses for Los Angeles River Reach 2 from the LARWQCB Basin Plan (Los Angeles Regional Water Quality Control Board, 2014) are included in **Table 3.9-2**.

The water quality impairments for the downstream receiving waters from the Project Site include:

- **LA River Reach 1 (Estuary to Carson Street):** Ammonia, Cadmium, Coliform Bacteria, Dissolved Copper, Cyanide, Diazinon, Lead, Nutrients (Algae), pH, Trash, and Dissolved Zinc;
- **LA River Estuary (Queensway Bay):** Chlordane (sediment), Dichloro-diphenyl-trichloroethane (DDT) (sediment), Polychlorinated biphenyl (PCB) (sediment), Sediment Toxicity, and Trash; and
- **San Pedro Bay Near/Off Shore Zones**: Chlordane, DDT (tissue and sediment), PCBs (sediment), and Sediment Toxicity (Tetra Tech, 2018b).

The LARWQCB Basin Plan provides the water quality objectives for all inland surface waters and enclosed bays and estuaries in the Region. **Table 3.9-3** includes the water quality constituents described in the Basin Plan and their objectives.

Table 3.9-1: TMDLs for Los Angeles River Reach 2 (Carson to Figueroa Street)

Listed Impairments	Potential Sources	First Year Listed	Estimated U.S. EPA TMDL Completion	Date[1]
Ammonia	Point and Nonpoint Sources	1996	Being addressed with U.S. EPA approved TMDL	2004
Copper	Unknown	2006	Being addressed with U.S. EPA approved TMDL	2005
Indicator Bacteria	Unknown	2014	Being addressed with U.S. EPA approved TMDL	2012
Lead	Point and Nonpoint Sources	1996	Being addressed with U.S. EPA approved TMDL	2005
Nutrients (Algae)	Point and Nonpoint Sources	1996	Being addressed with U.S. EPA approved TMDL	2004
Oil	Natural Sources	1996	TMDL Required	2019

Table 3.9-3: Water Quality Objectives Provided in the Water Quality Control Plan for the LARWQCB Basin Plan

Water Quality Constituent	Water Quality Objective
Ammonia	For inland surface waters not characteristic of freshwater, the four-day average concentration of unionized ammonia shall not exceed 0.035 milligrams per liter (mg/L) and the one-hour average concentration shall not exceed 0.233 mg/L.
Bacteria	In waters designated for non-water contact recreation (REC-2) and not designated for water contact recreation (REC-1), the fecal coliform concentration shall not exceed a log mean of 2000/100 ml (based on a minimum of not less than four samples for any 30-

Water Quality Constituent	Water Quality Objective
	day period), nor shall more than 10 percent of sampled collected during any 30-day period exceed 4000/100 ml.
Bioaccumulation	Toxic pollutants shall not be present at levels that will bioaccumulate in aquatic life to levels which are harmful to aquatic life or human health.
Biochemical Oxygen Demand (BODs)	Waters shall be free of substances that result in increases in the BOD which adversely affect beneficial uses.
Biostimulatory Substances	Waters shall not contain biostimulatory substances in concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.
Chemical Constituents	Surface waters shall not contain concentration of chemical constituents in amounts that adversely affect any designated beneficial use.
Chlorine, Total Residual	Chlorine residual shall not be present in surface water discharges at concentration that exceed 0.1 mg/L and shall not persist in receiving waters at any concentration that causes impairment of beneficial uses.
Color	Waters shall be free of coloration that causes nuisance or adversely affects beneficial uses.
Exotic Vegetation	Exotic vegetation shall not be introduced around stream courses to the extent that such growth causes nuisance or adversely affects beneficial uses.
Floating Material	Waters shall not contain floating materials, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely affect beneficial uses.
Methylene Blue Activated Substances (MBAS)	Waters shall not have MBAS concentrations greater than 0.5 mg/L in water designated MUN.
Nitrogen (Nitrate, Nitrite)	Waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO_3-N + NO_2-N), 45 mg/L as nitrate (NO_3), 10mg/L as nitrate-nitrogen (NO_3-N), or 1 mg/L as nitrite-nitrogen (NO_2-N).
Oil and Grease	Waters shall not contain oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the water's surface or on objects in the water, that cause nuisance, or that otherwise adversely affect beneficial uses.
Oxygen, Dissolved (DO)	At a minimum, the mean annual dissolved oxygen concentration of all waters shall be greater than 7 mg/L, and no single determination shall be less than 5.0 mg/L, except when natural conditions cause lesser concentrations.
Pesticides	No individual pesticide or combination of pesticides shall be present in concentrations that adversely affect beneficial uses. There shall be no increase in pesticide concentrations found in bottom sediments or aquatic life.
pH	The pH of inland surface waters shall not be depressed below 6.5 or raised above 8.5 as a result of waste discharges. Ambient pH levels shall not be changed more than 0.5 units from natural conditions as a result of water discharge.

Water Quality Constituent	Water Quality Objective
Polychlorinated Biphenyls (PCBs)	The purposeful discharge of PCBs (the sum of chlorinated biphenyls whose analytical characteristics resemble those of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260) to waters if the Region, or at locations where the waste can subsequently reach waters of the Region, is prohibited. Pass-through or uncontrollable discharges to waters of the Region, or at locations where the waste can subsequently reach water of the Region, are limited to 70 picograms per liter (30 day average) for protection of human health and 14 nanograms per liter (ng/L) and 30 ng/L (daily average) to protect aquatic life in inland fresh waters and estuarine waters respectively.
Priority Pollutants	The water quality criteria for metals contained in the California Toxics Rule (CTR) are expressed as a function of a water-effect ratio (WER). In the CTR, the U.S. EPA has provided for the adjustment of these water quality criteria through the application by States of the WER procedure. The WER has a default value of 1.0 unless a site-specific WER is approved by the Regional Board. To use a WER other than the default of 1.0, a study must be conducted, establishing the ratio that represents the difference between toxicity in laboratory test water and toxicity in a specific water body based on ambient conditions. The study must be consistent with U.S. EPA procedures on deriving WERs. Notwithstanding the provisions below, regulatory actions to achieve applicable criteria, as modified by site-specific WERs, must ensure that downstream standards will also be achieved. Additional receiving water monitoring shall be required of dischargers subject to site-specific WER(s) to evaluate whether criteria, as modified by the WER(s), are as protective of beneficial uses as the CTR criteria are intended to be.
Radioactive Substances	Radionuclides shall not be present in concentrations that are deleterious to human, plant, animal, or aquatic life or that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.
Solid, Suspended, or Settleable Materials	Waters shall not contain suspended or settleable material in concentrations that cause nuisance or adversely affect beneficial uses.
Taste and Odor	Waters shall not contain taste or odor-producing substances in concentrations that impart undesirable tastes or odors to fish flesh or other edible aquatic resources, cause nuisance, or adversely affect beneficial uses.
Temperature	The natural receiving water temperature of all regional waters shall not be altered unless it can be demonstrated to the satisfaction of the Regional Board that such alteration in temperature does not adversely affect beneficial uses.
Toxicity	All waters shall be maintained free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in, human, plant, animal, or aquatic life.
Turbidity	Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increases in natural turbidity attributable to controllable water quality factors shall not exceed the following limits:

Water Quality Constituent	Water Quality Objective
	Where natural turbidity is between 0 and 50 Nephelometric Turbidity Units (NTU), increases shall not exceed 20%. Where natural turbidity is greater than 50 NTU, increases shall not exceed 10%.

Source: (Los Angeles Regional Water Quality Control Board, 2014)

3.9.2.3 Site Hydrology

The Project Site currently consists of vacant lots and a construction site for the Viaduct Replacement Project. The Project Area is primarily pervious, with the exception of paved roadways and a few areas of asphalt and concrete paving. The existing impervious surface areas are summarized in **Table 3.9-4.**

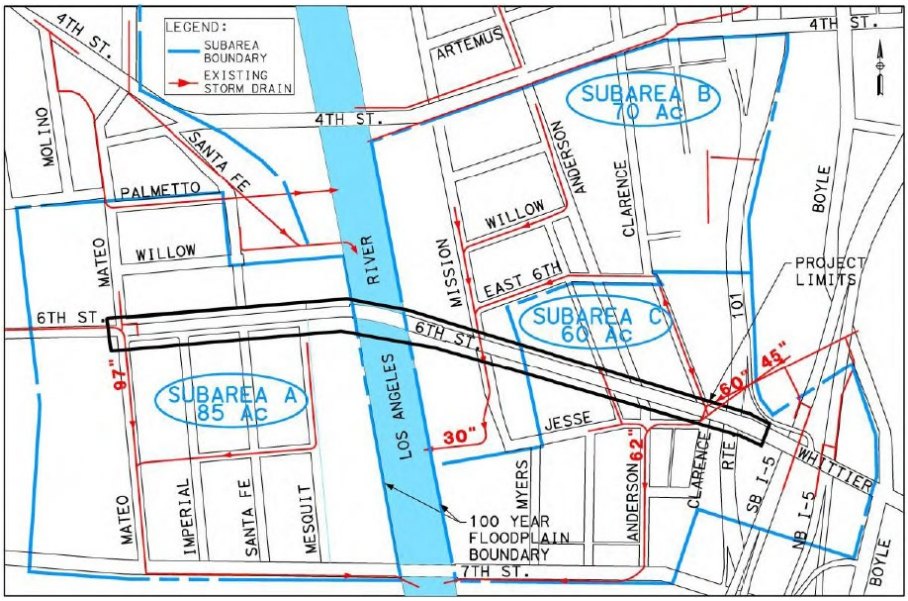
Table 3.9-4: Existing Impervious Surfaces

Location	Total Area (Acres)	Existing Impervious Area (Acres)	Existing Impervious Percentage (%)
Proposed Project Site			
West Park	1.93	0.23	12
Arts Plaza	1.62	1.52	94
East Park	7.34	0.22	3
Streets			
Santa Fe Avenue	0.32	0.31	97
Mission Road	0.55	0.50	91
Anderson Street	0.49	0.46	94
Clarence Street	0.34	0.31	91
Total Impervious Surfaces			
Total	12.59	3.55	28

Runoff generally sheet flows across the Project Site into the adjacent roadways, where it is drained by several separate stormwater drain systems that run along the major streets in the Project Area and ultimately drain into the LA River (see **Figure 3.9-1**, Local Stormwater Drain Systems).

The City and LA County maintain the existing catch basins in the Project Area, and the City maintains storm drains in the Project Area. There are no known existing capacity issues associated with the stormwater drainage facilities that receive flows from the Project Site (Los Angeles County Department of Public Works, n.d.). The topography throughout the Project Site is relatively flat (see **Figure 3.9-2**, Topography). Recent improvements to the hydraulic performance of the LA River resulted from the removal of the center pier of the Viaduct, which was demolished during the construction of the Viaduct Replacement Project.

Figure 3.9-1: Local Stormwater Drain Systems



Source: (California Department of Transportation and City of Los Angeles, 2011)

Table 3.9-5 summarizes the peak flow rates of the existing drainage area that encompasses the proposed Project Site and adjacent street areas. The drainage area extends beyond the boundaries of the proposed Project Site because it includes the total land area where precipitation collects and drains into a common outlet.

Table 3.9-5: Existing 24-Hour Design Storm Events

Drainage Subarea	Drainage Area (Acres)	Drainage Impervious Surface Area (Acres)	Percent Impervious Surface Area (%)	2-year (cfs)	5-year (cfs)	10-year (cfs)	25-year (cfs)	50-year (cfs)
Proposed PARC Areas	11.03	1.79	16	4.53	10.51	14.61	19.96	25.33
Adjacent Street Areas	6.03	5.36	89	4.02	7.25	9.48	12.46	15.12
Total	17.06	7.15	42	8.55	17.76	24.09	32.42	40.45

Sixth Street PARC Project

3.9.2.4 Groundwater Hydrology

Regional Groundwater Hydrology

The Project Area is in the Central Subbasin (Subbasin), which covers an area of approximately 177,000 acres in the southeastern portion of the Coastal Plain of Los Angeles Groundwater Basin (California Department of Water Resources, 2004). The Subbasin is bounded on the north by the La Brea high; on the northeast and east by the Elysian, Repetto, Merced, and Puente Hills; on the southeast by Coyote Creek; and on the southwest by the Newport Inglewood fault system. Average precipitation ranges from 11 to 13 inches throughout the Subbasin, with an average of about 12 inches.

Throughout the Subbasin, groundwater occurs at relatively shallow depths in Holocene and Pleistocene age sediments. Groundwater levels throughout the Subbasin have varied over a range of about 25 feet between 1961 and 1977 and have varied through a range of about 5 to 10 feet since 1996 (California Department of Water Resources, 2004).

The Subbasin has not been identified as a critically overdrafted basin (i.e., the average annual amount of groundwater extraction exceeds the long-term average annual supply of water to the basin) (California Department of Water Resources, 2019). Surface flows from the San Gabriel Valley are the major source of replenishment of the groundwater supply in the Subbasin. Groundwater also enters from surface and subsurface flow, and percolation of precipitation, stream flow, and imported and recycled water. Percolation is limited in some areas due to the amount of paved surfaces, and saltwater intrusion occurs in the basin.

Beneficial uses for the Subbasin from the LARWQCB Basin Plan (Los Angeles Regional Water Quality Control Board, 2014) are included in **Table 3.9-6**.

Table 3.9-6: Beneficial Uses for the Central Subbasin

Beneficial Use	Designation
Municipal and Domestic Supply (MUN)	Existing
Industrial Service Supply (IND)	Existing
Industrial Process Supply (PROC)	Existing
Agricultural Supply (AGR)	Existing

Source: (Los Angeles Regional Water Quality Control Board, 2014)

The LARWQB Basin Plan provides the water quality objectives for all ground waters of the Region. **Table 3.9-7** includes the water quality constituents described in the Basin Plan and their objectives.

Table 3.9-7: Regional Objectives for Ground Waters in the LARWQCB Basin Plan

Water Quality Constituent	Water Quality Objective
Bacteria	In ground waters used for MUN the concentration of coliform organisms over any seven day period shall be less than 1.1/100 ml.
Chemical Constituents and Radioactivity	Ground waters designated for use as MUN shall not contain concentrations of chemical constituents and radionuclides in excess of the limits specified in the following provisions of Title 22 of the California Code of Regulations which are incorporated by reference into the following tables of the Basin Plan: Table 64431-A of Section 64431 (Inorganic Chemicals), Table 64444-A of Section 64444 (Organic Chemicals), Table 64442 of Section 64442 (Gross Alpha Particle Activity, Radium-226, Radium-228, and Uranium), and Table 64443 of Section 64443 (Beta Particle and Photon Radioactivity). This incorporation by reference is prospective including future changes to the incorporated provisions as the changes take effect. See Tables 3-8, 3-9, 3-12a, and 3-12b of the Basin Plan. Ground waters shall not contain concentrations of chemical constituents in amounts that adversely affect any designated beneficial use.
Mineral Quality	Numerical mineral quality objectives for the Subbasin include: • TDS: 700 mg/l • Sulfate: 250 mg/l • Chloride: 150 mg/l • Boron: 1.0 mg/l
Nitrogen (Nitrate, Nitrite)	Ground waters shall not exceed 10 mg/L nitrogen as nitrate-nitrogen plus nitrite-nitrogen (NO_3-N + NO_2-N), 45 mg/L as nitrate (NO_3), 10 mg/L as nitrate-nitrogen (NO_3-N), or 1 mg/L as nitrite-nitrogen (NO_2-N).
Taste and Odor	Ground waters shall not contain taste or odor-producing substances in concentrations that cause nuisance or adversely affect beneficial uses.

MUN = Municipal and Domestic Supply; ml = Milliliter; TDS = Total Dissolved Solids; mg/l = Milligram/Liter
Source: (Los Angeles Regional Water Quality Control Board, 2014)

Local Groundwater Hydrology

Based on the Foundation Report for the Viaduct Replacement Project, measured groundwater elevations varied significantly throughout the Project Area and ranged from 170.9 to 228 feet (Earth Mechanics, Inc., 2015). Groundwater was not encountered in any of the boreholes performed during the investigations for the proposed Project (Hushmand Associates, Inc., 2018). This is likely because soil boring depths for the Viaduct Replacement Project, which varied from 3 to 200 feet, were deeper than the boring depths for the proposed Project, which varied from 5.67 to 39.08 feet (Earth Mechanics, Inc., 2015; Hushmand Associates, Inc., 2018). In addition, groundwater may fluctuate due to factors such as seasonal variation, nearby construction, irrigation, or other man-made and natural influences (Earth Mechanics, Inc., 2015).

There is one groundwater supply well that is within the Project Area, located on East Sixth Street near South Clarence Street (California State Water Resources Control Board, 2017). There are several groundwater wells in proximity to the Project Area: 11 environmental monitoring wells near Mateo Street and Seventh Street (approximately 780 feet south of Project Site) and three environmental monitoring wells near Palmetto Street and Seaton Street (approximately 880 feet northwest of Project Site).

As described in Section 3.8, the Los Angeles County Metropolitan Transportation Authority (Metro) 20 site at 590 South Santa Fe Avenue is in the process of implementing remediation of a groundwater and deep soil contamination plumes that extend under the proposed Arts Plaza. This contamination was from leaking underground structures previously located on the Metro site. The work is being performed under a Voluntary Cleanup Agreement between Metro, the U.S. EPA, and the Department of Toxic Substances Control (DTSC).

3.9.2.5 Geology and Soils

As described in Section 3.6, the Project Area is located in a region with Holocene age Quaternary alluvial deposits fan consisting of sand, silt, and gravel (Hushmand Associates, Inc., 2018). According to the Foundation Report for the Viaduct Replacement Project (Earth Mechanics, Inc., 2016), the Project Area is underlain with:

- Artificial Fill: Generally consists of disturbed and reworked alluvial sands, silts, and gravels, varying up to 15 feet thick in the Project Area, due to recent construction along the LA River.
- Quaternary Alluvium: Holocene to Pleistocene age alluvium consisting of active stream channel and unconsolidated floodplain deposits of gravel, sand, silt, and hardened remnants of older deposits.
- Fernando Formation, Upper (Pico) and Lower (Repetto) Members: Pliocene-age marine deposits consisting of tan to olive brown, semi-friable sandstone and conglomerate, in addition to gray to greenish gray, soft, poorly bedded marine claystone, and siltstone.

According to the Web Soil Survey, soils underlying the proposed West Park, Arts Plaza, and East Park are classified as “urban land, commercial, 0 to 5 percent slopes” (Natural Resources Conservation Service, 2017). The portions of the Project Site that include the LA River are underlain with soils classified as “urban land, frequently flooded, 0 to 5 percent slopes.”

Based on the borehole investigation from the *Geotechnical Site Investigation* prepared for the proposed Project, subsurface conditions consisted of about 5 to 20 feet of fill soils consisting of loose to medium dense silty sand to poorly graded sand with silt (Hushmand Associates, Inc., 2018). The fill is underlain by generally dense to very dense coarse grained materials comprising of sands, silty sands, gravelly sands, sandy gravels, cobbles, and possibly boulders.

3.9.2.6 Floodplain

The Project Area is included on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map Numbers 06037C1637F and 06037C1636F (Federal Emergency Management Agency, 2008). The Project Area includes the LA River, which is a major floodway; however, flood water is confined within the levees. The remaining portions of the Project Area are located in Zone X, which are areas determined to be outside of the 500-year floodplain (see **Figure 3.9-3**, Floodplain).

Sixth Street PARC Project

3.9.3 Environmental Impact Analysis

3.9.3.1 Methodology

Impacts were analyzed qualitatively based on professional judgment in light of the hydrologic and hydraulic analyses prepared for the proposed Project design. The analysis focused on issues related to water and wastewater facilities, flood risks, groundwater quality, and surface water hydrology. Information from the *Preliminary Hydrology and Hydraulics Report* (Tetra Tech, 2018a), the *Conceptual Low Impact Development Report* (Tetra Tech, 2018b), and the *Geotechnical Site Investigation* report (Hushmand Associates, Inc., 2018) prepared for the proposed Project provided the data for the following analysis.

3.9.3.2 Screening Analysis

Several impacts and corresponding thresholds of significance in the following section were eliminated from further analysis in this EIR. Topics were eliminated if the IS for the proposed Project concluded there would be "No Impact," or if impacts were identified to be "Less Than Significant… and will not be discussed further in the EIR." Therefore, only the topics described in the section below were determined to require further analysis in this EIR. A copy of the Initial Study, which contains the eliminated topics, is provided in Appendix A.

3.9.3.3 Thresholds of Significance

According to Appendix G of the CEQA Guidelines and the *L.A. CEQA Thresholds Guide*, the proposed Project would have a significant impact on Hydrology and Water Quality if it would:

X(b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.

G.2 Surface Water Quality. A project would normally have a significant impact on surface water quality if discharges associated with the project would create pollution, contamination or nuisance as defined in Section 13050 of the California Water Code (CWC) (see definitions below) or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

G.3 Groundwater Level. A project would normally have a significant impact on groundwater level if it would:

- Change potable water levels sufficiently to:
    - Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/winter peaking, or to respond to emergencies and drought;
    - Reduce yields of adjacent wells or well fields (public or private); or
    - Adversely change the rate or direction of flow of groundwater; or
- Result in demonstratable and sustained reduction of groundwater recharge capacity

X(c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

(i) Result in substantial erosion or siltation on- or off-site.

(ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite.

(iii) Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.

(iv) Impede or redirect flood flows.

G.1 Surface Water Hydrology. A proposed project would normally have a significant impact on surface water hydrology if it would:

- Cause flooding during the projected 50-year developed storm event, which would have the potential to harm people or damage property or sensitive biological resources;
- Substantially reduce or increase the amount of surface water in a water body; or
- Result in a permanent, adverse change to the movement of surface water sufficient to produce a substantial change in the current or direction of water flow.

G.2 Surface Water Quality. A project would normally have a significant impact on surface water quality if discharges associated with the project would create pollution, contamination or nuisance as defined in Section 13050 of the CWC (see definitions below) or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

G.3. Groundwater Level. A project would normally have a significant impact on groundwater level if it would:

• Change potable water levels sufficiently to:

- Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/winter peaking, or to respond to emergencies and drought;

- Reduce yields of adjacent wells or well fields (public or private); or

- Adversely change the rate or direction of flow of groundwater; or

• Result in demonstrable and sustained reduction of groundwater recharge capacity.

X(e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

3.9.3.4 Construction Impacts

X(b): Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?
