C. Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.03 INSTALLATION OF JOINT SEALANTS

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install sealant backings of kind indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
   1. Do not leave gaps between ends of sealant backings.
   2. Do not stretch, twist, puncture, or tear sealant backings.
   3. Remove absorbent sealant backings that have become wet before sealant application, and replace them with dry materials.

D. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.

E. Install sealants using proven techniques that comply with the following and at the same time backings are installed:
   1. Place sealants so they directly contact and fully wet joint substrates.
   2. Completely fill recesses in each joint configuration.
   3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

F. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified in subparagraphs below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
   1. Remove excess sealant from surfaces adjacent to joints.
   2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.
   3. Provide concave joint profile per Figure 8A in ASTM C 1193 unless otherwise indicated.
   4. Provide flush joint profile at locations indicated on Drawings according to Figure 8B in ASTM C 1193.
   5. Provide recessed joint configuration of recess depth and at locations indicated on Drawings according to Figure 8C in ASTM C 1193.
      a. Use masking tape to protect surfaces adjacent to recessed tooled joints.

3.04 FIELD QUALITY CONTROL

A. Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:
   1. Perform under observation of City Engineer and manufacturer’s technical representative.
   2. Extent of Testing: Test completed and cured sealant joints as follows:
      a. Perform 10 tests for the first 1000 feet (300 m) of joint length for each kind of sealant and joint substrate.
      b. Perform one test for each 1000 feet (300 m) of joint length thereafter or one test per each floor per elevation.
   3. Test Method: Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C 1193 or Method A, Tail Procedure, in ASTM C 1521.
      a. For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
   4. Inspect tested joints and report on the following:
      a. Whether sealants filled joint cavities and are free of voids.
      b. Whether sealant dimensions and configurations comply with specified requirements.
      c. Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. Compare these results to determine if adhesion complies with sealant manufacturer's field-adhesion hand-pull test criteria.

5. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant material, sealant configuration, and sealant dimensions.
6. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

B. Evaluation of Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

3.05 CLEANING

A. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.06 PROTECTION

A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out, remove, and repair damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

END OF SECTION

SECTION 08 11 13

HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes hollow-metal work.

B. Related Requirements: Section 08 71 00 "Door Hardware" for door hardware for hollow-metal doors.

1.2 DEFINITIONS

A. Minimum Thickness: Minimum thickness of base metal without coatings according to NAAMM-HMMA 803 or SDI A250.8.

1.3 COORDINATION

A. Coordinate anchorage installation for hollow-metal frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors. Deliver such items to Project site in time for installation.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product. Include construction details, material descriptions, core descriptions, and finishes.

B. Shop Drawings: Include the following:

1. Elevations of each door type.
2. Details of doors, including vertical- and horizontal-edge details and metal thicknesses.
3. Frame details for each frame type, including dimensioned profiles and metal thicknesses.
4. Locations of reinforcement and preparations for hardware.
5. Details of each different wall opening condition.
6. Details of anchorages, joints, field splices, and connections.
7. Details of accessories.
8. Details of moldings, removable stops, and glazing.
9. Details of conduit and preparations for power, signal, and control systems.

C. Samples for Verification:

1. For each type of exposed finish required, prepared on Samples of not less than 3 by 5 inches.

2. For "Doors" and "Frames" subparagraphs below, prepare Samples approximately 12 by 12 inches to demonstrate compliance with requirements for quality of materials and construction:

   a. Doors: Show vertical-edge, top, and bottom construction; core construction; and hinge and other applied hardware reinforcement. Include separate section showing glazing if applicable.
   b. Frames: Show profile, corner joint, floor and wall anchors, and silencers. Include separate section showing fixed hollow-metal panels and glazing if applicable.

D. Schedule: Provide a schedule of hollow-metal work prepared by or under the supervision of supplier, using same reference numbers for details and openings as those on Drawings. Coordinate with final Door Hardware Schedule.

1.6 INFORMATIONAL SUBMITTALS

A. Product Test Reports: For each type of hollow-metal door and frame assembly, for tests performed by a qualified testing agency.

B. Oversize Construction Certification: For assemblies required to be fire rated and exceeding limitations of labeled assemblies.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver hollow-metal work palletized, packaged, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic. Provide additional protection to prevent damage to factory-finished units.

B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.

C. Store hollow-metal work vertically under cover at Project site with head up. Place on minimum 4-inch-high wood blocking. Provide minimum 1/4-inch space between each stacked door to permit air circulation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Amweld International, LLC.
2. Ceco Door; ASSA ABLOY.
3. Curries Company; ASSA ABLOY.
4. Fleming Door Products Ltd.; Assa Abloy Group Company.
5. Karpen Steel Custom Doors & Frames.
6. Mesker Door Inc.
7. Republic Doors and Frames.
8. Steelcraft; an Allegion brand.

B. Source Limitations: Obtain hollow-metal work from single source from single manufacturer.

C. Recycled Content of Hollow-Metal Steel Products: Recycled content as defined in ISO 14021, with postconsumer recycled content plus one-half of preconsumer recycled content equal to not less than ***[25]*** percent.

2.2 HOLLOW-METAL DOORS AND FRAMES, GENERAL

2.3 INTERIOR DOORS AND FRAMES

A. Construct interior doors and frames to comply with the standards indicated for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.

B. Heavy-Duty Doors and Frames: SDI A250.8, Level 2.

1. Physical Performance: Level B according to SDI A250.4.
2. Doors:

    a. Type: As indicated in the Door and Frame Schedule.
    b. Thickness: 1-3/4 inches.
    c. Face: Metallic-coated, cold-rolled steel sheet, minimum thickness of 0.042 inch.
    d. Edge Construction: Model 2, Seamless.
    e. Core: Manufacturer's standard kraft-paper honeycomb, polystyrene, polyurethane, polyisocyanurate, mineral-board, or vertical steel-stiffener core at manufacturer's discretion.

3. Frames:

    a. Materials: Metallic-coated steel sheet, minimum thickness of 0.053 inch.
    b. Sidelite and Transom Frames: Fabricated from same thickness material as adjacent door frame.
    c. Construction: Full profile welded.

4. Exposed Finish: Prime.

2.4 EXTERIOR HOLLOW-METAL DOORS AND FRAMES

A. Construct exterior doors and frames to comply with the standards indicated for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.

B. Extra-Heavy-Duty Doors and Frames: SDI A250.8, Level 3..

1. Physical Performance: Level A according to SDI A250.4.
2. Doors:

    a. Type: As indicated in the Door and Frame Schedule.
    b. Thickness: 1-3/4 inches
    c. Face: Metallic-coated steel sheet, minimum thickness of 0.053 inch, with minimum A40 coating.
    d. Edge Construction: Model 2, Seamless.
    e. Core: Polystyrene. Thermal-Rated Doors: Provide doors fabricated with thermal-resistance value (R-value) of not less than 2.1 deg F x h x sq. ft./Btu when tested according to ASTM C 1363.

3. Frames:

a. Materials: Metallic-coated steel sheet, minimum thickness of 0.053 inch, with minimum A40 coating.
b. Construction: Full profile welded.

4. Exposed Finish: Prime.

2.5 FRAME ANCHORS

A. Jamb Anchors:

1. Masonry Type: Adjustable strap-and-stirrup or T-shaped anchors to suit frame size, not less than 0.042 inch thick, with corrugated or perforated straps not less than 2 inches wide by 10 inches long; or wire anchors not less than 0.177 inch thick.
2. Stud-Wall Type: Designed to engage stud, welded to back of frames; not less than 0.042 inch thick.
3. Postinstalled Expansion Type for In-Place Concrete or Masonry: Minimum 3/8-inch-diameter bolts with expansion shields or inserts. Provide pipe spacer from frame to wall, with throat reinforcement plate, welded to frame at each anchor location.

B. Floor Anchors: Formed from same material as frames, minimum thickness of 0.042 inch, and as follows: Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners.

2.6 MATERIALS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B; suitable for exposed applications.

C. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.

D. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B.

E. Frame Anchors: ASTM A 879/A 879M, Commercial Steel (CS), 04Z coating designation; mill phosphatized. For anchors built into exterior walls, steel sheet complying with ASTM A 1008/A 1008M or ASTM A 1011/A 1011M, hot-dip galvanized according to ASTM A 153/A 153M, Class B.

F. Inserts, Bolts, and Fasteners: Hot-dip galvanized according to ASTM A 153/A 153M.

G. Power-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hollow-metal frames of type indicated.

H. Grout: ASTM C 476, except with a maximum slump of 4 inches, as measured according to ASTM C 143/C 143M.

I. Mineral-Fiber Insulation: ASTM C 665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively; passing ASTM E 136 for combustion characteristics.

J. Glazing: Comply with requirements in Section 08 80 00 "Glazing."

K. Bituminous Coating: Cold-applied asphalt mastic, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.7 FABRICATION

A. Fabricate hollow-metal work to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for metal thickness. Where practical, fit and assemble units in manufacturer's plant. To ensure proper assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.

B. Hollow-Metal Doors:

1. Vertical Edges for Single-Acting Doors: Bevel edges 1/8 inch in 2 inches.
2. Top Edge Closures: Close top edges of doors with inverted closures, except provide flush closures at exterior doors of same material as face sheets.
3. Bottom Edge Closures: Close bottom edges of doors where required for attachment of weather stripping with end closures or channels of same material as face sheets.
4. Exterior Doors: Provide weep-hole openings in bottoms of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.

C. Hollow-Metal Frames: Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of same thickness metal as frames.

1. Sidelite Frames: Provide closed tubular members with no visible face seams or joints, fabricated from same material as door frame. Fasten members at crossings and to jambs by butt welding.
2. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.
3. Grout Guards: Weld guards to frame at back of hardware mortises in frames to be grouted.
4. Floor Anchors: Weld anchors to bottoms of jambs with at least four spot welds per anchor; however, for slip-on drywall frames, provide anchor clips or countersunk holes at bottoms of jambs.
5. Jamb Anchors: Provide number and spacing of anchors as follows:

    a. Masonry Type: Locate anchors not more than 16 inches from top and bottom of frame. Space anchors not more than 32 inches o.c., to match coursing, and as follows:

        1) Two anchors per jamb up to 60 inches high.
        2) Three anchors per jamb from 60 to 90 inches high.
        3) Four anchors per jamb from 90 to 120 inches high.
        4) Four anchors per jamb plus one additional anchor per jamb for each 24 inches or fraction thereof above 120 inches high.

    b. Stud-Wall Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:

        1) Three anchors per jamb up to 60 inches high.
        2) Four anchors per jamb from 60 to 90 inches high.

3) Five anchors per jamb from 90 to 96 inches high.
4) Five anchors per jamb plus one additional anchor per jamb for each 24 inches or fraction thereof above 96 inches high.

c. Postinstalled Expansion Type: Locate anchors not more than 6 inches from top and bottom of frame. Space anchors not more than 26 inches o.c.

6. Head Anchors: Two anchors per head for frames more than 42 inches wide and mounted in metal-stud partitions.
7. Door Silencers: Except on weather-stripped frames, drill stops to receive door silencers as follows. Keep holes clear during construction.

a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.

D. Fabricate concealed stiffeners and edge channels from either cold- or hot-rolled steel sheet.

E. Hardware Preparation: Factory prepare hollow-metal work to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping according to SDI A250.6, the Door Hardware Schedule, and templates.

1. Reinforce doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.
2. Comply with applicable requirements in SDI A250.6 and BHMA A156.115 for preparation of hollow-metal work for hardware.

F. Stops and Moldings: Provide stops and moldings around glazed lites and louvers where indicated. Form corners of stops and moldings with butted hairline joints.

1. Single Glazed Lites: Provide fixed stops and moldings welded on secure side of hollow-metal work.
2. Multiple Glazed Lites: Provide fixed and removable stops and moldings so that each glazed lite is capable of being removed independently.
3. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames.
4. Provide loose stops and moldings on inside of hollow-metal work.
5. Coordinate rabbet width between fixed and removable stops with glazing and installation types indicated.

2.8 STEEL FINISHES

A. Prime Finish: Clean, pretreat, and apply manufacturer's standard primer. Shop Primer: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with SDI A250.10; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

2.9 ACCESSORIES

A. Louvers: Provide louvers for interior doors, where indicated, which comply with SDI 111C, with blades or baffles formed of 0.020-inch-thick, cold-rolled steel sheet set into 0.032-inch-thick steel frame. Sightproof Louver: Stationary louvers constructed with inverted-V or inverted-Y blades.

B. Grout Guards: Formed from same material as frames, not less than 0.016 inch thick.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for embedded and built-in anchors to verify actual locations before frame installation.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Remove welded-in shipping spreaders installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces.

B. Drill and tap doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.

3.3 INSTALLATION

A. General: Install hollow-metal work plumb, rigid, properly aligned, and securely fastened in place. Comply with Drawings and manufacturer's written instructions.

B. Hollow-Metal Frames: Install hollow-metal frames for doors, transoms, sidelites, borrowed lites, and other openings, of size and profile indicated. Comply with SDI A250.11 or NAAMM-HMMA 840 as required by standards specified.

1. Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.

    a. At fire-rated openings, install frames according to NFPA 80.
    b. Where frames are fabricated in sections because of shipping or handling limitations, field splice at approved locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.
    c. Install frames with removable stops located on secure side of opening.
    d. Install door silencers in frames before grouting.
    e. Remove temporary braces necessary for installation only after frames have been properly set and secured.
    f. Check plumb, square, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.
    g. Field apply bituminous coating to backs of frames that will be filled with grout containing antifreezing agents.

2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, and secure with postinstalled expansion anchors.
3. Metal-Stud Partitions: Solidly pack mineral-fiber insulation inside frames.
4. Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with grout.

5. Concrete Walls: Solidly fill space between frames and concrete with mineral-fiber insulation.
6. In-Place Concrete or Masonry Construction: Secure frames in place with postinstalled expansion anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
7. Installation Tolerances: Adjust hollow-metal door frames for squareness, alignment, twist, and plumb to the following tolerances:

    a. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
    b. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
    c. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
    d. Plumbness: Plus or minus 1/16 inch, measured at jambs at floor.

C. Hollow-Metal Doors: Fit hollow-metal doors accurately in frames, within clearances specified below. Shim as necessary. Non-Fire-Rated Steel Doors:

1. Between Door and Frame Jambs and Head: 1/8 inch plus or minus 1/32 inch.
2. Between Edges of Pairs of Doors: 1/8 inch to 1/4 inch plus or minus 1/32 inch.
3. At Bottom of Door: 3/4 inch plus or minus 1/32 inch.
4. Between Door Face and Stop: 1/16 inch to 1/8 inch plus or minus 1/32 inch.

D. Glazing: Comply with installation requirements in Section 08 80 00 "Glazing" and with hollow-metal manufacturer's written instructions. Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches o.c. and not more than 2 inches o.c. from each corner.

3.4 ADJUSTING AND CLEANING

A. Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including hollow-metal work that is warped, bowed, or otherwise unacceptable.

B. Remove grout and other bonding material from hollow-metal work immediately after installation.

C. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible air-drying, rust-inhibitive primer.

D. Metallic-Coated Surface Touchup: Clean abraded areas and repair with galvanizing repair paint according to manufacturer's written instructions.

END OF SECTION

SECTION 08 31 13

ACCESS DOORS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes access doors and frames for walls and ceilings. Provide and install all access doors in walls and ceilings, whether shown on the Drawings or not, where required for access to Fire/Life Safety and/or MEP devices, valves and equipment. The door size must be appropriate for clear access, and the locations must be shown on Coordination Drawings as approved by the architect before installation.

B. Related Requirements: Section 07 72 00 "Roof Accessories" for roof hatches.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product. Include construction details material descriptions, dimensions of individual components and profiles, and finishes.

A. Shop Drawings:

1. Include plans, elevations, sections, details, and attachments to other work.
2. Detail fabrication and installation of access doors and frames for each type of substrate.

B. Samples: For each type of access door and frame and for each finish specified, complete assembly minimum 6 by 6 inches in size.

C. Product Schedule: For access doors and frames.

PART 2 - PRODUCTS

2.1 ACCESS DOORS AND FRAMES

A. Flush Access Doors with Exposed Flanges:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. Babcock-Davis.
b. JL Industries, Inc.; a division of the Activar Construction Products Group.
c. Karp Associates, Inc.
d. Lane-Aire Manufacturing Corp.
e. Larsens Manufacturing Company.
f. Milcor; Commercial Products Group of Hart & Cooley, Inc.
g. Nystrom, Inc.

2. Description: Face of door flush with frame, with exposed flange and concealed hinge.
3. Locations: Wall.
4. Door Size: As required to facilitate convenient access to concealed devices or equipment for maintenance or replacement.

5. Metallic-Coated Steel Sheet for Door: Nominal 0.064 inch, 16 gage, factory primed.
6. Frame Material: Same material, thickness, and finish as door.
7. Latch and Lock: Cam latch, screwdriver operated.

B. Flush Access Doors with Concealed Flanges:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Acudor Products, Inc.
    b. Babcock-Davis.
    c. JL Industries, Inc.; a division of the Activar Construction Products Group.
    d. Karp Associates, Inc.
    e. Lane-Aire Manufacturing Corp.
    f. Larsens Manufacturing Company.
    g. Milcor; Commercial Products Group of Hart & Cooley, Inc.
    h. Nystrom, Inc.

2. Description: Face of door flush with frame; with concealed flange for gypsum board installation and concealed hinge.
3. Locations: Wall and ceiling.
4. Door Size: As required to facilitate convenient access to concealed devices or equipment for maintenance or replacement.
5. Metallic-Coated Steel Sheet for Door: Nominal 0.064 inch, 16 gage factory primed.
6. Frame Material: Same material and thickness as door.

C. Latch and Lock: Cam latch, screwdriver operated. Exterior Flush Access Doors:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

    a. Babcock-Davis.
    b. JL Industries, Inc.; a division of the Activar Construction Products Group.
    c. Karp Associates, Inc.
    d. Larsens Manufacturing Company.
    e. Nystrom, Inc.

2. Description: Weatherproof assembly, with face of door fit flush with frame and with exposed frame. Include extruded door gaskets and minimum 2-inch-thick fiberglass insulation.
3. Locations: Wall.
4. Door Size: As required to facilitate convenient access to concealed devices or equipment for maintenance or replacement.
5. Stainless-Steel Sheet for Door: Nominal 0.062 inch, 16 gage, No. 4 finish.
6. Frame Material: Same material, thickness, and finish as door.
7. Latch and Lock: Cam latch operated by key.

2.2 MATERIALS

A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

B. Steel Sheet: Uncoated or electrolytic zinc coated, ASTM A 879/A 879M, with cold-rolled steel sheet substrate complying with ASTM A 1008/A 1008M, Commercial Steel (CS), exposed.

C. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with minimum G60 or A60 metallic coating.

D. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, Type 304. Remove tool and die marks and stretch lines, or blend into finish.

E. Frame Anchors: Same material as door face.

F. Inserts, Bolts, and Anchor Fasteners: Hot-dip galvanized steel according to ASTM A 153/A 153M or ASTM F 2329.

2.3 FABRICATION

A. General: Provide access door and frame assemblies manufactured as integral units ready for installation.

B. Metal Surfaces: For metal surfaces exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

C. Doors and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Furnish mounting holes, attachment devices and fasteners of type required to secure access doors to types of supports indicated. For concealed flanges with drywall bead, provide edge trim for gypsum panels securely attached to perimeter of frames.

D. Latch and Lock Hardware:

1. Quantity: Furnish number of latches and locks required to hold doors tightly closed.
2. Keys: Furnish two keys per lock and key all locks alike.

2.4 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

D. Painted Finishes: Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish. Factory Primed: Apply manufacturer's standard, lead- and chromate-free, universal primer immediately after surface preparation and pretreatment.

E. Stainless-Steel Finishes:

1. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
2. Polished Finish: No. 4 finish. Grind and polish surfaces to produce uniform finish, free of cross scratches.

a. Run grain of directional finishes with long dimension of each piece.
b. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

3.2 Proceed with installation only after unsatisfactory conditions have been corrected. INSTALLATION

A. Comply with manufacturer's written instructions for installing access doors and frames.

3.3 ADJUSTING

A. Adjust doors and hardware, after installation, for proper operation.

END OF SECTION

SECTION 08 41 13

ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Exterior storefront framing.
2. Exterior manual-swing entrance doors and door-frame units.
3. Delegated design responsibility for engineering of framing and entrance systems.

B. Related Requirements: Refer to requirements in Section 08 44 13 “Glazed Aluminum Curtain Walls” to integrate work of this Section with that of Section 08 44 13. A single manufacturer shall provide products for work of both Sections.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

B. Shop Drawings: For aluminum-framed entrances and storefronts. Include plans, elevations, sections, full-size details, and attachments to other work.

1. Include details of provisions for assembly expansion and contraction and for draining moisture occurring within the assembly to the exterior.
2. Include full-size isometric details of each vertical-to-horizontal intersection of aluminumframed entrances and storefronts, showing the following:

a. Joinery, including concealed welds.
b. Anchorage.
c. Expansion provisions.
d. Glazing.
e. Flashing and drainage.

3. Show connection to and continuity with adjacent thermal, weather, air, and vapor barriers.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

E. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12inch lengths of full-size components and showing details of the following:

1. Joinery, including concealed welds.
2. Anchorage.
3. Expansion provisions.
4. Glazing.
5. Flashing and drainage.

F. Delegated-Design Submittal: Provide structural design of complete system, including all components. Comply with performance requirements and design criteria. Prepare Shop Drawings, design calculations, and other structural data. Engineer licensed in State of California shall perform engineering analysis, and seal and sign documentation. When required by jurisdiction having authority, submit engineering data and obtain separate permit for Work.

G. Entrance Door Hardware Schedule: Prepared by or under supervision of supplier, detailing fabrication and assembly of entrance door hardware, as well as procedures and diagrams. Coordinate final entrance door hardware schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of entrance door hardware.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installe and field testing agency.

B. Energy Performance Certificates: For aluminum-framed entrances and storefronts, accessories, and components, from manufacturer. Basis for Certification: NFRC-certified energy performance values for each aluminum-framed entrance and storefront.

C. Product Test Reports: For aluminum-framed entrances and storefronts, for tests performed by manufacturer and witnessed by a qualified testing agency or a qualified testing agency.

D. Quality-Control Program: Developed specifically for Project, including fabrication and installation, according to recommendations in ASTM C 1401. Include periodic quality-control reports.

E. Source quality-control reports.

F. Field quality-control reports.

G. Sample Warranties: For special warranties.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For aluminum-framed entrances and storefronts to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

B. Testing Agency Qualifications: Qualified according to ASTM E 699 for testing indicated.

C. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they

relate to sightlines, to one another, and to adjoining construction. Do not change intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If changes are proposed, submit comprehensive explanatory data to Architect for review.

1.7 MOCKUPS

A. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.

1. Build mockup of typical wall area as directed by Architect.
2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of aluminum-framed entrances and storefronts that do not comply with requirements or that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including, but not limited to, excessive deflection.
b. Noise or vibration created by wind and thermal and structural movements.
c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
d. Water penetration through fixed glazing and framing areas.
e. Failure of operating components.

2. Warranty Period: Two years from date of Substantial Completion.

B. Special Finish Warranty: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied finishes within specified warranty period.

1. Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - <u>PRODUCTS</u>

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a California registered, professional engineer, to design aluminumframed entrances and storefronts.

B. General Performance: Comply with performance requirements specified, as determined by testing of aluminum-framed entrances and storefronts representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.

1. Aluminum-framed entrances and storefronts shall withstand movements of supporting structure including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.
2. Failure also includes the following:

a. Thermal stresses transferring to building structure.
b. Glass breakage.
c. Noise or vibration created by wind and thermal and structural movements.
d. Loosening or weakening of fasteners, attachments, and other components.
e. Failure of operating units. C. Structural Loads:

1. Wind Loads: As indicated on Drawings.
2. Other Design Loads: As indicated on Drawings.

D. Deflection of Framing Members: At design wind pressure, as follows:

1. Deflection Normal to Wall Plane: Limited to edge of glass in a direction perpendicular to glass plane not exceeding 1/175 of the glass edge length for each individual glazing lite or an amount that restricts edge deflection of individual glazing lites to 3/4 inch, whichever is less.
2. Deflection Parallel to Glazing Plane: Limited to 1/360 of clear span or 1/8 inch, whichever is smaller. Operable Units: Provide a minimum 1/16-inch clearance between framing members and operable units.
3. Cantilever Deflection: Where framing members overhang an anchor point, as follows: Perpendicular to Plane of Wall: No greater than 1/240 of clear span plus 1/4 inch for spans greater than 11 feet 8-1/4 inches or 1/175 times span, for spans less than 11 feet 8-1/4 inches.

E. Structural: Test according to ASTM E 330 as follows:

1. When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.
2. When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, or permanent deformation of main framing members exceeding 0.2 percent of span.
3. Test Durations: As required by design wind velocity, but not less than 10 seconds. F.

Air Infiltration: Test according to ASTM E 283 for infiltration as follows:

1. Fixed Framing and Glass Area: Maximum air leakage of 0.06 cfm/sq. ft. at a static-airpressure differential of 6.24 lbf/sq. ft.
2. Entrance Doors:

a. Pair of Doors: Maximum air leakage of 1.0 cfm/sq. ft. at a static-air-pressure differential of 1.57 lbf/sq. ft.
b. Single Doors: Maximum air leakage of 0.5 cfm/sq. ft. at a static-air-pressure differential of 1.57 lbf/sq. ft.

G. Water Penetration under Static Pressure: Test according to ASTM E 331 as follows: No evidence of water penetration through fixed glazing and framing areas when tested according to a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 12 lbf/sq. ft.

H. Water Penetration under Dynamic Pressure: Test according to AAMA 501.1 as follows:

1. No evidence of water penetration through fixed glazing and framing areas when tested at dynamic pressure equal to 20 percent of positive wind-load design pressure, but not less than 12 lbf/sq. ft.
2. Maximum Water Leakage: No uncontrolled water penetrating assemblies or water appearing on assemblies' normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters, or water that is drained to exterior.

I. Seismic Performance: Aluminum-framed entrances and storefronts shall withstand the effects of earthquake motions determined according to 2013 CBC.

J. Energy Performance: Certify and label energy performance according to NFRC as follows:

1. Thermal Transmittance (U-factor): Fixed glazing and framing areas shall have U-factor of not more than 0.59 Btu/sq. ft. x h x deg F as determined according to NFRC 100.
2. Condensation Resistance: Fixed glazing and framing areas shall have an NFRC-certified condensation resistance rating of no less than 51 as determined according to NFRC 500.

K. Noise Reduction: Test according to ASTM E 90, with ratings determined by ASTM E 1332, as follows. Outdoor-Indoor Transmission Class: Minimum 26.

L. Thermal Movements: Allow for thermal movements resulting from ambient and surface temperature changes: Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

2.2 MANUFACTURERS

A. Basis of Design Product: Subject to compliance with requirements, provide Arcadia, Inc., TC470 Thermal Series storefront system, or a comparable system manufactured by one of the acceptable manufacturers.

B. Acceptable Manufacturers: Subject to compliance with requirements, acceptable manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. EFCO Corporation.
2. Kawneer North America; an Alcoa company.
3. Oldcastle Building Envelope.
4. Pittco Architectural Metals, Inc.
5. Tubelite Inc.
6. U.S. Aluminum; a brand of C.R. Laurence.

C. Source Limitations: Obtain all components of aluminum-framed entrance and storefront system, and accessories, from single manufacturer. Systems specified in this Section and in Section 08 44 13 “Glazed Aluminum Curtain Walls” shall be obtained from the same manufacturer. Mixing products from different manufacturers is not acceptable.

2.3 FRAMING

A. Framing Members: Manufacturer's extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.

1. Construction: Thermally broken.
2. Glazing System: Retained mechanically with gaskets on four sides.
3. Glazing Plane: As indicated.
4. Finish: High-performance organic finish.
5. Fabrication Method: Field-fabricated stick system.

B. Backer Plates: Manufacturer's standard, continuous backer plates for framing members, if not integral, where framing abuts adjacent construction.

C. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components. D. Materials:

1. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
   a. Sheet and Plate: ASTM B 209.
   b. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221.
   c. Extruded Structural Pipe and Tubes: ASTM B 429/B 429M.
   d. Structural Profiles: ASTM B 308/B 308M.

2. Steel Reinforcement: Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM, and prepare surfaces according to applicable SSPC standard.
   a. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
   b. Cold-Rolled Sheet and Strip: ASTM A 1008/A 1008M.
   c. Hot-Rolled Sheet and Strip: ASTM A 1011/A 1011M.

2.4 ENTRANCE DOOR SYSTEMS

A. Basis of Design Entrance Doors: Subject to compliance with requirements, provide Arcadia, Inc., WS512 Series wide stile entrance doors, or a comparable product manufactured by one of the acceptable manufacturers. Standard glazed entrance doors for manual-swing operation.

1. Door Construction: 1-3/4-inch overall thickness, with minimum 0.125-inch- thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated and fillet welded or that incorporate concealed tie rods. Thermal Construction: High-performance plastic connectors separate aluminum members exposed to the exterior from members exposed to the interior.
2. Door Design: Wide stile; 5-inch nominal width.
3. Glazing Stops and Gaskets: Beveled, snap-on, extruded-aluminum stops and preformed gaskets. Provide nonremovable glazing stops on outside of door.

2.5 ENTRANCE DOOR HARDWARE

A. Entrance Door Hardware: Hardware not specified in this Section is specified in Section 08 71 00 "Door Hardware."

B. Weather Stripping: Manufacturer's standard replaceable components. Compression Type: Made of ASTM D 2000, molded neoprene, or ASTM D 2287, molded PVC.

C. Weather Sweeps: Manufacturer's standard exterior-door bottom sweep with concealed fasteners on mounting strip.

D. Silencers: BHMA A156.16, Grade 1.

E. Finger Guards: Manufacturer's standard collapsible neoprene or PVC gasket anchored to frame hinge-jamb at center-pivoted doors.

2.6 GLAZING

A. Glazing: Comply with Section 08 80 00 "Glazing."

B. Glazing Gaskets: Manufacturer's standard sealed-corner pressure-glazing system of black, resilient elastomeric glazing gaskets, setting blocks, and shims or spacers. C. Glazing Sealants: As recommended by manufacturer.

D. Weather-seal Sealants: ASTM C 920 for Type S; Grade NS; Class 25; Uses NT, G, A, and O; chemically curing silicone formulation that is compatible with structural sealant and other system components with which it comes in contact; recommended storefront manufacturers for this use. Color: As selected by Architect for manufacturer’s full range.

2.7 ACCESSORIES

A. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, nonbleeding fasteners and accessories compatible with adjacent materials.

1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
2. Reinforce members as required to receive fastener threads.

B. Anchors: Three-way adjustable anchors with minimum adjustment of 1 inch that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer. Concrete and Masonry Inserts: Hot-dip galvanized castiron, malleable-iron, or steel inserts complying with ASTM A 123/A 123M or ASTM A 153/A 153M requirements.

C. Concealed Flashing: Dead-soft, 0.018-inch-thick stainless steel, ASTM A 240/A 240M of type recommended by manufacturer.

D. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 30-mil thickness per coat.

2.8 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.

3. Physical and thermal isolation of glazing from framing members.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Provisions for field replacement of glazing from exterior.
6. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Mechanically Glazed Framing Members: Fabricate for flush glazing without projecting stops.

E. Storefront Framing: Fabricate components for assembly using shear-block system.

F. Entrance Door Frames: Reinforce as required to support loads imposed by door operation and for installing entrance door hardware.

1. At exterior doors, provide compression weather stripping at fixed stops.
2. At interior doors, provide silencers at stops to prevent metal-to-metal contact. Install three silencers on strike jamb of single-door frames and two silencers on head of frames for pairs of doors.

G. Entrance Doors: Reinforce doors as required for installing entrance door hardware.

1. At pairs of exterior doors, provide sliding-type weather stripping retained in adjustable strip and mortised into door edge.
2. At exterior doors, provide weather sweeps applied to door bottoms.

H. Entrance Door Hardware Installation: Factory install entrance door hardware to the greatest extent possible. Cut, drill, and tap for factory-installed entrance door hardware before applying finishes.

I. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.9 ALUMINUM FINISHES

A. Anodic coating conforming with AA-M12C22A41 (Class I Anodize)

a. Anodize finish color shall be colornordic, selected from manufacturer’s standard colors

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare surfaces that are in contact with structural sealant according to sealant manufacturer's written instructions to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.

3.3 INSTALLATION A.

General:

1. Comply with manufacturer's written instructions.
2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Rigidly secure nonmovement joints.
5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.
6. Seal perimeter and other joints watertight unless otherwise indicated. B. Metal Protection:

1. Where aluminum is in contact with dissimilar metals, protect against galvanic action by painting contact surfaces with materials recommended by manufacturer for this purpose or by installing nonconductive spacers.
2. Where aluminum is in contact with concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Set continuous sill members and flashing in full sealant bed as specified in Section 07 92 00 "Joint Sealants" to produce weathertight installation.

D. Install components plumb and true in alignment with established lines and grades.

E. Install operable units level and plumb, securely anchored, and without distortion. Adjust weather-stripping contact and hardware movement to produce proper operation.

F. Install glazing as specified in Section 08 80 00 "Glazing."

G. Install weatherseal sealant according to Section 07 92 00 "Joint Sealants" and according to sealant manufacturer's written instructions to produce weatherproof joints. Install joint filler behind sealant as recommended by sealant manufacturer.

H. Entrance Doors: Install doors to produce smooth operation and tight fit at contact points. Exterior Doors: Install to produce weathertight enclosure and tight fit at weather stripping.

3.4 ERECTION TOLERANCES

A. Erection Tolerances: Install aluminum-framed entrances and storefronts to comply with the following maximum tolerances:

1. Plumb: 1/8 inch in 10 feet; 1/4 inch in 40 feet.
2. Level: 1/8 inch in 20 feet; 1/4 inch in 40 feet.
3. Alignment:

    a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2 inch wide, limit offset from true alignment to 1/16 inch.

b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch wide, limit offset from true alignment to 1/8 inch.
c. Where surfaces are separated by reveal or protruding element of 1 inch wide or more, limit offset from true alignment to 1/4 inch.

4. Location: Limit variation from plane to 1/8 inch in 12 feet; 1/2 inch over total length.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Field Quality-Control Testing: Perform the following test on representative areas of aluminum framed entrances and storefronts. Water-Spray Test: Before installation of interior finishes has begun, areas designated by Architect shall be tested according to AAMA 501.2 and shall not evidence water penetration.

1. Perform a minimum of three tests in areas as directed by Architect.
2. Perform tests in each test area as directed by Architect. Perform at least three tests, prior to 10, 35, and 70 percent completion.

C. Aluminum-framed entrances and storefronts will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

END OF SECTION

SECTION 08 71 00
FINISH HARDWARE

PART ONE - GENERAL

1.1 DESCRIPTION

A. Section Includes:

1. Door Hardware for Hollow Metal Doors.
2. Door Hardware for wood doors.
3. Door Hardware for other doors indicated.
4. Keyed Cylinders as indicated

B. Related Sections:

1. Section 06400 - Architectural Woodwork.
2. Section 08110 - Metal Doors and Frames.
3. Section 16721 - Fire/Life-Safety Alarm System.

C. Specific Omissions: Hardware for the following is specified or indicated elsewhere.

1. Windows.
2. Cabinets, including open wall shelving and locks.
3. Toilet accessories, including grab bars.
4. Rough hardware.

1.2 QUALITY ASSURANCE

A. Regulatory Requirements**:**

1. Conform to the Los Angeles City Building Code and applicable Amendments and to the State of California, Title 24 California Building Code, Latest Edition and California State, Architectural Barriers Law (CAL/ABL) and Americans With Disabilities Act (ADA).

2. Conform to the U.L. Standards of the Underwriter's Laboratories, Inc.

3. Conform to the American National Standards Institute (A.N.S.I.)**,** A115-IG (Installation Guide for Doors and Hardware).

4. Conform to Steel Door Institute (SDI).

B. Substitutions: Requests shall be in accordance with requirements of the GENERAL CONDITIONS of the Project Manual. Finish hardware substitutions will not be accepted without written approval of the Project Manager or Inspector. Substituted hardware without City approval shall be removed and replaced with specified hardware, at no added cost to the City.

C. Manufacture: Unless specified otherwise each type of finish hardware used throughout the work shall be of the same make or manufacture although several may be indicated as equal product complying with requirements.

D. Hardware Supplier: Supplier must be a recognized building hardware supplier who has been furnishing hardware in the projects vicinity for a period of not less than two years. Supplier must be or employ an experienced Hardware Consultant who is available, at reasonable times during the course of the work, for consultation about the projects hardware requirements to the Project Manager or Inspector at no additional cost to the City**.**

E. **Pre Scheduled Conferences:** Prior to final approval of the submittals and installation of the cylinders and keys, the Contractor and Hardware Supplier shall meet in the field with the Project Manager or Inspector, its authorized representative to finalize all finish hardware information, the keying schedules and keying requirements, and obtain final instructions in writing**.**

1.3 SUBMITTALS

A. Comply with pertinent provisions of Article 10 - SUBMITTALS of DIVISION 1 - GENERAL REQUIREMENTS of the Project Manual.

B. Product Data:

1. Finish Hardware Schedule: Submit 7 copies, include Door and Hardware numbers, the manufacturer's name and product number, quantity, materials, inside and outside finish code, function, hand of door, door thickness, any non-standard latch or strike, fire rating, locations cross-referenced to floor plans and door schedule with an index of doors designating every item needed for each opening; all security and fire alarm interface and etc. Include manufacturer's installation instructions, all hardware elevations and backing support details. Coordinate and provide a list of hardware to be installed by door and door frame manufacturers.
   Project Manager or Inspector will return and will not review any submittal requiring coordination with others submittals until such other submits or required information is received by the Project Manager or Inspector.

2. Finish Hardware Floor Plans: Submit 7 copies of the floor plans which shall identify all opening and door locations, door type and door index, location of fire rated wall, thickness of wall and door frame, locations of door jamb and hinges, directions of door swing, keying schedule, door sign details, etc.

3. Product Data: Submit 7 copies of catalog cuts, descriptions and numbers marked for each item to be furnished. Submit with hardware schedule.

C. Templates: Mortise hardware shall be made to a template. Submit a complete template list showing references and data for each template. Furnish templates to other trades in a timely manner to assure orderly progress of the Work.

D. Samples: Submit for review, to the Project Manager or Inspector, physical sample of any finished hardware item proposed for use. Such items shall not be used in the work until review is completed.

E. Product Certification and Guarantee: Submit products certification signed by the manufactured certifying that the products to be furnished complying with the extended guaranty requirements. Upon completion manufacturer shall provide the Project Manager or Inspector the written guarantee for the extended guarantee specified.

F. When deemed necessary for product evaluation, Project Manager or Inspector may require submittal of full size standard production units for review.

1.4 TEMPORARY CYLINDERS

A. During construction period of Contract, Contractor shall employ temporary construction cylinders with temporary construction keys on door locks in the project to maintain necessary building security. Temporary construction keys shall be furnished in construction master key system.

B. Contractor and Hardware Supplier shall meet in prescheduled conference with the Project

Manager or Inspector and its authorized representative to finalize the Keying Schedules and requirements, and obtain final instructions in writing. On completion of the project, the Contractor shall collect all the construction keys and remove the construction cores from the lock cylinders and turn over the temporary construction keys and cores to the Project Manager or Inspector and/or its authorized representable. The Contractor shall install cylinder locks and keys in accordance with Final Keying Schedule approved by the Engineer**.**

1.5 COORDINATION

A. Deliver templates or physical samples of finish hardware to manufacturers of interfacing items such as doors and frames in a timely manner to insure orderly progress of the work.

1.6 PRODUCT HANDLING

A. Packaging: Individually package each hardware item complete with proper fastenings and appurtenances, clearly marked on outside of package with item identity and its specific location in the work.

B. Checking:

1. Check door thickness, details of trim; clearances for hinges, strikes, closers, fasteners and fire rating requirements before preparing "Hardware List".

2. Check kinds and quantities of delivered hardware to verify conditions, completeness and conformance to contract provisions and arrange for replacements or corrections of shortages and errors.

C. Storage at the Job-site**:** Contractor shall store hardware in a safe approved place at the job-site where directed by the Project Manager or Inspector to prevent loss or damage until installation.

1.7 GUARANTEES

A. All hardware shall be guaranteed for a period specified below from date of acceptance of the work, conforming to provisions of Article 16 – GUARANTY/WARRANTY of the GENERAL REQUIREMENTS. Correct defects in materials and workmanship and operation occurring during the guarantee period to the complete satisfaction of the City at no added cost to the City. Submit guaranty certification for review prior to start of work.

B.
1. Door Closer: 5 years except electronic closers, two years
2. Exit Devices: 3 years
3. Hinges: 10 years
4. All other Hardware: Two years.

1.8 CLEAN-UP

A. In addition to the requirements noted in Article 7 – REMOVAL, CLEAN UP AND DEMOBILIZATION in the GENERAL REQUIREMENTS, Contractor upon completion of the work of this Section shall remove all oil, grease or other soiling from exposed surfaces of finish hardware and shall remove all cartons, wrapping and other debris resulting from work herein and shall leave the building in a neat, clean and acceptable condition to the approval of the Project Manager or Inspector.

1.9 KEYING

A.. Lock manufacturer shall ship all master keys and grandmaster keys via registered mail to

the address directed by the Project Manager or Inspector. Properly identify all keys as to the Project Name and Key location(s). Provide duplicate copy of key listing to the Project Manager or Inspector.

B. Provide keyed construction cores and keys during the construction period. Construction control and operating keys and core shall not be part of the Owner's permanent keying system or furnished in the same keyway (or key section) as the Owner's permanent keying system. Permanent cores and keys (prepared according to the accepted keying schedule) will be furnished to the Owner.

C. Cylinders, removable and interchangeable core system: Best [Peaks], or approved equal, small format 7-pin, as directed by the Project Manager or Inspector.

D. Permanent keys and cores: Stamped with the applicable key mark for identification. These visual key control marks or codes will not include the actual key cuts. Permanent keys will also be stamped "DO NOT DUPLICATE." Release permanent keys to the Project Manager or Inspector or the Inspector only.

E. Furnish keys in the following quantities:
1 each Grand Masterkeys
4 each Masterkeys
2 each Change keys each keyed core
15 each Construction masterkeys
1 each Control keys

F. The Owner, or the Project Manager or Inspector, will install permanent cores and return the construction cores to the Hardware Supplier. Construction cores and keys remain the property of the Hardware Supplier.

G. Keying Schedule: Arrange for a keying meeting, and programming meeting with Project Manager or Inspector, Owner and hardware supplier, and other involved parties to ensure locksets and locking hardware, are functionally correct and keying and programming complies with project requirements. Furnish 3 typed copies of keying and programming schedule to Project Manager or Inspector.

PART 2 - PRODUCTS

2.1 MANUFACTURERS:

A. The following manufacturers are approved subject to compliance with requirements of the Contract Documents. Approval of manufacturers other than those listed shall be in accordance with Division 1, and this Section paragraph 1.2 B.

Item:	Manufacturer:	Approved:
Hinges	Stanley	Hager, McKinney
Locksets & Cylinders	Best	
Exit Devices	Precision	Von Duprin, Sargent
Pulls	Don Jo	Rockwood, Trimco
Closers	Stanley	Norton 7500, LCN 4041
Stops	Don Jo	Trimco, Rockwood
Overhead Stops	ABH	Rixson, Glynn Johnson
Flatgoods	Don Jo	Trimco, Rockwood
Thresholds & Gasketing	Pemko	Reese, Zero

2.2 MATERIALS:

A. Hinges:

1. Template screw hole locations
2. Minimum of 2 permanently lubricated non-detachable bearings
3. Equip with easily seated, non-rising pins
4. Sufficient size to allow 180-degree swing of door
5. Furnish hinges with five knuckles and flush [concealed] bearings
6. Provide hinge type as listed in schedule.
7. Furnish 3 hinges per leaf to 7 foot 6 inch height. Add one for each additional 30 inches in height or fraction thereof.
8. Tested and approved by BHMA for all applicable ANSI Standards for type, size, function and finish
9. UL10B listed for Fire
10. UL10B listed for Fire

B. Mortise Type Locks and Latches:
1. Tested and approved by BHMA for ANSI A156.13, Series 1000, Operational Grade 1, Extra-Heavy Duty, Security Grade 2 and be UL10C
2. Fit ANSI A115.1 door preparation
3. Functions and design as indicated in the hardware groups
4. One-piece, 3/4-inch (19mm) throw, anti-friction latchbolt made of self-lubricating stainless steel
5. Deadbolt functions shall have 1 inch (25mm) throw bolt made of hardened stainless steel
6. Latchbolt and Deadbolt are to extend into the case a minimum of 3/8 inch (9.5mm) when fully extended
7. Auxiliary deadlatch to be made of one piece stainless steel, permanently lubricated
8. Provide sufficient curved strike lip to protect door trim
9. Lever handles must be of forged or cast brass, bronze or stainless steel construction and conform to ANSI A117.1. Levers that contain a hollow cavity are not acceptable
10. Lock shall have self-aligning, thru-bolted trim
11. Levers to operate a roller bearing spindle hub mechanism
12. Mortise cylinders of lock shall have a concealed internal setscrew for securing the cylinder to the lockset. The internal setscrew will be accessible only by removing the core, with the control key, from the cylinder body.
13. Spindle to be designed to prevent forced entry from attacking of lever
14. Provide locksets with 7-pin removable and interchangeable core cylinders
15. Each lever to have independent spring mechanism controlling it
16. Core face must be the same finish as the lockset

C. Exit Devices shall:
1. Tested and approved by BHMA for ANSI 156.3, Grade 1
2. Provide a deadlocking latchbolt
3. Non-fire rated exit devices shall have cylinder dogging.
4. Touchpad shall be “T” style
5. Exposed components shall be of architectural metals and finishes.
6. Lever design shall match lockset lever design
7. Provide strikes as required by application.
8. Fire exit devices to be listed for UL10C
9. UL listed for Accident Hazard
10. Provide vandal resistant or breakaway trim

D. Door Closers shall:
1. Tested and approved by BHMA for ANSI 156.4, Grade 1
2. UL10C certified
3. Closer shall have extra-duty arms and knuckles
4. Conform to ANSI 117.1
5. Maximum 2 7/16 inch case projection with non-ferrous cover
6. Separate adjusting valves for closing and latching speed, and backcheck
7. Provide adapter plates, Ex-bolts, shim spacers and blade stop spacers as required by frame and door conditions

8. Full rack and pinion type closer with 1½“ minimum bore
9. Mount closers on non-public side of door, unless otherwise noted in specification
10. Closers shall be non-handed, non-sized and multi-sized.

E. Kickplates: Provide with four beveled edges, 8 inches high by width less 2 inches on single doors and 1 inch on pairs of doors. Furnish pan-head countersunk screws to match finish.

F. Seals: All seals shall be finished to match adjacent frame color. Seals shall be furnished as listed in schedule. Material shall be UL listed for labeled openings.

G. Key Control: Provide one wall mounted key cabinet complete with hooks, index and tags.

H. Silencers: Furnish silencers on all interior frames, 3 for single doors, 2 for pairs. Omit where any type of seals occur.

2.3 FINISH:

A. Designations used in Schedule of Finish Hardware - 3.5, and elsewhere to indicate hardware finishes are those listed in ANSI/BHMA A156.18 including coordination with traditional U.S. finishes shown by certain manufacturers for their products

B. Powder coat door closers to match other hardware, unless otherwise noted.

C. Aluminum items shall be finished to match predominant adjacent material. Seals to coordinate with frame color.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verification of conditions: Examine doors, frames, related items and conditions under which Work is to be performed and identify conditions detrimental to proper and or timely completion.

1. Do not proceed until unsatisfactory conditions have been corrected.

3.2 HARDWARE LOCATIONS:

A. Mount hardware units at heights indicated in the following publications except as specifically indicated or required to comply with the governing regulations.
1. Recommended Locations for Builder’s Hardware for Standard Steel Doors and Frames, by the Door and Hardware Institute (DHI).
2. NWWDA Industry Standard I.S.1.7, Hardware Locations for Wood Flush Doors.

3.3 INSTALLATION:

A. Install each hardware item per manufacturer's instructions and recommendations. Do not install surface mounted items until finishes have been completed on the substrate. Set units level, plumb and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.

B. Conform to local governing agency security ordinance.

C. ADA Standard: Conform to ANSI A117.1 for positioning requirements for disabled.

D. Installed hardware using the manufacturers fasteners provided. Drill and tap all screw holes located in metallic materials. Do not use “Riv-Nuts” or similar products.

3.4 FIELD QUALITY CONTROL AND FINAL ADJUSTMENT

A. Contractor/Installer Field Services: After installation is complete, Contractor shall inspect completed door openings on site to verify installation of hardware is complete and properly adjusted, in accordance with both the Contract Documents and final shop drawings.

1. Check and adjust closers to ensure proper operation.
   a. Adjust closer to complete full closing cycle in less than 4 to 6 seconds without abrupt change of speed between "Sweep" and "Latch" speeds.
   b. Adjust "Backcheck" according to manufacturer's instructions.
   c. Set exterior doors closers to have 5 lbs maximum pressure to open, interior non-rated at 5 lbs, rated openings at 12lbs

2. Check latchset, lockset, and exit devices are properly installed and adjusted to ensure proper operation.
   a. Verify levers are free from binding.
   b. Ensure latchbolts and dead bolts are engaged into strike and hardware is functioning.

3. Report findings, in writing, to the Architect and Hardware Supplier outlining corrective actions and recommendations.

3.5 SCHEDULE OF FINISH HARDWARE:

Manufacturer List

Code	Name
AB	ABH Manufacturing Inc.
BE	Best Access Systems
DJ	Don-Jo
LC	LCN Closers
NA	National Guard

END OF SECTION

SECTION 08 80 00
GLASS GLAZING

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to provide glass and glazing as indicated on the Drawings and specified herein.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The WORK of the following Sections or Divisions applies to the WORK of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this WORK.

1. Section 07 92 00 Joint Sealants.

2. Section 08 41 13 Aluminum Entrances and Storefronts.

3. Section 10 28 00 Toilet and Bath Accessories.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with reference standards and Standard Specifications of the GENERAL REQUIREMENTS.

B. Comply with the following American Institute of Steel Construction (AISC) references, as applicable:

1. Federal Specifications:
   a. DD-G-451DGlass, Float or plate, Sheet, Figured(Flat for Glazing, Mirrors and Other Uses.)

   b. DD-G-1403CGlass, Float, Sheet, Figured, Coated (Heat-Strengthened and Tempered.)

   c. TT-S-001543ASealing Compound, Silicone Rubber Base (For Calking, Sealing and Glazing in Buildings and Other Structures.)

2. Commercial Standards:
   a. ASTM C 1036 - Standard Specification for Flat Glass.

   b. ASTM C 1048 - Standard Specification for Heat-Treated Flat Glass--Kind HS, Kind FT Coated and Uncoated Glass.

   c. ASTM C 1172 – Standard Specification for Laminated Architectural Flat Glass.

   d. ASTM C 1376 - Standard Specification for Pyrolytic and Vacuum Deposition Coatings on Glass.

   e. ASTM E 1886 - Test Method for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Missile(s) and Exposed to Cyclic Pressure Differentials.

f. ASTM E 1996 - Standard Specification for Performance of Exterior Windows, Curtain Walls, Doors and Impact Protective Systems Impacted by Windborne Debris in Hurricanes.

g. CPSC 16CFR-1201 - Safety Standard for Architectural Glazing Materials.

h. GANA Glazing Manual.

i. GANA Laminated Glazing Reference Manual

j. ASTM D 2287Specification for Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds.

k. ANSI Z 97.1Glazing Materials used in Buildings, Safety Performance Specifications and Methods of Test.

3. Trade Standards:
   a. "Glazing Manual" and "Glazing Sealing Systems Manual."

   b. "Glazing Specifications for Sealed Insulating Glass Units" by the Sealed Insulating Glass Manufacturers Association (SIGMA).

4. Manufacturers' Standards: In addition to the standards listed above, the glass, calking materials, and their installation, shall be in accordance with the manufacturer's published recommendations and specifications.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. Manufacturer's Data:

1. A complete materials list showing all items proposed to be furnished and installed under this Section.

2. Sufficient data to demonstrate that all such materials meet or exceed the specified quality requirements with an analysis of each size, type, position and location of the glazing.

3. For information only, submit two copies of manufacturer's specifications, recommendations and installation instructions for each type of glazing sealant and compound, gasket and associated miscellaneous material required. Include manufacturer's published data, or letter of certification, or certified test laboratory report indicating that each material complies with the requirements and is intended generally for the applications shown including, but not limited to, manufacturer's certification that safety glass complies with ANSI Z97.1. Show by transmittal that one copy of each recommendation and instruction has been distributed to the glazier.

C. Buy Clean California Act

1. For project specifications that include GR Section 1601, Buy Clean California Act, bidders shall submit current Environmental Product Declarations (EPDs) for “Flat Glass” from the originating producer. When products are being secured from different producers, an EPD will be required for each specific product from each producer.

2. An EPD must conform to the following:

a. Shall be facility-specific manufacturer/mill EPD. However, industry-average EPDs may also be permitted when indicated as such per GR Section 1601.
b. Be independently verified in accordance with ISO 14025 (Type III).
c. Be developed according to the guidelines of the applicable Product Category Rule (PCR), as identified by the Department of General Services, State of California.
d. Have a valid date that has not expired.
e. Shall not exceed the maximum Global Warming Potential (GWP) limit as required by GR Section 1601.

3. EPD shall be submitted concurrently with the product's submittal for review and approval.

D. Samples: Submit samples of the following:

1. Tinted vision glass, 12-inches by 12-inches

2. Glazing Material: Submit three 12-inch long samples of each color required for each type of glazing sealant or gasket exposed to view. Install sample between two strips of material similar to or representative of channel surfaces where sealant or gasket will be used, held apart to represent typical joint widths.
Samples will be reviewed by ENGINEER for color and texture only. Compliance with all other requirements is the exclusive responsibility of the CONTRACTOR.

3. Glazing Gaskets: Two 12-inch by 12-inch corner pieces with vulcanized corner joints for each shape, section, kind, configuration, and hardness of compression seal gaskets, also glazing tapes, spacer blocks, and spacer backing materials.

4. Sealant: Two cured sealant beads for each color required for sealant in exposed joints with samples of backing materials.

E. Glass Certificate and Analysis: Submit four copies each of:

1. Certificate: A letter, signed by the glass manufacturer, stating that he has reviewed project glazing details, glass types and glass thicknesses and that he finds them suitable for intended purposes in accordance with his published literature and requirements of the Contract Documents.

2. Analysis for Exterior Glass: The glass manufacturer's certificate shall be accompanied by wind load, stress and deflection, and thermal stress analyses. Wind load analysis shall show the maximum wind load that each piece of glass can withstand with a failure probability no greater than eight lights per thousand at specified wind loads and in compliance with specified deflection limitations.

F. Sealant and Structural Silicone Data: Submit four copies each of:

1. Certificate: A letter signed by the sealant manufacturer stating that he has reviewed all sealant details, tested all contact surfaces and finds them suitable for their intended purpose and proposed sealant is compatible with surfaces it contacts, will adhere satisfactorily to bonding surfaces, and will not stain surfaces it will contact. Also, provide surface preparation and primer requirements, if any, based on testing of actual project substrates.

2. Test Reports:

a. Sealant manufacturer's certification as to compatibility, adhesion sufficiency, and nonstaining shall be accompanied by actual test results on production substrates

performed in accordance with applicable ASTM procedures and shall include the following based upon tests performed on production run materials:

b. Adhesion test data to production samples of metal and glass, tested in accordance with ASTM C 794, establishing adhesion over the temperature range **[as described under the performance criteria section of this Specification.]**

c. Compatibility statement that the materials in contact with the sealant such as gaskets, spacers, setting blocks, including seals in insulating glass units and laminate sheet in safety glass, are compatible with the sealant after 21 days' exposure to ultraviolet, 2,0004,000 (microwatt ultraviolet radiation).

d. Stress statement that, when exposed to the specified wind load, the stress on the silicone sealant does not exceed 20 psi to provide a safety factor of not less than 2.5.

G. Shop Drawings: Submit shop drawings showing glazing methods.

1.5 QUALITY ASSURANCE

A. Water Test: After nominal cure of exterior glazing sealants which are exposed to the weather, test for water leaks. Flood the joint exposure with water directed from a 3/4-inch garden hose held perpendicular to wall face, 2-feet from the joint, connected to a water system with 30 psi minimum normal water pressure. Move stream of water along joint at an approximate rate of 20-feet per minute.

B. Test Sample: Test approximately 5% of total glazing system, in locations which are typical of every joint condition and which can be inspected easily for leakage on opposite face. Conduct tests in the presence of the ENGINEER, who will determine the actual period of exposure to water from the hose, based upon the extent of observed leakage or lack thereof.

C. Repair Leaks: Repair glazing installation at leaks or, if leakage is excessive (uncontrolled), replace glazing sealants as directed.

D. Additional Testing: Whenever nature of observed leakage indicates the possibility of inadequate glazing joint bond strength, ENGINEER may direct that additional testing be performed at a time when joints have been fully cured, followed by natural exposure through both extreme temperatures, and returned to the range of temperature in which it is feasible to conduct testing. Repair or replace all deficient and defective work as required or directed.

PART 2 – PRODUCTS

2.1 MATERIALS

A. Glass: All materials shall be new of the types specified. Glass shall conform to the applicable requirements of Fed. Spec. DD-G-451 and DD-G-1403.

1. Primary and fabricated glass shall be products of a single manufacturer and shall be certified by him as suitable for intended use. Glass shall bear the manufacturer's labels and be accompanied by manufacturer's glazing instructions where applicable.

2. Glass thickness and temper shall not be less than as recommended by the manufacturers to resist heat breakage, meet structural loading requirements and provide visual uniformity federal selection of glass thickness and temper shall take into consideration that glass must meet

requirements of federal and state safety building code enforcement agencies. Glass thicknesses, where indicated, were included for design purposes and shall be minimum requirement.

3. Glass, except as noted otherwise, shall be product of Vitro Architectural Glass, Guardian Glass, or approved equal. Where type is not indicated on drawings, glass shall be designed by the CONTRACTOR to meet the criteria specified in the sections governing the work.

4. The manufacturer's names, item numbers, or trade names given, where used, indicate general design and/or color tint only and are not restrictive. Items of similar design by other manufacturers and meeting specified requirements and of equal overall quality may be submitted for approval except that all tinted glass and all insulated glass units shall be by the same manufacturer.

5. All glass furnished under this Contract shall comply with provisions of the Safety Standard for Architectural Glazing Materials (16 CFR 1201) and, in addition, to all glazing requirements of state and local safety and building codes, ordinances, and regulations.

6. Identify all glass, components of [aluminum] frames, and all boxing containing [aluminum] sections for frames with the labels of the manufacturer.

7. Keep label on glass until the final cleaning. Label on wire glass shall indicate that glass is for use in fire-rated construction.

8. Glass shall conform to color and physical properties (e.g., light transmission, shading coefficient, insulation values, etc.) published by manufacturers for the glass given as examples.

B. Schedule:

Class Type: Clear Panel - Solar Control Low-E Clear Insulating Glass

Total System Thickness: 1”
Outdoor lite: float glass, sputter coated on second surface
Indoor lite: clear (transparent) float glass
Low e coating on second surface
Outdoor appearance: clear
Insulating Unit Construction: 1/4” (6mm) glass + 1/2” (13mm) air space + 1/4” (6mm) glass

Description:

Visible Light Transmittance	U-Value Winter	U-Value Summer	SHGC	Shading Coefficient	Outdoor Visible Light Reflectance
64%	0.28	0.26	0.27	0.32	13%

Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Vitro Architectural Glass (basis of design) Solarban 70 (2) Clear
2. Guardian Glass

C. Elastomeric Sealants and Seals:

1. Colors: Provide in color selected by ENGINEER where exposed. Wherever material is not exposed to view, provide manufacturer's standard color which has the best overall performance characteristics for the application shown.

2. Hardness: Hardnesses shown and specified are intended to indicate the general range necessary for overall performance. Consult the glass manufacturer's technical representative to determine the actual hardness recommended for the conditions of installation and use. Information concerning anticipated glass movement and glazing channel width and depth shall be determined by the criteria for the curtain wall for exterior glazing.

   Except as otherwise recommended, provide glazing materials within the following ranges of hardness (Shore A, fully cured, at 75 degrees F):

   a. 15 to 35 for elastomeric compounds and tapes used with rigid stops and frames for large glass sizes (in excess of 100 united inches). Provide material sufficiently hard to withstand impact of moving sash and doors. 25 to 50 for rubberlike curing compounds used with rigid stops and frames for medium and small glass sizes (less than 100 united inches). Provide materials sufficiently hard to withstand impact of moving sash and doors.

   b. 35 to 60 for molded gaskets used with rigid stops and frames, depending upon strength needed for application or insertion of units.

   c. 75 to 80 for structural gaskets (not supported by stops).

   d. Nonelastomeric Compounds: (Shore A not applicable.) 2 to 12 mm penetration for 5.0 seconds of penetrometer needle on nominally cured compound (ASTM D 2541).

3. Compatibility: Before purchase of the specified glazing materials, investigate compatibility with the channel surfaces, joint fillers and other materials in the glazing channel. Provide only materials (manufacturer's recommended variation of the specified materials) which are known to be fully compatible with the actual installation condition, as shown by manufacturer's published data or certification or by test.

4. Type: Provide size and shape of gaskets and preformed glazing units as shown or, if not shown, as recommended by the manufacturer, either in his published data or upon consultation with his technical representative.

5. One-Component Elastomeric Glazing Sealants:

   a. Use only nonacid-type silicone rubber glazing sealant.

   b. One-part nonacid-type silicone rubber elastomeric sealant, complying with FS TT-S1543, Class A, nonsag, certified by manufacturer for glazing.

   c. Products/Manufacturers: Provide one of the following, or equal:

      1) 780 Building Sealant, Dow Corning Corp.

      2) Silicone Sealant 1300, General Electric Co.

3) 862 Silicon Arch. Sealant, Pecora Corp.

6. Preformed Elastomeric Glazing Sealants:

a. Butyl Rubber Glazing Tape:

1) A partially vulcanized, self-adhesive, nonstaining, elastomeric butyl rubber tape, recommended by the manufacturer for waterproof construction when compressed 35% in dynamically moving joints; not less than 98% solids; no deterioration for 3,000 hour test in Atlas Weatherometer.

b. Manufacturers: Provide one of the following, or equal:

1) Intercostal Corp., "Inco lastic 7500".

2) Protective Treatments, Inc., "PTI 606".

D. Miscellaneous Glazing Materials:

1. Channel Cleaner: Use the type of compound recommended by the sealant manufacturer for the channel surfaces to be cleaned.

2. Channel Primer/Sealer: Provide the type of primer or sealer recommended by the sealant manufacturer for application of his sealant to the channel surfaces.

3. Setting Blocks: Neoprene or other resilient blocks of 80 to 90 Shore A durometer hardness, tested for compatibility with specified glazing sealants. Shims, if required, shall be of same material as setting blocks. Shims for centering insulating glass units in rabbet for wet glazing shall be 40-50 durometer and placed in the rabbet on all four sides indoors and out. Shims shall be continuous or at least 4-inches long, placed on 18- to 24-inch centers with at least 1/8inch bite on the glazing unit edges. Setting blocks (and shims, if any) shall be full width of setting channel and not less than 0.1-inch per square foot of glass with a minimum length of 4inches.

4. Spacers and Edge Blocks: Black, dense, heat-cured silicone rubber of 60 to 70 Shore A durometer hardness, unless otherwise specified by the glass manufacturer, adhesively backed on one face only, tested for compatibility with specified glazing sealants. Size blocks to allow 1/8-inch clearance between block and edge of glass.

5. Compressible Filler Rod: Closed-cell or waterproof-jacketed foam of polyethylene, butyl rubber, neoprene, polyurethane or vinyl, tested for compatibility with specified glazing sealants, of 5 to 10 psi compression strength (25% deflection), as recommended by sealant manufacturers for use in glazing channel to prevent sealant from exuding from the channel.

PART 3 – EXECUTION

3.1 SURFACE CONDITIONS

A. Inspection:

1. General: Prior to installation of the work of this Section, carefully inspect the installed work of all other trades and verify that all such work is complete to the point where this installation may properly commence. Verify that glazing may be performed in strict accordance with the approved design and the referenced standards.

2. Framing System: Elements which directly support the glass shall be square, in plane, and free of glazing obstructions. Provide rigid four-side support at design wind loads by limiting deflection and rotational forces on the glass. Sill members shall be rigid and securely supported to properly support the weight of the unit. (Limit deflection with setting blocks in their proper position.) The framing system shall be watertight and weeped to prevent water accumulation detrimental to long-term performance of the glass.

3. Glazing Rabbet: The rabbet shall be sized to meet the minimum clearances recommended by the glass manufacturer.

4. Weep Holes: Make sure that accumulated water or moisture cannot remain in the glazing rabbet for prolonged periods of time. Drain or weep the sill of each opening to the outdoors at least three points using 3/8-inch diameter weep holes or the equivalent dimension. Locate one weep at the center of the span and one each between the jamb and setting block.

5. Weather Conditions: Do not proceed with installation of glass or sealants under adverse weather conditions or when temperatures are below or above manufacturer's recommended limitations for installation. Wherever channel action is affected by ambient temperature variations, install glazing sealants only when temperatures are in the middle third of manufacturer's recommended installation temperature range, so that sealant will not be subjected to excessive elongation or compression and bond stress will not be excessive at extremely low or high temperatures. Coordinate time schedule with CONTRACTOR to avoid delay of project.

6. Statement of Noncompliance: Wherever it is necessary to proceed with the installation of glazing sealants or compounds under conditions which do not fully comply with the requirements (because of time schedule or other reasons which the CONTRACTOR determines to be crucial to the project), prepare a written statement for the CITY'S record (with copies to the CONTRACTOR and ENGINEER) indicating the nature of the noncompliance, the reasons for proceeding, the extra or precautionary measures taken to ensure the best possible work, and the names of the individuals concurring with the decision to proceed with the glazing work.

B. Performance Requirements:

1. Watertight and airtight installation of each piece of glass is required. Each installation must withstand normal temperature changes, wind loading, without failure of any kind, including loss or breakage or glass, failure of sealants or gaskets to remain watertight and airtight, deterioration of glazing materials and other defects in the work.

2. Protect glass from edge damage at all times during handling, installation and operation of the building. Glass breakage during the guarantee period will be considered a form of faulty material or workmanship (resulting from edge damage) unless known to result from vandalism or other causes not related to materials and workmanship.

3. Glazing channel dimensions shall provide for necessary minimum bite on the glass, minimum edge clearance and adequate sealant thicknesses, with reasonable tolerances. Single glass panes shall have no less than 3/8-inch bite. The glazier shall be responsible for correct glass size for each opening, within the tolerances and necessary dimensions established.

C. Discrepancies: Do not commence installation until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General and Standards:

1. Comply with combined recommendations of the "Gazing Manual" by Glass Association of North America (GANA),[AAMA,] glass manufacturer, and manufacturer of sealants and other materials used in glazing, except where more stringent requirements are shown or specified and except where glass manufacturers' technical representatives direct otherwise.

2. Unify appearance of each series of lights by setting each piece to match others as nearly as possible. Inspect each piece and set with pattern, draw and bow oriented in the same direction as other pieces.

3. Inspect each piece of glass immediately before installation and eliminate pieces which have observable edge damage or face imperfections.

4. Cut and install colored (tinted) glass as recommended in "Technical Services Report No. 104B" by PPG Industries, or similar report by other glass manufacturer.

5. Cut and install reflective glass as recommended by LOF or manufacturer of glass.

B. Preparation of Substrate:

1. Clean the glazing channel, or other framing members to receive glass, immediately before glazing. Remove coatings which are not firmly bonded to the substrate. Remove lacquer from metal surfaces wherever elastomeric sealants are used.

2. Apply primer or sealer to joint surfaces wherever recommended by sealant manufacturer.

C. Glass Setting:

1. Items to be glazed may be shop-glazed or field-glazed, with glass of the quality and thickness specified.

2. Distortion: Cut and install glass with the visible lines or waves running in the horizontal direction.

3. Glazing shall be in accordance with the manufacturer's approved instructions.

4. All lights shall be free of edge shells, cracks, runs, surface scratches or excessive surface draw marks or visual distortion.

5. All glass shall be set free of warping, twisting or movement other than may be due to normal thermal expansion. Any lights which are cracked, chipped, or scratched during installation shall be removed and replaced with undamaged units.

6. Units shall be delivered to and handled at the site by methods which will prevent strain, distortion, or other damage.

7. Setting Blocks:

a. Provide two blocks (80-90 durometer) at quarter points but the nearest edge of the setting block should be no closer than 6-inches to the corner of the glass. The width of the setting block should be equal to or greater than the thickness of the glass unit it supports.

b. Chairs (risers): Where glazing rabbets are exceptionally deep, [aluminum] or other material may be used to elevate the (80-90 durometer) setting block. Where chairs are used, they shall be sized properly and fixed in position so they cannot shift during glazing or in service and the setting block shall be securely fastened to the chair.

8. In no case shall glazed units be identified by paper adhered to the glass or by use of soap or cleaning powder for markings. Identification shall only be by flags or markers attached to the framing members and held away from the glass.

9. Positioning Glass in Wet Seal: Set vision glass from inside the building. Position glass in glazing rabbet to maintain specified edge clearances and glass bite at perimeter on all four sides. Maintain position of glass in rabbet and provide the required sealant thickness on both sides of glass. Whenever glass dimensions are larger than 50 united inches, provide setting blocks at the sill and spacer shims on all four sides; locate setting blocks one quarter way in from each jamb edge of glass. Where setting blocks and spacer shims are required, set into a glazing sealant. They may be buttered with the sealant and they shall then be mechanically locked in position. Sealant shall be allowed to firmly set prior to installation of glass.

10. Setting Methods: Apply glazing sealant, glazing tape, and gaskets uniformly with accurately formed corners and bevels. Remove excess compound from glass and sash. Use only recommended thinners, cleaners, and solvents. Do not cut or dilute glazing compounds or sealants. Strip surplus angle to shed water and provide clean sight lines. Secure stop beads in place with suitable fastenings. Do not apply sealant at temperatures lower than 40 degrees

F or on a damp, dirty, or dusty surface. After glazing, fix sash so it cannot be operated until compound or sealant has set. The following setting methods shall be used as indicated and where shown on the approved shop drawings.

Type I: Compression gasket glazing, using compression gaskets both sides of glass and adjustable or snap-on interior stops shall be used unless otherwise indicated. Install gaskets in accordance with manufacturer's instructions.

Type II: Sealant glazing, using glazing sealant to completely fill the channel on edges and on both sides of glass.

Type III: Sealant and tape glazing, using glazing sealant for a cap bead above glazing tape against fixed exterior stops and glazing tape full height against removable interior stops.

Type IV: Sealant and tape glazing, using glazing sealant full height against removable exterior stops with heel bead or glazing sealant and glazing tape full height against fixed interior stops.

Type V: Tape, sealant, and compound glazing, using glazing tape full height against removable exterior stops with heal bead or glazing sealant and glazing tape full height against fixed interior stops.

Type VI: Tape, sealant, and gasket glazing, using glazing tape full height against fixed exterior stops, glazing sealant as a heel-bead at edge of glass, and preformed vision strip gasket against removable interior snap-on stops.

Type VII: Lock-strip gasket glazing, using lock-strip glazing gaskets. Install gaskets in accordance with manufacturer's instructions using special tools and lubricants.

D. Sealant Glazing:

1. Install setting blocks of proper size at quarter points of sill rabbet but not closer than 6-inches from corner. Set blocks in thin course of the heal-bead compound, if any.

2. Provide spacers inside and out, and of proper size and spacing, for all glass sizes larger than 50 united inches, except where gaskets are used for glazing. Provide 1/8-inch minimum lap of spacers on glass, and use thickness equal to sealant width, except with butyl rubber sealant tape, use thickness 1/32-inch less than final compressed thickness of tape.

3. Voids and Filler Rods: Prevent exudation of sealant or compound by installing filler rods in the channel at the heel or jambs and heads or by forming voids. Do not leave voids in the sill channels. In general, filler rods or voids are required for glazing insulating glass more than 1/2inch thick and for laminated or tinted glass larger than 75 united inches and for other glass more than 9/32-inch thick or larger than 120 united inches.

4. Force sealants into channel to eliminate air pockets and voids (other than expansion voids) and to ensure complete "wetting" or bond of sealant to glass and channel surfaces.

5. Tool exposed surfaces of glazing sealants and compounds to provide a substantial "wash" away from the glass.

6. When installing processed glass, exercise extreme care to avoid contact of glazing materials with processed surfaces except where concealed in the glazing channel. Use masking tape to ensure limitation of compounds to the channel area.

7. Clean and trim excess glazing materials from the glass and stops or frames promptly after installation, and eliminate stains and discolorations.

E. Gaskets and Tapes:

1. Miter cut and bond ends together at corners where gaskets are used for channel glazing, so that gaskets will not pull away from corners and result in voids or leaks in the glazing system.

2. Where wedge-shaped gaskets are driven into one side of the channel to pressurize the sealant or gasket on the opposite side, provide adequate anchorage to ensure that gasket will not "walk" out when subjected to dynamic movement. Anchor gasket to stop with matching ribs.

3.3 PROTECTION OF GLAZING

A. Instruction: The glazier shall advise the CONTRACTOR of procedures required for the protection of glass and glazing sealants and compounds during the construction period, so that they will be without deterioration of damage (other than normal weathering) at the time of CITY's acceptance.

B. Precautions: Take all necessary precautions and provisions required to prevent glass damage resulting from the alkaline wash from grout, green concrete surfaces, and similar sources of possible damage.

C. Protect glass from breakage immediately upon installation, by attachment of crossed streamers to framing held away from glass. Do not apply markers of any type to surfaces of glass.

D. Remove and replace glass which is broken, chipped, cracked, abraded, or damaged in other ways (including natural causes, accidents, and vandalism) during the construction period.

3.4 CLEANING GLASS

A. Maintain glass in a reasonably clean condition during construction, so that dirt accumulation will not cause damage by corrosive action and will not contribute (by wash-off) to the deterioration of glazing materials and other surfaces below.

B. Wash and polish glass on both faces not more than 4 days prior to CITY's acceptance of work in each area, removing manufacturer's adhesive label at this time. Comply with glass manufacturer's recommendations for cleaning.

3.5 CLEANUP

A. Upon completion of installation of glass and glazing work, cleanup all waste materials and debris resulting from this operation and dispose of such waste materials and debris off the site.

END SECTION

SECTION 08 83 00

MIRRORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes the following types of silvered flat glass mirrors: Annealed monolithic glass mirrors.

B. Related Requirements:

1. Section 08 81 00 "Glazing" for glass with reflective coatings used for vision and spandrel lites.
2. Section 10 28 00 "Toilet, Bath, and Laundry Accessories" for metal-framed mirrors.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product. Mirrors. Include description of materials and process used to produce each type of silvered flat glass mirror specified that indicates sources of glass, glass coating components, edge sealer, and quality-control provisions.

B. Shop Drawings: Include mirror elevations, edge details, mirror hardware, and attachment details.

C. Samples: For each type of the following:

1. Mirrors: 12 inches square, including edge treatment on two adjoining edges.
2. Mirror Clips: Full size.
3. Mirror Trim: 12 inches long.

1.3 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Product Certificates: For each type of mirror and mirror mastic.

C. Preconstruction Test Reports: From mirror manufacturer indicating that mirror mastic was tested for compatibility and adhesion with mirror backing and substrates on which mirrors are installed.

D. Sample Warranty: For special warranty.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For mirrors to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A qualified installer who employs glass installers for this Project who are certified under the National Glass Association's Certified Glass Installer Program.

1.6 PRECONSTRUCTION TESTING

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect mirrors according to mirror manufacturer's written instructions and as needed to prevent damage to mirrors from moisture, condensation, temperature changes, direct exposure to sun, or other causes.

B. Comply with mirror manufacturer's written instructions for shipping, storing, and handling mirrors as needed to prevent deterioration of silvering, damage to edges, and abrasion of glass surfaces and applied coatings. Store indoors.

1.8 FIELD CONDITIONS

A. Environmental Limitations: Do not install mirrors until ambient temperature and humidity conditions are maintained at levels indicated for final occupancy.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to replace mirrors that deteriorate within specified warranty period. Deterioration of mirrors is defined as defects developed from normal use that are not attributed to mirror breakage or to maintaining and cleaning mirrors contrary to manufacturer's written instructions. Defects include discoloration, black spots, and clouding of the silver film. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Binswanger Mirror; a division of Vitro America, Inc.
2. Gardner Glass, Inc.
3. Guardian Industries Corp.; SunGuard.
4. Walker Glass Co., Ltd.

B. Source Limitations for Mirrors: Obtain mirrors from single source from single manufacturer.

C. Source Limitations for Mirror Accessories: Obtain mirror glazing accessories from single source.

2.2 SILVERED FLAT GLASS MIRRORS

A. Mirrors, General: ASTM C 1503; manufactured using copper-free, low-lead mirror coating process.

B. Annealed Monolithic Glass Mirrors: Mirror Glazing Quality, clear. Nominal Thickness: 6.0 mm.

2.3 MISCELLANEOUS MATERIALS

A. Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.

B. Edge Sealer: Coating compatible with glass coating and approved by mirror manufacturer for use in protecting against silver deterioration at mirrored glass edges.

C. Mirror Mastic: An adhesive setting compound, asbestos-free, produced specifically for setting mirrors and certified by both mirror and mastic manufacturer as compatible with glass coating and substrates on which mirrors will be installed.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Laurence, C. R. Co., Inc.
    b. Macco Adhesives.
    c. Palmer Products Corporation.
    d. Pecora Corporation.
    e. Royal Adhesives & Sealants.
    f. Sommer & Maca Industries, Inc.

2. Adhesives shall have a VOC content of 70 g/L or less.

2.4 MIRROR HARDWARE

A. Aluminum J-Channels: Aluminum extrusions with a return deep enough to produce a glazing channel to accommodate mirrors of thickness indicated and in lengths required to cover edges of mirrors in a single piece.

1. Bottom Trim: J-channels formed with front leg and back leg not less than 3/8 and 7/8 inch in height, respectively, and a thickness of not less than 0.04 inch. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Andscot Company, Inc.
    b. Laurence, C. R. Co., Inc.
    c. Stylmark, Inc.

2. Top Trim: J-channels formed with front leg and back leg not less than 5/8 and 1 inch in height, respectively, and a thickness of not less than 0.04 inch. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Andscot Company, Inc.
    b. Laurence, C. R. Co., Inc.

c. Stylmark, Inc.

3. Finish: Clear bright anodized.

B. Fasteners: Fabricated of same basic metal and alloy as fastened metal and matching it in finished color and texture where fasteners are exposed.

C. Anchors and Inserts: Provide devices as required for mirror hardware installation. Provide toothed or lead-shield, expansion-bolt devices for drilled-in-place anchors. Provide galvanized anchors and inserts for applications on inside face of exterior walls and where indicated.

2.5 FABRICATION

A. Fabricate mirrors in the shop to greatest extent possible.

B. Fabricate cutouts for notches and holes in mirrors without marring visible surfaces. Locate and size cutouts so they fit closely around penetrations in mirrors.

C. Mirror Edge Treatment: Flat polished.

1. Seal edges of mirrors with edge sealer after edge treatment to prevent chemical or atmospheric penetration of glass coating.
2. Require mirror manufacturer to perform edge treatment and sealing in factory immediately after cutting to final sizes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, over which mirrors are to be mounted, with Installer present, for compliance with installation tolerances, substrate preparation, and other conditions affecting performance of the Work.

B. Verify compatibility with and suitability of substrates, including compatibility of existing finishes or primers with mirror mastic.

C. Proceed with installation only after unsatisfactory conditions have been corrected and surfaces are dry.

3.2 PREPARATION

A. Comply with mastic manufacturer's written installation instructions for preparation of substrates, including coating substrates with mastic manufacturer's special bond coating where applicable.

3.3 INSTALLATION

A. General: Install mirrors to comply with mirror manufacturer's written instructions and with referenced GANA publications. Mount mirrors accurately in place in a manner that avoids distorting reflected images. GANA Publications: "Glazing Manual" and "Mirrors, Handle with Extreme Care: Tips for the Professional on the Care and Handling of Mirrors."

B. Provide a minimum airspace of 1/8 inch between back of mirrors and mounting surface for air circulation between back of mirrors and face of mounting surface.

C. Install mirrors with mastic and mirror hardware. Attach mirror hardware securely to mounting surfaces with mechanical fasteners installed with anchors or inserts as applicable. Install fasteners so heads do not impose point loads on backs of mirrors.

1. Aluminum J-Channels: Provide setting blocks 1/8 inch thick by 4 inches long at quarter points. To prevent trapping water, provide, between setting blocks, two slotted weeps not less than 1/4 inch wide by 3/8 inch long at bottom channel.
2. Install mastic as follows:

a. Apply barrier coat to mirror backing where approved in writing by manufacturers of mirrors and backing material.
b. Apply mastic to comply with mastic manufacturer's written instructions for coverage and to allow air circulation between back of mirrors and face of mounting surface.
c. After mastic is applied, align mirrors and press into place while maintaining a minimum airspace of 1/8 inch between back of mirrors and mounting surface.

3.4 CLEANING AND PROTECTION

A. Protect mirrors from breakage and contaminating substances resulting from construction operations.

B. Do not permit edges of mirrors to be exposed to standing water.

C. Maintain environmental conditions that prevent mirrors from being exposed to moisture from condensation or other sources for continuous periods of time.

D. Clean exposed surface of mirrors not more than four days before date scheduled for inspections that establish date of Substantial Completion. Clean mirrors as recommended in writing by mirror manufacturer.

END OF SECTION

SECTION 08 91 19

FIXED LOUVERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Fixed, extruded-aluminum louvers.

B. Related Requirements: Section 08 11 13 "Hollow Metal Doors and Frames" for louvers in hollow-metal doors.

1.2 DEFINITIONS

A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.

B. Horizontal Louver: Louver with horizontal blades (i.e., the axes of the blades are horizontal).

C. Vertical Louver: Louver with vertical blades (i.e., the axes of the blades are vertical).

D. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.

B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.

1. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.
2. Show mullion profiles and locations.

C. Samples: For each type of metal finish required.

D. Delegated-Design Submittal: For louvers indicated to comply with structural and seismic performance requirements, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Product Test Reports: Based on evaluation of comprehensive tests performed according to AMCA 500-L by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver and showing compliance with performance requirements specified.

B. Windborne-debris-impact-resistance test reports.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following: AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

1.6 FIELD CONDITIONS

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain louvers from single source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design louvers, including comprehensive engineering analysis by a qualified professional engineer, using structural and seismic performance requirements and design criteria indicated.

B. Structural Performance: Louvers shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building. Wind Loads: Determine loads based on pressures as indicated on Drawings.

C. Seismic Performance: Louvers, including attachments to other construction, shall withstand the effects of earthquake motions determined according to 2013 CBC.

D. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

E. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

F. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

2.3 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Horizontal, Drainable-Blade Louver:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Air Balance Inc.; a division of MESTEK, Inc.
    b. Airolite Company, LLC (The).
    c. Carnes Company.
    d. Construction Specialties, Inc.
    e. Greenheck Fan Corporation.
    f. Nystrom, Inc.
    g. Ruskin Company.

2. Louver Depth: 4 inches.
3. Frame and Blade Nominal Thickness: Not less than 0.080 inch.
4. Mullion Type: Exposed.
5. Louver Performance Ratings:

    a. Free Area: Not less than 7.0 sq. ft. for 48-inch-wide by 48-inch-high louver.
    b. Point of Beginning Water Penetration: Not less than 900 fpm.
    c. Air Performance: Not more than 0.10-inch wg static pressure drop at 700-fpm free-area intake velocity.
    d. Air Performance: Not more than 0.15-inch wg static pressure drop at 900-fpm free-area exhaust velocity.

6. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

2.4 LOUVER SCREENS

A. General: Provide screen at each exterior louver.

1. Screen Location for Fixed Louvers: Interior face.
2. Screening Type: Bird screening except where insect screening is indicated.

B. Secure screen frames to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.

C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated.

1. Metal: Same type and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.
2. Finish: Same finish as louver frames to which louver screens are attached.
3. Type: Rewirable frames with a driven spline or insert.

D. Louver Screening for Aluminum Louvers:

1. Bird Screening: Aluminum, 1/2-inch-square mesh, 0.063-inch wire.
2. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch wire.

2.5 BLANK-OFF PANELS

A. Uninsulated, Blank-Off Panels: Metal sheet attached to back of louver.

1. Aluminum sheet for aluminum louvers, not less than 0.050-inch nominal thickness.
2. Panel Finish: Same finish applied to louvers.
3. Attach blank-off panels with sheet metal screws.

2.6 MATERIALS

A. Aluminum Extrusions: ASTM B 221, Alloy 6063-T5, T-52, or T6.

B. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

C. Fasteners: Use types and sizes to suit unit installation conditions.

1. Use hex-head or Phillips pan-head screws for exposed fasteners unless otherwise indicated.
2. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.

D. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed for masonry, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

E. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.7 FABRICATION

A. Factory assemble louvers to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints. Frame Type: Channel unless otherwise indicated.

D. Include supports, anchorages, and accessories required for complete assembly.

2.8 ALUMINUM FINISHES

A. Finish louvers after assembly.

B. High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions. Color and Gloss: Match Architect's sample.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

A. Locate and place louvers level, plumb, and at indicated alignment with adjacent work.

B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

F. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Section 07 92 00 "Joint Sealants" for sealants applied during louver installation.

3.4 ADJUSTING AND CLEANING

A. Clean exposed louver surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

C. Restore louvers damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

SECTION 09 22 16

NON-STRUCTURAL METAL FRAMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:
1. Non-load-bearing steel framing systems for interior gypsum board assemblies.
2. Suspension systems for interior gypsum ceilings, soffits, and grid systems.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.03 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For firestop tracks, from ICC-ES.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: For fire-resistance-rated assemblies that incorporate non-load-bearing steel framing, provide materials and construction identical to those tested in assembly indicated, according to ASTM E 119 by an independent testing agency.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated, according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

2.02 FRAMING SYSTEMS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Framing Members, General: Comply with ASTM C 754 for conditions indicated.
1. Steel Sheet Components: Comply with ASTM C 645 requirements for metal unless otherwise indicated.
2. Protective Coating: ASTM A 653/A 653M, G40 (Z120), hot-dip galvanized unless otherwise indicated.

C. Studs and Runners: ASTM C 645.
1. Steel Studs and Runners:
a. Minimum Base-Metal Thickness: 0.027 inch (0.68 mm).
b. Depth: As indicated on Drawings.

D. Slip-Type Head Joints: Where indicated, provide the following:
1. Single Long-Leg Runner System: ASTM C 645 top runner with 2-inch- (51-mm-) deep flanges in thickness not less than indicated for studs, installed with studs friction fit into top runner and with continuous bridging located within 12 inches (305 mm) of the top of studs to provide lateral bracing.

E. Firestop Tracks: Top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.
   1. Products: Subject to compliance with requirements, provide one of the following available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Fire Trak Corp.; Fire Trak System.
      b. Grace Construction Products; FlameSafe FlowTrak System.
      c. Metal-Lite, Inc.; The System.

F. Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated.
   1. Minimum Base-Metal Thickness: 0.033 inch (0.84 mm).

G. Cold-Rolled Channel Bridging: Steel, 0.053-inch (1.34-mm) minimum base-metal thickness, with minimum 1/2-inch- (13-mm-) wide flanges.
   1. Depth: 1-1/2 inches (38 mm).
   2. Clip Angle: Not less than 1-1/2 by 1-1/2 inches (38 by 38 mm), 0.068-inch- (1.72-mm-) thick, galvanized steel.

H. Hat-Shaped, Rigid Furring Channels: ASTM C 645.
   1. Minimum Base-Metal Thickness: 0.018 inch (0.45 mm).
   2. Depth: 7/8 inch (22.2 mm).

I. Resilient Furring Channels: 1/2-inch- (13-mm-) deep, steel sheet members designed to reduce sound transmission.
   1. Configuration: Asymmetrical.

J. Cold-Rolled Furring Channels: 0.053-inch (1.34-mm) uncoated-steel thickness, with minimum 1/2-inch- (13-mm-) wide flanges.
   1. Depth: 3/4 inch (19 mm).
   2. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with minimum uncoated-steel thickness of 0.033 inch (0.8 mm).
   3. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.062-inch- (1.59-mm-) diameter wire, or double strand of 0.048-inch- (1.21-mm-) diameter wire.

K. Z-Shaped Furring: With slotted or nonslotted web, face flange of 1-1/4 inches (32 mm), wall attachment flange of 7/8 inch (22 mm), minimum uncoated-metal thickness of 0.018 inch (0.45 mm), and depth required to fit insulation thickness indicated.

2.03 SUSPENSION SYSTEMS

A. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.062-inch- (1.59-mm-) diameter wire, or double strand of 0.048-inch- (1.21-mm-) diameter wire.

B. Wire Hangers: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.16 inch (4.12 mm) in diameter.

C. Carrying Channels: Cold-rolled, commercial-steel sheet with a base-metal thickness of 0.053 inch (1.34 mm) and minimum 1/2-inch- (13-mm-) wide flanges.
   1. Depth: 1-1/2 inches (38 mm).

D. Furring Channels (Furring Members):
   1. Cold-Rolled Channels: 0.053-inch (1.34-mm) uncoated-steel thickness, with minimum 1/2-inch- (13-mm-) wide flanges, 3/4 inch (19 mm) deep.
   2. Steel Studs and Runners: ASTM C 645.
      a. Minimum Base-Metal Thickness: 0.018 inch (0.45 mm) unless noted otherwise.
      b. Depth: As indicated on Drawings.
   3. Hat-Shaped, Rigid Furring Channels: ASTM C 645, 7/8 inch (22 mm) deep.

a. Minimum Base-Metal Thickness: 0.018 inch (0.45 mm).

2.04 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that comply with referenced installation standards.
1. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

B. Isolation Strip at Exterior Walls: Provide the following:
1. Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch (3.2 mm) thick, in width to suit steel stud size.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Suspended Assemblies: Coordinate installation of suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.
1. Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.

3.03 INSTALLATION, GENERAL

A. Installation Standard: ASTM C 754.
1. Portland Cement Plaster Assemblies: Also comply with requirements in ASTM C 1063 that apply to framing installation.
2. Gypsum Board Assemblies: Also comply with requirements in ASTM C 840 that apply to framing installation.

B. Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.

C. Install bracing at terminations in assemblies.

D. Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.

3.04 INSTALLING FRAMED ASSEMBLIES

A. Install framing system components according to spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.
1. Single-Layer Application: 16 inches (406 mm) o.c. unless otherwise indicated.
2. Multilayer Application: 16 inches (406 mm) o.c. unless otherwise indicated.
3. Tile Backing Panels: 16 inches (406 mm) o.c. unless otherwise indicated.

B. Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.

C. Install studs so flanges within framing system point in same direction.

D. Install tracks (runners) at floors and overhead supports. Extend framing full height to structural supports or substrates above suspended ceilings except where partitions are indicated to terminate at suspended ceilings. Continue framing around ducts penetrating partitions above ceiling.
   1. Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
   2. Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
      a. Install two studs at each jamb unless otherwise indicated.
      b. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch (13-mm) clearance from jamb stud to allow for installation of control joint in finished assembly.
      c. Extend jamb studs through suspended ceilings and attach to underside of overhead structure.
   3. Other Framed Openings: Frame openings other than door openings the same as required for door openings unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
   4. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.
      a. Firestop Track: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.
   5. Sound-Rated Partitions: Install framing to comply with sound-rated assembly indicated.
   6. Curved Partitions:
      a. Bend track to uniform curve and locate straight lengths so they are tangent to arcs.
      b. Begin and end each arc with a stud, and space intermediate studs equally along arcs. On straight lengths of no fewer than two studs at ends of arcs, place studs 6 inches (150 mm) o.c.

E. Direct Furring: Attach to concrete or masonry with stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches (610 mm) o.c.

F. Z-Furring Members:
   1. Erect insulation, specified in Section 072100 "Thermal Insulation," vertically and hold in place with Z-furring members spaced 24 inches (610 mm) o.c.
   2. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches (610 mm) o.c.
   3. At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than 12 inches (305 mm) from corner and cut insulation to fit.

G. Installation Tolerance: Install each framing member so fastening surfaces vary not more than 1/8 inch (3 mm) from the plane formed by faces of adjacent framing.

3.05 INSTALLING SUSPENSION SYSTEMS

A. Install suspension system components according to spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.
   1. Hangers: 48 inches (1219 mm) o.c.
   2. Carrying Channels (Main Runners): 48 inches (1219 mm) o.c.

3. Furring Channels (Furring Members): 16 inches (406 mm) o.c.

B. Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.

C. Suspend hangers from building structure as follows:
   1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.
      a. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
   2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
      a. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards.
   3. Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
   4. Do not attach hangers to steel roof deck.
   5. Do not connect or suspend steel framing from ducts, pipes, or conduit.

D. Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.

E. Seismic Bracing: Sway-brace suspension systems with hangers used for support.

F. Installation Tolerances: Install suspension systems that are level to within 1/8 inch in 12 feet (3 mm in 3.6 m) measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

END OF SECTION

SECTION 09 24 00

CEMENT PLASTERING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Exterior portland cement plasterwork (stucco) on metal lath and unit masonry.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Show locations and installation of control and expansion joints including plans, elevations, sections, details of components, and attachments to other work.

C. Samples for Initial Selection: For each type of factory-prepared finish coat indicated.

D. Samples for Verification: For each type of factory-prepared colored textured finish coat indicated; 12 by 12 inches (305 by 305 mm), and prepared on rigid backing.

1.03 QUALITY ASSURANCE

A. Fire-Resistance Ratings: Where indicated, provide portland cement plaster assemblies identical to those of assemblies tested for fire resistance per ASTM E 119 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   1. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

B. Mockups: Before plastering, install mockups of at least 100 sq. ft. (9.3 sq. m) in surface area to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Install mockups for each type of finish indicated.
   2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

C. Preinstallation Conference: Conduct conference at Project site.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes.

1.05 PROJECT CONDITIONS

A. Comply with ASTM C 926 requirements.

B. Interior Plasterwork: Maintain room temperatures at greater than 40 deg F (4.4 deg C) for at least 48 hours before plaster application, and continuously during and after application.
   1. Avoid conditions that result in plaster drying out during curing period. Distribute heat evenly; prevent concentrated or uneven heat on plaster.
   2. Ventilate building spaces as required to remove water in excess of that required for hydrating plaster in a manner that prevents drafts of air from contacting surfaces during plaster application and until plaster is dry.

C. Exterior Plasterwork:

1. Apply and cure plaster to prevent plaster drying out during curing period. Use procedures required by climatic conditions, including moist curing, providing coverings, and providing barriers to deflect sunlight and wind.
2. Apply plaster when ambient temperature is greater than 40 deg F (4.4 deg C).
3. Protect plaster coats from freezing for not less than 48 hours after set of plaster coat has occurred.

D. Factory-Prepared Finishes: Comply with manufacturer's written recommendations for environmental conditions for applying finishes.

PART 2 - PRODUCTS

2.01 METAL LATH

A. Expanded-Metal Lath: ASTM C 847 with ASTM A 653/A 653M, G60 (Z180), hot-dip galvanized zinc coating.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Alabama Metal Industries Corporation; a Gibraltar Industries company.
   b. CEMCO.
   c. Clark Western Building Systems.
   d. Dietrich Metal Framing; a Worthington Industries company.
   e. MarinoWARE.
   f. Phillips Manufacturing Co.
   g. Prior approved equal.
2. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
3. Diamond-Mesh Lath: Self-furring, 3.4 lb/sq. yd. (1.8 kg/sq. m).

2.02 ACCESSORIES

A. General: Comply with ASTM C 1063 and coordinate depth of trim and accessories with thicknesses and number of plaster coats required.

B. Building Paper: Grade D, 60 minute water resistance minimum, ASTM D779 equal to 60 Minute Super Jumbo Tex, Fortifiber Corporation, Los Angeles, CA.

C. Metal Accessories:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Alabama Metal Industries Corporation; a Gibraltar Industries company.
   b. CEMCO.
   c. Clark Western Building Systems.
   d. Dietrich Metal Framing; a Worthington Industries company.
   e. Flannery, Inc.
   f. MarinoWARE.
   g. Phillips Manufacturing Co.
   h. Prior approved equal.
2. Foundation Weep Screed: Fabricated from hot-dip galvanized-steel sheet, ASTM A 653/A 653M, G60 (Z180) zinc coating.
3. Cornerite: Fabricated from metal lath with ASTM A 653/A 653M, G60 (Z180), hot-dip galvanized zinc coating.
4. External-Corner Reinforcement: Fabricated from metal lath with ASTM A 653/A 653M, G60 (Z180), hot-dip galvanized zinc coating.
5. Cornerbeads: Fabricated from zinc or zinc-coated (galvanized) steel.
   a. Small nose cornerbead with expanded flanges; use unless otherwise indicated.
6. Casing Beads: Fabricated from zinc-coated (galvanized) steel; square-edged style; with expanded flanges.

7. Control Joints: Fabricated from zinc-coated (galvanized) steel; one-piece-type, folded pair of unperforated screeds in M-shaped configuration; with perforated flanges and removable protective tape on plaster face of control joint.
8. Expansion Joints: Fabricated from zinc-coated (galvanized) steel; folded pair of unperforated screeds in M-shaped configuration; with expanded flanges.
9. Two-Piece Expansion Joints: Fabricated from zinc-coated (galvanized) steel; formed to produce slip-joint and square-edged reveal that is adjustable from 1/4 to 5/8 inch (6.34 to 16 mm) wide; with perforated flanges.
10. Chanel Screed: Extruded aluminum, 6063, with chemical conversion coating.
    a. Depth: 3/4-inches.
    b. Width: 2-inches
    c. Product:
        1) Fry Reglet Corporation, Chanel Screed, PCS-75-200
        2) Or approved equal.
11. F Reveal: Extruded aluminum, 6063, with chemical conversion coating.
    a. Depth: 7/8-inches.
    b. Width: 2-inches
    c. Product:
        1) Fry Reglet Corporation
        2) Or approved equal.
12. Soffit Vent: Clear anodized aluminum.
    a. Depth: 7/8-inches.
    b. Width: 2-inches
    c. Product:
        1) Flannery Inc.
        2) Or approved equal.

2.03 MISCELLANEOUS MATERIALS

A. Water for Mixing: Potable and free of substances capable of affecting plaster set or of damaging plaster, lath, or accessories.

B. Fiber for Base Coat: Alkaline-resistant glass or polypropylene fibers, 1/2 inch (13 mm) long, free of contaminants, manufactured for use in portland cement plaster.

C. Bonding Compound: ASTM C 932.

D. Steel Drill Screws: For metal-to-metal fastening, ASTM C 1002 or ASTM C 954, as required by thickness of metal being fastened; with pan head that is suitable for application; in lengths required to achieve penetration through joined materials of no fewer than three exposed threads.

E. Fasteners for Attaching Metal Lath to Substrates: Complying with ASTM C 1063.

F. Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, not less than 0.0475-inch (1.21-mm) diameter, unless otherwise indicated.

2.04 PLASTER MATERIALS

A. Portland Cement: ASTM C 150, Type I, II or III, or air entrained equivalents as required.

B. Lime: ASTM C 206, Type S.

C. Ready-Mixed Plaster: Mill-mixed portland cement, aggregates, coloring agents, and proprietary ingredients.
1. Basis-of-Design Product: PAREX Inc.; PARREX Fiber 47 Armourwall or a comparable product of one of the following:
    a. California Stucco Products Corp.; Conventional Portland Cement Stucco.
    b. El Rey Stucco Company, Inc., a brand of ParexLaHabra, Inc.; Premium Stucco Finish.
    c. LaHabra, a brand of ParexLaHabra, Inc.; Exterior Stucco Color Coat.

2. Color: Match Architect's sample.

D. Acrylic-Based Finish Coatings: Factory-mixed acrylic-emulsion coating systems formulated with colorfast mineral pigments and fine aggregates; for use over cement plaster base coats. Include manufacturer's recommended primers and sealing topcoats for acrylic-based finishes.
1. Basis-of-Design Product: Subject to compliance with requirements, provide PAREX Inc.; PARREX 121 Dry Base Coat with Skim Coat.
2. Color: Grey Smooth Finish.

2.05 PLASTER MIXES

A. General: Comply with ASTM C 926 for applications indicated.
1. Fiber Content: Add fiber to base-coat mixes after ingredients have mixed at least two minutes. Comply with fiber manufacturer's written instructions for fiber quantities in mixes, but do not exceed 1 lb of fiber/cu. yd. (0.6 kg of fiber/cu. m) of cementitious materials.

B. Ready-Mixed Plaster: For ready-mixed base and scratch coat plasters, comply with manufacturer's written instructions.

C. Factory-Prepared Finish-Coat Mixes: For ready-mixed finish-coat plasters, with acrylic admixture, comply with manufacturer's written instructions.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Protect adjacent work from soiling, spattering, moisture deterioration, and other harmful effects caused by plastering.

B. Prepare solid substrates for plaster that are smooth or that do not have the suction capability required to bond with plaster according to ASTM C 926.

3.03 INSTALLING BUILDING PAPER

A. Weather Lap Sheets 2 inches.

B. Lap Sheet 6 inches at Ends.

C. Attach to sheathing in accordance with sheathing manufacturer’s recommendations to prevent leaks and sheathing deterioration.

D. Provide 2 overlapping layers under plaster.

3.04 INSTALLING METAL LATH

A. Expanded-Metal Lath: Install according to ASTM C 1063.
1. Partition Framing and Vertical Furring: Install flat diamond-mesh lath.
2. Flat-Ceiling and Horizontal Framing: Install flat diamond-mesh 3/8-inch (9.5-mm) rib lath lath.
3. On Solid Surfaces, Not Otherwise Furred: Install self-furring, diamond-mesh lath.

3.05 INSTALLING ACCESSORIES

A. Install according to ASTM C 1063 and at locations indicated on Drawings.

B. Reinforcement for External Corners:
   1. Install lath-type, external-corner reinforcement at exterior locations.
   2. Install cornerbead at exterior locations.

C. Control Joints: Install control joints at locations indicated on Drawings.
   1. As required to delineate plasterwork into areas (panels) of the following maximum sizes:
      a. Vertical Surfaces: 144 sq. ft. (13.4 sq. m).
      b. Horizontal and other Nonvertical Surfaces: 100 sq. ft. (9.3 sq. m).
   2. At distances between control joints of not greater than 18 feet (5.5 m) o.c.
   3. As required to delineate plasterwork into areas (panels) with length-to-width ratios of not greater than 2-1/2:1.
   4. Where control joints occur in surface of construction directly behind plaster.
   5. Where plasterwork areas change dimensions, to delineate rectangular-shaped areas (panels) and to relieve the stress that occurs at the corner formed by the dimension change.

3.06 PLASTER APPLICATION

A. General: Comply with ASTM C 926.
   1. Do not deviate more than plus or minus 1/4 inch in 10 feet (6.4 mm in 3 m) from a true plane in finished plaster surfaces, as measured by a 10-foot (3-m) straightedge placed on surface.
   2. Finish plaster flush with metal frames and other built-in metal items or accessories that act as a plaster ground unless otherwise indicated. Where casing bead does not terminate plaster at metal frame, cut base coat free from metal frame before plaster sets and groove finish coat at junctures with metal.
   3. Provide plaster surfaces that are ready to receive field-applied finishes indicated.

3.07 PLASTER APPLICATION ON LATH

A. Scratch Coat:
   1. Apply first coat with sufficient material and pressure to form full keys through, and to embed into, metal lath.
   2. Provide sufficient depth of material over metal lath to allow for scratching of surface.
   3. Bring surface to true even plane by rodding; fill surface defects and scratches.
   4. As soon as first coat has become firm, scratch entire surface in one direction only to provide mechanical bond with second coat.
   5. On vertical surfaces, scratch horizontally.

B. Brown Coat:
   1. Begin second coat application after 48 moist cure of scratch coat.
   2. Apply second coat with sufficient material and pressure to ensure tight contact with scratch coat.
   3. Bring surface to true even plane by rodding; fill surface defects and scratches.
   4. Pause and allow plaster to achieve proper moisture content so that necessary reconsolidation of plaster can be achieved. Determine correct time for floating by placing a finishing trowel against surface; trowel should not stick to unworked plaster.
   5. Float surface and leave uniformly rough to provide bond for finish coat.
   6. Moist cure brown coat for 48 hours.
   7. Allow scratch and brown coats to set for 7 to 10 days before application of basecoat, mesh, and finish coat.

C. Bonding Compound: Apply on unit masonry plaster bases.

D. Walls; Base-Coat Mixes for Use over Metal Lath: Scratch and brown coats for three-coat plasterwork, on masonry; 3/4-inch (19-mm) thickness.
   1. Portland cement mixes.

E. Ceilings; Base-Coat Mixes for Use over Metal Lath: Scratch and brown coats for three-coat plasterwork; 1/2 inch (13 mm) thick.
   1. Portland cement mixes.

F. Skim Coat: Apply skim coat approximately 1/16th of an inch thick with steel trowel to a smooth and uniform consistency.

G. Finish Coat:
   1. Provide tools and techniques as required to achieve specified finish.
   2. Apply finish coat with sufficient pressure and material to ensure tight contact with, and complete coverage of, brown coat.
   3. Bring to required plaster thickness; Finish coat not less than 1/16 inch (1.6 mm).
   4. Finish surface to uniform float uniform texture finish to match accepted sample.

H. Plaster Finish Coats: Apply to provide steel troweled finish to match Architect's sample.

I. Moist Curing:
   1. Follow procedures for each coat as recommended by ASTM C926 and PCA and as required based on environmental conditions.
   2. Prevent premature dry-out.

J. Concealed Exterior Plasterwork: Where plaster application will be used as a base for adhered finishes, omit finish coat.

3.08 PLASTER REPAIRS

A. Repair or replace work to eliminate cracks, dents, blisters, buckles, crazing and check cracking, dry outs, efflorescence, sweat outs, and similar defects and where bond to substrate has failed.

3.09 PROTECTION

A. Remove temporary protection and enclosure of other work. Promptly remove plaster from door frames, windows, and other surfaces not indicated to be plastered. Repair floors, walls, and other surfaces stained, marred, or otherwise damaged during plastering.

END OF SECTION

SECTION 09 29 00

GYPSUM BOARD

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Interior gypsum board.
   2. Tile backing panels.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Samples: For the following products:
   1. Trim Accessories: Full-size Sample in 12-inch- (300-mm-) long length for each trim accessory indicated.

1.03 QUALITY ASSURANCE

A. Mockups: Before beginning gypsum board installation, install mockups of at least 100 sq. ft. (9 sq. m) in surface area to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Install mockups for the following:
      a. Each level of gypsum board finish indicated for use in exposed locations.
      b. Each texture finish indicated.
   2. Apply or install final decoration indicated, including painting and wallcoverings, on exposed surfaces for review of mockups.
   3. Simulate finished lighting conditions for review of mockups.
   4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.04 DELIVERY, STORAGE AND HANDLING

A. Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage. Stack panels flat and supported on risers on a flat platform to prevent sagging.

1.05 FIELD CONDITIONS

A. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.

B. Do not install paper-faced gypsum panels until installation areas are enclosed and conditioned.

C. Do not install panels that are wet, those that are moisture damaged, and those that are mold damaged.
   1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
   2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Fire-Resistance-Rated Assemblies: For fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing agency.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

2.02 GYPSUM BOARD, GENERAL

A. Recycled Content of Gypsum Panel Products: Postconsumer recycled content plus one-half of preconsumer recycled content 10 percent maximum.

B. Regional Materials: Gypsum panel products shall be manufactured within 500 miles (800 km) of Project site.

C. Size: Provide maximum lengths and widths available that will minimize joints in each area and that correspond with support system indicated.

2.03 INTERIOR GYPSUM BOARD

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. CertainTeed Corp.
   2. Georgia-Pacific Gypsum LLC.
   3. National Gypsum Company.
   4. USG Corporation.

B. Gypsum Board, Type X: ASTM C 1396/C 1396M.
   1. Thickness: 5/8 inch (15.9 mm).
   2. Long Edges: Tapered.

C. Moisture- and Mold-Resistant Gypsum Board: ASTM C 1396/C 1396M. With moisture- and mold-resistant core and paper surfaces.
   1. Core: 5/8 inch (15.9 mm), Type X.
   2. Long Edges: Tapered.
   3. Mold Resistance: ASTM D 3273, score of 10 as rated according to ASTM D 3274.
   4. Surface paper: 100% recycled content moisture/mold/mildew resistant paper on front, back, and long edges.
   5. Locations: Toilet and Locker Rooms, non-tile areas.
   6. Products: Subject to compliance with requirements, provide one of the following:
      a. CertainTeed Corp; Proroc Moisture And Mold Resistant With M2tech
      b. National Gypsum Company; XP Wallboard
      c. USG Corporation; Sheetrock Brand Mold Tough

2.04 TILE BACKING PANELS

A. Cementitious Backer Units: ANSI A118.9 and ASTM C 1288 or 1325, with manufacturer's standard edges.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Custom Building Products; Wonderboard.
      b. National Gypsum Company, Permabase Cement Board.
      c. USG Corporation; DUROCK Cement Board.
   2. Thickness: 5/8 inch (15.9 mm).
   3. Mold Resistance: ASTM D 3273, score of 10 as rated according to ASTM D 3274.

2.05 TRIM ACCESSORIES

A. Interior Trim: ASTM C 1047.
   1. Material: Galvanized or aluminum-coated steel sheet or rolled zinc.
   2. Shapes:
      a. Cornerbead.
      b. LC-Bead: J-shaped; exposed long flange receives joint compound.
      c. L-Bead: L-shaped; exposed long flange receives joint compound.
      d. U-Bead: J-shaped; exposed short flange does not receive joint compound.
      e. Expansion (control) joint.
      f. Curved-Edge Cornerbead: With notched or flexible flanges.

2.06 JOINT TREATMENT MATERIALS

A. General: Comply with ASTM C 475/C 475M.

B. Joint Tape:
   1. Interior Gypsum Board: Paper.
   2. Tile Backing Panels: Polymer coated fiberglass mesh as recommended by panel manufacturer.

C. Joint Compound for Interior Gypsum Board: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.
   1. Board manufacturer's standard ready-mixed joint compounds low-VOC joint compounds with no detectable amounts of crystalline silica based on NIOSH Method 7500.
   2. Prefilling: At open joints, rounded or beveled panel edges, and damaged surface areas, use setting-type taping compound.
   3. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use setting-type taping compound.
   4. Fill Coat: For second coat, use drying-type, all-purpose compound.
   5. Finish Coat: For third coat, use drying-type, all-purpose compound.
   6. Skim Coat: For final coat of Level 5 finish, use high-build interior coating product designed for application by airless sprayer and to be used instead of skim coat to produce Level 5 finish.

D. Joint Compound for Tile Backing Panels:
   1. Cementitious Backer Units: As recommended by backer unit manufacturer.

2.07 SURFACING MATERIAL

A. Flat latex basecoat for use on surfaces located in areas of intense lighting and indicated to receive a Level 4 finish. Basecoat is in addition to primer and finish coating specified in Section 099000.
   1. Products: Subject to compliance with requirements, provide one of the following products:
      a. “Builders Solution System Interior Latex Primer/Surfacer”, A63W100; Sherwin Williams.
      b. “SHEETROCK First Coat”; USG Corporation.

2.08 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.

B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.
   1. Adhesives and sealants shall meet or exceed the VOC and chemical component limits of SCAQMD Rule 1168, Cal-GREEN Table 5.504.4.1 Adhesive VOC Limit, and Cal GREEN Table 5.504.4.2 Sealant VOC Limit requirements.

C. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.
   1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch (0.84 to 2.84 mm) thick.

2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.

D. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.
   1. Thickness to match wall stud depth unless noted otherwise.
   2. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.
   3. Recycled Content of Blankets: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 20 percent.
   4. Use formaldehyde free materials where available.
   5. Acceptable Mineral Fiber Products:
      a. FBX 450, Fibrex, Westmont, IL.
      b. Thermafiber Sound Attenuation Fire Blankets, Thermafiber LLC, Wabash, LLC
   6. Acceptable Glass Fiber Products:
      a. Sound Attenuation Batts, Owens Corning, Toledo, OH.
      b. Sound Control Batts, CertainTeed Corporation, Valley Forge, PA.
      c. Sound Control Batts, Johns Manville, Denver, CO.

E. Acoustical Joint Sealant: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C 834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Accumetric LLC; BOSS 824 Acoustical Sound Sealant.
      b. Grabber Construction Products; Acoustical Sealant GSC.
      c. Pecora Corporation, BA-98 Acoustical Sealant.
      d. Specified Technologies, Inc.; Smoke N Sound Acoustical Sealant.
      e. Tremco, Inc., Acoustical Sealant.
      f. USG Corporation; SHEETROCK Acoustical Sealant.
   2. Sealants shall meet VOC and chemical component limits of South Coast Air Quality Management District (SCAQMD) Rule No. 1168 and Cal-GREEN Table 5.504.4.2 Sealant VOC Limit requirements.

F. Thermal Insulation: As specified in Section 072100 "Thermal Insulation."

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas and substrates including welded hollow-metal frames and framing, with Installer present, for compliance with requirements and other conditions affecting performance.

B. Examine panels before installation. Reject panels that are wet, moisture damaged, and mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLYING AND FINISHING PANELS, GENERAL

A. Comply with ASTM C 840.

B. Install ceiling panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.

C. Install panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch (1.5 mm) of open space between panels. Do not force into place.

D. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.

E. Form control and expansion joints with space between edges of adjoining gypsum panels.

F. Cover both faces of support framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.
   1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. (0.7 sq. m) in area.
   2. Fit gypsum panels around ducts, pipes, and conduits.
   3. Where partitions intersect structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by structural members; allow 1/4- to 3/8-inch- (6.4- to 9.5-mm-) wide joints to install sealant.

G. Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments, except floors. Provide 1/4- to 1/2-inch- (6.4- to 12.7-mm-) wide spaces at these locations and trim edges with edge trim where edges of panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.

H. Attachment to Steel Framing: Attach panels so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.

I. STC-Rated Assemblies: Seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C 919 and with manufacturer's written recommendations for locating edge trim and closing off sound-flanking paths around or through assemblies, including sealing partitions above acoustical ceilings.

J. Install sound attenuation blankets before installing gypsum panels unless blankets are readily installed after panels have been installed on one side.

3.03 APPLYING INTERIOR GYPSUM BOARD

A. Install interior gypsum board in the following locations:
   1. Wallboard Type: As indicated on Drawings.
   2. Type X: As indicated on Drawings.
   3. Flexible Type: As indicated on Drawings.
   4. Ceiling Type: Ceiling surfaces.
   5. Moisture- and Mold-Resistant Type: As indicated on Drawings.

B. Single-Layer Application:
   1. On ceilings, apply gypsum panels before wall/partition board application to greatest extent possible and at right angles to framing unless otherwise indicated.
   2. On partitions/walls, apply gypsum panels horizontally (perpendicular to framing) unless otherwise indicated or required by fire-resistance-rated assembly, and minimize end joints.
      a. Stagger abutting end joints not less than one framing member in alternate courses of panels.
      b. At stairwells high walls, install panels horizontally unless otherwise indicated or required by fire-resistance-rated assembly.
   3. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
   4. Fastening Methods: Apply gypsum panels to supports with steel drill screws.

C. Multilayer Application:
   1. On ceilings, apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints one framing member, 16 inches (400 mm) minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.

2. On partitions/walls, apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
3. On Z-furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
4. Fastening Methods: Fasten base layers with screws; fasten face layers with adhesive and supplementary fasteners.

D. Curved Surfaces:
1. Install panels horizontally (perpendicular to supports) and unbroken, to extent possible, across curved surface plus 12-inch- (300-mm-) long straight sections at ends of curves and tangent to them.
2. For double-layer construction, fasten base layer to studs with screws 16 inches (400 mm) o.c. Center gypsum board face layer over joints in base layer, and fasten to studs with screws spaced 12 inches (300 mm) o.c.

3.04 APPLYING TILE BACKING PANELS

A. Cementitious Backer Units: ANSI A108.11, at locations indicated to receive tile.

B. Water-Resistant Backing Board: Install where indicated with 1/4-inch (6.4-mm) gap where panels abut other construction or penetrations.

C. Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.05 INSTALLING TRIM ACCESSORIES

A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.

B. Control Joints: Install control joints at locations indicated on Drawings and according to ASTM C 840 and in specific locations approved by Architect for visual effect.

C. Interior Trim: Install in the following locations:
1. Cornerbead: Use at outside corners unless otherwise indicated.
2. LC-Bead: Use at exposed panel edges.
3. L-Bead: Use where indicated.
4. U-Bead: Use where indicated.
5. Curved-Edge Cornerbead: Use at curved openings.

3.06 FINISHING GYPSUM BOARD

A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.

B. Prefill open joints, rounded or beveled edges, and damaged surface areas.

C. Apply joint tape over gypsum board joints, except for trim products specifically indicated as not intended to receive tape.

D. Gypsum Board Finish Levels: Finish panels to levels indicated below and according to ASTM C 840:
1. Level 1: Ceiling plenum areas, concealed areas, and where indicated.
2. Level 2: Fire-rated, sound-rated, and smoke-rated assemblies in ceiling plenums and concealed areas.
3. Level 3: Areas where gypsum board used as a tile substrate.

4. Level 4: At panel surfaces that will be exposed to view unless otherwise indicated.
    a. Finish gypsum board in areas of intense lighting shall receive one coat of specified base coat/surfacer to entire surface at manufacturer's recommended coverage rate or mil thickness.
5. Level 5: Where indicated on Drawings.

E. Cementitious Backer Units: Finish according to manufacturer's written instructions.

3.07 APPLYING TEXTURE FINISHES

A. Surface Preparation and Primer: Prepare and apply primer to gypsum panels and other surfaces receiving texture finishes. Apply primer to surfaces that are clean, dry, and smooth.

3.08 PROTECTION

A. Protect adjacent surfaces from drywall compound and promptly remove from floors and other non-drywall surfaces. Repair surfaces stained, marred, or otherwise damaged during drywall application.

B. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.

C. Remove and replace panels that are wet, moisture damaged, and mold damaged.
1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION

SECTION 09 30 00

TILING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:
1. Ceramic tile.
2. Stone thresholds.
3. Waterproof membrane.
4. Crack isolation membrane.

1.02 DEFINITIONS

A. General: Definitions in the ANSI A108 series of tile installation standards and in ANSI A137.1 apply to Work of this Section unless otherwise specified.

B. ANSI A108 Series: ANSI A108.01, ANSI A108.02, ANSI A108.1A, ANSI A108.1B, ANSI A108.1C, ANSI A108.4, ANSI A108.5, ANSI A108.6, ANSI A108.8, ANSI A108.9, ANSI A108.10, ANSI A108.11, ANSI A108.12, ANSI A108.13, ANSI A108.14, ANSI A108.15, ANSI A108.16, and ANSI A108.17, which are contained in "American National Standard Specifications for Installation of Ceramic Tile."

C. Module Size: Actual tile size plus joint width indicated.

D. Face Size: Actual tile size, excluding spacer lugs.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Show locations of each type of tile and tile pattern. Show widths, details, and locations of expansion, contraction, control, and isolation joints in tile substrates and finished tile surfaces.

C. Samples for Initial Selection: For each type of grout indicated. Include Samples of accessories involving color selection.

D. Samples for Verification:
1. Full-size units of each type and composition of tile and for each color and finish required.
2. Assembled samples mounted on a rigid panel, with grouted joints, for each type and composition of tile and for each color and finish required. Make samples at least 24 inches (600 mm) square, but not fewer than 4 tiles. Use grout of type and in color or colors approved for completed Work.
3. Full-size units of each type of trim and accessory for each color and finish required.
4. Stone thresholds in 6-inch (150-mm) lengths.
5. Metal edge strips in 6-inch (150-mm) lengths.

1.04 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Master Grade Certificates: For each shipment, type, and composition of tile, signed by tile manufacturer and Installer.

C. Product Certificates: For each type of product, signed by product manufacturer.

D. Material Test Reports: For each tile-setting and -grouting product.

1.05 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match and are from same production runs as products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Tile and Trim Units: Furnish one full, properly packaged box of each tile color, type and size, identified by room or area.
   2. Grout: Furnish quantity of grout equal to 3 percent of amount installed for each type, composition, and color indicated.

1.06 QUALITY ASSURANCE

A. Source Limitations for Tile: Obtain tile of each type and color or finish from one source or producer.
   1. Obtain tile of each type and color or finish from same production run and of consistent quality in appearance and physical properties for each contiguous area.

B. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from one manufacturer and each aggregate from one source or producer.

C. Source Limitations for Other Products: Obtain each of the following products specified in this Section from a single manufacturer for each product:
   1. Stone thresholds.
   2. Waterproof membrane.
   3. Crack isolation membrane.
   4. Metal edge strips.

D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Build mockup of each type of tile installation.
   2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion and approved by City Engineer.

E. Preinstallation Conference: Conduct conference at Project site.
   1. Review requirements in ANSI A108.01 for substrates and for preparation by other trades.
   2. Require attendance of installation material manufacturer, tile supplier, tile installer and installers of related work. Review installation procedures and coordination required with related work.
   3. Review tile and installation material compatibility.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirements in ANSI A137.1 for labeling tile packages.

B. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.

C. Store liquid materials in unopened containers and protected from freezing.

1.08 PROJECT CONDITIONS

A. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

PART 2 - PRODUCTS

2.01 PRODUCTS, GENERAL

A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1 for types, compositions, and other characteristics indicated.
   1. Provide tile complying with Standard grade requirements unless otherwise indicated.

B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI A108.02, ANSI standards referenced in other Part 2 articles, ANSI standards referenced by TCA installation methods specified in tile installation schedules, and other requirements specified.

C. Factory Blending: For tile exhibiting color variations within ranges, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match approved Samples.

D. Factory-Applied Temporary Protective Coating: Where indicated under tile type, protect exposed surfaces of tile against adherence of mortar and grout by precoating with continuous film of petroleum paraffin wax, applied hot. Do not coat unexposed tile surfaces.

2.02 TILE PRODUCTS

A. Tile: Refer to "Materials List" on Drawing Sheet A703.

2.03 THRESHOLDS

A. General: Fabricate to sizes and profiles indicated or required to provide transition between adjacent floor finishes.
   1. Bevel edges at 1:2 slope, with lower edge of bevel aligned with or up to 1/16 inch (1.5 mm) above adjacent floor surface. Finish bevel to match top surface of threshold. Limit height of threshold to 1/2 inch (12.7 mm) or less above adjacent floor surface.

B. Marble Thresholds: ASTM C 503/C 503M, with a minimum abrasion resistance of 12 according to ASTM C 1353 or ASTM C 241/C 241M and with honed finish.
   1. Description: Uniform, fine- to medium-grained white stone with gray veining.

2.04 WATERPROOF MEMBRANE

A. General: Manufacturer's standard product that complies with ANSI A118.10 and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.

B. Chlorinated Polyethylene Sheet: Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; 0.030-inch (0.76-mm) nominal thickness.
   1. Basis-of-Design Product: The design is based on the product named. Subject to compliance with requirements, provide either the named product or a prior approved product by one of the other manufacturers specified.
      a. Noble Company (The); Nobleseal TS.
      b. Prior approved equal.

2.05 CRACK ISOLATION MEMBRANE

A. General: Manufacturer's standard product that complies with ANSI A118.12 for standard performance and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.

B. Chlorinated Polyethylene Sheet: Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; 0.030-inch (0.76-mm) nominal thickness.
   1. Basis-of-Design Product: The design is based on the product named. Subject to compliance with requirements, provide either the named product or a prior approved product by one of the other manufacturers specified.
      a. Noble Company (The); Nobleseal TS.
      b. Prior approved equal.

2.06 SETTING MATERIALS

A. Portland Cement Mortar (Thickset) Installation Materials: ANSI A108.02; at exterior showers.
   1. Portland Cement: ASTM C150, Type I, from one source only, non-staining and non-air-entraining.
   2. Mortar Sand: ASTM C144, free of deleterious materials, well graded.
   3. Setting Bed Sand: ASTM C136, 100 percent passing No. 4 sieve.
   4. Chlorinated Polyethylene Sheet: Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; 0.030-inch (0.76-mm) nominal thickness.
   5. Expanded Metal Lath: Diamond-mesh lath complying with ASTM C 847.
      a. Base Metal and Finish for Exterior Applications: Zinc-coated (galvanized) steel sheet.
      b. Configuration over Solid Surfaces: Self furring.
      c. Weight: 3.4 lb/sq. yd. (1.8 kg/sq. m).
   6. Latex Additive: Manufacturer's standard water emulsion, serving as replacement for part or all of gaging water, of type specifically recommended by latex-additive manufacturer for use with field-mixed portland cement and aggregate mortar bed.
   7. Acceptable Products:
      a. Laticrete 3701 Mortar Admix with Laticrete 226 Thick Bed Mortar Mix, Laticrete International
      b. Planicrete AC, Mapei Corporation, Garland, TX.
      c. CustomCrete Latex Mortar Admix, Custom Building Products, Seal Beach, CA

B. Dry-Set Portland Cement Mortar (Thin Set): ANSI A118.1.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Custom Building Products, MegaFlex Crack Prevention Mortar.
      b. Laticrete International, Inc., Laticrete 4237 Mortar Admix with Laticrete 211 Crete Filler.
      c. MAPEI Corporation, Kerabond and Keralastic
   2. For wall applications, provide mortar that complies with requirements for nonsagging mortar in addition to the other requirements in ANSI A118.1.

2.07 GROUT MATERIALS

A. Sand-Portland Cement Grout: ANSI A108.10, composed of white or gray cement and white or colored aggregate as required to produce color indicated.

B. Standard Cement Grout: ANSI A118.6.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Custom Building Products, a. Laticrete 1500 Sanded Grout with Laticrete 1776 Grout Admix
      b. Laticrete International, Inc., Laticrete 4237 Mortar Admix with Laticrete 211 Crete Filler.
      c. MAPEI Corporation, Kerabond and Keralastic

C. Grout for Pregrouted Tile Sheets: Same product used in factory to pregrout tile sheets.

2.08 ELASTOMERIC SEALANTS

A. General: Provide sealants, primers, backer rods, and other sealant accessories that comply with the following requirements and with the applicable requirements in Section 079200 "Joint Sealants."

1. Vertical Surfaces: Silicone—Sanitary.
2. Horizontal Surfaces: Urethane—Traffic-Bearing.

B. Colors: Provide colors of exposed sealants to match colors of grout in tile adjoining sealed joints unless otherwise indicated.

C. Adhesives & Sealants (including grouts): Only use adhesives and sealants (grouts) in the interior of the building that meet or do not exceed the VOC limits of the CURRENT requirements of South Coast Air Quality Management District (SCAQMD) Rule No. 1168 on the interior of the building.
1. Adhesives and sealants shall meet the more stringent VOC and chemical component limits of SCAQMD Rule 1168, Cal-GREEN Table 5.504.4.1 Adhesive VOC Limit, and Cal GREEN Table 5.504.4.2 Sealant VOC Limit requirements.
2. Use sealers that comply with the more stringent VOC limits of the current requirements of South Coast Air Quality Management District (SCAQMD) Rule No. 1113 and Cal GREEN Table 5.504.4.3 for VOC Content Limits for Architectural Coatings.

2.09 MISCELLANEOUS MATERIALS

A. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.

B. Grout Sealer: Manufacturer's standard product for sealing grout joints and that does not change color or appearance of grout.
1. Use sealers that comply the more stringent VOC limits of the current requirements of South Coast Air Quality Management District (SCAQMD) Rule No. 1113 and Cal GREEN Table 5.504.4.3 for VOC Content Limits for Architectural Coatings.
2. Products: Subject to compliance with requirements, provide one of the following:
   a. Aqua Mix. Grout Sealer.
   b. AO Tile and Grout Sealer
   c. Bostik, Inc.; Instant Pro Grout Sealer.
   d. C-Cure; Penetrating Sealer 978.
   e. Laticrete 190 Grout Sealer.
   f. Miracle Sealants Grout Sealer.

2.10 MIXING MORTARS AND GROUT

A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.

B. Add materials, water, and additives in accurate proportions.

C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
1. Verify that substrates for setting tile are firm, dry, clean, free of coatings that are incompatible with tile-setting materials including curing compounds and other substances that contain soap, wax,

oil, or silicone; and comply with flatness tolerances required by ANSI A108.01 for installations indicated.

2. Verify that concrete substrates for tile floors installed with thin-set mortar comply with surface finish requirements in ANSI A108.01 for installations indicated.
   a. Verify that surfaces that received a steel trowel finish have been mechanically scarified.
   b. Verify that protrusions, bumps, and ridges have been removed by sanding or grinding.
3. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed.
4. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Architect.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Fill cracks, holes, and depressions in concrete substrates for tile floors installed with thin-set mortar with trowelable leveling and patching compound specifically recommended by tile-setting material manufacturer.

B. Where indicated, prepare substrates to receive waterproofing by applying a reinforced mortar bed that complies with ANSI A108.1A and is sloped 1/4 inch per foot (1:50) toward drains.

C. Blending: For tile exhibiting color variations, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.03 TILE INSTALLATION

A. Comply with TCA's "Handbook for Ceramic Tile Installation" for TCA installation methods specified in tile installation schedules. Comply with parts of the ANSI A108 Series "Specifications for Installation of Ceramic Tile" that are referenced in TCA installation methods, specified in tile installation schedules, and apply to types of setting and grouting materials used.
   1. For the following installations, follow procedures in the ANSI A108 Series of tile installation standards for providing 95 percent mortar coverage:
      a. Exterior tile floors and walls.
      b. Tile floors in wet areas.
      c. Tile swimming pool decks.
      d. Tile floors composed of tiles 8 by 8 inches (200 by 200 mm) or larger.

B. Extend tile work into recesses and under or behind equipment and fixtures to form complete covering without interruptions unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.

C. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.

D. Provide manufacturer's standard trim shapes where necessary to eliminate exposed tile edges.

E. Jointing Pattern: Lay tile in grid pattern unless otherwise indicated. Lay out tile work and center tile fields in both directions in each space or on each wall area. Lay out tile work to minimize the use of pieces that are less than half of a tile. Provide uniform joint widths unless otherwise indicated.
   1. Where adjoining tiles on floor, base, walls, or trim are specified or indicated to be same size, align joints.

2. Where tiles are specified or indicated to be whole integer multiples of adjoining tiles on floor, base, walls, or trim, align joints unless otherwise indicated.

F. Joint Widths: Unless otherwise indicated, install tile with the following joint widths:
1. Quarry Tile: 1/4 inch (6.35 mm).
2. Glazed Wall Tile: 1/16 inch (1.6 mm).

G. Lay out tile wainscots to dimensions indicated or to next full tile beyond dimensions indicated.

H. Expansion Joints: Provide expansion joints and other sealant-filled joints, including control, contraction, and isolation joints, where indicated. Form joints during installation of setting materials, mortar beds, and tile. Do not saw-cut joints after installing tiles.
1. Where joints occur in concrete substrates, locate joints in tile surfaces directly above them.
2. Prepare joints and apply sealants to comply with requirements in Section 079200 "Joint Sealants."

I. Grout Sealer: Apply grout sealer to cementitious grout joints according to grout-sealer manufacturer's written instructions. As soon as grout sealer has penetrated grout joints, remove excess sealer and sealer from tile faces by wiping with soft cloth.

3.04 WATERPROOFING INSTALLATION

A. Install waterproofing to comply with ANSI A108.13 and manufacturer's written instructions to produce waterproof membrane of uniform thickness and bonded securely to substrate.

B. Do not install tile or setting materials over waterproofing until waterproofing has cured and been tested to determine that it is watertight.

3.05 CRACK ISOLATION MEMBRANE INSTALLATION

A. Install crack isolation membrane to comply with ANSI A108.17 and manufacturer's written instructions to produce membrane of uniform thickness and bonded securely to substrate.

B. Do not install tile or setting materials over crack isolation membrane until membrane has cured.

3.06 CLEANING AND PROTECTING

A. Cleaning: On completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.
1. Remove grout residue from tile as soon as possible.
2. Clean grout smears and haze from tile according to tile and grout manufacturer's written instructions. Use only cleaners recommended by tile and grout manufacturers and only after determining that cleaners are safe to use by testing on samples of tile and other surfaces to be cleaned. Protect metal surfaces and plumbing fixtures from effects of cleaning. Flush surfaces with clean water before and after cleaning.

B. Protect installed tile work with kraft paper or other heavy covering during construction period to prevent staining, damage, and wear. If recommended by tile manufacturer, apply coat of neutral protective cleaner to completed tile walls and floors.

C. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.

D. Before final inspection, remove protective coverings and rinse neutral protective cleaner from tile surfaces.

3.07 TILE INSTALLATION SCHEDULE

A. Interior Floor Installations:
   1. Tile Installation F122: Thin-set mortar on waterproof membrane; TCA F122.
      a. Tile Type: Quarry.
      b. Thin-Set Mortar: Latex- portland cement mortar.
      c. Grout: Polymer-modified sanded grout.

B. Interior Wall Installations:
   1. Tile Installation W243: Thin-set mortar on gypsum board; TCA W243.
      a. Tile Type: Glazed ceramic.
      b. Thin-Set Mortar: Latex-modified dry-set portland cement mortar.
      c. Grout: Polymer-modified sanded grout.
   2. Tile Installation W244C: Thin-set mortar on cementitious backer units underlayment waterproofing membrane; TCA W244C.
      a. Tile Type: Glazed ceramic.
      b. Thin-Set Mortar: Latex-modified dry-set portland cement mortar.
      c. Grout: Polymer-modified sanded grout.
      d. Location: Interior shower, with waterproofing membrane, toilet rooms without waterproofing membrane.

C. Exterior Shower Installations:
   1. Tile Installation W241: Cement mortar bed (thickset); TCA W241 and ANSI A108.1B.
      a. Tile Type: Glazed ceramic.
      b. Thin-Set Mortar for Cured-Bed Method: Latex-modified dry-set portland cement mortar.
      c. Grout: Polymer-modified sanded grout.
      d. Location: Exterior shower.

1.03 SUBMITTALS

A. Product data: submit manufacturer's printed product literature, specifications and data sheet.
B. Submit duplicate 1-⅝” X 2-inch X 6 inch (41mm X 50.8mm X 150mm) samples of cladding material, of color and profile specified.
C. Shop drawings to indicate dimensions, profiles, attachment methods, schedule of wall elevations, trim and closure pieces, soffits, fascia, metal furring, and related work.
D. Certifications: Manufacturer's certifications that products comply with specified requirements, including laboratory reports showing compliance with specified tests and standards.
E. LEED Submittal Data: Manufacturer’s product data for each product specified in this section per ecoscorecard.com.
F. Submit manufacturer’s installation instructions.

1.04 LEED

A. Category - Material & Resources
    1. MR Credit 2.1, 2.2 - Construction Waste Management Divert 50% or 75% from disposal.
B. Category – Indoor Environment Quality
    1. EQ Credit 4.1 to 4.6 – Low Emitting Materials.
C. Category – Innovation and Design Process
    1. ID Credit – Biophilic Design.

1.05 WARRANTY

A. Provide a written guarantee, signed and issued in the name of the owner, covering the metal cladding/cladding material for 15 (fifteen) years from the date of Substantial Completion.
B. The manufacturer's warranty is limited to replacement of defective material only, rather than installation of the same. Faulty installation shall be corrected by the installing contractor. The warranty required herein is the sole remedy against the manufacturer and there are no other implied warranties. In any event, the manufacturer shall not be liable for incidentals or consequential damages.

PART 2 - PRODUCTS

2.01 ALUMINUM CLADDING AND COMPONENTS

A. 1-⅝” X 2 inch (41mm X 51mm) Link & Lock Batten extruded aluminum 6063-T5
    1. Finish coating: powder coated finish.
    2. Color: color selected by Owner’s Representative.
    3. Gloss: 30 ± 5.
    4. Thickness: 1/16 inch (1.65mm) base metal thickness.
    5. Profile: 1-⅝” X 2 inch (41mm X 51mm), 24 ft (7315.2mm) batten.

2.02 ACCESSORIES

A. Batten End Caps with matching powder-coated finish.

B. Attachment Clips: Mounting Clips and End Mounts that are shipped loose for field installation.

2.03 MANUFACTURERS

A. Longboard Architectural Products #120 - 1777 Clearbrook Rd.
Abbotsford, BC, Canada V2T 5X5

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install battens in accordance with manufacturer's written instructions.
B. Attach battens in a manner not restricting thermal movement.

3.02 CLEANING

A. Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

END OF SECTION

SECTION 09 65 13

RESILIENT BASE AND ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:
   1. Resilient base.
   2. Resilient stair accessories.

1.02 ACTION SUBMITTALS

A. Samples: For each exposed product and for each color and texture specified, not less than 12 inches (300 mm) long.

B. Samples for Initial Selection: For each type of product indicated.

C. Samples for Verification: For each type of product indicated and for each color, texture, and pattern required in manufacturer's standard-size Samples, but not less than 12 inches (300 mm) long.

D. Product Schedule: For resilient base and accessory products. Use same designations indicated on Drawings.

1.03 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Furnish not less than 10 linear feet (3 linear m) for every 500 linear feet (150 linear m) or fraction thereof, of each type, color, pattern, and size of resilient product installed.

1.04 QUALITY ASSURANCE

A. Single Source Responsibility: Obtain each type, color, and pattern of resilient base products from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.

B. Installer Qualifications: Acceptable to manufacturer with experience on at least 5 projects of similar nature in past 5 years.

C. Regulatory Requirements:
   1. Comply with local regulations controlling use of volatile organic compounds for installation products.
   2. Slip resistance: ASTM D2047, minimum static coefficient of friction; 0.6 for floors, 0.8 for ramps.

D. Certifications:
   1. Manufacturer’s certification that products furnished for project meet or exceed specified requirements.
   2. Installer Certification: Manufacturer’s certification attesting that Installer is trained and approved for application of materials.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Store resilient products and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 50 deg F (10 deg C) or more than 90 deg F (32 deg C).

1.06 FIELD CONDITIONS

A. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F (21 deg C) or more than 95 deg F (35 deg C), in spaces to receive resilient products during the following time periods:
   1. 48 hours before installation.
   2. During installation.
   3. 48 hours after installation.

B. After installation and until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F (13 deg C) or more than 95 deg F (35 deg C).

C. Install resilient products after other finishing operations, including painting, have been completed.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. FloorScore Compliance: Resilient base and stair accessories shall comply with requirements of FloorScore certification.

2.02 THERMOSET-RUBBER BASE

A. Manufacturers: Refer to "Material List" on Drawing Sheet A703.

B. Product Standard: ASTM F 1861, Type TS (rubber, vulcanized thermoset), Group I (solid, homogeneous).
   1. Style and Location:
      a. Style A, Straight: Provide in areas with carpet.
      b. Style B, Cove: Provide in areas with resilient flooring.

C. Thickness: 0.125 inch (3.2 mm).

D. Height: 4 inches (102 mm).

E. Lengths: Coils in manufacturer's standard length.

F. Outside Corners: Job formed.

G. Inside Corners: Job formed.

H. Colors: As selected by City Engineer from manufacturer’s standard palette.

2.03 RUBBER MOLDING ACCESSORY

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Roppe Corporation, USA.

2. Mercer Products Co., Inc.
3. Macklanburg-Duncan.
4. Johnsonite.
5. Or approved equal.

B. Description:
1. Rubber stair-tread nosing
2. Reducer strip for resilient flooring
3. Joiner for tile and carpet.

C. Profile and Dimensions: As indicated.

D. Locations: Provide rubber molding accessories in areas indicated.

E. Colors: As selected by Architect.

2.04 INSTALLATION MATERIALS

A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by resilient-product manufacturer for applications indicated.

B. Adhesives: Water-resistant type recommended by resilient-product manufacturer for resilient products and substrate conditions indicated.
1. Adhesives shall comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."
2. Adhesives shall meet VOC and chemical component limits of South Coast Air Quality Management District (SCAQMD) Rule No. 1168 and Cal GREEN Table 5.504.4.1 Adhesive VOC Limit requirements.

C. Stair-Tread Nose Filler: Two-part epoxy compound recommended by resilient stair-tread manufacturer to fill nosing substrates that do not conform to tread contours.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.

B. Proceed with installation only after unsatisfactory conditions have been corrected.
1. Installation of resilient products indicates acceptance of surfaces and conditions.

3.02 PREPARATION

A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.

B. Concrete Substrates for Resilient Stair Accessories: Prepare horizontal surfaces according to ASTM F 710.

1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
2. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrate alkalinity falls within range on pH scale recommended by manufacturer in writing, but not less than 5 or more than 9 pH.

C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound; remove bumps and ridges to produce a uniform and smooth substrate.

D. Do not install resilient products until they are the same temperature as the space where they are to be installed.
1. At least 48 hours in advance of installation, move resilient products and installation materials into spaces where they will be installed.

E. Immediately before installation, sweep and vacuum clean substrates to be covered by resilient products.

3.03 RESILIENT BASE INSTALLATION

A. Comply with manufacturer's written instructions for installing resilient base.

B. Apply resilient base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required.

C. Install resilient base in lengths as long as practical without gaps at seams and with tops of adjacent pieces aligned.

D. Tightly adhere resilient base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.

E. Do not stretch resilient base during installation.

F. On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient base with manufacturer's recommended adhesive filler material.

G. Job-Formed Corners:
1. Outside Corners: Use straight pieces of maximum lengths possible and form with returns not less than 3 inches (76 mm) in length.
   a. Form without producing discoloration (whitening) at bends.
2. Inside Corners: Use straight pieces of maximum lengths possible and form with returns not less than 3 inches (76 mm) in length.
   a. Miter or cope corners to minimize open joints.

3.04 RESILIENT ACCESSORY INSTALLATION

A. Comply with manufacturer's written instructions for installing resilient accessories.

B. Resilient Stair Accessories:
1. Use stair-tread-nose filler to fill nosing substrates that do not conform to tread contours.
2. Tightly adhere to substrates throughout length of each piece.
3. For treads installed as separate, equal-length units, install to produce a flush joint between units.

C. Resilient Molding Accessories: Butt to adjacent materials and tightly adhere to substrates throughout length of each piece. Install reducer strips at edges of floor covering that would otherwise be exposed.

3.05 CLEANING AND PROTECTION

A. Comply with manufacturer's written instructions for cleaning and protecting resilient products.

B. Perform the following operations immediately after completing resilient-product installation:
   1. Remove adhesive and other blemishes from exposed surfaces.
   2. Sweep and vacuum horizontal surfaces thoroughly.
   3. Damp-mop horizontal surfaces to remove marks and soil.

C. Protect resilient products from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.

D. Cover resilient products subject to wear and foot traffic until Substantial Completion.

END OF SECTION

SECTION 09 65 19.23

RESILIENT TILE FLOORING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Resilient tile flooring with special seam adhesive and applied rubber base.

2. Resilient static-dissipative vinyl tile flooring. B. Related

Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00 - Cast-in-Place Concrete.
3. Section 09 65 13 - Rubber Base.Resilient Base and Accessories

1.2 DEFINITIONS

A. Pop-up: A pop-up is defined as any surface deviation or looseness of substrate that is equal to or greater than 1/64 (0.015625) inch above the concrete floor level, regardless of the size.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's published technical data describing materials, construction and recommended installation procedures. Submit technical data and installation instructions for each adhesive material. Submit list and Product Data of recommended finish materials.

B. Low VOC product

C. Recommendations for maintenance, care and cleaning.

D. Samples: Submit 5 full size tile samples of each selected color and pattern

E. Installer's Experience Qualifications: Submit list of not less than five projects, extending over period of not less than five years, indicating installer's experience record. Submit letter from manufacturer indicating manufacturer's approval for installer of the products.

F. Extra Materials: Furnish standard manufacturer tile size in quantity equal to 5 percent of amount installed for each color and pattern.

1.4 QUALITY ASSURANCE

A. Qualifications of Installer: Minimum five years experience in successfully installing the specified products or similar flooring materials.

B. Comply with the following as a minimum requirement:

1. Materials shall be compliant with requirements of CBC Chapter 11B and ADAAG.
2. ASTM D 2047 – 11: Standard Test Method for Static Coefficient of Friction of Polish-Coated Flooring System as Measured by the James Machine.
3. ASTM E 84:Class A Flame Spread Rating of 25 or less.

4. ASTM E 648 (NFPA 253) Critical Radiant Flux of 0.45 watts per sq. cm. or greater, Class I

4 .ASTM F 710: Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring.

5. ASTM E 662 (NFPA 258) (Smoke Generation) Maximum Specific Optical Density of 450 or less

6. ASTM F 1066 – Class 2: Vinyl Composition Floor Tile, through pattern.

7. ASTM F 1869: Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride.

8. ASTM F 1913: Sheet Vinyl Floor Covering Without Backing.

9. Fire Test Data: ASTM E 648, NFPA 253, ASTM E 662, NFPA 258.

10. Moisture Testing: ASTM F1869.

11. Slip Resistance: Provide floor surfaces with minimum static coefficient of friction of 0.60, measured in accordance with ASTM D2047.

C. Pre-Installation Conference: Arrange an on-site meeting with a manufacturer's representative after cleaning has been performed and flooring is ready to be installed. Contractor and Inspector shall be present for the conference. Inspect all required areas and conditions. Make final preparation requirements as recommended by the manufacturer's representative.

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with 01150 Storage of Materials and Equipment.

B. Comply with manufacturer's ordering instructions and lead time requirements to avoid construction delays.

C. Deliver materials in good condition to the jobsite in the manufacturer's original unopened containers that bear the name and brand of the manufacturer, project identification, and shipping and handling instructions.

D. Store materials in a clean, dry, enclosed space off the ground, protected from harmful weather conditions and at temperature and humidity conditions recommended by the manufacturer. Protect adhesives from freezing. Store flooring, adhesives, and accessories in the spaces where they will be installed for at least 48 hours before beginning installation.

1.6 PROJECT CONDITIONS

A. Ventilation and Temperature: Verify areas that are to receive new flooring are ventilated to remove fumes from installation materials, and areas are within temperature range recommended by the various material manufactures for Project site installation conditions.

B. Maintain a minimum temperature in the spaces to receive the flooring and accessories of 65ºF (18ºC) and a maximum temperature of 85ºF (29ºC) for at least 48 hours before, during, and for not less than 48 hours after installation. Thereafter, maintain a minimum temperature of 55ºF (13ºC) in areas where work is completed. Protect all materials from the direct flow of heat from hot-air registers, radiators, or other heating fixtures and appliances.

1.7 WARRANTY

A. Manufacturer shall provide five year material warranty from date of purchase

B. Installer shall provide a two year fabrication and installation warranty.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Armstrong Contract Interiors.

B. Azrock.

C. Congoleum.

D. Johnsonite.

E. Or Approved qual.

2..2 RESILENT TILE FLOORING

A. Description: A layered construction consisting of a tough, clear, rigid vinyl wear layer protecting a high-fidelity print layer on a solid vinyl backing. Protected by a diamondinfused UV-cured polyurethane finish, the wear surface is embossed with different textures to enhance each of the printed visuals. Colors are insoluble in water and resistant to cleaning agents and light.

B. Reference specification - ASTM F 1700, “Standard Specification for Solid Vinyl Tile", Class III, Type B – Embossed Surface. Meets requirements for size, squareness, thickness, thickness of wear layer, residual indentation, resistance to chemicals, resistance to light and resistance to heat.

C. Pattern and Color: See finish schedule
D. Size: See finish schedule
E. Wear layer thickness: min. 20 mil
F. Thickness: min. 3 mm

G. Miscellaneous Shapes: Provide miscellaneous moldings as follows and as required to complete the installation. Catalog numbers are those of Mercer. Colors shall be as selected by Architect from manufacturer’s standard colors.

1. Corner Guards, No. 695 Junior Corner Guard.
2. Utility Moldings: No. 655 Utility Molding.
3. Tile Reducer: No. 633, 1/8 inch size. H. Floor Sealer: Provide one of the following:

1. Super Polymer 85, manufactured by Maintex.
2. Butcher’s Mainstay Floor Finish, manufactured by Waxie Stationary Supply.
3. Polymer L. A. manufactured by Alkot Industries.
4. Equal.

I. Slip – resistance: Minimum coefficient of friction 0.6 per ASTM D2047.

PART 3 - EXECUTION

3.1 COORDINATION

A. Coordinate with related Work to assure level, smooth, and clean finish surfaces to receive floor tile.

3.2 EXAMINATION

A. Field verify dimensions and other conditions affecting the Work of this section before commencing the Work of this section.

B. Before the Work of this section is started, examine surfaces to receive resilient sheet vinyl flooring and correct deficiencies before starting the Work of this section.

3.3 PREPARATION

A. Concrete Slabs:

1. Do not start preparation until concrete floor slabs are at least 90 days old.

2. Leveling: Check subfloors for level, and make floor slabs true to level and plane within a tolerance of 1/8 inch in 10 feet. Test floor areas both ways with a 10-foot straightedge and repair high and low areas exceeding allowable tolerance. Pop ups shall be hammered out and floor filled with a cementitious leveling compound. Remove high areas by power sanding, stone rubbing or grinding, chipping off and filling with leveling compound, or equivalent method. Fill low areas with leveling compound. Repair and level the surfaces having abrupt changes in plane, such as trowel marks or ridges, whether or not within the allowable tolerance. Clean areas where repairs are performed.

3. Cleaning: After leveling, if required, clean substrates of deleterious substances and foreign matter.

4. Cracks or Depressions: Fill voids with cementitious leveling compound of the type recommended by flooring manufacturer for the specific conditions.

5. Moisture Testing: Test new and old concrete slabs for adequate dryness. Testing shall conform to ASTM F 1869, and the following. Minimum testing requirements are three calcium chloride tests for the first 1,000 square feet of floor area, and one for each additional 1,000 square feet or fraction thereof.

   Unless more stringent requirements are recommended by flooring manufacturer, maximum allowable moisture release at time of flooring installation shall be three pounds per 24 hours per 1,000 square feet. Provide report of test as specified above. For each test, perform the following steps:

   a. Weigh the sealed dish of crystals immediately prior to exposure. Record starting weight, date, and time.

   b. Open kit and set crystal dish on clean concrete surface. Immediately install plastic dome over the dish. Confirm the dome is gasketed to the concrete and is airtight.

   c. Leave test to absorb moisture for 60 to 72 hours. Maintain room temperature above 55 degrees F for duration of test.

   d. After exposure, remove and discard housing. Replace dish lid and tape shut. Weigh the sample within one hour of removal from floor.

   e. Compute the vapor emission in pounds, indicate location of test and vapor emission on report.

f. Delay application of flooring until sub-floors are sufficiently dry, or perform remedial measures as recommended by flooring materials manufacturer.

6. Priming: Prime concrete floor slabs installed directly on grade and other slabs if recommended by flooring manufacturer.

7. Sweep floors and vacuum sanding dust.

3.4 INSTALLATION OF SHEET FLOORING

A. Install flooring wall to wall before the installation of floor-set cabinets, casework, furniture, equipment, movable partitions, etc. Extend flooring into toe spaces, door recesses, closets, and similar openings as shown on the drawings.

B. If required, install flooring on pan-type floor access covers. Maintain continuity of color and pattern within pieces of flooring installed on these covers. Adhere flooring to the subfloor around covers and to covers.

C. Scribe, cut, and fit to permanent fixtures, columns, walls, partitions, pipes, outlets, and built-in furniture and cabinets.

D. Roll with a 100-lb. (45.36 kilogram) roller in the field areas. Refer to specific rolling instructions of the flooring manufacturer.

E. Install flooring with adhesives, tools, and procedures in strict accordance with the manufacturer's written instructions. Observe the recommended adhesive trowel notching, open times, and working times.

3.6 CLEANING

A. Keep flooring surfaces clean as installation progresses.

B. Clean flooring when sufficiently seated and remove foreign substances.

C. Finish sheet vinyl flooring with two coats of floor finish installed in accordance with manufacturers instruction. Do not buff unless specifically required. Provide the manufacturers recommended drying time for each coat.

D. Clean adjacent surfaces of adhesive or other materials. Replace damaged or defective Work.

3.7 CLEAN UP

A. Remove rubbish, debris and waste material and legally dispose off the Project site.

3.8 PROTECTION

A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 09 91 13

EXTERIOR PAINTING

PART 1 - GENERAL

1.01 SUMMARY

A. This Section includes surface preparation and field painting of exposed items and surfaces.
   1. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.

B. Paint exposed surfaces, except where these Specifications indicate that the surface or material is not to be painted or is to remain natural. If an item or a surface is not specifically mentioned, paint the item or surface the same as similar adjacent materials or surfaces. If a color of finish is not indicated, Architect will select from standard colors and finishes available.
   1. Painting includes field painting of exposed bare and covered pipes and ducts (including color coding), hangers, exposed steel and iron supports, and surfaces of mechanical and electrical equipment that do not have a factory-applied final finish.

1.02 DEFINITIONS

A. Conform to PDCA Glossary for interpretation of terms used in this Section except as modified below.

B. Exposed Surfaces: Surfaces of products, assemblies, and components visible from any angle after final installation. Includes internal surfaces visible when operable doors, panels or drawers are open, and surfaces visible behind registers, grilles, or louvers.

C. Concealed Surfaces: Surfaces permanently hidden from view in finished construction and which are only visible after removal or disassembly of part or all of product or assembly.

D. Inaccessible Spaces: Spaces not intended for human use.

E. Sheen: Degree of luster as measured with specular gloss meter in accordance with ASTM D523:
   1. Gloss Level 1: Not more than 5 units at 60 degrees and 10 units at 85 degrees.
   2. Gloss Level 2: Not more than 10 units at 60 degrees and 10 to 35 units at 85 degrees..
   3. Gloss Level 3: 10 to 25 units at 60 degrees and 10 to 35 units at 85 degrees.
   4. Gloss Level 4: 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees.
   5. Gloss Level 5: 35 to 70 units at 60 degrees.
   6. Gloss Level 6: 70 to 85 units at 60 degrees.
   7. Gloss Level 7: More than 85 units at 60 degrees.

F. System DFT: Dry film thickness of entire coating system unless otherwise noted.

1.03 SUBMITTALS

A. Product Data: For each paint system indicated. Include block fillers and primers.
   1. Material List: An inclusive list of required coating materials. Indicate each material and cross-reference specific coating, finish system, and application. Identify each material by manufacturer's catalog number and general classification.
   2. Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each coating material.

B. Samples for Verification: Submit 3 samples for each color and material to be applied, with texture to simulate actual conditions, on representative Samples of the actual substrate.

C. LEED Submittals: Provide special submittals conforming to Section 018113 - Sustainable Design Requirements for the following:
   1. LEED Credit MR Cost Data: Provide special materials cost data breakdown data.
   2. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regional materials, certificates indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating distance to Project, cost for each regional material, and fraction by weight that is considered regional.
      a. Include statement indicating location of manufacturer and point of extraction, harvest, or recovery for each raw material used in regionally extracted and manufactured materials. Indicate distance to Project and fraction by weight of each regionally manufactured material that is regionally extracted.
   3. Product Data for Credit EQ 4.2: For paints and coatings, including printed statement of VOC content.
   4. Laboratory Test Reports for Credit EQ 4.2: For paints and coatings, documentation indicating that they meet the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

1.04 QUALITY ASSURANCE

A. Applicator Qualifications: A firm or individual experienced in applying paints and coatings similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.

B. Source Limitations: Obtain primers for each coating system from the same manufacturer as the finish coats.

1.05 FIELD SAMPLES

A. Sample Installation: Duplicate finishes of approved coating system samples on wall surfaces and other interior and exterior components selected by Architect.

B. Provide full-coat finish on at least 100 sq ft of surface until required color, sheen, and texture are obtained. Simulate finished lighting conditions for review of in-place work.

C. Request review by City Engineer of first finished room, space, or item for each coating system for color, texture, quality, and workmanship

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to Project site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label and the following information:
   1. Product name or title of material.
   2. Product description (generic classification or binder type).
   3. Manufacturer's stock number and date of manufacture.
   4. Contents by volume, for pigment and vehicle constituents.
   5. Thinning instructions.
   6. Application instructions.
   7. Color name and number.
   8. VOC content.

B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 deg F. Maintain storage containers in a clean condition, free of foreign materials and residue.
   1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily.

1.07 PROJECT CONDITIONS

A. Environmental Conditions: Comply with more restrictive of following or manufacturer's requirements under which systems can be applied.
   1. Provide continuous ventilation during application of coatings to exhaust hazardous fumes.
   2. Provide heating necessary to maintain surface and ambient temperatures within specified limits.
   3. Maintain temperature and humidity conditions for minimum 24 hours before, during, and 48 hours after application of finishes, unless longer times are required by manufacturer.
   4. Do not permit wide variations in ambient temperatures which might result in condensation on freshly coated surfaces.
   5. Provide illumination of not less than 80 footcandles measured mid-height at substrate surface during application of coatings.
   6. Apply water reducible coatings only when ambient and surface temperatures are between 50 degrees F and 90 degrees F.
   7. Apply solvent reducible coatings only when ambient and surface temperatures are between 45 degrees F and 90 degrees F.
   8. Do not apply coatings under any of following conditions:
      a. When surfaces are damp or wet.
      b. During snow, rain, fog, or mist.
      c. When relative humidity is less than 20 percent or exceeds 85 percent.
      d. When temperature is less than 5 degrees F above dew point.
      e. When dust may be generated before coatings have dried.
      f. In direct sunlight.
      g. When wind velocity is above 20 mph.
   9. Application of coatings may continue during inclement weather provided work areas and surfaces to be coated are enclosed and specified environmental conditions are maintained.

1.08 WARRANTY

A. Warrant installation to be free from defects in material and workmanship for 5 years.

B. Repair or replace defects occurring during warranty period.

C. Defects include but are not limited to pinholes, crazing or cracking, loss of adhesion to substrate, deficient thickness, improper materials and workmanship.

1.09 EXTRA MATERIALS

A. Furnish extra paint materials from the same production run as the materials applied and in the quantities described below. Package with protective covering for storage and identify with labels describing contents. Deliver extra materials to Owner.
   1. Quantity: Furnish Owner with 1 gallon extra paint materials for each type, sheen or color used.

PART 2 - PRODUCTS

2.01 COATING MATERIALS - GENERAL

A. Coatings:
   1. Ready-mixed, factory tinted, best professional grade produced by manufacturer.
   2. Use manufacturer’s appropriate base materials to achieve required colors.
   3. Fully grind pigments to maintain soft paste consistency in vehicle.
   4. Capable of being dispersed into uniform, homogeneous mixture.
   5. Possess good flowing and brushing properties.
   6. Capable of drying or curing free of streaks or sags, and yielding specified finish.
   7. VOC content of field applied coatings shall comply with local governing authorities.

B. Paint Maximum Product Emissions Limits: Top coat and primer interior paints must meet or not exceed the VOC (Volatile Organic Compounds) limits of the current requirements of Green Seal Standards GS-11 - Paints in the building, and Cal-GREEN Table 5.504.4.3 for VOC Content Limits for Architectural Coatings.

C. Cal-GREEN Requirements for typical paint coatings:
   1. Primers, Sealers, and Undercoaters: 100 grams per liter of product minus water
   2. Flats: 50 grams per liter of product minus water
   3. Non-flats: 100 grams per liter of product minus water
   4. Non-flat High Gloss: 150 grams per liter of product minus water

2.02 MANUFACTURERS

A. Manufacturers' Names: Subject to compliance with requirements, provide products by one of the manufactures listed below.
   1. Benjamin Moore and Company
   2. Dunn Edwards Corporation.
   3. Glidden Professional.
   4. Sherwin-Williams Co.
   5. Tnemec.
   6. Vista Paint Corporation.
   7. Prior approved equal.

2.03 PAINT MATERIALS, GENERAL

A. Material Compatibility: Provide block fillers, primers, and finish-coat materials that are compatible with one another and with the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

B. Material Quality: Provide manufacturer's best-quality paint material of the various coating types specified that are factory formulated and recommended by manufacturer for application indicated. Paint-material containers not displaying manufacturer's product identification will not be acceptable.
   1. Proprietary Names: Use of manufacturer's proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other manufacturers. Furnish manufacturer's material data and certificates of performance for proposed substitutions.

C. Colors: As selected by Architect or as noted on Contract Drawings.

2.04 EXTERIOR PRIMERS

A. Exterior Concrete and Masonry Primer: Factory-formulated alkali-resistant acrylic-latex primer for exterior application.
   1. Benjamin Moore and Company: XXXX Applied at a dry film thickness of not less than x.x mil.
   2. Dunn-Edwards Corporation; ESPR00 Eff-Stop Premium Interior / Exterior 100% Acrylic Masonry Primer / Sealer: Applied at a dry film thickness of not less than 1.5 mils.
   3. Glidden Professional; GP6001 Hydrosealer Primer Sealer: Applied at a dry film thickness of not less than 1.4 mils
   4. Sherwin-Williams; Loxon Concrete & Masonry Primer A24W08300: Applied at a dry film thickness of not less than 3.0 mils
   5. Tnemec; Series 180 W.B. Tneme-Crete. Applied at a dry film thickness rate of not less than 3.0 mils.
   6. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

B. Exterior Gypsum Soffit Board Primer: Factory-formulated alkyd- or alkali-resistant acrylic-latex primer for exterior application.

1. Dunn-Edwards Corporation; UGPR00-1 Ultra-Grip Premium, Ultra-Low VOC, Interior / Exterior Acrylic Multi-Surface Primer: Applied at a dry film thickness of not less than 1.5 mils.
2. Glidden Professional; 3210 Gripper Interior/Exterior Primer Sealer: Applied at a dry film thickness of not less than 1.8 mils
3. Sherwin-Williams; : Exterior Latex Wood Primer, B42W0841Applied at a dry film thickness of not less than 1.4 mils
4. Tnemec; Series 180 W.B. Tneme-Crete. Applied at a dry film thickness rate of not less than 4.0 mils.
5. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

C. Exterior Ferrous-Metal Primer: Factory-formulated rust-inhibitive metal primer for exterior application.
1. Dunn-Edwards Corporation; BRPR00-1 Bloc-Rust Premium, Interior / Exterior, Red Oxide or White, Waterborne Alkyd Rust Preventative Metal Primer: Applied at a dry film thickness of not less than 2.0 mils
2. Glidden Professional; 4160-XXXX Devguard Multi-Purpose Tank & Structural Primer. Applied at a dry film thickness of not less than 2.0 mils
3. Sherwin-Williams; Kem Kromik Universal Metal Primer B50NZ6/B50WZ1: Applied at a dry film thickness of not less than 3.0 milsIf a waterbased primer is desired, use S-W Pro Industrial ProCryl Universal Acrylic Primer, B66W310. Applied at a dry film thickness of not less than 3.0 mils.
4. Tnemec;Series 115 Uni-Bond DF. Applied at a dry film thickness rate of not less than 3.0 mils DFT.
5. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

D. Exterior Galvanized Metal Primer: Factory-formulated galvanized metal primer for exterior application.
1. Dunn-Edwards Corporation; UGPR00-1 Ultra-Grip Premium, Ultra-Low VOC, Interior / Exterior Acrylic Multi-Surface Primer: Applied at a dry film thickness of not less than 1.5 mils.
2. Glidden Professional; 4020-XXXX Devflex DTM Flat Interior/Exterior Waterborne Primer & Finish: Applied at a dry film thickness of not less than 2.2 mils
3. Glidden Professional; 4160-XXXX Devguard Multi-Purpose Tank & Structural Primer: Applied at a dry film thickness of not less than 2.0 mils
4. Sherwin-Williams; S-W Pro Industrial ProCryl Universal Acrylic Primer, B66W310. Applied at a dry film thickness of not less than 3.0 mils.
5. Tnemec:
    a. Under Acrylics: Series 115 Uni-Bond DF; Applied at a dry film thickness rate of not less than 3.0 mils.
    b. Under Urethane: Series L69 H.B. Epoxoline II; Applied at a dry film thickness rate of not less than 3.0 mils.
6. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

E. Exterior Aluminum Primer under Acrylic Finishes: Factory-formulated acrylic-based metal primer for exterior application.
1. Benjamin Moore and Company: XXXX Applied at a dry film thickness of not less than x.x mil.
2. Dunn-Edwards Corporation; UGPR00-1 Ultra-Grip Premium, Ultra-Low VOC, Interior / Exterior Acrylic Multi-Surface Primer: Applied at a dry film thickness of not less than 1.5 mils.
3. Glidden Professional; 4020-XXXX Devflex DTM Flat Interior/Exterior Waterborne Primer & Finish: Applied at a dry film thickness of not less than 2.2 mils
4. Glidden Professional; 4160-XXXX Devguard Multi-Purpose Tank & Structural Primer: Applied at a dry film thickness of not less than 2.0 mils
5. Sherwin-Williams; S-W Pro Industrial ProCryl Universal Acrylic Primer, B66W310. Applied at a dry film thickness of not less than 3.0 mils.
6. Tnemec; Series 115 Uni-Bond DF; Applied at a dry film thickness rate of not less that 3.0 mils.
7. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

F. Exterior Aluminum Primer under Alkyd Finishes: Factory-formulated acrylic-based metal primer for exterior application.
   1. Dunn-Edwards Corporation; UGPR00-1 Ultra-Grip Premium, Ultra-Low VOC, Interior / Exterior Acrylic Multi-Surface Primer: Applied at a dry film thickness of not less than 1.5 mils.
   2. Glidden Professional; 4020-XXXX Devflex DTM Flat Interior/Exterior Waterborne Primer & Finish: Applied at a dry film thickness of not less than 2.2 mils
   3. Sherwin-Williams S-W Pro Industrial ProCryl Universal Acrylic Primer, B66W310Applied at a dry film thickness of not less than XXX mils .Applied at a dry film thickness of not less than 3.0 mils.
   4. Tnemec; Series 115 Uni-Bond DF; Applied at a dry film thickness rate of not less than 3.0 mils.
   5. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

G. Exterior Concrete Block Filler: Factory-formulated interior and exterior concrete block filler. PDCA Level 2
   1. Dunn-Edwards Corporation; SBSL00 Smooth Blocfil Select, Interior / Exterior Concrete Block Filler.
   2. Glidden Professional;
   3. Sherwin-Williams: Prep-Rite Block Filler B25W25.
   4. Tnemec; Series 130 Envirofill
   5. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

2.05 EXTERIOR FINISH COATS

A. Exterior Low-Luster Acrylic Paint: Factory-formulated low-sheen (eggshell) acrylic-latex paint for exterior application.
   1. Dunn-Edwards Corporation; SSHL40 Spartashield Exterior, Ultra-Low VOC, 100% Acrylic Low Sheen Paint: Applied at a dry film thickness of not less than 1.5 mils.
   2. Glidden Professional; 2412-XXXX Dulux Professional Exterior 100 Percent Acrylic Satin Finish: Applied at a dry film thickness of not less than 1.4 mils
   3. Sherwin-Williams; A-100 Exterior Latex Satin A82 Series: Applied at a dry film thickness of not less than 1.5 mils
   4. Tnemec; Series 1029 Enduratone; Applied at a dry film thickness rate of not less than 2.0 mils.
   5. Vista Paint Corporation: 4600 Uniprime II at a dry film thickness of not less than 2.0 mil.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for paint application. Comply with procedures specified in PDCA P4.
   1. Proceed with paint application only after unsatisfactory conditions have been corrected and surfaces receiving paint are thoroughly dry.
   2. Start of painting will be construed as Applicator's acceptance of surfaces and conditions within a particular area.

B. Coordination of Work: Review other Sections in which primers are provided to ensure compatibility of the total system for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.
   1. Notify Architect about anticipated problems when using the materials specified over substrates primed by others.

3.02 PREPARATION

A. General: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items already installed that are not to be painted. If removal is impractical or

impossible because of size or weight of the item, provide surface-applied protection before surface preparation and painting.
1. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.

B. Cleaning: Before applying paint or other surface treatments, clean substrates of substances that could impair bond of the various coatings. Remove oil and grease before cleaning.
1. Schedule cleaning and painting so dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.

C. Surface Preparation: Clean and prepare surfaces to be painted according to manufacturer's written instructions for each particular substrate condition and as specified.
1. Provide barrier coats over incompatible primers or remove and reprime.
2. Cementitious Materials: Prepare concrete, concrete unit masonry, cement plaster, and mineral-fiber-reinforced cement panel surfaces to be painted. Remove efflorescence, chalk, dust, dirt, grease, oils, and release agents. Roughen as required to remove glaze. If hardeners or sealers have been used to improve curing, use mechanical methods of surface preparation.
   a. Use abrasive blast-cleaning methods if recommended by paint manufacturer.
   b. Determine alkalinity and moisture content of surfaces by performing appropriate tests. If surfaces are sufficiently alkaline to cause the finish paint to blister and burn, correct this condition before application. Do not paint surfaces if moisture content exceeds that permitted in manufacturer's written instructions.
3. Ferrous Metals: Clean ungalvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with SSPC's recommendations.
   a. Blast steel surfaces clean as recommended by paint system manufacturer and according to SSPC-SP 6/NACE No. 3.
   b. Treat bare and sandblasted or pickled clean metal with a metal treatment wash coat before priming.
   c. Touch up bare areas and shop-applied prime coats that have been damaged. Wire-brush, clean with solvents recommended by paint manufacturer, and touch up with same primer as the shop coat.
4. Galvanized Surfaces: Clean galvanized surfaces with nonpetroleum-based solvents so surface is free of oil and surface contaminants. Remove pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods.

D. Material Preparation: Mix and prepare paint materials according to manufacturer's written instructions.
1. Maintain containers used in mixing and applying paint in a clean condition, free of foreign materials and residue.
2. Stir material before application to produce a mixture of uniform density. Stir as required during application. Do not stir surface film into material. If necessary, remove surface film and strain material before using.
3. Use only thinners approved by paint manufacturer and only within recommended limits.

E. Tinting: Tint each undercoat a lighter shade to simplify identification of each coat when multiple coats of same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.

3.03 APPLICATION

A. General: Apply paint according to manufacturer's written instructions. Use applicators and techniques best suited for substrate and type of material being applied.
1. Paint colors, surface treatments, and finishes are indicated in the paint schedules.
2. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.
3. Provide finish coats that are compatible with primers used.

4. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, grilles, convector covers, covers for finned-tube radiation, and similar components are in place. Extend coatings in these areas, as required, to maintain system integrity and provide desired protection.
5. Paint surfaces behind movable equipment and furniture the same as similar exposed surfaces. Before final installation of equipment, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
6. Paint interior surfaces of ducts with a flat, nonspecular black paint where visible through registers or grilles.
7. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.
8. Finish exterior doors on tops, bottoms, and side edges the same as exterior faces.
9. Finish interior of wall and base cabinets and similar field-finished casework to match exterior.
10. Sand lightly between each succeeding enamel or varnish coat.

B. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.
1. The number of coats and film thickness required are the same regardless of application method. Do not apply succeeding coats until previous coat has cured as recommended by manufacturer. If sanding is required to produce a smooth, even surface according to manufacturer's written instructions, sand between applications.
2. Omit primer over metal surfaces that have been shop primed and touchup painted.
3. If undercoats, stains, or other conditions show through final coat of paint, apply additional coats until paint film is of uniform finish, color, and appearance. Give special attention to ensure that edges, corners, crevices, welds, and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces.
4. Allow sufficient time between successive coats to permit proper drying. Do not recoat surfaces until paint has dried to where it feels firm, and does not deform or feel sticky under moderate thumb pressure, and until application of another coat of paint does not cause undercoat to lift or lose adhesion.

C. Minimum Coating Thickness: Apply paint materials no thinner than manufacturer's recommended spreading rate to achieve dry film thickness indicated. Provide total dry film thickness of the entire system as recommended by manufacturer.

D. Mechanical and Electrical Work: Painting of mechanical and electrical work is limited to items exposed in equipment rooms and occupied spaces.

E. Mechanical items to be painted include, but are not limited to, the following:
1. Uninsulated metal piping.
2. Uninsulated plastic piping.
3. Pipe hangers and supports.
4. Tanks that do not have factory-applied final finishes.
5. Visible portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets.
6. Duct, equipment, and pipe insulation having "all-service jacket" or other paintable jacket material.
7. Mechanical equipment that is indicated to have a factory-primed finish for field painting.

F. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.

G. Prime Coats: Before applying finish coats, apply a prime coat, as recommended by manufacturer, to material that is required to be painted or finished and that has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to ensure a finish coat with no burn-through or other defects due to insufficient sealing.

H. Pigmented (Opaque) Finishes: Completely cover surfaces as necessary to provide a smooth, opaque surface of uniform finish, color, appearance, and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections will not be acceptable.

I. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

3.04 CLEANING

A. Cleanup: At the end of each workday, remove empty cans, rags, rubbish, and other discarded paint materials from Project site.
   1. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping without scratching or damaging adjacent finished surfaces.

3.05 PROTECTION

A. Protect work of other trades, whether being painted or not, against damage from painting. Correct damage by cleaning, repairing or replacing, and repainting, as approved by Architect.

B. Provide "Wet Paint" signs to protect newly painted finishes. After completing painting operations, remove temporary protective wrappings provided by others to protect their work.
   1. After work of other trades is complete, touch up and restore damaged or defaced painted surfaces. Comply with procedures specified in PDCA P1.

3.06 EXTERIOR PAINT SCHEDULE

A. Concrete, Stucco, and Masonry (Other Than Concrete Unit Masonry): Provide the following finish systems over exterior concrete, stucco, and brick masonry substrates:
   1. Low-Luster Acrylic Finish: Two finish coats over a primer.
      a. Primer: Exterior concrete and masonry primer.
      b. Finish Coats: Exterior low-luster acrylic paint.

B. Concrete Unit Masonry: Provide the following finish systems over exterior concrete unit masonry:
   1. Low-Luster Acrylic Finish: Two finish coats over block filler.
      a. Block Filler: Concrete unit masonry block filler.
      b. Finish Coats: Exterior low-luster acrylic paint.

C. Ferrous Metal: Provide the following finish systems over exterior ferrous metal. Primer is not required on shop-primed items.
   1. Semigloss Acrylic-Enamel Finish: Two finish coats over a rust-inhibitive primer.
      a. Primer: Exterior ferrous-metal primer.
      b. Finish Coats: Exterior semigloss acrylic enamel.

D. Zinc-Coated Metal: Provide the following finish systems over exterior zinc-coated metal surfaces:
   1. Semigloss Acrylic-Enamel Finish: Two finish coats over a galvanized metal primer.
      a. Primer: Exterior galvanized metal primer.
      b. Finish Coats: Exterior semigloss acrylic enamel.

END OF SECTION

SECTION 09 91 23

INTERIOR PAINTING

PART 1 - GENERAL

1.01 SUMMARY

A. This Section includes surface preparation and field painting of exposed items and surfaces.
   1. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.

B. Paint exposed surfaces, except where these Specifications indicate that the surface or material is not to be painted or is to remain natural. If an item or a surface is not specifically mentioned, paint the item or surface the same as similar adjacent materials or surfaces. If a color of finish is not indicated, Architect will select from standard colors and finishes available.
   1. Painting includes field painting of exposed bare and covered pipes and ducts (including color coding), hangers, exposed steel and iron supports, and surfaces of mechanical and electrical equipment that do not have a factory-applied final finish.

1.02 DEFINITIONS

A. Conform to PDCA Glossary for interpretation of terms used in this Section except as modified below.

B. Exposed Surfaces: Surfaces of products, assemblies, and components visible from any angle after final installation. Includes internal surfaces visible when operable doors, panels or drawers are open, and surfaces visible behind registers, grilles, or louvers.

C. Concealed Surfaces: Surfaces permanently hidden from view in finished construction and which are only visible after removal or disassembly of part or all of product or assembly. D. Inaccessible Spaces: Spaces not intended for human use.

E. Sheen: Degree of luster as measured with specular gloss meter in accordance with ASTM D523:
   1. Gloss Level 1: Not more than 5 units at 60 degrees and 10 units at 85 degrees.
   2. Gloss Level 2: Not more than 10 units at 60 degrees and 10 to 35 units at 85 degrees..
   3. Gloss Level 3: 10 to 25 units at 60 degrees and 10 to 35 units at 85 degrees.
   4. Gloss Level 4: 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees.
   5. Gloss Level 5: 35 to 70 units at 60 degrees.
   6. Gloss Level 6: 70 to 85 units at 60 degrees.
   7. Gloss Level 7: More than 85 units at 60 degrees.

F. System DFT: Dry film thickness of entire coating system unless otherwise noted. 1.03

SUBMITTALS

A. Product Data: For each paint system indicated. Include block fillers and primers.
   1. Material List: An inclusive list of required coating materials. Indicate each material and cross reference specific coating, finish system, application, and location of application areas. Identify each material by manufacturer's catalog number and general classification.
   2. Manufacturer's Information: Manufacturer's technical information, including label analysis and instructions for handling, storing, and applying each coating material.

B. Samples for Verification: Submit 3 samples for each color and material to be applied, with texture to simulate actual conditions, on representative Samples of the actual substrate.

1.04 QUALITY ASSURANCE

A. Applicator Qualifications: A firm or individual experienced in applying paints and coatings similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.

B. Source Limitations: Obtain primers for each coating system from the same manufacturer as the finish coats.

1.05 FIELD SAMPLES

A. Sample Installation: Duplicate finishes of approved coating system samples on wall surfaces and other interior and exterior components selected by City Engineer.

B. Provide full-coat finish on at least 100 sq ft of surface until required color, sheen, and texture are obtained. Simulate finished lighting conditions for review of in-place work.

C. Request review by Project Manager or Architect of first finished room, space, or item for each coating system for color, texture, quality, and workmanship

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to Project site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label and the following information:
1. Product name or title of material.
2. Product description (generic classification or binder type).
3. Manufacturer's stock number and date of manufacture.
4. Contents by volume, for pigment and vehicle constituents.
5. Thinning instructions.
6. Application instructions.
7. Color name and number.
8. VOC content.

B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 deg F. Maintain storage containers in a clean condition, free of foreign materials and residue.
1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily.

1.07 PROJECT CONDITIONS

A. Environmental Conditions: Comply with more restrictive of following or manufacturer's requirements under which systems can be applied.
1. Provide continuous ventilation during application of coatings to exhaust hazardous fumes.
2. Provide heating necessary to maintain surface and ambient temperatures within specified limits.
3. Maintain temperature and humidity conditions for minimum 24 hours before, during, and 48 hours after application of finishes, unless longer times are required by manufacturer.
4. Do not permit wide variations in ambient temperatures which might result in condensation on freshly coated surfaces.
5. Provide illumination of not less than 80 footcandles measured mid-height at substrate surface during application of coatings.
6. Apply water reducible coatings only when ambient and surface temperatures are between 50 degrees F and 90 degrees F.
7. Apply solvent reducible coatings only when ambient and surface temperatures are between 45 degrees F and 90 degrees F.

8. Do not apply coatings under any of following conditions:
   a. When surfaces are damp or wet.
   b. During snow, rain, fog, or mist.
   c. When relative humidity is less than 20 percent or exceeds 85 percent.
   d. When temperature is less than 5 degrees F above dew point.
   e. When dust may be generated before coatings have dried. f. In direct sunlight.
   g. When wind velocity is above 20 mph.
9. Application of coatings may continue during inclement weather provided work areas and surfaces to be coated are enclosed and specified environmental conditions are maintained.

1.08 WARRANTY

A. Warrant installation to be free from defects in material and workmanship for 5 years.

B. Repair or replace defects occurring during warranty period.

C. Defects include but are not limited to pinholes, crazing or cracking, loss of adhesion to substrate, deficient thickness, improper materials and workmanship.

1.09 EXTRA MATERIALS

A. Furnish extra paint materials from the same production run as the materials applied and in the quantities described below. Package with protective covering for storage and identify with labels describing contents. Deliver extra materials to Owner.
   1. Quantity: Furnish Owner with 1 gallon extra paint materials for each type, sheen or color used.

PART 2 - PRODUCTS

2.01 COATING MATERIALS - GENERAL

A. Coatings:
   1. Ready-mixed, factory tinted, best professional grade produced by manufacturer.
   2. Use manufacturer's appropriate base materials to achieve required colors.
   3. Fully grind pigments to maintain soft paste consistency in vehicle.
   4. Capable of being dispersed into uniform, homogeneous mixture.
   5. Possess good flowing and brushing properties.
   6. Capable of drying or curing free of streaks or sags, and yielding specified finish.
   7. VOC content of field applied coatings shall comply with local governing authorities.

B. Paint Maximum Product Emissions Limits: Top coat and primer interior paints must meet or not exceed the VOC (Volatile Organic Compounds) limits of the current requirements of Green Seal Standards GS-11 - Paints in the building, and Cal-GREEN Table 5.504.4.3 for VOC Content Limits for Architectural Coatings.

C. Cal-GREEN Requirements for typical paint coatings:
   1. Primers, Sealers, and Undercoaters: 100 grams per liter of product minus water
   2. Flats: 50 grams per liter of product minus water
   3. Non-flats: 100 grams per liter of product minus water
   4. Non-flat High Gloss: 150 grams per liter of product minus water

2.02 MANUFACTURERS

A. Manufacturers' Names: Subject to compliance with requirements, provide products by one of the manufactures listed below.

B. Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:
1. Dunn Edwards Corporation.
2. Glidden Professional.
3. Sherwin-Williams Co.
4. Vista Paint Corporation
5. Prior approved equal.

2.03 PAINT MATERIALS, GENERAL

A. Material Compatibility: Provide block fillers, primers, and finish-coat materials that are compatible with one another and with the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

B. Material Quality: Provide manufacturer's best-quality paint material of the various coating types specified that are factory formulated and recommended by manufacturer for application indicated. Paint-material containers not displaying manufacturer's product identification will not be acceptable.
1. Proprietary Names: Use of manufacturer's proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other manufacturers. Furnish manufacturer's material data and certificates of performance for proposed substitutions.

C. Colors: As selected by Project Manager or as noted on the Drawings.

2.04 INTERIOR PRIMERS

A. Interior Gypsum Board Primer: Factory-formulated latex-based primer for interior application.
1. Dunn-Edwards Corporation; VNSL00-1 Vinylastic Select Low Odor / Zero VOC Interior Wall Sealer: Applied at a dry film thickness of not less that 1.5 mils.
2. Glidden Professional; 1030-1200 PVA Interior Primer Sealer General Purpose Wall Primer: Applied at a dry film thickness of not less than 1.2 mils
3. Kelly-Moore; 971 Acry-Prime Interior Latex Primer/Sealer: Applied at a dry film thickness of not less than 1.6 mils
4. Sherwin-Williams; S-W ProMar 200 Zero VOC Primer, B28W02600. Applied at a dry film thickness of not less than 1.0 mil.
5. Vista Paint Corporation: 5001 V-Pro Zero VOC Primer Applied at a dry film thickness of not less than 1.2 mil.

B. Interior Ferrous-Metal Primer: Factory-formulated quick-drying rust-inhibitive alkyd-based metal primer.
1. Dunn-Edwards Corporation; BRPR00-1 Bloc-Rust Premium, Ultra Low VOC, Interior / Exterior, Red Oxide or White, Waterborne Alkyd Rust Preventative Metal Primer: Applied at a dry film thickness of not less than 2.0 mils.
2. Dunn-Edwards Corporation; ULDM00 Ultrashield, Low Odor / Zero VOC, Interior / Exterior DTM Gray Primer: Applied at a dry film thickness of not less than 2.0 mils.
3. Glidden Professional; 4020-XXXX Devflex DTM Flat Interior/Exterior Waterborne Primer & Finish: Applied at a dry film thickness of not less than 2.2 mils
4. Sherwin-Williams; Kem Kromik Universal Metal Primer B50NZ6/B50WZ1: Applied at a dry film thickness of not less than 3.0 mils
5. Vista Paint Corporation: 9600 Protec Metal Primer Applied at a dry film thickness of not less than 2.0 mil.

C. Interior Zinc-Coated Metal Primer: Factory-formulated galvanized metal primer.
1. Dunn-Edwards Corporation; UGSL00-1 Ultra-Grip Select, Low Odor / Zero VOC, Interior / Exterior Acrylic Multi-Surface Primer: Applied at a dry film thickness of not less than 1.5 mils.

2. Glidden Professional 4020-XXXX Devflex DTM Flat Interior/Exterior Waterborne Primer & Finish: Applied at a dry film thickness of not less than 2.2 mils
3. Sherwin-Williams: Pro-Cryl universal primer/finish, B66-310. Applied at a dry film thickness of not less than 3.0 mils.
4. Sherwin-Williams; S-W DTM acrylic primer/finish, B66W1. Applied at a dry film thickness of not less than 3.0 mils.
5. Vista Paint Corporation: 4800 Metal Pro Primer Applied at a dry film thickness of not less than 1.2 mil.

D. Interior Concrete Block Filler: Factory-formulated interior and exterior concrete block filler. PDCA Level 2

1. Dunn-Edwards Corporation; SBSL00 Smooth Blocfil Select, Interior / Exterior Concrete Block Filler:
2. Sherwin-Williams: Prep-Rite Block Filler B25W25.
3. Vista Paint Corporation: 040 Block Kote Applied at a dry film thickness of not less than 8.4 mil. 2.05 INTERIOR FINISH COATS

A. Interior Low-Luster Acrylic Enamel: Factory-formulated eggshell acrylic-latex interior enamel.
1. Dunn-Edwards Corporation; SZRO20 Spartazero Low Odor / Zero VOC Interior Velvet Paint: Applied at a dry film thickness of not less than 1.5 mils.
2. Dunn-Edwards Corporation; SZRO30 Spartazero Low Odor / Zero VOC Interior Eggshell Paint: Applied at a dry film thickness of not less than 1.5 mils.
3. Glidden Professional; GP9300 Lifemaster No VOC Acrylic Eggshell Interior Wall & Trim Enamel: Applied at a dry film thickness of not less than 1.4 mils
4. Sherwin-Williams; S-W ProMar 200 Zero VOC EgShel, B20W02651. Applied at a dry film thickness of not less than 1.6 mil.
5. Vista Paint Corporation: 5300 V-Pro Eggshell Applied at a dry film thickness of not less than 1.8 mil.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for paint application. Comply with procedures specified in PDCA P4.
1. Proceed with paint application only after unsatisfactory conditions have been corrected and surfaces receiving paint are thoroughly dry.
2. Start of painting will be construed as Applicator's acceptance of surfaces and conditions within a particular area.

B. Coordination of Work: Review other Sections in which primers are provided to ensure compatibility of the total system for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.
1. Notify Architect about anticipated problems when using the materials specified over substrates primed by others.

3.02 PREPARATION

A. General: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items already installed that are not to be painted. If removal is impractical or impossible because of size or weight of the item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.

B. Cleaning: Before applying paint or other surface treatments, clean substrates of substances that could impair bond of the various coatings. Remove oil and grease before cleaning.
1. Schedule cleaning and painting so dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.

C. Surface Preparation: Clean and prepare surfaces to be painted according to manufacturer's written instructions for each particular substrate condition and as specified.
1. Provide barrier coats over incompatible primers or remove and reprime.
2. Cementitious Materials: Prepare concrete, concrete unit masonry, cement plaster, and mineralfiber-reinforced cement panel surfaces to be painted. Remove efflorescence, chalk, dust, dirt, grease, oils, and release agents. Roughen as required to remove glaze. If hardeners or sealers have been used to improve curing, use mechanical methods of surface preparation.
a. Use abrasive blast-cleaning methods if recommended by paint manufacturer.
b. Determine alkalinity and moisture content of surfaces by performing appropriate tests. If surfaces are sufficiently alkaline to cause the finish paint to blister and burn, correct this condition before application. Do not paint surfaces if moisture content exceeds that permitted in manufacturer's written instructions.
3. Ferrous Metals: Clean ungalvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with SSPC's recommendations.
a. Blast steel surfaces clean as recommended by paint system manufacturer and according to SSPC-SP 6/NACE No. 3.
b. Treat bare and sandblasted or pickled clean metal with a metal treatment wash coat before priming.
c. Touch up bare areas and shop-applied prime coats that have been damaged. Wire-brush, clean with solvents recommended by paint manufacturer, and touch up with same primer as the shop coat.
4. Galvanized Surfaces: Clean galvanized surfaces with nonpetroleum-based solvents so surface is free of oil and surface contaminants. Remove pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods.

D. Material Preparation: Mix and prepare paint materials according to manufacturer's written instructions.
1. Maintain containers used in mixing and applying paint in a clean condition, free of foreign materials and residue.
2. Stir material before application to produce a mixture of uniform density. Stir as required during application. Do not stir surface film into material. If necessary, remove surface film and strain material before using.
3. Use only thinners approved by paint manufacturer and only within recommended limits.

E. Tinting: Tint each undercoat a lighter shade to simplify identification of each coat when multiple coats of same material are applied. Tint undercoats to match the color of the finish coat, but provide sufficient differences in shade of undercoats to distinguish each separate coat.

3.03 APPLICATION

A. General: Apply paint according to manufacturer's written instructions. Use applicators and techniques best suited for substrate and type of material being applied.
1. Paint colors, surface treatments, and finishes are indicated in the paint schedules.
2. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.
3. Provide finish coats that are compatible with primers used.

4. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, grilles, convector covers, covers for finned-tube radiation, and similar components are in place. Extend coatings in these areas, as required, to maintain system integrity and provide desired protection.
5. Paint surfaces behind movable equipment and furniture the same as similar exposed surfaces. Before final installation of equipment, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
6. Paint interior surfaces of ducts with a flat, nonspecular black paint where visible through registers or grilles.
7. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.
8. Finish exterior doors on tops, bottoms, and side edges the same as exterior faces.
9. Finish interior of wall and base cabinets and similar field-finished casework to match exterior.
10. Sand lightly between each succeeding enamel or varnish coat.

B. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.
   1. The number of coats and film thickness required are the same regardless of application method. Do not apply succeeding coats until previous coat has cured as recommended by manufacturer. If sanding is required to produce a smooth, even surface according to manufacturer's written instructions, sand between applications.
   2. Omit primer over metal surfaces that have been shop primed and touchup painted.
   3. If undercoats, stains, or other conditions show through final coat of paint, apply additional coats until paint film is of uniform finish, color, and appearance. Give special attention to ensure that edges, corners, crevices, welds, and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces.
   4. Allow sufficient time between successive coats to permit proper drying. Do not recoat surfaces until paint has dried to where it feels firm, and does not deform or feel sticky under moderate thumb pressure, and until application of another coat of paint does not cause undercoat to lift or lose adhesion.

C. Application Procedures: Apply paints and coatings by brush, roller, spray, or other applicators according to manufacturer's written instructions.
   1. Brushes: Use brushes best suited for type of material applied. Use brush of appropriate size for surface or item being painted.
   2. Rollers: Use rollers of carpet, velvet-back, or high-pile sheep's wool as recommended by manufacturer for material and texture required.
   3. Spray Equipment: Use airless spray equipment with orifice size as recommended by manufacturer for material and texture required.

D. Minimum Coating Thickness: Apply paint materials no thinner than manufacturer's recommended spreading rate to achieve dry film thickness indicated. Provide total dry film thickness of the entire system as recommended by manufacturer.

E. Mechanical and Electrical Work: Painting of mechanical and electrical work is limited to items exposed in equipment rooms and occupied spaces.

F. Mechanical items to be painted include, but are not limited to, the following:
   1. Uninsulated metal piping.
   2. Uninsulated plastic piping.
   3. Pipe hangers and supports.
   4. Tanks that do not have factory-applied final finishes.
   5. Visible portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets.
   6. Duct, equipment, and pipe insulation having "all-service jacket" or other paintable jacket material.
   7. Mechanical equipment that is indicated to have a factory-primed finish for field painting.

G. Prime Coats: Before applying finish coats, apply a prime coat, as recommended by manufacturer, to material that is required to be painted or finished and that has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to ensure a finish coat with no burn-through or other defects due to insufficient sealing.

H. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

3.04 CLEANING

A. Cleanup: At the end of each workday, remove empty cans, rags, rubbish, and other discarded paint materials from Project site.

1. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping without scratching or damaging adjacent finished surfaces.

3.05 PROTECTION

A. Protect work of other trades, whether being painted or not, against damage from painting. Correct damage by cleaning, repairing or replacing, and repainting, as approved by Architect.

B. Provide "Wet Paint" signs to protect newly painted finishes. After completing painting operations, remove temporary protective wrappings provided by others to protect their work.

1. After work of other trades is complete, touch up and restore damaged or defaced painted surfaces. Comply with procedures specified in PDCA P1.

3.06 INTERIOR PAINT SCHEDULE

A. Gypsum Board: Provide the following finish systems over interior gypsum board surfaces:

1. Semigloss Acrylic-Enamel Finish: Two finish coats over a primer.
   a. Primer: Interior gypsum board primer.
   b. Finish Coats: Interior semigloss acrylic enamel.
   c. Finish Coats: Interior full-gloss acrylic enamel.

B. Ferrous Metal: Provide the following finish systems over ferrous metal:

1. Semigloss Acrylic-Enamel Finish: Two finish coats over a primer.
   a. Primer: Interior ferrous-metal primer.
   b. Finish Coats: Interior semigloss acrylic enamel.

C. Zinc-Coated Metal: Provide the following finish systems over interior zinc-coated metal surfaces:

1. Low-Luster Acrylic-Enamel Finish: Two finish coats over a primer.
   a. Primer: Interior zinc-coated metal primer.
   b. Finish Coats: Interior low-luster acrylic enamel.

D. All-Service Jacket over Insulation: Provide the following finish system on cotton or canvas insulation covering:

1. Flat Acrylic Finish: Two finish coats. Add fungicidal agent to render fabric mildew proof.
   a. Finish Coats: Interior flat latex-emulsion size.

END OF SECTION

SECTION 09 96 23

GRAFFITI-RESISTANT COATINGS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Masonry anti-graffiti coating applied to locations above grade, vertical, as indicated on the drawings.

1.02 SYSTEM DESCRIPTION

A. Performance Requirements: The application shall leave the finished surfaces uniform in graffiti repellent and not alter the natural color and texture of the masonry units.

1.03 SUBMITTALS

A. General: Submit following items under provisions of Division 01.

B. Product Data: Submit product data for coatings.

C. Samples: Submit 12 by 24 inch samples on each type of substrate indicated to receive repellent treatment with specified coating applied at required rate to half of each sample.

D. Submit following Informational Submittals:
1. Qualification Data: Applicator's qualification data.
2. Manufacturer's instructions.

E. Applicator Qualifications: Submit qualifications of applicator.
1. Certification stating applicator is experienced in the application of the specified products.
2. List of recently completed graffiti resistant coatings projects, including project name and location, names of Owner and Architect, and description of products used, substrates, applicable local environmental regulations, and application procedures.

1.04 QUALITY ASSURANCE

A. Applicator Qualifications:
1. Experienced in the application of the specified products.
2. Employs persons trained for the application of the specified products.

B. Pre-Application Meeting: Convene a pre-application meeting at project site before the start of application of graffiti resistant coatings. Require attendance of parties directly affecting work of this section, including the Contractor, Architect, applicator, and manufacturer representative. Review environmental regulations, test panel procedures, protection of surrounding areas and non-masonry surfaces, surface preparation, application, field quality control, final cleaning, and coordination with other work.

1.05 ENVIRONMENTAL REGULATIONS

A. Comply with applicable federal, state, and local environmental regulations.

1.06 TEST PANELS

A. Before performing coating work, including bulk purchase and delivery of products, prepare a small application in an unobtrusive location and in a manner approved by City Engineer to demonstrate the final effect (visual, physical, and chemical) of planned application.
   1. Provide 100 square foot sample of coating for Architect's review.

B. Apply graffiti resistant coatings to test panels in accordance with manufacturer's written instructions. Allow 48 hours or until test panels are thoroughly dry before evaluating final appearance and results. Do not begin full-scale application until test panels are inspected and approved by the Architect.

C. Test Panel Requirements:
   1. Size: Minimum 100 square foot, or as determined by the Architect.

D. Retain and protect test panels approved by the Architect in undisturbed condition during the work of this section, to be used as a standard for judging the graffiti resistant coating work.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

B. Storage and Handling: Store containers upright in a cool, dry, well ventilated place, above 50 degrees F. Store away from all other chemicals and potential sources of contamination. Keep lights, fire, sparks, and heat away from containers. Do not drop containers or slide across sharp objects. Keep containers tightly closed when not in use. Store and handle materials in accordance with manufacturer's written instructions.

1.08 PROJECT CONDITIONS

A. Temperature Limitations:
   1. Do not apply at surface and air temperatures below 40 deg F or above 100 deg F, unless otherwise indicated by manufacturer's written instructions.
   2. Do not apply when surface and air temperatures are not expected to remain above 40 deg F for a minimum of 8 hours after application, unless otherwise indicated by manufacturer's written instructions.

B. Do not apply under windy conditions such that graffiti resistant coating may be blown to surfaces not intended to be treated.

C. Do not apply to frozen substrate. Allow adequate time for substrate to thaw, if freezing conditions exist before application.

D. Do not apply earlier than 24 hours after rain or if rain is predicted for a period of 8 hours after application, unless otherwise indicated by manufacturer's written instructions.

1.09 WARRANTY

A. Manufacturer’s warranty: Warrant coating against water penetration through treated surfaces, peeling, cracking, discoloration and other defects of the coating caused by faulty materials and workmanship for 5 years after Substantial Completion.

B. Repair coating defects and failures during the warranty period, at no additional cost to the City.

1.10 MAINTENANCE

A. Extra materials: Furnish the City with a 5-gallon container of cleaner to be used for graffiti removal, properly identified by material and substrate, and packaged for future maintenance or replacement.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Products: Provide one of the following Products:
   1. Monochem Permashield Premium Graffiti Control System, Monopole Inc., Los Angeles, CA. (required for use on fiber cement board panels)
   2. Graffiti Solution System, American Polymer Corporation, Sandy, UT.
   3. Siloseal WB, L&M Construction Chemicals, Omaha, NE.
   4. Protectosil Antigraffiti, Degussa Corp., Parsippany, NJ.
   5. Dur A Pell GS, Chemprobe Coating Systems, Subsidiary Tnemec, Kansas City, MO.

B. Graffiti Resistant Coating:
   1. Permanent (non-sacrificial), low viscosity, gloss-free, nearly invisible, non-yellowing, breathable, VOC compliant liquid that impregnates plaster and masonry surfaces to form a stain resistant barrier that allows the easy removal of graffiti from surfaces without staining.
   2. Mixing: Proper proportions as required by manufacturer for Project conditions for horizontal and vertical surfaces.
   3. Coats: Minimum of 2 coats; additional coats may be required on porous surfaces.
   4. Location: Coatings over plaster and painted metals.
   5. Acceptable Products and Manufacturers:

C. Paint Maximum Product Emissions Limits: Top coat and primer interior paints must meet current requirements for VOC (Volatile Organic Compounds) limits of South Coast Air Quality Management District (SCAQMD) Rule No. 1113 and Cal-GREEN Table 5.504.4.3 for VOC Content Limits for Architectural Coatings.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Specify actions required to determine that conditions are acceptable to receive the specified graffiti resistant coatings.

B. Verify by examination that surfaces are acceptable to receive the specified graffiti resistant coatings. Notify the Architect if surfaces are not acceptable to receive the specified products.

C. Verify that surfaces are clean, dry, dust free, and free of efflorescence, oil or other matter detrimental to coating application.

D. Verify that joint sealant work in adjoining surfaces is complete.

3.02 SURFACE PREPARATION

A. Clean all dirt, dust, oil, grease, and other contaminants from surfaces that interfere with penetration or performance of graffiti resistant coatings. Use appropriate masonry or concrete cleaners approved by the graffiti resistant coating manufacturer where necessary. Rinse thoroughly using pressure water spray to remove cleaner residues. Allow surfaces to dry completely before application of graffiti resistant coatings.

B. Repair, patch, and fill all cracks, voids, defects, and damaged areas in surface as approved by the Architect. Allow repair materials to cure completely before application of graffiti resistant coatings.

C. Apply specified sealants and caulking and allow to cure completely before application of graffiti resistant coatings.

D. Seal all open joints.

E. Allow new masonry and concrete construction and repointed surfaces to cure completely before application of graffiti resistant coatings.

F. Allow surfaces to dry sufficiently after washing in accordance with manufacturer's directions.

G. Protect adjacent surfaces from overspray or drift.

3.03 APPLICATION OF GRAFFITI CONTROL COATINGS

A. Apply graffiti resistant coatings to substrates in accordance with manufacturer's written instructions, environmental regulations, and application procedures determined from test panel results approved by the Architect.

B. Consult manufacturer's written instructions for information on application equipment to be used and precautions to be taken with the specified products.

C. Mix per manufactures instructions.

D. Start coating application in presence of coating manufacturer's technical representative.

3.04 APPLICATION OF SACRIFICIAL COATINGS

A. Apply coating using low pressure airless sprayer or roller in number of coats and at rate indicated by manufacturer to obtain penetration and full coverage.

B. Do not dilute or alter material as packaged.

C. Site tests: The City may employ a testing agency to test applied coating for compliance with specified requirements.
   1. The City will pay test costs, except when testing discloses the coating tested does not comply with these Specifications.
   2. In the event testing shows that the coating is deficient, apply additional coating at no cost to the City.
   3. Contractor shall pay for re-testing until the application demonstrates compliance with specified requirements.

D. Manufacturer’s field services: Promptly repair unsatisfactory conditions disclosed by the manufacturer's visits to the site, to the satisfaction of the City Engineer, and have the corrected areas re-inspected by the manufacturer before work starts or resumes in affected areas.

3.05 FIELD QUALITY CONTROL

A. Examination: Examine the graffiti resistant coating work with the Contractor, Architect, applicator, and manufacturer's representative, and compare with test panel results approved by the Architect. Determine if the substrates are suitably protected by the graffiti resistant coatings.
   1. Site tests: The City may employ a testing agency to test applied coating for compliance with specified requirements.
   2. The City will pay test costs, except when testing discloses the coating tested does not comply with these Specifications.
   3. In the event testing shows that the coating is deficient, apply additional coating at no cost to the City.

4. Contractor shall pay for re-testing until the application demonstrates compliance with specified requirements

B. Manufacturer's Field Services: Provide the services of a manufacturer's authorized field representative to verify specified products are used, and protection, surface preparation, and application of graffiti resistant coatings are in accordance with the manufacturer's written instructions and the test panel results approved by the Architect.

3.06 FINAL CLEANING

A. Clean site of unused graffiti resistant coatings, residues, rinse water, wastes, and effluent in accordance with environmental regulations.

B. Remove and dispose of materials used to protect surrounding areas and non-masonry surfaces, following completion of the work of this section.

C. Repair, restore, or replace to the satisfaction of the Architect, materials, landscaping, and non-masonry surfaces damaged by exposure to graffiti resistant coatings.

D. Clean spillage, overspray, or drift from adjacent surfaces; remove immediately in accordance with manufacturer's instructions.

END OF SECTION

SECTION 10 14 16

PLAQUES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes plaques.

B. Related Requirements: Section 10 14 23 "Panel Signage" for signs, with or without frames that are made of materials other than solid metal.

1.2 DEFINITIONS

A. Accessible: In accordance with the accessibility standard.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For plaques.

1. Include fabrication and installation details and attachments to other work.
2. Show plaque mounting heights, locations of supplementary supports to be provided by others, and accessories.
3. Show message list, typestyles, graphic elements, including raised characters and Braille, and layout for each plaque at least half size.

C. Samples for Verification: For each type of plaque showing all components and with the required finish(es), in manufacturer's standard size unless otherwise indicated and as follows:

1. Plaques: Full-size Sample.
2. Exposed Accessories: Full-size Sample of each accessory type.

D. Plaque Schedule: Use same designations specified or indicated on Drawings or in a plaque or sign schedule.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and manufacturer.

B. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For plaques to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of plaques that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Deterioration of finishes beyond normal weathering.
b. Deterioration of embedded graphic image.

2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Accessibility Standard: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities and 2013 CBC for signs.

2.2 PLAQUES

A. Cast Plaque: Plaque with background texture, border, and characters having uniform faces, sharp corners, and precisely formed lines and profiles; and as follows:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

a. A.R.K. Ramos.
b. ACE Sign Systems, Inc.
c. Erie Landmark Company; a division of Paul W. Zimmerman Foundries.
d. Metal Arts.
e. Metallic Arts.

2. Plaque Material: Cast bronze.
3. Plaque Thickness: 0.25 inch.
4. Finishes:

a. Integral Metal Finish: As selected by Architect from full range of industry finishes.
b. Overcoat: Manufacturer's standard baked-on clear coating.

5. Background Texture: As selected by Architect from manufacturer's full range.
6. Integrally Cast Border Style: As indicated.
7. Mounting: As indicated.
8. Text and Typeface: Accessible raised characters and Braille typeface as selected by Architect from manufacturer's full range and variable content as scheduled. Finish raised characters to contrast with background color, and finish Braille to match background color.

2.3 MATERIALS

A. Cast Aluminum: ASTM B 584, alloy recommended by manufacturer and finisher for finish indicated.

2.4 ACCESSORIES

A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of plaques, noncorrosive and compatible with each material joined, and complying with the following:

1. Use concealed fasteners and anchors unless indicated to be exposed.
2. For exterior exposure, furnish nonferrous-metal devices unless otherwise indicated.
3. Exposed Metal-Fastener Components, General: Fabricated from same basic metal and finish of fastened metal unless otherwise indicated.
4. Plaque Mounting Fasteners: Through Fasteners: Exposed metal fasteners matching plaque finish, with type of head indicated, installed in predrilled holes.

B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.5 FABRICATION

A. General: Provide manufacturer's standard plaques according to requirements indicated.

1. Preassemble plaques in the shop to greatest extent possible. Disassemble plaques only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.
2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather to resist water penetration and retention.
3. Comply with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.
4. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.
5. Provide rebates, lugs, and brackets necessary to assemble components and to attach to existing work. Drill and tap for required fasteners. Use concealed fasteners where possible; use exposed fasteners that match plaque finish.
6. Castings: Fabricate castings free of warp, cracks, blowholes, pits, scale, sand holes, and other defects that impair appearance or strength. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks before finishing.

2.6 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

C. Directional Finishes: Run grain with long dimension of each piece and perpendicular to long dimension of finished trim or border surface unless otherwise indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of plaque work.

B. Verify that plaque-support surfaces are within tolerances to accommodate plaques without gaps or irregularities between backs of plaques and support surfaces unless otherwise indicated.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install plaques using mounting methods indicated and according to manufacturer's written instructions.

1. Install plaques level, plumb, true to line, and at locations and heights indicated, with plaque surfaces free of distortion and other defects in appearance.
2. Install plaques so they do not protrude or obstruct according to the accessibility standard.
3. Before installation, verify that plaque surfaces are clean and free of materials or debris that would impair installation.

B. Mounting Methods: Through Fasteners: Drill holes in substrate using predrilled holes in plaque as template. Countersink holes in plaque if required. Place plaque in position and flush to surface. Install through fasteners and tighten.

3.3 ADJUSTING AND CLEANING

A. Remove and replace damaged or deformed plaques and plaques that do not comply with specified requirements. Replace plaques with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.

B. Remove temporary protective coverings and strippable films as plaques are installed.

C. On completion of installation, clean exposed surfaces of plaques according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain plaques in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION

SECTION 10 14 19

DIMENSIONAL LETTER SIGNAGE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Cutout dimensional characters.

1.02 COORDINATION

A. Furnish templates for placement of electrical service embedded in permanent construction by other installers.

1.03 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For dimensional letter signs.
1. Include fabrication and installation details and attachments to other work.
2. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.
3. Show message list, typestyles, graphic elements, and layout for each sign at least half size.

C. Samples for Initial Selection: For each type of sign assembly, exposed component, and exposed finish.
1. Include representative Samples of available typestyles and graphic symbols.

D. Samples for Verification: For each type of sign assembly showing all components and with the required finishes, in manufacturer's standard size unless otherwise indicated and as follows:
1. Dimensional Characters: Full-size Sample of dimensional character.
2. Exposed Accessories: Full-size Sample of each accessory type.
3. Number of Samples: Five.

E. Sign Schedule: Use same designations specified or indicated on Drawings or in a sign schedule.

1.04 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and manufacturer.

B. Sample Warranty: For special warranty.

1.05 CLOSEOUT SUBMITTALS

A. Maintenance Data: For signs to include in maintenance manuals.

1.06 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer of products.

1.07 FIELD CONDITIONS

A. Field Measurements: Verify locations of electrical service embedded in permanent construction by other installers by field measurements before fabrication, and indicate measurements on Shop Drawings.

PART 2 - PRODUCTS

2.01 DIMENSIONAL CHARACTERS

A. Cutout Characters: Characters with uniform faces; square-cut, smooth edges; precisely formed lines and profiles; and as follows:
   1. Basis-of-Design Product: Subject to compliance with requirements, provide ASI Sign Systems, Inc., or comparable product by one of the following:
      a. ACE Sign Systems, Inc.
      b. APCO Graphics, Inc.
      c. A. R. K. Ramos Signage Systems.
      d. ASI Sign Systems, Inc.
      e. Charleston Industries, Inc.
      f. Diskey Sign Company.
      g. Gemini Incorporated.
      h. InPro Corporation.
      i. Metal Arts; Division of L & H Mfg. Co.
      j. Metallic Arts.
      k. Nelson-Harkins Industries.
      l. Southwell Company (The).
      m. Steel Art Company.
   2. Character Material: Sheet or plate aluminum.
   3. Character Height: 4 inches and 6 inches as indicated on Drawings.
   4. Thickness: 1/2-inch.
   5. Finishes:
      a. Integral Aluminum Finish: Clear anodized.
   6. Mounting: Concealed aluminum studs and silicone adhesive with threaded studs.
   7. Typeface: Arial.

2.02 DIMENSIONAL CHARACTER MATERIALS

A. Aluminum Sheet and Plate: ASTM B 209 (ASTM B 209M), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.

B. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.

2.03 ACCESSORIES

A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of signage, noncorrosive and compatible with each material joined, and complying with the following:
   1. Use concealed fasteners and anchors unless indicated to be exposed.
   2. For exterior exposure, furnish nonferrous-metal devices unless otherwise indicated.
   3. Exposed Metal-Fastener Components, General:
      a. Fabricated from same basic metal and finish of fastened metal unless otherwise indicated.
      b. Fastener Heads: For nonstructural connections, use flathead oval countersunk screws and bolts with Allen-head slots unless otherwise indicated.
   4. Sign Mounting Fasteners:
      a. Concealed Studs: Concealed (blind), threaded studs welded or brazed to back of sign material, screwed into back of sign assembly, or screwed into tapped lugs cast integrally into back of cast sign material, unless otherwise indicated.
      b. Projecting Studs: Threaded studs with sleeve spacer, welded or brazed to back of sign material, screwed into back of sign assembly, or screwed into tapped lugs cast integrally into back of cast sign material, unless otherwise indicated.
      c. Through Fasteners: Exposed metal fasteners matching sign finish, with type of head indicated, installed in predrilled holes.

B. Adhesives: As recommended by sign manufacturer and with a VOC content of 70 g/L or less for adhesives used inside the weatherproofing system and applied on-site when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Adhesives shall meet VOC and chemical component limits of South Coast Air Quality Management District (SCAQMD) Rule No. 1168 and Cal GREEN Table 5.504.4.1 Adhesive VOC Limit requirements.

D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.04 FABRICATION

A. General: Provide manufacturer's standard sign assemblies according to requirements indicated.
   1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.
   2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather to resist water penetration and retention.
   3. Comply with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.
   4. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.
   5. Internally brace signs for stability and for securing fasteners.
   6. Provide rebates, lugs, and brackets necessary to assemble components and to attach to existing work. Drill and tap for required fasteners. Use concealed fasteners where possible; use exposed fasteners that match sign finish.

B. Brackets: Fabricate brackets, fittings, and hardware for bracket-mounted signs to suit sign construction and mounting conditions indicated. Modify manufacturer's standard brackets as required.
   1. Aluminum Brackets: Factory finish brackets with baked-enamel or powder-coat finish to match sign-background color color unless otherwise indicated.

2.05 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

C. Directional Finishes: Run grain with long dimension of each piece and perpendicular to long dimension of finished trim or border surface unless otherwise indicated.

D. Anodic Finishes: Apply to formed metal after fabrication but before applying contrasting polished finishes on raised features unless otherwise indicated.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage work.

B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise indicated.

C. Verify that electrical service is correctly sized and located to accommodate signs.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. General: Install signs using mounting methods indicated and according to manufacturer's written instructions.
   1. Install signs level, plumb, true to line, and at locations and heights indicated, with sign surfaces free of distortion and other defects in appearance.
   2. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.
   3. Corrosion Protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

B. Mounting Methods:
   1. Concealed Studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.
      a. Masonry Substrates: Fill holes with adhesive. Leave recess space in hole for displaced adhesive. Place sign in position and push until flush to surface, embedding studs in holes. Temporarily support sign in position until adhesive fully sets.
      b. Thin or Hollow Surfaces: Place sign in position and flush to surface, install washers and nuts on studs projecting through opposite side of surface, and tighten.
   2. Projecting Studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.
      a. Masonry Substrates: Fill holes with adhesive. Leave recess space in hole for displaced adhesive. Place spacers on studs, place sign in position, and push until spacers are pinched between sign and substrate, embedding the stud ends in holes. Temporarily support sign in position until adhesive fully sets.
      b. Thin or Hollow Surfaces: Place spacers on studs, place sign in position with spacers pinched between sign and substrate, and install washers and nuts on stud ends projecting through opposite side of surface, and tighten.
   3. Through Fasteners: Drill holes in substrate using predrilled holes in sign as template. Countersink holes in sign if required. Place sign in position and flush to surface. Install through fasteners and tighten.
   4. Back Bar and Brackets: Remove loose debris from substrate surface and install backbar or bracket supports in position so that signage is correctly located and aligned.
   5. Adhesive: Clean bond-breaking materials from substrate surface and remove loose debris. Apply linear beads or spots of adhesive symmetrically to back of sign and of suitable quantity to support weight of sign after cure without slippage. Keep adhesive away from edges to prevent adhesive extrusion as sign is applied and to prevent visibility of cured adhesive at sign edges. Place sign in position, and push to engage adhesive. Temporarily support sign in position until adhesive fully sets.
   6. Two-Face Tape: Clean bond-breaking materials from substrate surface and remove loose debris. Apply tape strips symmetrically to back of sign and of suitable quantity to support weight of sign without slippage. Keep strips away from edges to prevent visibility at sign edges. Place sign in position, and push to engage tape adhesive.

3.03 ADJUSTING AND CLEANING

A. Remove and replace damaged or deformed characters and signs that do not comply with specified requirements. Replace characters with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.

B. Remove temporary protective coverings and strippable films as signs are installed.

C. On completion of installation, clean exposed surfaces of signs according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION

SECTION 10 14 23

PANEL SIGNAGE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Room-identification signs.

1.02 DEFINITIONS

A. Accessible: In accordance with the accessibility standard.

1.03 COORDINATION

A. Furnish templates for placement of sign-anchorage devices embedded in permanent construction by other installers.

1.04 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For panel signs.
   1. Include fabrication and installation details and attachments to other work.
   2. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.
   3. Show message list, typestyles, graphic elements, and layout for each sign at full size.

C. Samples for Initial Selection: Submit 5 samples for each type of sign assembly, exposed component, and exposed finish.
   1. Include representative Samples of available typestyles and graphic symbols.

D. Samples for Verification: Submit 5 samples for each type of sign assembly showing all components and with the required finishes, in manufacturer's standard size unless otherwise indicated and as follows:
   1. Room-Identification Signs: Full-size Sample.

E. Sign Schedule: Use same designations specified or indicated on Drawings or in a sign schedule.

1.05 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and manufacturer.

B. Sample Warranty: For special warranty.

1.06 CLOSEOUT SUBMITTALS

A. Maintenance Data: For signs to include in maintenance manuals.

1.07 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer of products.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Accessibility Standard: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities and ICC A117.1 for signs.

2.02 SIGNS

A. Basis-of-Design Product: Subject to compliance with requirements, provide ASI Sign Systems, Inc. or comparable product by one of the following:
   1. Ace Sign Systems, Inc.
   2. Advance Corporation; Braille-Tac Division.
   3. Allen Industries, Inc.
   4. Allen Markings International.
   5. APCO Graphics, Inc.
   6. ASE, Inc.
   7. Best Sign Systems Inc.
   8. Bunting Graphics, Inc.
   9. Clarke Systems.
   10. Diskey Sign Company.
   11. Fossil Industries, Inc.
   12. InPro Corporation.
   13. Mohawk Sign Systems.
   14. Nelson-Harkins Industries.
   15. Poblocki Sign Company, LLC.
   16. Seton Identification Products.
   17. Supersine Company (The); Division of Stamp-Rite, Inc.
   18. Vista System.
   19. Vomar Products, Inc.

B. Room-Identification Sign: Sign with smooth, uniform surfaces; with message and characters having uniform faces, sharp corners, and precisely formed lines and profiles; and as follows:
   1. Basis-of-Design Product: Horizon Wall Mounted.
   2. Laminated-Sheet Sign: Photopolymer face sheet with raised graphics laminated to aluminum backing sheet to produce composite sheet.
      a. Composite-Sheet Thickness: Manufacturer's standard for size of sign.
      b. Subsurface Graphics: Slide-in changeable insert.
      c. Color(s): As selected by Architect from manufacturer's full range.
   3. Frame: Aluminum.
      a. Frame Depth: Convex-curved frame to receive removable face sheet and changeable subsurface graphics 4-inches by 10-inches.
      b. Profile: Square.
      c. Corner Condition in Elevation: Square.
      d. Finish and Color: As indicated on Drawings.
   4. Mounting: Manufacturer's standard method for substrates indicated Surface mounted to wall with two-face tape.
   5. Text and Typeface: As indicated on Drawings.

2.03 SIGN MATERIALS

A. Aluminum Sheet and Plate: ASTM B 209 (ASTM B 209M), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.

B. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.

C. Acrylic Sheet: ASTM D 4802, category as standard with manufacturer for each sign, Type UVF (UV filtering).

D. Paints and Coatings for Sheet Materials: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposure indicated.
   1. Paint Maximum Product Emissions Limits: Top coat and primer interior paints must meet current requirements for VOC (Volatile Organic Compounds) limits of South Coast Air Quality Management District (SCAQMD) Rule No. 1113 and Cal GREEN Table 5.504.4.3 for VOC Content Limits for Architectural Coatings.
   2. Cal-GREEN Requirements for typical paint coatings:
      a. Primers, Sealers, and Undercoaters: 100 grams per liter of product minus water
      b. Flats: 50 grams per liter of product minus water
      c. Non-flats: 100 grams per liter of product minus water
      d. Non-flat High Gloss: 150 grams per liter of product minus water

2.04 ACCESSORIES

A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of signage, noncorrosive and compatible with each material joined, and complying with the following:
   1. Use concealed fasteners and anchors unless indicated to be exposed.

B. Two-Face Tape: Manufacturer's standard high-bond, foam-core tape, 0.045 inch (1.14 mm) thick, with adhesive on both sides.

2.05 FABRICATION

A. General: Provide manufacturer's standard sign assemblies according to requirements indicated.
   1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.
   2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather to resist water penetration and retention.
   3. Comply with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.

B. Signs with Changeable Message Capability: Fabricate signs to allow insertion of changeable messages as follows:
   1. For slide-in changeable inserts, fabricate slot without burrs or constrictions that inhibit function. Furnish initial changeable insert. Subsequent changeable inserts are by Owner Furnish two blank inserts for each sign for Owner's use.
   2. For frame to hold changeable sign panel, fabricate frame without burrs or constrictions that inhibit function. Furnish initial sign panel. Subsequent changeable sign panels are by Owner.

2.06 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

C. Directional Finishes: Run grain with long dimension of each piece and perpendicular to long dimension of finished trim or border surface unless otherwise indicated.

D. Organic, Anodic, and Chemically Produced Finishes: Apply to formed metal after fabrication but before applying contrasting polished finishes on raised features unless otherwise indicated.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage work.

B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise indicated.

C. Verify that anchor inserts are correctly sized and located to accommodate signs.

D. Verify that electrical service is correctly sized and located to accommodate signs.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. General: Install signs using mounting methods indicated and according to manufacturer's written instructions.
   1. Install signs level, plumb, true to line, and at locations and heights indicated, with sign surfaces free of distortion and other defects in appearance.
   2. Install signs so they do not protrude or obstruct according to the accessibility standard.
   3. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.
   4. Corrosion Protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

B. Room-Identification Signs: Install in locations on walls as indicated and according to accessibility standard.

C. Mounting Methods:
   1. Through Fasteners: Drill holes in substrate using predrilled holes in sign as template. Countersink holes in sign if required. Place sign in position and flush to surface. Install through fasteners and tighten.
      a. Tamper proof screws.
      b. Silicone adhesive.

3.03 ADJUSTING AND CLEANING

A. Remove and replace damaged or deformed signs and signs that do not comply with specified requirements. Replace signs with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.

B. Remove temporary protective coverings and strippable films as signs are installed.

C. On completion of installation, clean exposed surfaces of signs according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION

SECTION 10 21 13.17

PHENOLIC-CORE TOILET COMPARTMENTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Phenolic-core toilet compartments configured as shower dividers, dressing compartments, toilet enclosures and urinal screens.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for toilet compartments.

B. Shop Drawings: For toilet compartments.
   1. Include plans, elevations, sections, details, and attachment details.
   2. Show locations of cutouts for compartment-mounted toilet accessories.
   3. Show locations of centerlines of toilet fixtures.
   4. Show locations of floor drains.
   5. Show overhead support or bracing locations.

C. Samples for Verification: Submit 5 samples each of the following products, in manufacturer's standard sizes unless otherwise indicated:
   1. Each type of material, color, and finish required for toilet compartments, prepared on 3-inch- (152-mm-) square Samples of same thickness and material indicated for Work.
   2. Each type of hardware and accessory.

D. Product Schedule: For toilet compartments, prepared by or under the supervision of supplier, detailing location and selected colors for toilet compartment material.

1.03 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of toilet compartment.

1.04 CLOSEOUT SUBMITTALS

A. Maintenance Data: For toilet compartments to include in maintenance manuals.

1.05 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of toilet fixtures, walls, columns, ceilings, and other construction contiguous with toilet compartments by field measurements before fabrication.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   1. Flame-Spread Index: 75 or less.
   2. Smoke-Developed Index: 450 or less.

B. Recycled Content of Phenolic-Core Panel: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 20 percent.

C. Regulatory Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities and ICC A117.1 for toilet compartments designated as accessible.

2.02 PHENOLIC-CORE TOILET COMPARMENTS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Bobrick DuraLine Series 1080 or comparable product by one of the following:
   1. Accurate Partitions Corporation.
   2. All American Metal Corp.
   3. Ampco, Inc.
   4. Bradley Corporation; Mills Partitions.
   5. Flush Metal Partition Corp.
   6. General Partitions Mfg. Corp.
   7. Global Steel Products Corp.
   8. Knickerbocker Partition Corporation.
   9. Marlite.
   10. Metpar Corp.
   11. Scranton Products.
   12. Approved equal.

B. Toilet-Enclosure Style: Floor Anchored.

C. Urinal-Screen Style: Wall hung.

D. Door, Panel, and Pilaster Construction: Solid phenolic-core panel material with melamine facing on both sides fused to substrate during panel manufacture (not separately laminated), and with eased and polished edges. Provide minimum 3/4-inch- (19-mm-) thick doors and pilasters and minimum 1/2-inch- (13-mm-) thick panels.

E. Pilaster Shoes: Formed from stainless-steel sheet, not less than 0.031-inch (0.79-mm) nominal thickness and 3 inches (76 mm) high, finished to match hardware.

F. Brackets (Fittings):
   1. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel.

G. Phenolic-Panel Finish:
   1. Facing Sheet Finish: One color and pattern in each room.
   2. Color and Pattern: As indicated by manufacturer's designations S-431 Willow Grey, with manufacturer's standard through-color core matching face sheet.
   3. Edge Color: Manufacturer's standard black.

2.03 HARDWARE AND ACCESSORIES

A. Hardware and Accessories: Manufacturer's standard operating hardware and accessories.
   1. Material: Stainless steel.
   2. Hinges: Manufacturer's standard continuous, spring-loaded type, allowing emergency access by lifting door.
   3. Latch and Keeper: Manufacturer's standard surface-mounted latch unit designed for emergency access and with combination rubber-faced door strike and keeper. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible.
   4. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories.
   5. Door Bumper: Manufacturer's standard rubber-tipped bumper at out-swinging doors.
   6. Door Pull: Manufacturer's standard unit at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible.

B. Hardware and Accessories: Manufacturer's heavy-duty operating hardware and accessories.
   1. Hinges: Manufacturer's minimum 0.062-inch- (1.59-mm-) thick stainless-steel continuous, spring-loaded type, allowing emergency access by lifting door. Mount with through-bolts.
   2. Latch and Keeper: Manufacturer's heavy-duty surface-mounted cast-stainless-steel latch unit designed to resist damage due to slamming, with combination rubber-faced door strike and keeper, and with provision for emergency access. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible. Mount with through-bolts.
   3. Coat Hook: Manufacturer's heavy-duty combination cast-stainless-steel hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories. Mount with through-bolts.
   4. Door Bumper: Manufacturer's heavy-duty rubber-tipped cast-stainless-steel bumper at out-swinging doors. Mount with through-bolts.
   5. Door Pull: Manufacturer's heavy-duty cast-stainless-steel pull at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible. Mount with through-bolts.

C. Overhead Bracing: Manufacturer's standard continuous, extruded-aluminum head rail with antigrip profile and in manufacturer's standard finish.

D. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel, finished to match the items they are securing, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use stainless-steel, hot-dip galvanized-steel, or other rust-resistant, protective-coated steel compatible with related materials.

2.04 MATERIALS

A. Aluminum Extrusions: ASTM B 221 (ASTM B 221M).

B. Stainless-Steel Sheet: ASTM A 666, Type 304, stretcher-leveled standard of flatness.

C. Stainless-Steel Castings: ASTM A 743/A 743M.

2.05 FABRICATION

A. Fabrication, General: Fabricate toilet compartment components to sizes indicated. Coordinate requirements and provide cutouts for through-partition toilet accessories where required for attachment of toilet accessories.

B. Overhead-Braced Units: Provide manufacturer's standard corrosion-resistant supports, leveling mechanism, and anchors at pilasters to suit floor conditions. Provide shoes at pilasters to conceal supports and leveling mechanism.

C. Door Size and Swings: Unless otherwise indicated, provide 24-inch- (610-mm-) wide in-swinging doors for standard toilet compartments and 36-inch- (914-mm-) wide out-swinging doors with a minimum 32-inch- (813-mm-) wide clear opening for compartments designated as accessible.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for fastening, support, alignment, operating clearances, and other conditions affecting performance of the Work.
   1. Confirm location and adequacy of blocking and supports required for installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.
   1. Maximum Clearances:
      a. Pilasters and Panels: 1/2 inch (13 mm).
      b. Panels and Walls: 1 inch (25 mm).
   2. Full-Height (Continuous) Brackets: Secure panels to walls and to pilasters with full-height brackets.
      a. Locate bracket fasteners so holes for wall anchors occur in masonry or tile joints.
      b. Align brackets at pilasters with brackets at walls.

B. Overhead-Braced Units: Secure pilasters to floor and level, plumb, and tighten. Set pilasters with anchors penetrating not less than 1-3/4 inches (44 mm) into structural floor unless otherwise indicated in manufacturer's written instructions. Secure continuous head rail to each pilaster with no fewer than two fasteners. Hang doors to align tops of doors with tops of panels, and adjust so tops of doors are parallel with overhead brace when doors are in closed position.

C. Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb, rigid, and secured to resist lateral impact.

3.03 ADJUSTING

A. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging

doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors to return doors to fully closed position.

END OF SECTION

SECTION 10 44 13

FIRE PROTECTION CABINETS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Fire-protection cabinets for the following:
   1. Portable fire extinguishers.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product. Show door hardware, cabinet type, trim style, and panel style. Include roughing-in dimensions and details showing recessed-, semirecessed-, or surface-mounting method and relationships of box and trim to surrounding construction.

B. Shop Drawings: For fire-protection cabinets. Include plans, elevations, sections, details, and attachments to other work.

C. Samples for Initial Selection: For each type of exposed finish required.

D. Samples for Verification: For each type of exposed finish required, prepared on Samples 6 by 6 inches (150 by 150 mm) square.

E. Product Schedule: For fire-protection cabinets. Indicate whether recessed, semirecessed, or surface mounted. Coordinate final fire-protection cabinet schedule with fire-extinguisher schedule to ensure proper fit and function. Use same designations indicated on Drawings.

1.03 CLOSEOUT SUBMITTALS

A. Maintenance Data: For fire-protection cabinets to include in maintenance manuals.

1.04 COORDINATION

A. Coordinate size of fire-protection cabinets to ensure that type and capacity of fire extinguishers indicated are accommodated.

B. Coordinate sizes and locations of fire-protection cabinets with wall depths.

PART 2 - PRODUCTS

2.01 FIRE-PROTECTION CABINET

A. Cabinet Type: Suitable for fire extinguisher.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. JL Industries, Inc.; a division of the Activar Construction Products Group.
      b. Larsens Manufacturing Company.
      c. Potter Roemer LLC.

B. Cabinet Construction: Nonrated.

C. Cabinet Material: Stainless-steel sheet.

D. Recessed Cabinet:
   1. Trimless with Concealed Flange: Surface of surrounding wall finishes flush with exterior finished surface of cabinet frame and door, without overlapping trim attached to cabinet. Provide recessed flange, of same material as box, attached to box to act as drywall bead.

E. Cabinet Trim Material: Stainless-steel sheet.

F. Door Material: Stainless-steel sheet.

G. Door Style: Center glass panel with frame.

H. Door Glazing: Break glass.

I. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
   1. Provide manufacturer's standard.
   2. Provide manufacturer's standard hinge permitting door to open 180 degrees.

J. Accessories:
   1. Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire-protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.
   2. Break-Glass Strike: Manufacturer's standard metal strike, complete with chain and mounting clip, secured to cabinet.
   3. Door Lock: Cam lock that allows door to be opened during emergency by pulling sharply on door handle.
   4. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as directed by Architect.
      a. Identify fire extinguisher in fire-protection cabinet with the words "FIRE EXTINGUISHER."
         1) Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by City Engineer. Individual press-on letters.

K. Materials:
   1. Stainless Steel: ASTM A 666, Type 304.
      a. Finish: No. 4 directional satin finish.
   2. Tempered Break Glass: ASTM C 1048, Kind FT, Condition A, Type I, Quality q3, 1.5 mm thick.

2.02 FABRICATION

A. Fire-Protection Cabinets: Provide manufacturer's standard box (tub) with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.
   1. Weld joints and grind smooth.
   2. Provide factory-drilled mounting holes.
   3. Prepare doors and frames to receive locks.

B. Cabinet Doors: Fabricate doors according to manufacturer's standards, from materials indicated and coordinated with cabinet types and trim styles.
   1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum 1/2 inch (13 mm) thick.
   2. Fabricate door frames of one-piece construction with edges flanged.
   3. Miter and weld perimeter door frames.

C. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

2.03 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's AMP 500, "Metal Finishes Manual for Architectural and Metal Products," for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces of fire-protection cabinets from damage by applying a strippable, temporary protective covering before shipping.

C. Finish fire-protection cabinets after assembly.

D. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine walls and partitions for suitable framing depth and blocking where recessed cabinets will be installed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Prepare recesses for recessed fire-protection cabinets as required by type and size of cabinet and trim style.

3.03 INSTALLATION

A. General: Install fire-protection cabinets in locations and at mounting heights indicated or, if not indicated, at heights acceptable to authorities having jurisdiction.
   1. Fire-Protection Cabinets: 54 inches (1372 mm) above finished floor to top of cabinet.

B. Fire-Protection Cabinets: Fasten cabinets to structure, square and plumb.
   1. Unless otherwise indicated, provide recessed fire-protection cabinets. If wall thickness is inadequate for recessed cabinets, provide semirecessed fire-protection cabinets.
   2. Provide inside latch and lock for break-glass panels.
   3. Fasten mounting brackets to inside surface of fire-protection cabinets, square and plumb.

3.04 ADJUSTING AND CLEANING

A. Remove temporary protective coverings and strippable films, if any, as fire-protection cabinets are installed unless otherwise indicated in manufacturer's written installation instructions.

B. Adjust fire-protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.

C. On completion of fire-protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.

D. Touch up marred finishes, or replace fire-protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire-protection cabinet and mounting bracket manufacturers.

E. Replace fire-protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

SECTION 10 44 16

FIRE EXTINGUISHERS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes portable, fire extinguishers and mounting brackets for fire extinguishers.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product. Include rating and classification, material descriptions, dimensions of individual components and profiles, and finishes for fire extinguisher and mounting brackets.

B. Product Schedule: For fire extinguishers. Coordinate final fire-extinguisher schedule with fire-protection cabinet schedule to ensure proper fit and function.

1.03 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fire extinguishers to include in maintenance manuals.

1.04 COORDINATION

A. Coordinate type and capacity of fire extinguishers with fire-protection cabinets to ensure fit and function.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."

B. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.
   1. Provide fire extinguishers approved, listed, and labeled by FM Global.

2.02 PORTABLE, HAND-CARRIED FIRE EXTINGUISHERS

A. Fire Extinguishers: Type, size, and capacity for each fire-protection cabinet and mounting bracket indicated.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. JL Industries, Inc.; a division of the Activar Construction Products Group.
      b. Larsens Manufacturing Company.
      c. Potter Roemer LLC.
      d. Prior approved equal.
   2. Valves: Nickel-plated, polished-brass body.
   3. Handles and Levers: Stainless steel.

4. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B, and bar coding for documenting fire-extinguisher location, inspections, maintenance, and recharging.

B. Multipurpose Dry-Chemical Type in Steel Container: UL-rated 2-A:10-B:C, 5-lb (2.3-kg) nominal capacity, with monoammonium phosphate-based dry chemical in enameled-steel container.

2.03 MOUNTING BRACKETS

A. Mounting Brackets: Manufacturer's standard steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated, with plated or red baked-enamel finish.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. JL Industries, Inc.; a division of the Activar Construction Products Group.
b. Larsens Manufacturing Company.
c. Potter Roemer LLC.

B. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Architect.
1. Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.
a. Orientation: Vertical.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine fire extinguishers for proper charging and tagging.
1. Remove and replace damaged, defective, or undercharged fire extinguishers.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. General: Install fire extinguishers and mounting brackets in locations indicated and in compliance with requirements of authorities having jurisdiction.
1. Mounting Brackets: 54 inches (1372 mm) above finished floor to top of fire extinguisher.

B. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.

END OF SECTION

SECTION 11 31 00

APPLIANCES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Cooking appliances.
2. Refrigeration appliances.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include installation details, material descriptions, dimensions of individual components, and finishes for each appliance.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.

B. Sustainable Design Submittals: Product Data: For indicated products, indicating compliance with requirements for ENERGY STAR product labeling.

C. Product Schedule: For appliances. Use same designations indicated on Drawings.

1.03 INFORMATIONAL SUBMITTALS

A. Qualification Data: For manufacturer.

B. Product Certificates: For each type of appliance.

C. Field quality-control reports.

D. Sample Warranties: For manufacturers' special warranties.

1.04 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each appliance to include in operation and maintenance manuals.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications: Maintains, within 50 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

1.06 WARRANTY

A. Special Warranties: Manufacturer agrees to repair or replace appliances or components that fail in materials or workmanship within specified warranty period. Warranty Period: Two years from date of Substantial Completion.

B. Microwave Oven: Full warranty, including parts and labor, for on-site service on the magnetron tube. Warranty Period: Two years from date of Substantial Completion.

C. Refrigerator/Freezer, Sealed System: Full warranty, including parts and labor, for on-site service on the product.

1. Warranty Period for Sealed Refrigeration System: Two years from date of Substantial Completion.
2. Warranty Period for Other Components: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Source Limitations: Obtain residential appliance from single manufacturer.

2.02 PERFORMANCE REQUIREMENTS

A. Electrical Appliances: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Accessibility: Where appliances are indicated to comply with accessibility requirements, comply with applicable provisions in the DOJ's 2010 ADA Standards for Accessible Design and 2013 CBC.

2.03 MICROWAVE OVENS

A. Microwave Oven:

1. Basis of Design Product: Subject to compliance with requirements, provide Viking Model RVM320 microwave oven, or equal.
2. Mounting: Undercabinet.
3. Type: Conventional.
4. Capacity: 2.0 cu. ft.
5. Oven Door: Door with observation window and pushbutton latch release.
6. Microwave Power Rating: Manufacturer's standard. Convection Element Power Rating: Manufacturer's standard.
7. Electric Power Supply: 120 V, 60 Hz, 1 phase, 15 A.
8. Controls: Digital panel controls and timer display.
9. Other Features: Turntable.
10. Material: Stainless steel.

2.04 REFRIGERATOR/FREEZERS

A. Refrigerator/Freezer: Comply with AHAM HRF-1.

1. Basis of Design Product: Subject to compliance with requirements, provide Viking Model RVRF336 refrigerator, or equal
2. Type: Freestanding.
3. ENERGY STAR: Provide appliances that qualify for the EPA/DOE ENERGY STAR product-labeling program.
4. Front Panel(s): Stainless steel.
5. Appliance Color/Finish: Stainless steel.

2.05 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, power connections, and other conditions affecting installation and performance of appliances.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before appliance installation.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install appliances according to manufacturer's written instructions.

B. Built-in Equipment: Securely anchor units to supporting cabinets or countertops with concealed fasteners. Verify that clearances are adequate for proper functioning and that rough openings are completely concealed.

C. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.

3.03 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Perform visual, mechanical, and electrical inspection and testing for each appliance according to manufacturers' written recommendations. Certify compliance with each manufacturer's appliance-performance parameters.
2. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
3. Operational Test: After installation, start units to confirm proper operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.

B. An appliance will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.04 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain appliances.

END OF SECTION

SECTION 22 05 00

COMMON WORK RESULTS FOR PLUMBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Piping materials and installation instructions common to most piping systems.
   2. Transition fittings.
   3. Dielectric fittings.
   4. Mechanical sleeve seals.
   5. Sleeves.
   6. Escutcheons.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

1.4 SUBMITTALS

A. Product Data: Submit brochures for the following materials to the Architect in accordance with the provisions of Division 1 of these specifications.
   1. Transition fittings.
   2. Dielectric fittings.
   3. Mechanical sleeve seals.
   4. Escutcheons.

1.5 QUALITY ASSURANCE

A. Codes and Standards:
   1. All governing Codes, Ordinances and Agencies, in accordance with the provisions of Division 1 of these specifications.

B. Warranty: In accordance with the provisions of Division 1 of these specifications.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

1.7 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress

of construction, to allow for plumbing installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for plumbing items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Section 22 11 19 "Domestic Water Piping Specialties."

1.8 SERVICE CONNECTIONS

A. Water: To water meter as shown on drawings. Contractor shall arrange for installation of the water meter and vault by LA Department of Water and Power and shall pay all fees and charges. Water for construction shall be separately arranged for and paid for by the contractor.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 22 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 15 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

E. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated.

2.4 TRANSITION FITTINGS

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
   1. Manufacturers:
      a. Cascade Waterworks Mfg. Co.
      b. Dresser Industries, Inc.; DMD Div.
      c. JCM Industries.
   2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.
   3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.
   4. Aboveground Pressure Piping: Pipe fitting.

B. Plastic-to-Metal Transition Fittings: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
   1. Manufacturers:
      a. Eslon Thermoplastics, or equal.

C. Plastic-to-Metal Transition Adaptors: One-piece fitting with manufacturer's SDR 11 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
   1. Manufacturers:
      a. Thompson Plastics, Inc., or equal.

D. Plastic-to-Metal Transition Unions: MSS SP-107, PVC four-part union. Include brass end, solvent-cement-joint end, rubber O-ring, and union nut.
   1. Manufacturers:
      a. NIBCO INC., or equal.

2.5 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
   1. Manufacturers:
      a. Epco Sales, Inc.
      b. Watts Industries, Inc.; Water Products Div.
      c. Zurn Industries, Inc.; Wilkins Div.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.
   1. Manufacturers:
      a. Epco Sales, Inc.
      b. Watts Industries, Inc.; Water Products Div.

E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
   1. Manufacturers:
      a. Advance Products & Systems, Inc.
      b. Calpico, Inc.
      c. Pipeline Seal and Insulator, Inc.
   2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.
   1. Manufacturers:
      a. Calpico, Inc.
      b. Lochinvar Corp.

G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.
   1. Manufacturers:
      a. Precision Plumbing Products, Inc.
      b. Sioux Chief Manufacturing Co., Inc.
      c. Victaulic Co. of America.

2.6 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Manufacturers:

a. Calpico, Inc.
b. Metraflex Co.
c. Thunderline “Line-Seal”.

2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
3. Pressure Plates: Stainless steel. Include two for each sealing element.
4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
1. Underdeck Clamp: Clamping ring with set screws.

E. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.

F. PVC Pipe: ASTM D 1785, Schedule 40.

G. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.8 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening. Polished chrome-plated with set screw.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as closely as practical to routing indicated on plans.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:

1. New Piping:
    a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
    b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
    c. Insulated Piping: One-piece, stamped-steel type with spring clips.
    d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
    e. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished chrome-plated finish.
    f. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
    g. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

M. Sleeves are not required for core-drilled holes.

N. Permanent sleeves are not required for holes formed by removable PE sleeves.

O. Install sleeves for pipes passing through concrete and masonry walls and concrete floor and roof slabs.

P. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
1. Cut sleeves to length for mounting flush with both surfaces.
    a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below
    floor slab as required to secure clamping ring if ring is specified.
2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
3. Install sleeves that are large enough to provide 1/2 inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
    a. Steel Pipe Sleeves: For pipes smaller than NPS 6.
    b. Steel Sheet Sleeves: For pipes NPS 6 and larger, penetrating gypsum-board partitions.
    c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing.
    Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Refer to Division 07 Section 07 62 00 "Sheet Metal Flashing and Trim" for flashing.
        1) Seal space outside of sleeve fittings with grout.
4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint.

Q. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.
3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

R. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

S. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with approved firestop materials, equal to Hilti.

T. Verify final equipment locations for roughing-in.

U. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end.
Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install plumbing equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

A. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Section 05 50 00 "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor plumbing materials and equipment.

C. Field Welding: Comply with AWS D1.1.

3.7 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor plumbing materials and equipment.

B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.

C. Attach to substrates as required to support applied loads.

END OF SECTION

SECTION 22 05 19

METERS AND GAGES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. METERS AND GAGES FOR PLUMBING PIPING consists of furnishing transportation, labor, materials, and equipment to furnish and install the following meters and gages for mechanical systems:
   1. Thermometers
   2. Gages
   3. Test plugs

1.2 RELATED WORK

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1of these specifications.

B. DOMESTIC WATER PIPING Section 22 11 16

C. COMMON WORK RESULTS FOR PLUMBING Section 22 05 00

1.3 REFERENCES

A. American Society of Mechanical Engineers (ASME)

1.4 QUALITY ASSURANCE

A. Codes and Standards:
   1. All governing Code, Ordinance and Agencies, in accordance with the provisions of Division 1 of these specifications.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated; include performance curves.

B. Product Certificates: For each type of thermometer, gauge, flowmeter and thermal-energy meter, signed by product manufacturer.

C. Operation and Maintenance Data: For flowmeters and thermal-energy meters to include in emergency, operation, and maintenance manuals.

PART 2 - PRODUCTS

2.1 METAL-CASE, LIQUID-IN-GLASS THERMOMETERS

A. Manufacturers:
   1. Palmer - Wahl Instruments Inc.
   2. Weiss Instruments, Inc.
   3. Trerice, H.O. Co.

B. Case: Die-cast aluminum or brass, 7 inches long.

C. Tube: Red or blue reading, mercury or organic-liquid filled, with magnifying lens.

D. Tube Background: Satin-faced, nonreflective aluminum with permanently etched scale markings.

E. Window: Glass.

F. Connector: Adjustable type, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device.

G. Stem: Copper-plated steel, aluminum, or brass for thermowell installation and of length to suit installation.

H. Accuracy: Plus or minus 1 percent of range or plus or minus 1 scale division to maximum of 1.5 percent of range.

2.2 PRESSURE GAGES

A. Manufacturers:
1. Palmer – Wahl Instruments Inc.
2. Trerice, H. O. Co.
3 Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.

B. Direct-Mounting, Dial-Type Pressure Gages: Indicating-dial type complying with ASME B40.100.
1. Case: Liquid-filled type, drawn steel or cast aluminum, 6-inch diameter.
2. Pressure-Element Assembly: Bourdon tube, unless otherwise indicated.
3. Pressure Connection: Brass, NPS 1/4, bottom-outlet type unless back-outlet type is indicated.
4. Movement: Mechanical, with link to pressure element and connection to pointer.
5. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings.
6. Pointer: Red or other dark-color metal.
7. Window: Glass.
8. Ring: Metal.
9. Accuracy: Grade B, plus or minus 2 percent of middle half scale.
10. Vacuum-Pressure Range: 30-inch Hg of vacuum to 15 psig of pressure.
11. Range for Fluids under Pressure: Two times operating pressure.

C. Pressure-Gage Fittings:
1. Valves: NPS 1/4 brass or stainless-steel needle type.
2. Syphons: NPS 1/4 coil of brass tubing with threaded ends.
3. Snubbers: ASME B40.5, NPS 1/4 brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure.

2.3 TEST PLUGS

A. Manufacturers:
1. Flow Design, Inc.
2. MG Piping Products Co.
3. Watts Industries, Inc.; Water Products Div.

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F.

D. Core Inserts: One or two self-sealing rubber valves.
1. Insert material for air, water, oil, or gas service at 20 to 200 degrees F shall be CR.
2. Insert material for air or water service at minus 30 to plus 275 degrees F shall be EPDM.

PART 3 – EXECUTION

3.1 THERMOMETER APPLICATIONS

A. Install liquid-in-glass thermometers in the following locations:
1. Outlet of each domestic water heater.
2. Each domestic hot water return pipe.

B. Provide the following temperature ranges for thermometers:
1. Domestic Hot Water: 30 to 180 degrees F, with 2-degree scale divisions.

3.2 GAGE APPLICATIONS

A. Install dry-case-type pressure gages for discharge of each pressure-reducing valve.

3.3 INSTALLATIONS

A. Install direct-mounting thermometers and adjust vertical and tilted positions.

B. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.

C. Install test plugs in tees in piping.

3.4 CONNECTIONS

A. Install meters and gages adjacent to machines and equipment to allow service and maintenance for meters, gages, machines, and equipment.

3.5 ADJUSTING

A. Adjust faces of thermometers and gages to proper angle for best visibility.

END OF SECTION

SECTION 22 05 23

GENERAL-DUTY VALVES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. GENERAL-DUTY VALVES FOR PLUMBING PIPING consists of furnishing transportation, labor, materials, and equipment to furnish and install the following general-duty valves:
   1. Ball valves.
   2. Check valves.
   3. Gate valves.

1.2 RELATED WORK

A. Drawings and general provision of the Contract, including General and Supplementary Conditions and Division 1 of these specifications.

B. COMMON WORK RESULTS FOR PLUMBING Section 22 05 00

1.3 REFERENCES

A. American Society of Mechanical Engineers (ASME)

B. American Water Works Association (AWWA)

1.4 SUBMITTALS

A. Product Data: For each type of valve indicated. Include body, seating, and trim materials; valve design; pressure and temperature classifications; end connections; arrangement; dimensions; and required clearances. Include list indicating valve and its application. Include rated capacities; shipping, installed, and operating weights; furnished specialties; and accessories.

1.5 QUALITY ASSURANCE

A. Codes and Standards:
   1. All governing Codes, Ordinance and Agencies, in accordance with the provisions of Division 1 of these specifications.

B. ASME Compliance:
   1. ASME B16.10 and ASME B16.34 for ferrous valved dimensions and design criteria.
   2. ASME B31.9 for building service piping valves.

C. NSF Compliance: NSF 61-G for valve materials for potable-water service.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
   1. Protect internal parts against rust and corrosion.
   2. Protect threads, flange faces, grooves, and weld ends.
   3. Set gate valves closed to prevent rattling.
   4. Set ball and plug valves open to minimize exposure of functional surfaces.
   5. Block check valves in either closed or open position.

B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher than ambient dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

PART 2 - PRODUCTS

2.1 VALVES, GENERAL

A. Refer to Valve Applications Article in this Section for applications of valves.

B. Bronze valves shall be made with dezincification-resistant materials.
   1. Valves for potable water must comply with California Lead Free Law.
   2. Lead free refers to the wetted surface of pipe, fittings and fixtures in potable water systems that have a weighted average lead content ≤ 0.25%. Source: California Health Safety Code (116875).
   3. All valves must be 3rd party certified.

C. Bronze Valves: NPS 2 and smaller with threaded ends, unless otherwise indicated.

D. Ferrous Valves: NPS 2-1/2" and larger with flanged ends, unless otherwise indicated.

E. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

F. Valve Sizes: Same as upstream pipe, unless otherwise indicated.

G. Valve Actuator Types:
   1. Handwheel: For valves other than quarter-turn types.
   2. Handlever: For quarter-turn valves NPS 6 and smaller, except plug valves.

H. Valves in Insulated Piping: With 2-inch stem extensions and the following features:
   1. Gate Valves: With rising stem.
   2. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeves that allows operation of valve without breaking the vapor seal or disturbing insulation and memory stops that are fully adjustable after insulation is applied.

I. Valve-End Connections:
   1. Flanged: With flanges according to ASME B16.1 for iron valves, ASME B16.5 for steel valves.
   2. Solder Joint: With sockets according to ASME B16.18.
   3. Threaded: With threads according to ASME B1.20.1.

J. Valve Bypass and Drain Connections: MSS SP-45.

2.2 BRONZE BALL VALVES

A. Manufacturers:
   1. Two-Piece, Full-Port, Bronze Ball Valves:
      a. Conbraco Industries, Inc.; Apollo Div.
      b. NIBCO INC., Model T-685-80-66-LF

B. Two-Piece, Bronze Ball Valves: Dezincification resistant lead free bronze body with full-port, stainless steel ball and trim; TFE seats; and 600-psig minimum cold working pressure rating and blowout-proof stem.

2.3 BRONZE CHECK VALVES

A. Manufacturers:
   1. Type 4, Bronze, Swing Check Valves with Nonmetallic TFE Disc:
      a. Milwaukee Valve Company.
      b. NIBCO INC., Model T-413-Y-LF

B. Bronze Check Valves, General: MSS SP-80.

C. Type 4, Class 125, Bronze, Swing Check Valves: Dezincification resistant lead free bronze body with nonmetallic disc and bronze seat.

2.4 BRONZE GATE VALVES

A. Manufacturers:
   1. Type 1, Bronze, Rising-Stem Gate Valves:
      a. Milwaukee Valve Company.
      b. NIBCO INC., Model T-111-LF
      c. Red-White Valve Corp.
      d. Watts Industries, Inc.; Water Products Div.

B. Bronze Gate Valves, General: MSS SP-80, with ferrous-alloy handwheel.

C. Type 1, Class 125, Bronze Gate Valves: Lead free bronze body with rising stem and bronze solid wedge.

2.5 CAST-IRON GATE VALVES

A. Manufacturers:
   1. Type I, Cast-Iron, Nonrising-Stem Gate Valves:
      a. Grinnell Corporation.
      b. Milwaukee Valve Company.
      c. NIBCO INC., Model F-619-RW

B. Cast-Iron Gate Valves, General: MSS SP-70, Type I.

C. Class 125, NRS, Bronze-Mounted, Cast-Iron Gate Valves: Ductile body with ductile iron trim, nonrising stem, and resilient-wedge.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine piping system for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

C. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

D. Examine threads on valve and mating pipe for form and cleanliness.

E. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

F. Do not attempt to repair defective valves; replace with new valves.

3.2 VALVE APPLICATIONS

A. Refer to piping Sections for specific valve applications. If valve applications are not indicated, use the following:
   1. Shutoff Service: Ball, or gate valves.
   2. Throttling Service: Ball valves.

B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP class or CWP ratings may be substituted.

C. Domestic Water Piping: Use the following types of valves:
   1. Ball Valves, NPS 2 and Smaller: Two-piece, 600-psig CWP rating, copper alloy.
   2. Swing Check Valves, NPS 2 and Smaller: Type 4, Class 125, bronze.
   3. Swing Check Valves, NPS 2-1/2 and Larger: Type II, Class 125, gray iron.
   4. Spring-Loaded, Lift-Disc Check Valves, NPS 2 and Smaller: Type IV, Class 125 minimum.
   5. Gate Valves, NPS 2-1/2 and Larger: Type I, Class 125, OS&Y, bronze-mounted cast iron.

3.3 VALVE INSTALLATION

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

C. Locate valves for easy access and provide separate support where necessary.

D. Install valves in horizontal piping with stem at or above center of pipe.

E. Install valves in position to allow full stem movement.

F. Install check valves for proper direction of flow and as follows:
   1. Swing Check Valves: In horizontal position with hinge pin level.
   2. Lift Check Valves: With stem upright and plumb.

3.4 JOINT CONSTRUCTION

A. Refer to Division 22 Section "Common Work Results for Plumbing" for basic piping joint construction.

B. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B32, lead-free-alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

3.5 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

END OF SECTION

SECTION 22 05 29

HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Hangers and supports for plumbing piping and equipment consists of furnishing transportation, labor, materials and equipment to furnish and install the following:
   1. Steel pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Thermal-hanger shield inserts.
   5. Fastener systems.
   6. Pipe stands.
   7. Pipe positioning systems.
   8. Equipment supports.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 General Requirements Sections, apply to this Section.

B. Related Sections include the following:
   1. Section 05 50 00 "Metal Fabrications" for structural-steel shapes and plates for trapeze hangers for pipe and equipment supports.
   2. Section 21 00 00 "Wet Pipe Fire-Suppression Systems" for pipe hangers for fire-suppression piping.
   3. Section 22 05 48 "Noise, Vibration and Seismic Controls for Plumbing Piping and Equipment" for vibration isolation devices.

1.3 DEFINITIONS

A. MSS: Manufacturers Standardization Society for The Valve and Fittings Industry Inc.

B. Terminology: As defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports."

1.4 PERFORMANCE REQUIREMENTS

A. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

B. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

C. Design seismic-restraint hangers and supports for piping and equipment and obtain approval from authorities having jurisdiction.

1.5 SUBMITTALS

A. Product Data: For the following:
   1. Steel pipe hangers and supports.
   2. Thermal-hanger shield inserts.
   3. Powder-actuated fastener systems.
   4. Pipe positioning systems.

B. Welding certificates.

1.6 QUALITY ASSURANCE

A. Welding: Welding shall be performed only by qualified welders, and shall comply with ASME Boiler Construction Code, ANSI Code and State of California requirements.

B. Codes and Standards:
   1. All governing codes, ordinances and agencies, in accordance with the provisions of Division 1 of these specifications.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 STEEL PIPE HANGERS AND SUPPORTS

A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.

B. Manufacturers:
   1. B-Line Systems, Inc.; a division of Cooper Industries.
   2. ERICO/Michigan Hanger Co.
   3. Hilti Inc.
   4. Tolco Inc.

C. Galvanized, Metallic Coatings: Pregalvanized or hot dipped.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

E. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion for support of bearing surface of piping.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS

A. Description: MFMA-3, shop- or field-fabricated pipe-support assembly made of steel channels and other components.

B. Manufacturers:
   1. B-Line Systems, Inc.; a division of Cooper Industries.
   2. ERICO/Michigan Hanger Co.; ERISTRUT Div.
   3. Hilti Inc.
   4. Tolco Inc.
   5. Unistrut Corp.; Tyco International, Ltd.

C. Coatings: Manufacturer's standard finish unless bare metal surfaces are indicated.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.5 THERMAL-HANGER SHIELD INSERTS

A. Description: 100-psig- minimum, compressive-strength insulation insert encased in sheet metal shield.

B. Manufacturers:

1. ERICO/Michigan Hanger Co.
2. Pipe Shields, Inc.

C. Insulation-Insert Material for Cold Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate or ASTM C 552, Type II cellular glass with vapor barrier.

D. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate or ASTM C 552, Type II cellular glass.

E. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

F. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

G. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.6 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
1. Manufacturers:
a. Hilti, Inc.
b. ITW Ramset/Red Head.
c. Powers Fasteners.

B. Mechanical-Expansion Anchors: Insert-wedge-type stainless steel, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
1. Manufacturers:
a. B-Line Systems, Inc.; a division of Cooper Industries.
b. Hilti, Inc.
c. ITW Ramset/Red Head.
d. Powers Fasteners.

2.7 PIPE STAND FABRICATION

A. Pipe Stands, General: Shop or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

B. Compact Pipe Stand: One-piece plastic unit with integral-rod-roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
1. Manufacturers:
a. ERICO/Michigan Hanger Co.
b. MIRO Industries.

C. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe support made from structural-steel shape, continuous-thread rods, and rollers for mounting on permanent stationary roof curb.

2.8 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, system of metal brackets, clips, and straps for positioning piping in pipe spaces for plumbing fixtures for commercial applications.

B. Manufacturers:
1. C & S Mfg. Corp.
2. HOLDRITE Corp.; Hubbard Enterprises.
3. Samco Stamping, Inc.

2.9 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural-steel shapes.

2.10 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Specific hanger and support requirements are specified in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use padded hangers for piping that is subject to scratching.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated stationary pipes, NPS 1/2 to NPS 30.
2. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes, NPS 1/2 to NPS 24, if little or no insulation is required.
3. Pipe Hangers (MSS Type 5): For suspension of pipes, NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.
4. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of noninsulated stationary pipes, NPS 3/4 to NPS 8.
5. Split Pipe-Ring with or without Turnbuckle-Adjustment Hangers (MSS Type 11): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 8.
6. Extension Hinged or 2-Bolt Split Pipe Clamps (MSS Type 12): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 3.
7. U-Bolts (MSS Type 24): For support of heavy pipes, NPS 1/2 to NPS 30.
8. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
9. Pipe Saddle Supports (MSS Type 36): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange.
10. Pipe Stanchion Saddles (MSS Type 37): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange and with U-bolt to retain pipe.
11. Adjustable, Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes, NPS 2-1/2 to NPS 36, if vertical adjustment is required, with steel pipe base stanchion support and cast-iron floor flange.
12. Single Pipe Rolls (MSS Type 41): For suspension of pipes, NPS 1 to NPS 30, from 2 rods if longitudinal movement caused by expansion and contraction might occur.
13. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes, NPS 2-1/2 to NPS 20, from single rod if horizontal movement caused by expansion and contraction might occur.
14. Complete Pipe Rolls (MSS Type 44): For support of pipes, NPS 2 to NPS 42, if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
15. Pipe Roll and Plate Units (MSS Type 45): For support of pipes, NPS 2 to NPS 24, if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
16. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes, NPS 2 to NPS 30, if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, NPS 3/4 to NPS 20.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
   2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
   3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
   4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
   5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
   2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape.
   3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
   4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
   5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
   6. C-Clamps (MSS Type 23): For structural shapes.
   7. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
   8. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
   9. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I- beams for heavy loads, with link extensions.
   10. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
   11. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
      a. Light (MSS Type 31): 750 lb.
      b. Medium (MSS Type 32): 1500 lb.
      c. Heavy (MSS Type 33): 3000 lb.
   12. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
   13. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
   14. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

J. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
   2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
   3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

K. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
   2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.

4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from hanger.
6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from base support.
7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from trapeze support.
8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include
   the following types:
   a. Horizontal (MSS Type 54): Mounted horizontally.
   b. Vertical (MSS Type 55): Mounted vertically.
   c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

L. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

M. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

N. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

O. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.2 HANGER AND SUPPORT INSTALLATION

A. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated trapeze pipe hangers.
1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.
2. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported.
   Weld steel according to AWS D1.1.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled metal framing systems.

D. Fiberglass Strut System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled fiberglass struts.

E. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

F. Fastener System Installation:
1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder- actuated tool manufacturer's operating manual.
2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

G. Pipe Stand Installation:
1. Pipe Stand Types except Curb-Mounting Type: Assemble components and mount

on smooth roof surface. Do not penetrate roof membrane.

2. Curb-Mounting-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. Refer to Division Section 07 72 00 "Roof Accessories" for curbs.

H. Pipe Positioning System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture. Refer to Division 22 Section 22 40 00 "Plumbing Fixtures" for plumbing fixtures.

I. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

J. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

K. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

L. Install lateral bracing with pipe hangers and supports to prevent swaying.

M. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

N. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

O. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9 (for building services piping) are not exceeded.

P. Insulated Piping: Comply with the following:

1. Attach clamps and spacers to piping.
   a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
   b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
   c. Do not exceed pipe stress limits according to ASME B31.9 for building services piping.
2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
   a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
   b. NPS 4: 12 inches long and 0.06 inch thick.
   c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick.
   d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.
   e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick.
5. Pipes NPS 8 and Larger: Include wood inserts.
6. Insert Material: Length at least as long as protective shield.
7. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.3 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.4 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.5 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.6 PAINTING

A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Touch Up: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION

SECTION 22 05 48

NOISE, VIBRATION AND SEISMIC CONTROL OF PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Noise, vibration and seismic control of plumbing piping and equipment consists of furnishing transportation, labor, materials, and equipment to furnish and install the following:
   1. Isolators
   2. Seismic Restraints

1.2 RELATED DOCUMENTS

A. Drawings and General provisions of the Contract, including General and Supplementary Conditions and Division 1 of these specifications.

1.3 DESCRIPTION

A. Work Included: Isolation of domestic hot and cold water lines, circulation pumps, and water heaters.

1.4 QUALITY ASSURANCE

A. Codes and Standards
   1. All governing Codes, Ordinances and Agencies in accordance with the provisions of Division 1 of these specifications.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATORS

A. Type A: Neoprene pad. Waffle, ribbed, or other forms. Typically 1/4 to 5/16 inch thick.
Durometers of 40 to 65. Static deflections from 0.01 to 0.07 inches. Nominal design 40 durometer for 0.05 inches static deflection. Provide steel load distribution plates. Size of pad to be specified by isolator supplier based on load per pot. Mason W and WM, Vibrex R, or equivalent.

B. Type D: Is a molded neoprene element enclosed by a ductile housing. The isolator may be utilized in compression, shear or tension. The isolator shall provide seismic restraint in any direction up to 1.0g. The isolator shall be Mason Industries "BR" or approved equal.

C. Type I: Spring hangers. Steel spring with neoprene cap in steel hanger frame. Static deflection range 1.2 to 2.0 inches nominal. Designed to preclude contact of hanger rods with frame (30 degree misalignment.) Mason 30, Vibex RMSA, or equivalent.

D. Type T: Trisolators. Sheet metal sleeve with felt insert to be installed at attachment points of hangers or piping. Semco, Elcen, Elmdor/Stoneman or equivalent shop- fabricated device.

E. Vibration Isolation for Domestic Hot and Cold Water Plumbing Lines.
   1. Riser Support: 0.06 inch deflection Type A neoprene pads with load- distribution pads under riser clamps.
   2. Horizontal Piping: Minimum 3/8 inch felt between pipe and clevis hanger.
   3. Miscellaneous Attachments: Trisolators.

4. Seismic Restraints: Suspended piping - cables as required by code.
5. Vibration Isolation: Isolate plumbing lines within the vicinity of pumps. Plumbing line isolators shall have a static deflection equal to that of the pump isolation.

F. Vibration Isolation for Water Heaters:
1. 0.06 inch deflection Type A neoprene pads.

G. Seismic Restraints: Suspended piping cables as required by Code.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Vibration Isolation: In accordance with the manufacturer's directions.

B. Seismic Restraint: In accordance with the requirements of all applicable Code and Standards, and manufacturers recommendations.

END OF SECTION

SECTION 22 05 53
IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Identification for plumbing piping and equipment consists of furnishing transportation, labor, materials, and equipment to furnish and install the following:
   1. Pipe labels.
   2. Valve tags.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 General Requirements Sections, apply to this Section.

B. Section 22 05 00 “Common Work Results for Plumbing”

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

1.4 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

1.5 QUALITY ASSURANCE

A. Codes and Standards:
   1. All governing codes, ordinances and agencies, in accordance with the provisions of Division 1 of these specifications.

PART 2 - PRODUCTS

2.1 PIPE LABELS

A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.

C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
   1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions, or as separate unit on each pipe label to indicate flow direction.
   2. Lettering Size: At least 1-1/2 inches high.

2.2 VALVE TAGS

A. Valve Tags: Provide a valve tag consisting of a 2 in. dia., 20 ga. brass disk for each valve with 1/2 in. letters identifying service designation. Fasten tags in place with continuous chain around valve stem.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.2 PIPE LABEL INSTALLATION

A. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
   1. Near each valve and control device.
   2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
   3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
   4. At access doors, manholes, and similar access points that permit view of concealed piping.
   5. Near major equipment items and other points of origination and termination.
   6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
   7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

B. Pipe Label Color Schedule:
   1. Domestic Water Piping:
      a. Background Color: Yellow.
      b. Letter Color: Black.
   2. Sanitary Waste and Storm Drainage Piping:
      a. Background Color: Green.
      b. Letter Color: White.

3.3 VALVE-TAG INSTALLATION

A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn-watering hose connections; and similar roughing-in connections of end-use fixtures and units.

END OF SECTION

SECTION 22 07 19

PLUMBING PIPING INSULATION

PART 1 - GENERAL

1.1 WORK INCLUDED

A. PLUMBING PIPING INSULATION consists of furnishing transportation, labor, materials, and equipment to furnish and install piping insulation including preformed, rigid and flexible pipe insulation; field-applied jackets; accessories and attachments; and sealing compounds.

1.2 RELATED WORK

A. Section 22 05 00 “Common Work Results for Plumbing.”

B. Section 22 05 29 “Hangers and Supports for Plumbing Piping and Equipment.”

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM International)

1.4 SUBMITTALS

A. Product Data: Identify thermal conductivity, thickness, and jackets (both factory and field applied, if any), for each type of product indicated.

1.5 QUALITY ASSURANCE

A. Insulation Installed Indoors: Flame-spread rating of 25 or less, and smoke-developed rating of 50 or less.

B. Insulation Installed Outdoors: Flame-spread rating of 75 or less, and smoke-developed rating of 150 or less.

C. Codes and Standards:
   1. All governing Codes, Ordinances and agencies, in accordance with the provisions of Division 1 of these specifications.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Ship insulation materials in containers marked by manufacturer with appropriate ASTM specification designation, type and grade, and maximum use temperature.

1.7 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Section 22 05 29.

B. Coordinate clearance requirements with piping Installer for insulation application.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Glass Fiber Insulation:
   1. Johns-Manville
   2. Pittsburgh-Corning Corporation

B. Closed-Cell Phenolic-Foam Insulation:
   1. Kooltherm Insulation Products, Ltd.

2.2 INSULATION MATERIALS

A. Glass Fiber Insulation: Inorganic, foamed or cellulated glass, annealed, rigid, hermetically sealed cells, incombustible.
   1. Preformed Pipe Insulation, without Jacket: Comply with ASTM C552, Type II, Class 1.
   2. Preformed Pipe Insulation, with Jacket: Comply with ASTM C552, Type II, Class 2.
   3. Closed-Cell Phenolic-Foam Insulation: Preformed pipe insulation of rigid, expanded, closed-cell structure. Comply with ASTM C1126, Type III, Grade 1.

B. Prefabricated Thermal Insulating Fitting Covers: Comply with ASTM C450 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.

2.3 FIELD-APPLIED JACKETS

A. General: ASTM C921, Type 1, unless otherwise indicated.

B. Foil and Paper Jacket: Laminated, glass-fiber-reinforced, flame-retardant kraft paper and aluminum foil.

C. PVC Jacket: High-impact, ultraviolet-resistant PVC; 20 mils thick; roll stock ready for shop or field cutting and forming.
   1. Adhesive: As recommended by insulation material manufacturer.
   2. PVC Jacket Color: Color-code piping jackets based on materials contained within the piping system.
   3. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories for the disabled.
   4. Adhesive: As recommended by insulation material manufacturer.

D. Standard PVC Fitting Covers: Factory-fabricated fitting covers manufactured from 20-mil- thick, high- impact, ultraviolet-resistant PVC.
   1. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories for the disabled.
   2. Adhesive: As recommended by insulation material manufacturer.

E. Aluminum Jacket: Factory cut and rolled to indicated sizes. Comply with ASTM B209, 3003 alloy, H- 14 temper.
   1. Finish and Thickness: Smooth finish, 0.010 inch thick.
   2. Moisture Barrier: 1-mil- thick, heat-bonded polyethylene and kraft paper.
   3. Elbows: Preformed, 45- and 90-degree, short- and long-radius elbows; same material, finish, and thickness as jacket.

2.4 ACCESSORIES AND ATTACHMENTS

A. Glass Cloth and Tape: Comply with MIL-C-20079H, Type I for cloth and Type II for tape. Woven glass-fiber fabrics, plain weave, presized a minimum of 8 ounces per square yard.
   1. Tape Width: 4 inches.

B. Bands: 3/4 inch wide, in one of the following materials compatible with jacket:
   1. Stainless Steel: ASTM A666, Type 304; 0.020 inch thick.
   2. Galvanized Steel: 0.005 inch thick.
   3. Aluminum: 0.007 inch thick.
   4. Brass: 0.010 inch thick.
   5. Nickel-Copper Alloy: 0.005 inch thick.

C. Wire: 0.080-inch, nickel-copper alloy; 0.062-inch, soft-annealed, stainless steel; or 0.062-inch, soft- annealed, galvanized steel.

2.5 VAPOR RETARDERS

A. Mastics: Materials recommended by insulation material manufacturer that are compatible with insulation materials, jackets, and substrates.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry pipe and fitting surfaces. Remove materials that will adversely affect insulation application.

3.3 GENERAL APPLICATION REQUIREMENTS

A. Apply insulation materials, accessories, and finishes according to the manufacturer's written instructions; with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.

B. Refer to schedules at the end of this Section for materials, forms, jackets, and thicknesses required for each piping system.

C. Use accessories compatible with insulation materials and suitable for the service. Use accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Apply insulation with longitudinal seams at top and bottom of horizontal pipe runs.

E. Apply multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Seal joints and seams with vapor-retarder mastic on insulation indicated to receive a vapor retarder.

H. Keep insulation materials dry during application and finishing.

I. Apply insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by the insulation material manufacturer.

J. Apply insulation with the least number of joints practical.

K. Apply insulation over fittings, valves, and specialties, with continuous thermal and vapor-retarder integrity, unless otherwise indicated. Refer to special instructions for applying insulation over fittings, valves, and specialties.

L. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic.
   1. Apply insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor retarders are indicated, extend insulation on anchor legs at least 12 inches from point of attachment to pipe and taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.
   3. Install insert materials and apply insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by the insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect the jacket from tear or puncture by the hanger, support, and shield.

M. Insulation Terminations: For insulation application where vapor retarders are indicated, taper insulation ends. Seal tapered ends with a compound recommended by the insulation material

manufacturer to maintain vapor retarder.

N. Apply adhesives and mastics at the manufacturer's recommended coverage rate.

O. Apply insulation with integral jackets as follows:
   1. Pull jacket tight and smooth.
   2. Circumferential Joints: Cover with 3-inch wide strips, of same material as insulation jacket.
      Secure strips with adhesive and outward clinching staples along both edges of strip and spaced 4 inches on center.
   3. Longitudinal Seams: Overlap jacket seams at least 1-1/2 inches. Apply insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 4 inches on center.
      a. Exception: Do not staple longitudinal laps on insulation having a vapor retarder.
   4. Vapor-Retarder Mastics: Where vapor retarders are indicated, apply mastic on seams and joints and at ends adjacent to flanges, unions, valves, and fittings.
   5. At penetrations in jackets for thermometers and pressure gages, fill and seal voids with vapor- retarder mastic.

P. Roof Penetrations: Apply insulation for interior applications to a point even with top of roof flashing.
   1. Seal penetrations with vapor-retarder mastic.
   2. Apply insulation for exterior applications tightly joined to interior insulation ends.
   3. Extend metal jacket of exterior insulation outside roof flashing at least 2 inches below top of roof flashing.
   4. Seal metal jacket to roof flashing with vapor-retarder mastic.

Q. Exterior Wall Penetrations: For penetrations of below-grade exterior walls, terminate insulation flush with mechanical sleeve seal. Seal terminations with vapor-retarder mastic.

R. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and floors.

S. Fire-Rated Wall and Partition Penetrations: Apply insulation continuously through penetrations of fire- rated walls and partitions.
   1. Firestopping and fire-resistive joint sealers are specified in Section 21 00 00 “Wet Pipe Fire Suppression Systems.”

T. Floor Penetrations: Apply insulation continuously through floor assembly.
   1. For insulation with vapor retarders, seal insulation with vapor-retarder mastic where floor supports penetrate vapor retarder.

3.4 GLASS FIBER INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:
   1. Secure each layer of insulation to pipe with wire, tape, or bands without deforming insulation materials.
   2. Where vapor retarders are indicated, seal longitudinal seams and end joints with vapor-retarder mastic.
   3. For insulation with factory-applied jackets, secure laps with outward clinched staples at 6 inches on center.
   4. For insulation with factory-applied jackets with vapor retarders, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by the insulation material manufacturer and seal with vapor-retarder mastic.

B. Apply insulation to flanges as follows:
   1. Apply preformed pipe insulation to outer diameter of pipe flange.
   2. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation.
   3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of the same thickness as pipe insulation.
   4. Apply canvas jacket material with manufacturer's recommended adhesive, overlapping seams at least 1 inch, and seal joints with vapor-retarder mastic.

C. Apply insulation to fittings and elbows as follows:
   1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
   2. When premolded sections of insulation are not available, apply mitered sections of cellular-glass insulation. Secure insulation materials with wire, tape, or bands.
   3. Cover fittings with heavy PVC fitting covers. Overlap PVC covers on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

D. Apply insulation to valves and specialties as follows:
   1. Apply premolded segments of cellular-glass insulation or glass-fiber blanket insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation. For check valves, arrange insulation for access to strainer basket without disturbing insulation.
   2. Apply insulation to flanges as specified for flange insulation application.
   3. Use preformed standard PVC fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.
   4. Use preformed heavy PVC fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.
   5. For larger sizes where PVC fitting covers are not available, seal insulation with canvas jacket and sealing compound recommended by the insulation material manufacturer.

3.5 CLOSED-CELL PHENOLIC-FOAM INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:
   1. Secure each layer of insulation to pipe with wire, tape, or bands without deforming insulation materials.
   2. Where vapor retarders are indicated, seal longitudinal seams and end joints with vapor-retarder mastic.
   3. For insulation with factory-applied jackets, secure laps with outward clinched staples at 6 inches
      on center.
   4. For insulation with factory-applied jackets with vapor retarders, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by the insulation material manufacturer and seal with vapor-retarder mastic.

B. Apply insulation to flanges as follows:
   1. Apply preformed pipe insulation to outer diameter of pipe flange.
   2. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation.
   3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of the same material and thickness as pipe insulation.
   4. Apply canvas jacket material with manufacturer's recommended adhesive, overlapping seams at least 1 inch, and seal joints with vapor-retarder mastic.

C. Apply insulation to fittings and elbows as follows:
   1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer’s written instructions.
   2. When premolded sections of insulation are not available, apply mitered sections of phenolic- foam insulation. Secure insulation materials with wire, tape, or bands.
   3. Cover fittings with heavy PVC fitting covers. Overlap PVC covers on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

D. Apply insulation to valves and specialties as follows:
   1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.

2. When premolded sections of insulation are not available, apply mitered segments of phenolic- foam insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation. For check valves, arrange insulation for access to strainer basket without disturbing insulation.
3. Apply insulation to flanges as specified for flange insulation application.
4. Use preformed heavy PVC fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.
5. For larger sizes where PVC fitting covers are not available, seal insulation with canvas jacket and sealing compound recommended by the insulation material manufacturer.

3.6 FIELD-APPLIED JACKET APPLICATION

A. Apply glass-cloth jacket, where indicated, directly over bare insulation or insulation with factory-applied jackets.
   1. Apply jacket smooth and tight to surface with 2-inch overlap at seams and joints.
   2. Embed glass cloth between two 0.062-inch- thick coats of jacket manufacturer's recommended adhesive.
   3. Completely encapsulate insulation with jacket, leaving no exposed raw insulation.

B. Foil and Paper Jackets: Apply foil and paper jackets where indicated.
   1. Draw jacket material smooth and tight.
   2. Apply lap or joint strips with the same material as jacket.
   3. Secure jacket to insulation with manufacturer's recommended adhesive.
   4. Apply jackets with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
   5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-retarder mastic.

C. Apply PVC jacket where indicated, with 1-inch overlap at longitudinal seams and end joints. Seal with manufacturer's recommended adhesive.

D. Apply metal jacket where indicated, with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches on center and at end joints.

3.7 PIPING SYSTEM APPLICATIONS

A. Insulation materials and thicknesses are specified in schedules at the end of this Section.

B. Items Not Insulated: Unless otherwise indicated, do not apply insulation to the following systems, materials, and equipment:
   1. Flexible connectors.
   2. Vibration-control devices.
   3. Fire-suppression piping.
   4. Drainage piping located in crawl spaces, unless otherwise indicated.
   5. Below-grade piping, unless otherwise indicated.
   6. Chrome-plated pipes and fittings, unless potential for personnel injury.
   7. Air chambers, unions, strainers, check valves, plug valves, and flow regulators.

3.8 INSULATION APPLICATION SCHEDULE, GENERAL

A. Refer to insulation application schedules for required insulation materials, vapor retarders, and field- applied jackets.

B. Application schedules identify piping system and indicate pipe size ranges and material, thickness, and jacket requirements.

3.9 INTERIOR INSULATION APPLICATION SCHEDULE

A. Service: Domestic hot, tempered and recirculated hot water.
   1. Operating Temperature: 60 to 165 degrees F.
   2. Insulation Material: Cellular glass fiber, with jacket.

3. Insulation Thickness: Apply the following insulation thicknesses:
    a. Copper Pipe, 1/2 in to 1 inch: 1 inch thick.
    b. Copper Pipe, 1-1/4 inch and larger: 1-1/2 inches thick.
4. Field-Applied Jacket: Foil and paper at mechanical rooms where piping is exposed.
5. Vapor Retarder Required: Yes.
6. Finish: None.

B. Service: Condensate drain.
1. Operating Temperature: 35 to 60 degrees F.
2. Insulation Material: Closed-cell phenolic foam.
3. Insulation Thickness: Apply the following insulation thicknesses:
    a. Copper Pipe, 1/2 inch to 1 inch: 1/2 inch thick.
    b. Copper Pipe, 1-1/4 inches and larger: 1/2 inch thick.
4. Finish: None.

END OF SECTION

SECTION 22 11 16

DOMESTIC WATER PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Under-building slab and above ground domestic water pipes, tubes, fittings, and specialties inside the building.
   2. Encasement for piping.
   3. Specialty valves.
   4. Flexible connectors.

B. Related Section:
   1. Division 2 Section "Water Distribution" for water-service piping outside the building from source to the point where water-service piping enters the building.

1.3 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Domestic water piping and support and installation shall withstand effects of earthquake motions determined according to SMACNA Guidelines.

1.4 SUBMITTALS

A. Product Data: For the following products:
   1. Specialty valves.
   2. Transition fittings.
   3. Dielectric fittings.
   4. Flexible connectors.
   5. Backflow preventers and vacuum breakers.
   6. Water penetration systems.

B. Water Samples: Specified in "Cleaning" Article.

C. Field quality-control reports.

1.5 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 61-G and California Lead Free Law for potable domestic water piping and components.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.2 COPPER TUBE AND FITTINGS

A. Hard Copper Tube: ASTM B 88, Type K and L water tube, drawn temper.
   1. Wrought-Copper Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
   2. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and- socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

2.3 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, 1/8 inch thick or ASME B16.21, nonmetallic and asbestos free, unless otherwise indicated; full-face or ring type unless otherwise indicated.

B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.

2.4 ENCASEMENT FOR PIPING

A. Standard: ASTM A 674 or AWWA C105.

B. Material: Factory coated with 20 mil high density polyethylene coating.

C. Color: Yellow.

2.5 SPECIALTY VALVES

A. Comply with requirements in Division 22 Section "General-Duty Valves for Plumbing Piping" for general-duty metal valves.

B. Comply with requirements in Division 22 Section "Domestic Water Piping Specialties" for balancing valves, drain valves, backflow preventers, and vacuum breakers.

2.6 TRANSITION FITTINGS

A. General Requirements:
   1. Same size as pipes to be joined.
   2. Pressure rating at least equal to pipes to be joined.
   3. End connections compatible with pipes to be joined.

B. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.

C. Sleeve-Type Transition Coupling: AWWA C219.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cascade Waterworks Manufacturing.
      b. Dresser, Inc.; Dresser Piping Specialties.
      c. Ford Meter Box Company, Inc. (The).
      d. JCM Industries.
      e. Romac Industries, Inc.
      f. Smith-Blair, Inc; a Sensus company.
      g. Viking Johnson; c/o Mueller Co.

D. Plastic-to-Metal Transition Fittings:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Charlotte Pipe and Foundry Company.
      b. Harvel Plastics, Inc.
      c. Spears Manufacturing Company.
   2. Description: Schedule 80 PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert and one solvent-cement-socket end.

E. Plastic-to-Metal Transition Unions:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the

following:
a. Colonial Engineering, Inc.
b. NIBCO INC.
c. Spears Manufacturing Company.

2. Description: Schedule 80 PVC four-part union. Include brass or stainless-steel threaded end, solvent-cement-joint plastic end, rubber O-ring, and union nut.

2.7 DIELECTRIC FITTINGS

A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.

B. Dielectric Unions:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Capitol Manufacturing Company.
b. Central Plastics Company.
c. Hart Industries International, Inc.
d. Jomar International Ltd.
e. Matco-Norca, Inc.
f. McDonald, A. Y. Mfg. Co.
g. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
h. Wilkins; a Zurn company.
2. Description:
a. Standard: ASSE 1079.
b. End Connections: Solder-joint copper alloy and threaded ferrous.

C. Dielectric Flanges:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Capitol Manufacturing Company.
b. Central Plastics Company.
c. Matco-Norca, Inc.
d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
e. Wilkins; a Zurn company.
2. Description:
a. Standard: ASSE 1079.
b. Factory-fabricated, bolted, companion-flange assembly.
c. Pressure Rating: 150 psig.
d. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

D. Dielectric-Flange Insulating Kits:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Advance Products & Systems, Inc.
b. Calpico, Inc.
c. Central Plastics Company.
d. Pipeline Seal and Insulator, Inc.
2. Description:
a. Nonconducting materials for field assembly of companion flanges.
b. Pressure Rating: 150 psig.
c. Gasket: Neoprene or phenolic.
d. Bolt Sleeves: Phenolic or polyethylene.
e. Washers: Phenolic with steel backing washers.

E. Dielectric Nipples:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Elster Perfection.
b. Grinnell Mechanical Products.
c. Matco-Norca, Inc.
d. Precision Plumbing Products, Inc.
e. Victaulic Company.
2. Description:
a. Standard: IAPMO PS 66
b. Electroplated steel nipple. complying with ASTM F 1545.
c. End Connections: Male threaded or grooved.
d. Lining: Inert and noncorrosive, propylene.

2.8 FLEXIBLE CONNECTORS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Flex-Hose Co., Inc.
2. Flexicraft Industries.
3. Flex Pression, Ltd.
4. Flex-Weld, Inc.
5. Hyspan Precision Products, Inc.
6. Mercer Rubber Co.
7. Metraflex, Inc.
8. Proco Products, Inc.
9. Tozen Corporation.
10. Unaflex, Inc.
11. Universal Metal Hose; a Hyspan company

B. Stainless-Steel-Hose Flexible Connectors: Corrugated-stainless-steel tubing with stainless-steel wire-braid covering and ends welded to inner tubing.
1. Working-Pressure Rating: Minimum 200 psig.
2. End Connections NPS 2 and Smaller: Threaded steel-pipe nipple.
3. End Connections NPS 2-1/2 and Larger: Flanged steel nipple.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Comply with requirements in Division 2 Section "Earthwork" for excavating, trenching, and backfilling.

3.2 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic and recycled water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install underground copper tube in PE encasement according to ASTM A 674 or AWWA C105.

C. Install shutoff valve and hose-end drain valve, inside the building at each domestic water service entrance. Comply with requirements in Division 22 Section "Meters and Gages for Plumbing Piping" for pressure gages and Division 22 Section "Domestic Water Piping Specialties" for drain valves and strainers.

D. Install shutoff valve immediately upstream of each dielectric fitting.

E. Install domestic water piping level with slope up in direction of water flow to air elimination device and plumb.

F. Install seismic restraints on piping. Comply with requirements in Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

G. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

H. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

I. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.

J. Install piping adjacent to equipment and specialties to allow service and maintenance.

K. Install piping to permit valve servicing.

L. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than system pressure rating used in applications below unless otherwise indicated.

M. Install piping free of sags and bends.

N. Install fittings for changes in direction and branch connections.

O. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.

P. Install thermostats in hot-water circulation piping. Comply with requirements in Division 22 Section "Domestic Water Pumps" for thermostats.

Q. Install thermometers on inlet and outlet piping from each water heater. Comply with requirements in Division 22 Section "Meters and Gages for Plumbing Piping" for thermometers.

R. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Division 22 Section "Sleeves and Sleeve Seals for Plumbing Piping."

S. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Division 22 Section "Sleeves and Sleeve Seals for Plumbing Piping."

T. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Division 22 Section "Escutcheons for Plumbing Piping."

3.3 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs.

B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

D. Brazed Joints: Join copper tube and fittings according to CDA's "Copper Tube Handbook," "Brazed Joints" Chapter.

E. Soldered Joints: Apply ASTM B 813, water-flushable flux to end of tube. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."

F. Flanged Joints: Select appropriate asbestos-free, nonmetallic gasket material in size, type, and thickness suitable for domestic water service. Join flanges with gasket and bolts according to ASME B31.9.

G. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.4 VALVE INSTALLATION

A. General-Duty Valves: Comply with requirements in Division 22 Section "General-Duty Valves for Plumbing Piping" for valve installations.

B. Install shutoff valve close to water main on each branch and riser serving plumbing fixtures or equipment, on each water supply to equipment, and on each water supply to plumbing fixtures that do not have supply stops. Use ball valves for piping NPS 2 and smaller. Use gate valves for piping NPS 2-1/2 and larger.

C. Install drain valves for equipment at base of each water riser, at low points in horizontal piping, and where required to drain water piping. Drain valves are specified in Division 22 Section "Domestic Water Piping Specialties."
   1. Hose-End Drain Valves: At low points in water mains, risers, and branches.
   2. Stop-and-Waste Drain Valves: Instead of hose-end drain valves where indicated.

3.5 TRANSITION FITTING INSTALLATION

A. Install transition couplings at joints of dissimilar piping.

B. Transition Fittings in Underground Domestic Water Piping:
   1. NPS 1-1/2 and Smaller: Fitting-type coupling.
   2. NPS 2 and Larger: Sleeve-type coupling.

C. Transition Fittings in Aboveground Domestic Water Piping NPS 2 and Smaller: Plastic-to-metal transition fittings or unions.

3.6 DIELECTRIC FITTING INSTALLATION

A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

B. Dielectric Fittings for NPS 2 and Smaller: Use dielectric couplings or nipples or unions.

C. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric flanges, flange kits, nipples.

3.7 FLEXIBLE CONNECTOR INSTALLATION

A. Install stainless-steel-hose flexible connectors in copper domestic water tubing.

3.8 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements in Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

B. Comply with requirements in Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support products and installation.
   1. Vertical Piping: MSS Type 8 or 42, clamps.
   2. Individual, Straight, Horizontal Piping Runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet If Indicated: MSS Type 49, spring cushion rolls.
   3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls.
      Support pipe rolls on trapeze.
   4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced one size for double-rod hangers, to a minimum of 3/8 inch.

E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/2 and Smaller: 72 inches with 3/8-inch rod.
   2. NPS 2 and larger: 10 feet with 3/8-inch rod.

F. Install supports for vertical copper tubing every 10 feet.

G. Support piping and tubing not listed in this article according to MSS SP-69 and manufacturer's written instructions.

3.9 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.

D. Connect domestic water piping to water-service piping with shutoff valve; extend and connect to the following:
   1. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
   2. Plumbing Fixtures: Cold- and hot-water supply piping in sizes indicated, but not smaller than required by plumbing code. Comply with requirements in Division 22 plumbing fixture Sections for connection sizes.
   3. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 and larger.

3.10 IDENTIFICATION

A. Identify system components. Comply with requirements in Division 15 Section "Identification for Plumbing Piping and Equipment" for identification materials and installation.

3.11 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Piping Inspections:
   1. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
   2. During installation, notify authorities having jurisdiction at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
      a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing- in after roughing-in and before setting fixtures.
      b. Final Inspection: Arrange final inspection for authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
   3. Reinspection: If authorities having jurisdiction find that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
   4. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

C. Piping Tests:
   1. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
   2. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
   3. Leave new, altered, extended, or replaced domestic and recycled water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   4. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand
      for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
   5. Repair leaks and defects with new materials and retest piping or portion thereof until satisfactory results are obtained.
   6. Prepare reports for tests and for corrective action required.

D. Domestic water piping will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.12 ADJUSTING

A. Perform the following adjustments before operation:
1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
5. Remove and clean strainer screens. Close drain valves and replace drain plugs.
6. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
7. Check plumbing specialties and verify proper settings, adjustments, and operation.

3.13 CLEANING

A. Clean and disinfect potable and non-potable domestic water piping as follows:
1. Purge new piping.
2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
b. Fill and isolate system according to either of the following:
1) Fill system or part thereof with water/chlorine solution with at least 50 ppm of chlorine. Isolate with valves and allow to stand for 24 hours.
2) Fill system or part thereof with water/chlorine solution with at least 200 ppm of chlorine. Isolate and allow to stand for three hours.
c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

B. Prepare and submit reports of purging and disinfecting activities.

C. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

3.14 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.

B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.

C. Below ground, domestic water piping shall be the following:
1. Hard copper tube, ASTM B 88, Type K; wrought-copper solder-joint fittings; and brazed joints.

D. Aboveground domestic water piping shall be the following:
1. Hard copper tube, ASTM B 88, Type L; wrought- copper solder-joint fittings; and soldered joints.

3.15 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
1. Shutoff Duty: Use ball valves for piping NPS 2 and smaller. Use gate valves with flanged ends for piping NPS 2-1/2 and larger.
2. Throttling Duty: Use ball valves for piping NPS 2 and smaller. Use ball valves with flanged ends for piping NPS 2-1/2 and larger.
3. Drain Duty: Hose-end drain valves.

B. Use check valves to maintain correct direction of domestic water flow to and from equipment.

END OF SECTION

SECTION 22 11 19

PLUMBING SPECIALTIES

PART 1 - GENERAL

1.1 WORK INCLUDED

A. PLUMBING SPECIALTIES consists of furnishing transportation, labor, materials, and equipment to furnish and install the following plumbing specialties:
   1. Backflow preventers.
   2. Water pressure reducing valves.
   3. Temperature-actuated water mixing valves.
   4. Strainers.
   5. Outlet boxes.
   6. Wall hydrants.
   7. Drain valves.
   8. Air vents.
   9. Trap seal primer valves.
   10. Miscellaneous piping specialties.
   11. Access Panels.
   12. Flashing materials.
   13. Cleanouts.
   14. Drains.
   15. Water Hammer Arrestors.

1.2 RELATED WORK

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1, apply to this Section.

B. METERS AND GAGES FOR PLUMBING SYSTEMS Section 22 05 19

C. COMMON WORK RESULTS FOR PLUMBING Section 22 05 00

1.3 REFERENCES

A. American Water Works Association (AWWA)

B. American Society of Testing and Materials (ASTM)

C. American Society of Sanitation Engineers (ASSE)

D. American Society of Mechanical Engineering (ASME)

1.4 PERFORMANCE REQUIREMENTS

A. Provide components and installation capable of producing piping systems with following minimum working-pressure ratings, unless otherwise indicated:
   1. Domestic Water Piping: 125 psig.
   2. Sanitary Waste and Vent Piping: 10-foot head of water.
   3. Storm Drainage Piping: 10-foot head of water.

1.5 QUALITY ASSURANCE

A. Codes and Standards:
   1. All governing Codes, Ordinances and Agencies, in accordance with the provisions of Division 1 of these specifications.
   2. Comply with NSF 61-G and California Lead Free Law for potable domestic water piping and components.

1.6 SUBMITTALS

A. Product Data:
   1. Backflow preventers.
   2. Balancing valves and strainers.
   3. Water hammer arresters, air vents, and trap seal primer valves and systems.
   4. Hose bibbs.
   5. Cleanouts, floor drains, open receptors and roof drains.
   6. Vent caps, vent terminals, and roof flashing assemblies.
   7. Sleeve penetration systems.

B. Operation and Maintenance Data:
   1. Backflow preventers.
   2. Trap seal primer valves and systems.
   3. Balancing Valves.
   4. Hose bibbs.

PART 2 - PRODUCTS

2.1 BACKFLOW PREVENTERS

A. Manufacturers:
   1. Watts.
   2. Cla-Val Co.
   3. Zurn Industries, Inc.; Wilkins Div.

B. General: ASSE standard, backflow preventers.
   1. NPS 2 and Smaller: Bronze body with threaded ends.
   2. NPS 2-1/2 and Larger: Bronze, cast-iron, steel, or stainless-steel body with flanged ends.

a. Interior Lining: AWWA C550 or FDA-approved, epoxy coating for backflow preventers having cast-iron or steel body.
   3. Interior Components: Corrosion-resistant materials.
   4. Exterior Finish: Polished chrome plate if used in chrome-plated piping system.
   5. Strainer: On inlet.

C. Reduced-Pressure-Principle Backflow Preventers: ASSE 1013, suitable for continuous pressure application. Include ball valves on inlet and outlet, and strainer on inlet; test cocks; and pressure- differential relief valve with ASME A112.1.2 air-gap fitting Model AG-8 located below device. Wilkins Model 975. Pipe full size drain to nearest indirect waste receptor.

2.2 WATER PRESSURE-REDUCING VALVES

A. 3 in. and smaller: Wilkins Model 500XL-YSBR-XL, lead free, bronze, stainless steel seat and strainer.

2.3 TEMPERATURE-ACTUATED WATER MIXING VALVES

A. Lead free bronze body, integral check valves on hot and cold inlets, 0.5 gpm min. flow, 125 PSI max. pressure, ASSE 1017 certified. Leonard 270-LF or equivalent.

2.4 STRAINERS

A. Strainers: Lead free Y-pattern, unless otherwise indicated, and full size of connecting piping. Include ASTM A 666, Type 304, stainless-steel screens with 3/64-inch round perforations, unless otherwise indicated. Wilkins model YBS-XL.
   1. Pressure Rating: 125-psig minimum working pressure, unless otherwise indicated.
   2. NPS 3 and Smaller: Bronze body, with female threaded ends.

2.5 OUTLET BOXES

Not Applicable.

2.6 WALL HYDRANTS

A. Nonfreeze Wall Hydrants (HB-1):
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Woodford Manufacturing company.
      b. Zurn Plumbing Products Group; Specification Drainage Operation.
      c. Chicago Faucets.
   2. Standard: ASME A112.21.3M for concealed-outlet, self-draining wall hydrants.
   3. Pressure Rating: 125 psig.
   4. Operation: Loose key.
   5. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
   6. Inlet: NPS 3/4 or NPS 1.
   7. Outlet: Concealed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
   8. Box: Deep, flush mounting with cover.
   9. Box and Cover Finish: Nickel bronze.
   10. Outlet: Exposed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7
   11. Nozzle and Wall-Plate Finish: Nickel bronze.
   12. Operating Key(s): One with each wall hydrant.

2.7 DRAIN VALVES

A. Ball-Valve-Type, Hose-End Drain Valves:
   1. Standard: MSS SP-110 for standard-port, two-piece ball valves.
   2. Pressure Rating: 400-psig minimum CWP.
   3. Size: NPS 3/4.
   4. Body: Copper alloy.
   5. Ball: Chrome-plated brass.
   6. Seats and Seals: Replaceable.
   7. Handle: Vinyl-covered steel.
   8. Inlet: Threaded or solder joint.
   9. Outlet: Threaded, short nipple with garden-hose thread complying with ASME B1.20.7 and cap with brass chain.

2.8 WATER HAMMER ARRESTORS

A. Water Hammer Arrestors:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. AMTROL, Inc.
      b. Josam Company.
      c. MIFAB, Inc.
      d. PPP Inc.
      e. Sioux Chief Manufacturing Company, Inc.
      f. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
      g. Tyler Pipe; Wade Div.
      h. Watts Drainage Products Inc.
      i. Zurn Plumbing Products Group; Specification Drainage Operation.
   2. Standard: ASSE 1010 or PDI-WH 201.
   3. Type: Metal bellows.
   4. Size: ASSE 1010, Sizes AA and A through F or PDI-WH 201, Sizes A through F.

2.9 AIR VENTS

A. Bolted-Construction Automatic Air Vents:
   1. Body: Bronze.
   2. Pressure Rating: 125-psig minimum pressure rating at 140 deg. F.
   3. Float: Replaceable, corrosion-resistant metal.
   4. Mechanism and Seat: Stainless steel.
   5. Size: NPS 1/2 minimum inlet.
   6. Inlet and Vent Outlet End Connections: Threaded.

B. Welded-Construction Automatic Air Vents:
   1. Body: Stainless steel.
   2. Pressure Rating: 150-psig minimum pressure rating.
   3. Float: Replaceable, corrosion-resistant metal.
   4. Mechanism and Seat: Stainless steel.
   5. Size: NPS 3/8 minimum inlet.
   6. Inlet and Vent Outlet End Connections: Threaded.

2.10 TRAP SEAL PRIMER VALVES (TP-1)

A. Piston Operated Trap Seal Primer Valves: ASSE 1018, pressure drop activated, with distribution unit as required.
   1. Manufacturers:
      a. Precision Plumbing Products Model P-1 or P-2, or equal.
   2. Provide for drains and floor sinks where trap primer is not provided from a water closet and as indicated and specified, each including trap primer valve, standpipe, and distribution unit(s) required for the specified distribution. Provide each concealed assembly with access panel, 8 in. by 8 inch size when distribution units are not required and 12 inches by 12 inches size when one or two distribution units are required. Provide trap primer piping same as specified for domestic water, including pipe wrapping.

2.11 MISCELLANEOUS PLUMBING SPECIALTIES

A. Access Panels:
   1. Access Panels in Plaster Walls and Ceilings: Karp #DSC214PL, Elmdor PW, 24x24 in. with metal access door and frame, prime coated steel and painted to match adjacent surfaces. For fire rated areas use Karp #KRP-150 FR 1-1/2 hour "B" Label access panels, U.L. listed.
   2. Access Panels in Acoustic Tile Ceilings: Karp #DSC-210, Elmdor AT, 24x24 in. with metal access door and frame, 24x24 in. minimum size, prime coated steel, recessed to accept standard tile in full opening door.
   3. Access Panels in Ceramic Tile Walls: Karp #DSC214M, Smith 4730, chrome-plated cover and frame of suitable size for purpose intended, but not less than 8x8 in. size. For fire rated areas use Karp #FRP-150 FR 1-1/2 hour "B" Label access panels, U.L. listed.

B. Roof Flashing Assemblies: Manufactured assembly made of 4 pounds per square foot, 0.0625-inch- thick, one piece lead flashing collar and skirt extending at least 6 inches from pipe with galvanized steel boot reinforcement, and counterflashing fitting.
   1. Manufacturers:
      a. Semco Model 1100.
   2. Low-Silhouette Vent Cap: With vandal-proof vent cap.

2.12 SLEEVE PENETRATION SYSTEMS

A. Fire-rated wall and floor penetrations installed in conformance with manufacturers directions. Pro Set, Hilti, Nelson.

B. Description: UL 1479, through-penetration firestop assembly through fire rated walls and floors.

C. Provide at concrete or masonry exterior bearing walls, Adjust-to-Crete, Paramount, or Sperzel Cretesleeve. Wall sleeves shall be flush with finished surface. Sleeves shall be sized to allow 1/2

in. clearance around pipe or insulation. Insulation and covering shall be continuous through sleeves.

D. At exterior walls below grade provide a modular mechanical seal consisting of inter-locking EPDM rubber links shaped to continuously fill the annular space between the pipe and the wall opening with a molded high density polyethylene sleeve water-stop ring, end caps and reinforcing ribs. ASTM B117, ISO 9002. Mechanical seals shall be "Thunderline" Link Seal.

2.13 CLEANOUTS

A. For cast-iron soil pipe, iron body with extra heavy bronze plugs screwed into caulking ferrules; for steel pipe, extra heavy bronze plugs; and for vitrified clay pipe, vitrified clay plugs. Where cleanouts occur in finished interior walls, provide access panels, plates, and frames for flush mounting. Exposed parts of floor cleanouts shall have adjustable top. All cleanouts and cleanout plugs shall be accessible. Cleanout shall be the following:

1. In finished floors: Cast-iron with polished nickel bronze round top, non-skid diamond tread set flush with the floor. Provide with carpet marker when located in future carpeted areas and flashing flange when used with waterproofing membrane.
   a. Smith - 4023
   b. Wade - W-6000
   c. Zurn - ZN-1420-2
2. In mechanical equipment areas: Cast-iron with heavy cast-iron round top, non-skid diamond tread set flush with the floor. Provide flashing flange when used with waterproofing membrane.
   a. Smith - 4223
   b. Wade - W-6000
   c. Zurn - Z-1400
3. In walls: Cleanout tee with squared polished nickel bronze access plate with vandalproof screws and frames. Opening 8 inches by 8 inches minimum.
   a. Smith - 4558-U
   b. Wade - W-8460-S
   c. Zurn - ZN-1447
4. In exterior grades: Cast-iron body, vandalproof cover, non-skid diamond tread, set flush with grade or finished surface. In non-surfaced area, they shall be cast in a concrete block 14 inches by 14 by 6 inches deep.
   a. Smith – 4248
   b. Wade - 6010-Z-75

2.14 FLOOR DRAINS AND FLOOR SINKS

A. Floor Drain (FD-1): Foot traffic.

1. Cast-iron double drainage drain with clamping flange, bottom outlet and 5 inch round polished stainless steel adjustable strainer and trap primer tapping.
   a. Smith - 2005-B
   b. Zurn – Z-415

B. Floor Sink (FS-1)

1. 8-1/2 inch square, 6 inch deep acid-resisting enameled cast-iron drain with stainless steel rim and grate, sediment bucket and anchor flange with membrane clamp. Provide partial grate for discharge pipes.
   a. Smith - 3100Y
   b. Zurn – ZN-1910-K

2.15 ROOF DRAINS

A. Roof Drain (RD-1):

1. Cast-iron drain, adjustable extension sleeve, flashing collar, gravel stop cast-iron dome strainer, sump receiver and underdeck clamp.
   a. Smith – 1010-ERC
   b. Zurn – Z-100-ERC

B. Overflow Drain (OD-1):
   1. Cast-iron drain, extension sleeve, flashing collar, 2 inch high water dam, cast-iron dome strainer, sumo receiver and underdeck clamp.
      a. Smith – 1070-Y
      b. Zurn – Z-100-W2

2.16 DECK DRAINS (AD-1):
   1. Cast-iron drain, extension sleeve, seepage pan and flashing collar, heel proof grate and underdeck clamp.
      a. Zurn – Z610-Z

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to COMMON WORK RESULTS FOR PLUMBING Section 22 05 00 for piping joining materials, joint construction, and basic installation requirements.

B. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.
   1. Locate backflow preventers as indicated on plans.
   2. Install drain for backflow preventers with fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to receptor. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
   3. Do not install bypass piping around backflow preventers.

C. Install pressure regulators with inlet and outlet shutoff valves. Install pressure gages on inlet and outlet.

D. Install strainers on supply side of each pressure regulator.

E. Install outlet boxes recessed in wall. Install 2 x 4 inch fire-retardant-treated-wood blocking wall reinforcement between studs. Fire-retardant-treated-wood blocking is specified in Division 6 Section “Rough Carpentry”.

F. Install water hammer arrestors in water piping according to PDI-WH201.

G. Install air vents at high points of water piping.

H. Install trap seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.

I. Install cleanout deck plates with top flush with finished floor for floor cleanouts on piping below floors.

J. Install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall, for cleanouts located in concealed piping.

K. Install flashing flange and clamping device with each stack and cleanout passing through floors with waterproof membrane.

L. Install vent flashing sleeves on stacks passing through roof. Secure over stack flashing according to manufacturer's written instructions.

M. Install drains at low points of surface areas to be drained as indicated on the architectural drawings.
   Set grates of drains flush with finished floor, unless otherwise indicated.

N. Install roof drains at low points of roof areas as indicated on the architectural Drawings.

O. Fasten wall-hanging plumbing specialties securely to supports attached to building substrate if supports are specified and to building wall construction if no support is indicated.

P. Fasten recessed-type plumbing specialties to reinforcement built into walls.

Q. Install blocking reinforcement for wall-mounting and recessed-type plumbing specialties.

R. Install individual shutoff valve in each water supply to plumbing specialties. Use ball, gate, or globe valve if specific valve is not indicated. Install shutoff valves in accessible locations. See GENERAL- DUTY VALVES Section 22 05 23 for general-duty ball, butterfly, check, gate, and globe valves.

S. Install escutcheons at wall, floor, and ceiling penetrations in exposed finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding pipe fittings.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Connect plumbing specialties to piping specified in other Division 22 Sections.

D. Connect plumbing specialties and devices that require power conforming to Division 22 Sections.

3.3 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Department maintenance personnel to adjust, operate, and maintain plumbing specialties.

3.5 FIELD QUALITY CONTROL

A. Remove and replace malfunctioning domestic water piping specialties and retest.

3.6 ADJUSTING

A. Set field-adjustable pressure set points of water pressure reducing valves.

B. Set field-adjustable temperature set points of temperature actuated water mixing valves.

END OF SECTION

SECTION 22 13 16

SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. SANITARY WASTE AND VENT PIPING consists of furnishing transportation, labor, materials, and equipment to furnish and install the following for soil, waste, and vent piping inside the building:
   1. Pipe and fittings.
   2. Special pipe fittings.
   3. Encasement for underground metal piping.

1.2 RELATED WORK

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1, apply to this Section.

B.	EARTHWORK	Division 31
C.	TRENCHING AND BACKFILLING	Division 31
D.	COMMON WORK RESULTS FOR PLUMBING	Section 22 05 00

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM International)

B. American Water Works Association (AWWA)

C. Cast Iron Soil Pipe Institute (CISPI)

D. Sheet Metal and Air Condition Contractor's National Association (SMACNA)

1.4 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure, unless otherwise indicated:
   1. Soil, Waste, and Vent Piping: 10-foot head of water.

B. Seismic Performance: Soil, waste, and vent piping and support and installation shall be in conformance with the SMACNA Guidelines.

1.5 SUBMITTALS

A. Product Data: For pipe, tube, fittings, and couplings.

1.6 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Codes and Standards:
   1. All governing Codes, Ordinances and Agencies in accordance with the provisions of Division 1 of these specifications.

PART 2 - PRODUCTS

2.1 HUBLESS CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings:
   1. Soil, waste, vent and storm drain piping to 5 feet outside building: Cast-iron soil pipe and fittings conforming to the requirements of CISPI Standard 301, ASTM A888 or ASTM A74 for all pipe and fittings. Pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute or receive prior approval of the Engineer. Wrap all underground piping per paragraph 3.3 G, 1 herein.

a. Manufacturers:
1) Tyler Pipe
2) A.B. & I.
3) Charlotte Pipe and Foundry

B. Shielded Couplings: ASTM C1277 assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop.
1. Above Ground: Type 300 Series stainless steel, "No-Hub" standard duty, shielded couplings as approved by the Cast Iron Soil Pipe Institute, CISPI-310-85 with stainless steel corrugated shield, stainless steel bands and tightening devices and ASTM C564 rubber sleeve. Equivalent to Tyler.
2. Below Ground, 4 inches and Larger: Type 304 stainless steel, "No-Hub" by the Cast Iron Soil Pipe Institute, CISPI-310-85 with stainless steel shield, stainless steel band and tightening devices and ASTM C564 rubber sleeve. Equivalent to Husky HD-2000.
a. Manufacturers:
1) Clamp-All Corporation
2) Husky Technologies.
3) Tyler Pipe; Soil Pipe Division

PART 3 - EXECUTION

3.1 EXCAVATION

A. Refer to EARTHWORK and TRENCHING AND BACKFILLING Sections for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. Soil and waste piping shall be hubless cast-iron soil pipe and fittings; standard-duty shielded, stainless- steel couplings; and hubless-coupling joints.

B. Vent piping shall be hubless cast-iron soil pipe and fittings; standard, shielded, stainless-steel couplings; and hubless-coupling joints.

3.3 PIPING INSTALLATION

A. Sanitary sewer piping outside the building is specified in SANITARY SEWERAGE Section, or civil drawings.

B. Basic piping installation requirements are specified in COMMON WORK RESULTS FOR PLUMBING Section 22 05 00.

C. Install seismic restraints on piping. Seismic-restraint devices are specified in NOISE, VIBRATION AND SEISMIC CONTROLS OF PLUMBING PIPING AND EQUIPMENT Section 22 05 48.

D. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers.

E. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in PLUMBING SPECIALTIES Section.

F. Install wall-penetration fitting at each service pipe penetration through foundation wall. M

ake installation watertight.

G. Install cast-iron soil piping in conformance with CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
1. Where soil is corrosive install 8 mil. polyethylene encasement on underground piping in conformance with ASTM A674 or AWWA C105/ANSI AZ1.5.

H. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used

on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if 2 fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

I. Install soil and waste drainage piping at 2 percent minimum slope, unless otherwise indicated on Drawings:

J. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

3.4 JOINT CONSTRUCTION

A. Basic piping joint construction requirements are specified in COMMON WORK RESULTS FOR PLUMBING Section 22 05 00.

B. Join hubless cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.

3.5 HANGER AND SUPPORT INSTALLATION

A. Seismic-restraint devices are specified in NOISE, VIBRATION AND SEISMIC CONTROLS Section 22 05 48.

B. Pipe hangers and supports are specified in HANGERS AND SUPPORTS FOR PLUMBING PIPING & EQUIPMENT Section 22 05 29. Install the following:
   1. Vertical Piping: MSS Type 8 or Type 42, clamps.
   2. Install individual, straight, horizontal piping runs in conformance with to the following:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet, if Indicated: MSS Type 49, spring cushion rolls.
   3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Install supports according to Hangers and Supports Section.

D. Support vertical piping and tubing at base and at each floor.

E. Horizontal cast-iron no-hub piping: Provide hangers or supports at each side of a no-hub fitting.

F. Install hangers for cast-iron soil piping with maximum horizontal spacing and minimum rod diameters in accordance with the requirements of the California Plumbing Code.

3.6 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect drainage and vent piping to the following:
   1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by the CPC.
   2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by the CPC.
   3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by the CPC.

3.7 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.

2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test sanitary drainage and vent piping according to procedures of the authorities having jurisdiction or, in absence of published procedures, in accordance with the requirements of the California Plumbing Code.

3.8 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

END OF SECTION

SECTION 22 14 13

STORM DRAINAGE PIPING

PART 1 - GENERAL

1.1 WORK INCLUDED

A. STORM DRAINAGE PIPING consists of furnishing transportation, labor, materials, and equipment to furnish and install the following storm drainage piping inside the building:
   1. Pipe, tube, and fittings.
   2. Special pipe fittings.

1.2 RELATED WORK

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 apply to this Section.

B.	EARTHWORK	Division 31
C.	TRENCHING AND BACKFILLING	Division 31
D.	COMMON WORK RESULTS FOR PLUMBING	Section 22 05 00

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM International)

B. Cast iron Soil Pipe (CISPI)

C. Sheet Metal and Air Conditioning Contractors National Association (SMACNA)

D. American Water Works Association (AWWA)

1.4 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working-pressure, unless otherwise indicated:
   1. Storm Drainage Piping: 10-foot head of water.

B. Seismic Performance: Piping and support and installation shall be in conformance with the SMACNA Guidelines.

1.5 SUBMITTALS

A. Product Data: For pipe, tube, fittings, and couplings.

1.6 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Codes and Standards:
   1. All governing Codes, Ordinances and Agencies, in accordance with the provisions of Division 1 of these specifications.

PART 2 - PRODUCTS

2.1 HUBLESS CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings:
   1. Soil, waste, vent and storm drain piping to 5 feet outside building: Cast-iron soil pipe and fittings conforming to the requirements of CISPI Standard 301, ASTM A888 or ASTM A74 for all pipe and fittings. Pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute or receive prior approval of the engineer. Wrap all underground piping as specified in this Section.
      a. Manufacturers:
         1) Tyler Pipe

2) A.B. & I.
3) Charlotte Pipe and Foundry.

B. Shielded Couplings: ASTM C1277 assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop.
1. Above Ground: Type 300 Series stainless steel, "No-Hub" standard duty, shielded couplings as approved by the Cast Iron Soil Pipe Institute, CISPI-310-85 with stainless steel corrugated shield, stainless steel bands and tightening devices and ASTM C564 rubber sleeve. Equivalent to Tyler.
2. Below Ground, 4 inch and Larger: Type 304 stainless steel, "No-Hub" by the Cast Iron Soil Pipe Institute, CISPI-310-85 with stainless steel shield, stainless steel band and tightening devices and ASTM C564 rubber sleeve. Equivalent to Husky HD-2000.
a. Manufacturers:
1) Clamp-All Corporation
2) Husky Technologies
3) Tyler Pipe; Soil Pipe Division

2.2 COPPER TUBE AND FITTINGS

A. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.
1. Copper Drainage Fittings: ASME B16.23, cast-copper or ASME B16.29, wrought-copper, solder- joint fittings.

2.3 ENCASEMENT FOR UNDERGROUND METAL PIPING

A. Description: ASTM A 674 or AWWA C105, high-density, cross laminated PE film of 0.004-inch minimum thickness.

B. Form: Sheet or tube.

C. Color: Black or natural.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Refer to EARTHWORK and TRENCHING AND BACKFILLING Sections for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. Storm drainage piping inside building shall be hubless cast-iron soil pipe and fittings; standard-duty shielded, stainless-steel couplings; and hubless-coupling joints or copper DWV tube copper drainage fittings and soldered joints.

3.3 PIPING INSTALLATION

A. Storm drainage piping outside the building downstream of point of connection (POC) are specified in STORM DRAINAGE Section or civil drawings.

B. Basic piping installation requirements are specified in COMMON WORK RESULTS FOR PLUMBING Section 22 05 00.

C. Install seismic restraints on piping. Seismic-restraint devices are specified in NOISE, VIBRATION AND SEISMIC CONTROLS OF PLUMBING PIPING AND EQUIPMENT Section 22 05 48.

D. Install cleanouts at grade and extend to where building storm drains connect to building storm sewers.
Cleanouts are specified in PLUMBING SPECIALTIES Section.

E. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in PLUMBING SPECIALTIES Section.

F. Install wall-penetration fitting system at each service pipe penetration through foundation wall.

Make installation watertight.

G. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
   1. Where soil is corrosive install 8 mil. polyethylene encasement on underground piping in conformance with ASTM A674 or AWWA C105/ANSI A21.5.

H. Make changes in direction for storm piping using appropriate branches, bends, and long-sweep bends.
   Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

I. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

J. Install piping at indicated slopes.

K. Install piping to allow application of insulation.

L. Install piping free of sags and bends.

M. Install above ground copper tubing according to CDA's "Copper Tube Handbook".

3.4 JOINT CONSTRUCTION

A. Basic piping joint construction requirements are specified in COMMON WORK RESULTS FOR PLUMBING Section 22 05 00.

B. Hubless Cast-Iron Soil Piping Coupled Joints: Join according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.

C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux, ASTM B 32, lead-free alloy solder; and ASTM B828 procedure, unless otherwise indicated.

3.5 HANGER AND SUPPORT INSTALLATION

A. Seismic-restraint devices are specified in SOUND, VIBRATION AND SEISMIC CONTROLS Section 13 48 00.

B. Pipe hangers and supports are specified in HANGERS AND SUPPORTS Section. Install the following:
   1. Vertical Piping: MSS Type 8 or Type 42, clamps.
   2. Individual, Straight, Horizontal Piping Runs: According to the following:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet, if indicated: MSS Type 49, spring cushion rolls.
   3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Install supports in conformance with HANGERS AND SUPPORTS Section.

D. Support vertical piping and tubing at base and at each floor.

E. Horizontal cast-iron no-hub piping: Provide hangers or supports at each side of a no-hub fitting.

F. Install hangers for cast-iron soil piping with maximum horizontal spacing and minimum rod diameter in accordance with the requirements of the California Plumbing Code.

G. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.6 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect interior storm drainage piping to exterior storm drainage piping. Use transition fitting to join dissimilar piping materials.

C. Connect storm drainage piping to roof drains and storm drainage specialties.

3.7 IDENTIFICATION

A. Identify exposed storm drainage piping, comply with requirements for identification specified in Division 22 Section “Identification for Plumbing Piping and Equipment”.

3.8 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test storm drainage piping according to the procedures of authorities having jurisdiction or, in absence of published procedures, in accordance with the requirements of the California Plumbing Code.

3.9 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. SUMMARY

C. Section Includes:

1. Commercial, electric, domestic-water booster heaters.
2. Commercial, electric, storage, domestic-water heaters.
3. Commercial, medium-duty, storage, electric, domestic-water heaters.
4. Commercial, light-duty, storage, electric, domestic-water heaters.
5. Residential, small-capacity, electric, domestic-water heaters.
6. Residential, collector-to-tank, solar, electric, domestic-water heaters.
7. Residential, collector-to-tank-coil, solar, electric, domestic-water heaters.
8. Residential, electric, storage, domestic-water heaters.
9. Residential, tabletop, electric, domestic-water heaters.
10. Flow-control, electric, tankless, domestic-water heaters.
11. Thermostat-control, electric, tankless, domestic-water heaters.
12. Domestic-water heater accessories.

1.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Commercial domestic-water heaters shall withstand the effects of earthquake motions determined according to SMACNA Guidelines.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

1.3 ACTION SUBMITTALS

A. Product Data: For each type and size of domestic-water heater indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings:

1. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For commercial domestic-water heaters, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Product Certificates: For each type of [commercial] [residential] [and] [tankless], electric, domestic-water heater, from manufacturer.
C. Domestic-Water Heater Labeling: Certified and labeled by testing agency acceptable to authorities having jurisdiction.
D. Source quality-control reports.
E. Field quality-control reports.
F. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For electric, domestic-water heaters to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1.
C. ASME Compliance: Where ASME-code construction is indicated, fabricate and label commercial, domestic-water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
D. NSF Compliance: Fabricate and label equipment components that will be in contact with potable water to comply with NSF 61, "Drinking Water System Components - Health Effects."

1.7 COORDINATION
A. Coordinate sizes and locations of concrete bases with actual equipment provided

1.8 WARRANTY
A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of electric, domestic-water heaters that fail in materials or workmanship within specified warranty period.
    1. Failures include, but are not limited to, the following:
        a. Structural failures including storage tank and supports.
        b. Faulty operation of controls.
        c. Deterioration of metals, metal finishes, and other materials beyond normal use.
    2. Warranty Periods: From date of Substantial Completion.
        a. Commercial, Electric, Domestic-Water Booster Heaters:
            1) Controls and Other Components: Five years.
        b. Commercial, Electric, Storage, Domestic-Water Heaters:
            1) Storage Tank: Five years.
            2) Controls and Other Components: one year.
        c. Commercial, Light-Duty, Storage, Electric, Domestic-Water Heaters:
            1) Storage Tank: Five years.
            2) Controls and Other Components: One year.
        d. Residential, Electric, Storage, Domestic-Water Heaters:
            1) Storage Tank: Six years.
            2) Controls and Other Components: Six years.

PART 2 - PRODUCTS

2.1 COMMERCIAL, ELECTRIC, DOMESTIC-WATER HEATERS

A. Commercial, Electric, Storage, Domestic-Water Heaters:
1. Basis-of-Design Product: Subject to compliance with requirements, provide products by Bradford White Corporation or comparable product by one of the following:
a. Rheem Manufacturing Company.
Smith, A. O. Water Products Co.; a division of A. O. Smith Corporation.
2. Standard: UL 1453.
3. Storage-Tank Construction: Non-ASME-code, steel vertical arrangement.
a. Tappings: Factory fabricated of materials compatible with tank and piping connections. Attach tappings to tank before testing.
1) NPS 2 (DN 50) and Smaller: Threaded ends according to ASME B1.20.1.
2) NPS 2-1/2 (DN 65) and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges, and according to ASME B16.24 for copper and copper-alloy flanges.
b. Pressure Rating: 150 psig (1035 kPa).
c. Interior Finish: Vitraglas lining to comply with NSF 61 barrier materials for potable-water tank linings.
4. Factory-Installed Storage-Tank Appurtenances:
a. Anode Rod: Replaceable magnesium.
b. Drain Valve: Low restriction brass ball-type complying with ASSE 1005.
c. Insulation: Comply with ASHRAE/IESNA 90.1.
d. Jacket: Steel with painted finish.
e. Heating Elements: Electric, screw-in type.
f. Temperature Control: Adjustable [surface mount] [immersion type] thermostat.
g. Safety Controls: High-temperature-limit [and] [or] [low-water cutoff] devices or systems.
h. Relief Valves: ASME rated and stamped for combination temperature-and-pressure relief valves. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting of 150 psig (1035 kPa). Select one relief valve with sensing element that extends into storage tank.
5. Special Requirements: NSF 5 construction.

B. Commercial, Light-Duty, Storage, Electric, Domestic-Water Heaters:
1. Basis-of-Design Product: Subject to compliance with requirements, provide products by Bradford White Corporation or comparable product by one of the following:
a. Rheem Manufacturing Company.
Smith, A. O. Water Products Co.; a division of A. O. Smith Corporation.
2. Standard: UL 174.
3. Storage-Tank Construction: Steel, vertical arrangement.
a. Tappings: ASME B1.20.1 pipe thread.
b. Pressure Rating: 150 psig (1035 kPa).
c. Interior Finish: Vitraglas lining to comply with NSF 61 barrier materials for potable-water tank linings.
4. Factory-Installed Storage-Tank Appurtenances:
a. Anode Rod: Replaceable magnesium.

b. Dip Tube: HydroJet diptube required unless cold-water inlet is near bottom of tank.
c. Drain Valve: Low restriction brass ball-type complying with ASSE 1005.
d. Insulation: Comply with ASHRAE/IESNA 90.1.
e. Jacket: Steel with painted finish.
f. Heat-Trap Fittings: Inlet type in cold-water inlet and outlet type in hot-water outlet.
g. Heating Elements: One; electric, screw-in immersion type; wired for non-simutaneous operation unless otherwise indicated. Limited to 6 kW total per element.
h. Temperature Control: Adjustable surface mount thermostat with160 deg F (71 deg C).
i. Safety Control: High-temperature-limit cutoff device or system.
j. Relief Valve: ASME rated and stamped for combination temperature-and-pressure relief valves. Include relieving capacity at least as great as heat input, and include pressure setting at 150 psig (1035 kPa). Select relief valve with sensing element that extends into storage tank.

5. Special Requirements: NSF 5 construction with legs for off-floor installation.

C. Capacity and Characteristics:
1. Capacity: <80 gal.
2. Recovery: <29 gph > at 90 deg F temperature rise.
3. Temperature Setting: 120 deg F
4. Power Demand: <Insert kilowatts>.
5. Compressor BTU/H: 4200
6. Electrical Characteristics:
a. Volts: 208
b. Phases: [Single]
c. Hertz: 60.
d. Full-Load Amperes: <Insert value>.
e. Minimum Circuit Ampacity: <Insert value>.
f. Maximum Overcurrent Protection: <Insert amperage>.

2.2 DOMESTIC-WATER HEATER ACCESSORIES
A. Domestic-Water Compression Tanks:
1. Manufacturers: Subject to compliance with requirements, AMTROL Inc. [available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
2. Basis-of-Design Product: Subject to compliance with requirements, provide [product indicated on Drawings] <Insert manufacturer's name; product name or designation> or comparable product by one of the following:
a. AMTROL Inc.
b. Flexcon Industries.
c. Honeywell International Inc.
d. Pentair Pump Group (The); Myers.
e. Smith, A. O. Water Products Co.; a division of A. O. Smith Corporation.
f. State Industries.
g. Taco, Inc.

3. Description: Steel pressure-rated tank constructed with welded joints and factory-installed butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.
4. Construction:
    a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1 pipe thread.
    b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
    c. Air-Charging Valve: Factory installed.
5. Capacity and Characteristics:
    a. Working-Pressure Rating: [150]
    b. Capacity Acceptable: 8 gal.
    c. Air Precharge Pressure: <55 PSIG>.

B. Drain Pans: Corrosion-resistant metal with raised edge. Comply with ANSI/CSA LC 3. Include dimensions not less than 4 inches (102 mm) greater than the base of domestic-water heater, and include drain outlet not less than NPS 3/4 (DN 20) with ASME B1.20.1 pipe threads or with ASME B1.20.7 garden-hose threads.

C. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1.

D. Heat-Trap Fittings: ASHRAE 90.2.

E. Combination Temperature-and-Pressure Relief Valves: ASME rated and stamped. Include relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select relief valves with sensing element that extends into storage tank.

F. Pressure Relief Valves: ASME rated and stamped. Include pressure setting less than domestic-water heater working-pressure rating.

G. Vacuum Relief Valves: ANSI Z21.22/CSA 4.4.

H. Shock Absorbers: ASSE 1010 or PDI-WH 201, Size A water hammer arrester.

I. Domestic-Water Heater Stands: Manufacturer's factory-fabricated steel stand for floor mounting, capable of supporting domestic-water heater and water. Include dimension that will support bottom of domestic-water heater a minimum of 18 inches (457 mm) above the floor.

J. Domestic-Water Heater Mounting Brackets: Manufacturer's factory-fabricated steel bracket for wall mounting, capable of supporting domestic-water heater and water.

2.3 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect domestic-water heaters specified to be ASME-code construction, according to ASME Boiler and Pressure Vessel Code.

B. Electric, domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 014000 "Quality Requirements" for retesting and re-inspecting requirements and Section 017300 "Execution" for requirements for correcting the Work.

C. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 DOMESTIC-WATER HEATER INSTALLATION

A. Commercial, Electric, Domestic-Water Heater Mounting: Install commercial, electric, domestic-water heaters on concrete base. Comply with requirements for concrete bases specified in [Section 033000 "Cast-in-Place Concrete."] [Section 033053 "Miscellaneous Cast-in-Place Concrete."]
   1. Exception: Omit concrete bases for commercial, electric, domestic-water heaters if installation on stand, bracket, suspended platform, or directly on floor is indicated.
   2. Maintain manufacturer's recommended clearances.
   3. Arrange units so controls and devices that require servicing are accessible.
   4. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
   5. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   6. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   7. Install anchor bolts to elevations required for proper attachment to supported equipment.
   8. Anchor domestic-water heaters to substrate.

B. Install electric, domestic-water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.
   1. Install shutoff valves on domestic-water-supply piping to domestic-water heaters and on domestic-hot-water outlet piping. Comply with requirements for shutoff valves specified in Section 220523 "General-Duty Valves for Plumbing Piping."

C. Install commercial, electric, domestic-water heaters with seismic-restraint devices. Comply with requirements for seismic-restraint devices specified in Section 220548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

D. Install combination temperature-and-pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic-water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

E. Install combination temperature-and-pressure relief valves in water piping for electric, domestic-water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic-water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

F. Install water-heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for electric, domestic-water heaters that do not have tank drains. Comply with requirements for hose-end drain valves specified in Section 221119 "Domestic Water Piping Specialties."

G. Install thermometers on outlet piping of electric, domestic-water heaters. Comply with requirements for thermometers specified in Section 220519 "Meters and Gages for Plumbing Piping."

H. Install thermometers on inlet and outlet piping of residential, solar, electric, domestic-water heaters. Comply with requirements for thermometers specified in Section 220519 "Meters and Gages for Plumbing Piping."

I. Assemble and install inlet and outlet piping manifold kits for multiple electric, domestic-water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each electric,

domestic-water heater. Include shutoff valve and thermometer in each domestic-water heater inlet and outlet, and throttling valve in each electric, domestic-water heater outlet. Comply with requirements for valves specified in Section 220523 "General-Duty Valves for Plumbing Piping," and comply with requirements for thermometers specified in Section 220519 "Meters and Gages for Plumbing Piping."

J. Install pressure-reducing valve with integral bypass relief valve in electric, domestic-water booster-heater inlet piping and water hammer arrester in booster-heater outlet piping. Set pressure-reducing valve for outlet pressure of 25 psig (172 kPa). Comply with requirements for pressure-reducing valves and water hammer arresters specified in Section 221119 "Domestic Water Piping Specialties."

K. Install piping-type heat traps on inlet and outlet piping of electric, domestic-water heater storage tanks without integral or fitting-type heat traps.

L. Fill electric, domestic-water heaters with water.

M. Charge domestic-water compression tanks with air.

3.2 CONNECTIONS

A. Comply with requirements for piping specified in Section 221116 "Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to electric, domestic-water heaters, allow space for service and maintenance of water heaters. Arrange piping for easy removal of domestic-water heaters.

3.3 IDENTIFICATION

A. Identify system components. Comply with requirements for identification specified in Section 220553 "Identification for Plumbing Piping and Equipment."

3.4 FIELD QUALITY CONTROL

A. Perform tests and inspections.

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation. Be sure unites are full of water to eliminate dry-firing elements.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Electric, domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 014000 "Quality Requirements" for retesting and re-inspecting requirements and Section 017300 "Execution" for requirements for correcting the Work.

C. Prepare test and inspection reports.

3.5 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain commercial, electric, domestic-water heaters.

END OF SECTION

SECTION 22 40 00

PLUMBING FIXTURES

PART 1 - GENERAL

1.1 WORK INCLUDED

A. PLUMBING FIXTURES consists of furnishing transportation, labor, materials, and equipment to furnish and install the following plumbing fixtures and related components:
   1. Faucets
   2. Flushometers
   3. Toilet seats
   4. Protective shielding guards
   5. Fixture supports
   6. Shower receptors
   7. Water closets
   8. Urinals
   9. Lavatories
   10. Individual showers
   11. Service sinks

1.2 RELATED WORK

A.	DRINKING FOUNTAINS AND WATER COOLERS	Section 22 47 00
B.	PLUMBING SPECIALTIES	Section 22 11 19
C.	COMMON WORK RESULTS FOR PLUMBING	Section 22 05 00

1.3 DEFINITIONS

A. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Fitting: Device that controls the flow of water into or out of the plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

C. Solid Surface: Nonporous, homogeneous, cast-polymer-plastic material with heat-, impact-, scratch-, and stain-resistance qualities.

1.4 SUBMITTALS

A. Manufacturer's Literature: Submit brochures on all materials and equipment to the Architect.

B. Other Submittals:
   1. Operations and Maintenance Manuals.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.
   1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.

B. Codes and Standards:
   1. All governing codes, ordinances and agencies, in accordance with the provisions of Division 1 of these specifications.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities," Public Law 90-480, "Architectural Barriers Act;" and Public Law 101-336, "Americans with Disabilities Act;" for plumbing fixtures for people with disabilities.

E. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

F. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

G. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

H. Comply with the following applicable standards and other requirements specified for plumbing fixtures:
   1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
   2. Porcelain-Enameled, Formed-Steel Fixtures: ASME A112.19.4M.
   3. Slip-Resistant Bathing Surfaces: ASTM F 462.
   4. Stainless-Steel Commercial, Handwash Sinks: NSF 2 construction.
   5. Vitreous-China Fixtures: ASME A112.19.2M.
   6. Water-Closet, Flush Valve, Tank Trim: ASME A112.19.5.
   7. Water-Closet, Flushometer Tank Trim: ASSE 1037.

I. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:
   1. Faucets: ASME A112.18.1.
   2. Hose-Connection Vacuum Breakers: ASSE 1011.
   3. Hose-Coupling Threads: ASME B1.20.7.
   4. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
   5. NSF Potable-Water Materials: NSF 61.
   6. Pipe Threads: ASME B1.20.1.
   7. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
   8. Supply Fittings: ASME A112.18.1.
   9. Brass Waste Fittings: ASME A112.18.2.

J. Comply with the following applicable standards and other requirements specified for shower faucets:
   1. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M.
   2. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016.
   3. Deck-Mounted Bath/Shower Transfer Valves: ASME 18.7.
   4. Faucets: ASME A112.18.1.
   5. Hand-Held Showers: ASSE 1014.
   6. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
   7. Hose-Coupling Threads: ASME B1.20.7.
   8. Manual-Control Antiscald Faucets: ASTM F 444.
   9. Pipe Threads: ASME B1.20.1.
   10. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
   11. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
   12. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.

K. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:
   1. Atmospheric Vacuum Breakers: ASSE 1001.
   2. Brass and Copper Supplies: ASME A112.18.1.
   3. Dishwasher Air-Gap Fittings: ASSE 1021.
   4. Manual-Operation Flushometers: ASSE 1037.
   5. Plastic Tubular Fittings: ASTM F 409.
   6. Brass Waste Fittings: ASME A112.18.2.
   7. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.

L. Comply with the following applicable standards and other requirements specified for

miscellaneous components:

1. Disposers: ASSE 1008 and UL 430.
2. Dishwasher Air-Gap Fittings: ASSE 1021.
3. Flexible Water Connectors: ASME A112.18.6.
4. Floor Drains: ASME A112.6.3.
5. Grab Bars: ASTM F 446.
6. Hose-Coupling Threads: ASME B1.20.7.
7. Hot-Water Dispensers: ASSE 1023 and UL 499.
8. Off-Floor Fixture Supports: ASME A112.6.1M.
9. Pipe Threads: ASME B1.20.1.
10. Plastic Shower Receptors: ANSI Z124.2.
11. Plastic Toilet Seats: ANSI Z124.5.
12. Supply and Drain Protective Shielding Guards: ICC A117.1.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Flush Valves: As specified.

B. Plumbing Fixtures: As specified.

C. Toilet Seats: As Specified.

D. Faucets: As specified.

2.2 PLUMBING FIXTURES AND TRIMS

A. See fixture schedules on contract drawings

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before plumbing fixture installation.

B. Examine cabinets, counters, floors, and walls for suitable conditions where fixtures will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Assemble plumbing fixtures, trim, fittings, and other components according to manufacturers' written instructions.

B. Install off-floor supports, affixed to building substrate, for wall-mounting fixtures.
   1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
   2. Use carrier supports without waste fitting for fixtures with tubular waste piping.

C. Install back-outlet, wall-mounting fixtures onto waste fitting seals and attach to supports.

D. Install wall-mounting fixtures with tubular waste piping attached to supports.

E. Install counter-mounting fixtures in and attached to casework.

F. Install fixtures level and plumb according to roughing-in drawings.

G. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.

H. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

I. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

J. Install flushometer valves for accessible water closets and urinals with handle mounted on wide side of compartment. Install other actuators in locations that are easy for people with disabilities to reach.

K. Install toilet seats on water closets.

L. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

M. Install water-supply flow-control fittings with specified flow rates in fixture supplies at stop valves.

N. Install faucet flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

O. Install shower flow-control fittings with specified maximum flow rates in shower arms.

P. Install traps on fixture outlets.
   1. Exception: Omit trap on fixtures with integral traps.

Q. Install disposer in outlet of each sink indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

R. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings.

S. Set shower receptors and service basins in leveling bed of cement grout.

T. Seal joints between fixtures and walls, floors, and countertops using sanitary-type, one-part, mildew- resistant silicone sealant. Match sealant color to fixture color.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping.
Use size fittings required to match fixtures.

C. Ground equipment according to Division 26 Section “Grounding and Bonding for Electrical Systems.”

D. Connect wiring according to Division 26 Section “Low-Voltage Electrical Power Conductors and Cables.

3.4 FIELD QUALITY CONTROL

A. Verify that installed plumbing fixtures are categories and types specified for locations where installed.

B. Check that plumbing fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed plumbing fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Repl
ace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

E. Install fresh batteries in sensor-operated mechanisms.

3.5 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Adjust water pressure at faucets and flushometer valves to produce proper flow and stream.

C. Replace washers and seals of leaking and dripping faucets and stops.

D. Operate and adjust disposers. Replace damaged and malfunctioning units.

3.6 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials.
   1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
   2. Remove sediment and debris from drains.

B. After completing installation of exposed, factory-finished fixtures, faucets, and fittings, inspect exposed finishes and repair damaged finishes.

3.7 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of plumbing fixtures for temporary facilities unless approved in writing by Owner.

END OF SECTION

SECTION 22 47 00

DRINKING FOUNTAINS AND WATER COOLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following drinking fountains and water coolers and related components:

1. Drinking fountains.

1.3 DEFINITIONS

A. Accessible Drinking Fountain or Water Cooler: Fixture that can be approached and used by people with disabilities.

B. Cast Polymer: Dense, cast-filled-polymer plastic.

C. Drinking Fountain: Fixture with nozzle for delivering stream of water for drinking.

D. Fitting: Device that controls flow of water into or out of fixture.

E. Fixture: Drinking fountain or water cooler unless one is specifically indicated.

F. Remote Water Cooler: Electrically powered equipment for generating cooled drinking water.

G. Water Cooler: Electrically powered fixture for generating and delivering cooled drinking water.

1.4 SUBMITTALS

A. Product Data: For each fixture indicated. Include furnished specialties, and accessories.

B. Operation and Maintenance Data: For fixtures to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act"; for fixtures for people with disabilities.

C. ANSI/NSF Standard: Comply with NSF 61, Section 9, California Proposition 65, and the Federal Safe Drinking Water Act for fixture materials that will be in contact with potable water.

D. ARI Standard: Comply with ARI 1010, "Self-Contained, Mechanically Refrigerated Drinking-Water Coolers," for water coolers and with ARI's "Directory of Certified Drinking Water Coolers" for type and style classifications.

E. ASHRAE Standard: Comply with ASHRAE 34, "Designation and Safety Classification of Refrigerants," for water coolers. Provide HFC 134a (tetrafluoroethane) refrigerant, unless otherwise indicated.

F. California Health and Safety: Comply with 116875 as evaluated by CSA International.

PART 2 - PRODUCTS

2.1 DRINKING FOUNTAINS

A. Drinking Fountains, (DF-1):

1. Manufacturers: Subject to compliance with requirements, provide products by the

following: Elkay Model LVRCTL8WSK wall mounted drinking fountain.

2. Description: Accessible, Hi-lo, barrier free wall-mounting drinking fountain
   a. Stainless steel basin with integral drain.
   b. Stainless steel bottle filler wrapper with ABS plastic alcove.
   c. Easy-touch front and side pushbar controls.
   d. Integrated Silver Ion Anti-microbial Protection in key areas.
   e. Vandal-resistant bubbler.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before fixture installation. Verify that sizes and locations of piping and types of supports match those indicated.

B. Examine walls and floors for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Use carrier off-floor supports for wall-mounting fixtures, unless otherwise indicated.

B. Use mounting frames for recessed water coolers, unless otherwise indicated.

C. Use chrome-plated brass or copper tube, fittings, and valves in locations exposed to view. Plain copper tube, fittings, and valves may be used in concealed locations.

3.3 INSTALLATION

A. Install off-floor supports affixed to building substrate and attach wall-mounting fixtures, unless otherwise indicated.

B. Install mounting frames affixed to building construction and attach water coolers to mounting frames, unless otherwise indicated.

C. Install fixtures level and plumb.

D. Install water-supply piping with shutoff valve on supply to each fixture to be connected to water distribution piping. Use ball valve. Install valves in locations where they can be easily reached for operation. Valves are specified in Division 15 Section "Valves."

E. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.

F. Install pipe escutcheons at wall penetrations in exposed, finished locations. Use deep-pattern escutcheons where required to conceal protruding pipe fittings. Escutcheons are specified in Division 22 Section "Escutcheons for Plumbing Piping."

G. Seal joints between fixtures and walls and floors using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 7 Section "Joint Sealants."

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping.

   Use size fittings required to match fixtures.

C. Ground equipment according to Division 26 Section "Grounding and Bonding."

D. Connect wiring according to Division 26 Section "Conductors and Cables."

3.5 FIELD QUALITY CONTROL

A. Water Cooler Testing: After electrical circuitry has been energized, test for compliance with requirements. Test and adjust controls and safeties.
   1. Remove and replace malfunctioning units and retest as specified above.
   2. Report test results in writing.

3.6 ADJUSTING

A. Adjust fixture flow regulators for proper flow and stream height.

B. Adjust water cooler temperature settings.

3.7 CLEANING

A. After completing fixture installation, inspect unit. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean fixtures, on completion of installation, according to manufacturer's written instructions.

END OF SECTION

SECTION 23 05 00

COMMON WORK RESULTS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Piping materials and installation instructions common to most piping systems.
   2. Transition fittings.
   3. Dielectric fittings.
   4. Mechanical sleeve seals.
   5. Sleeves.
   6. Escutcheons.
   7. Grout.
   8. Equipment installation requirements common to equipment sections.
   9. Painting and finishing.
   10. Concrete bases.
   11. Supports and anchorages.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for plastic materials:
   1. ABS: Acrylonitrile-butadiene-styrene plastic.
   2. CPVC: Chlorinated polyvinyl chloride plastic.
   3. PE: Polyethylene plastic.
   4. PVC: Polyvinyl chloride plastic.

G. The following are industry abbreviations for rubber materials:
   1. EPDM: Ethylene-propylene-diene terpolymer rubber.
   2. NBR: Acrylonitrile-butadiene rubber.

1.4 SUBMITTALS

A. Product Data: For the following:
   1. Transition fittings.
   2. Dielectric fittings.
   3. Mechanical sleeve seals.
   4. Escutcheons.

B. Welding certificates.

1.5 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.7 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 8 Section "Access Doors and Frames."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Basis of Design Product: The design for each product is based on manufacturer named on the drawings. Subject to compliance with requirements, provide either named product or a comparable equivalent product by on of the other manufacturers specified.
   2. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.
   3. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 22 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 22 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
   2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

F. Brazing Filler Metals: AWS A5.8, BcuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

H. Solvent Cements for Joining Plastic Piping:
   1. ABS Piping: ASTM D 2235.
   2. CPVC Piping: ASTM F 493.
   3. PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
   4. PVC to ABS Piping Transition: ASTM D 3138.

I. Fiberglass Pipe Adhesive: As furnished or recommended by pipe manufacturer.

2.4 TRANSITION FITTINGS

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.
   1. Available Manufacturers:
      a. Cascade Waterworks Mfg. Co.
      b. Dresser Industries, Inc.; DMD Div.
      c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
      d. JCM Industries.
      e. Smith-Blair, Inc.
      f. Viking Johnson.
   2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.
   3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.
   4. Aboveground Pressure Piping: Pipe fitting.

B. Plastic-to-Metal Transition Fittings: CPVC and PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement- joint end.
   1. Available Manufacturers:
      a. Eslon Thermoplastics.

C. Plastic-to-Metal Transition Adaptors: One-piece fitting with manufacturer's SDR 11 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.
   1. Available Manufacturers:
      a. Thompson Plastics, Inc.

D. Plastic-to-Metal Transition Unions: MSS SP-107, PVC four-part union. Include brass end, solvent-cement-joint end, rubber O-ring, and union nut.
   1. Available Manufacturers:
      a. NIBCO INC.
      b. NIBCO, Inc.; Chemtrol Div.

2.5 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 deg F.
   1. Available Manufacturers:
      a. Capitol Manufacturing Co.
      b. Central Plastics Company.
      c. Eclipse, Inc.
      d. Epco Sales, Inc.
      e. Hart Industries, International, Inc.
      f. Watts Industries, Inc.; Water Products Div.
      g. Zurn Industries, Inc.; Wilkins Div.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.
   1. Available Manufacturers:
      a. Capitol Manufacturing Co.
      b. Central Plastics Company.
      c. Epco Sales, Inc.
      d. Watts Industries, Inc.; Water Products Div.

E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
   1. Available Manufacturers:
      a. Advance Products & Systems, Inc.
      b. Calpico, Inc.
      c. Central Plastics Company.
      d. Pipeline Seal and Insulator, Inc.
   2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.
   1. Available Manufacturers:
      a. Calpico, Inc.
      b. Lochinvar Corp.

G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.
   1. Available Manufacturers:
      a. Perfection Corp.
      b. Precision Plumbing Products, Inc.
      c. Sioux Chief Manufacturing Co., Inc.
      d. Victaulic Co. of America.

2.6 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.
   1. Manufacturers:
      a. Thunderline Link Seal
      b. Calpico, Inc.
      c. Metraflex Co.
   2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   3. Pressure Plates: Stainless steel. Include two for each sealing element.

4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral water stop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

1. Underdeck Clamp: Clamping ring with set screws.

E. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.

F. PVC Pipe: ASTM D 1785, Schedule 40.

G. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.8 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.
1. Finish: Polished chrome-plated.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.
1. Finish: Polished chrome-plated.

E. One-Piece, Stamped-Steel Type: With set screw and chrome-plated finish.

F. Split-Plate, Stamped-Steel Type: With concealed hinge, set screw, and chrome-plated finish.

G. One-Piece, Floor-Plate Type: Cast-iron floor plate.

H. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:
   1. New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
      c. Insulated Piping: One-piece, stamped-steel type with spring clips.
      d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      e. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, stamped- steel type.
      f. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      g. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished chrome-plated finish.
      h. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
      i. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

M. Sleeves are not required for core-drilled holes.

N. Permanent sleeves are not required for holes formed by removable PE sleeves.

O. Install sleeves for pipes passing through concrete and masonry walls and concrete floor and roof slabs.

P. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.
   1. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
   2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
   3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
      a. Steel Pipe Sleeves: For pipes smaller than NPS 6.
      b. Steel Sheet Sleeves: For pipes NPS 6 and larger, penetrating gypsum-board partitions.
      c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Refer to Division 7 Section "Sheet Metal Flashing and Trim" for flashing.
         1) Seal space outside of sleeve fittings with grout.
   4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 7 Section "Joint Sealants" for materials and installation.

Q. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Install steel pipe for sleeves smaller than 6 inches in diameter.
   2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.
   3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten

bolts against pressure plates that cause sealing elements to expand and make watertight seal.

R. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

S. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 7 Section "Through-Penetration Firestop Systems" for materials.

T. Verify final equipment locations for roughing-in.

U. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
   3. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
   4. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
   5. PVC Nonpressure Piping: Join according to ASTM D 2855.
   6. PVC to ABS Nonpressure Transition Fittings: Join according to ASTM D 3138 Appendix.

J. Plastic Pressure Piping Gasketed Joints: Join according to ASTM D 3139.

K. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D 3212.

L. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
   1. Plain-End Pipe and Fittings: Use butt fusion.
   2. Plain-End Pipe and Socket Fittings: Use socket fusion.

M. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
   3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
   4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

A. Painting of mechanical systems, equipment, and components is specified in Division 9.

B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 5 Section "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

C. Field Welding: Comply with AWS D1.1.

END OF SECTION

SECTION 23 05 13

COMMON MOTOR REQUIREMENTS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes basic requirements for factory installed motors.

1.3 DEFINITIONS

A. Factory-Installed Motor: A motor installed by motorized-equipment manufacturer as a component of equipment.

1.4 SUBMITTALS

A. Manufacturer Seismic Qualification Certification: Submit certification that motors, accessories, and components will withstand seismic forces defined in Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment". Include the following:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
      b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and
      their installation requirements.

B. Qualification Data: For testing agency.

C. Source quality-control test reports.

D. Operation and Maintenance Data: For motors to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

1.6 COORDINATION

A. Coordinate features of motors, installed units, and accessory devices and features that comply with the following:
   1. Compatible with the following:
      a. Magnetic controllers.
      b. Multispeed controllers.
      c. Reduced-voltage controllers.
      d. Variable speed drive.

2. Designed and labeled for use with variable frequency controllers, and suitable for use throughout speed range without overheating.
3. Matched to torque and horsepower requirements of the load.
4. Matched to ratings and characteristics of supply circuit and required control sequence.

PART 2 - PRODUCTS

2.1 MOTOR REQUIREMENTS

A. Motor requirements apply to factory installed motors except as follows:
1. Different ratings, performance, or characteristics for motor are specified in another Section.
2. Motorized-equipment manufacturer requires ratings, performance, or characteristics, other than those specified in this Section, to meet performance specified.

2.2 MOTOR CHARACTERISTICS

A. Motors 3/4 HP and Larger: Three phase.

B. Motors Smaller Than 3/4 HP: Single phase.

C. Frequency Rating: 60 Hz.

D. Voltage Rating: NEMA standard voltage selected to operate on nominal circuit voltage to which motor is connected.

E. Service Factor: 1.15 for open drip proof motors; 1.0 for totally enclosed motors.

F. Duty: Continuous duty at ambient temperature of 105 deg F and at altitude of 3300 feet above sea level.

G. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

H. Enclosure:
1. Open drip proof (ODP) for indoor applications.
2. Totally enclosed fan cooled (TEFC) for outdoor applications.

2.3 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Premium, as defined in NEMA MG 1.

C. Stator: Copper windings, unless otherwise indicated.
1. Multispeed motors shall have separate winding for each speed.

D. Rotor: Squirrel cage, unless otherwise indicated.

E. Bearings: Double-shielded, pre-lubricated ball bearings suitable for radial and thrust loading.

F. Temperature Rise: Match insulation rating, unless otherwise indicated.

G. Insulation: Class F, unless otherwise indicated.

H. Code Letter Designation:
1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
2. Motors Smaller Than 15 HP: Manufacturer's standard starting characteristic.

I. Enclosure: Cast iron for motors 7.5 hp and larger; rolled steel for motors smaller than 7.5 hp.
1. Finish: Gray enamel.

2.4 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Reduced-Inrush Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
1. Designed with critical vibration frequencies outside operating range of controller output.

2. Temperature Rise: Matched to rating for Class B insulation.
3. Insulation: Class H.
4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

2.5 SINGLE-PHASE MOTORS

A. Type: One of the following, to suit starting torque and requirements of specific motor application:
1. Permanent-split capacitor.
2. Split-phase start, capacitor run.
3. Capacitor start, capacitor run.

B. Shaded-Pole Motors: For motors 1/20 hp and smaller only.

C. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Bearings: Ball type for belt-connected motors and other motors with high radial forces on motor shaft; sealed, pre-lubricated-sleeve type for other single-phase motors.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive motors for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in for conduit systems to verify actual locations of conduit connections before motor installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

END OF SECTION

SECTION 23 05 29

HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following hangers and supports for mechanical system piping and equipment:
   1. Steel pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Thermal-hanger shield inserts.
   5. Fastener systems.
   6. Pipe stands.
   7. Pipe positioning systems.
   8. Equipment supports.

B. Related Sections include the following:
   1. Division 5 Section "Metal Fabrications" for structural-steel shapes and plates for trapeze hangers for pipe and equipment supports.
   2. Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment for vibration isolation devices.
   3. Division 23 Section "Metal Ducts and Casings" for duct hangers and supports.
   4. Comply with Section 01 61 00 for seismic requirements for non-structural components.

1.3 DEFINITIONS

A. MSS: Manufacturers Standardization Society for The Valve and Fittings Industry Inc.

B. Terminology: As defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports."

1.4 PERFORMANCE REQUIREMENTS

A. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

1.5 SUBMITTALS

A. Product Data: For the following:
   1. Steel pipe hangers and supports.
   2. Thermal-hanger shield inserts.
   3. Powder-actuated fastener systems.
   4. Pipe positioning systems.
   5. Equipment supports.

B. Shop Drawings: Show fabrication and installation details and include calculations for the following:

1. Trapeze pipe hangers. Include Product Data for components.
2. Metal framing systems. Include Product Data for components, pipe stands. Include Product Data for components.
3. Equipment supports.

C. Welding certificates.

1.6 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to the following:
1. AWS D1.1, "Structural Welding Code--Steel."
2. AWS D1.2, "Structural Welding Code--Aluminum."
3. AWS D1.3, "Structural Welding Code--Sheet Steel."
4. AWS D1.4, "Structural Welding Code--Reinforcing Steel."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 STEEL PIPE HANGERS AND SUPPORTS

A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.

B. Available Manufacturers:
1. AAA Technology & Specialties Co., Inc.
2. Bergen-Power Pipe Supports.
3. B-Line Systems, Inc.; a division of Cooper Industries.
4. Carpenter & Paterson, Inc.
5. Empire Industries, Inc.
6. ERICO/Michigan Hanger Co.
7. Hilti, Inc.
8. Globe Pipe Hanger Products, Inc.
9. Grinnell Corp.
10. GS Metals Corp.
11. National Pipe Hanger Corporation.
12. PHD Manufacturing, Inc.
13. PHS Industries, Inc.
14. Piping Technology & Products, Inc.
15. Tolco Inc.

C. Galvanized, Metallic Coatings: Pregalvanized or hot dipped.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

E. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion for support of bearing surface of piping.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS

A. Description: MFMA-3, shop- or field-fabricated pipe-support assembly made of steel channels and other components. Available Manufacturers:
   1. B-Line Systems, Inc.; a division of Cooper Industries.
   2. ERICO/Michigan Hanger Co.; ERISTRUT Div.
   3. GS Metals Corp.
   4. Power-Strut Div.; Tyco International, Ltd.
   5. Thomas & Betts Corporation.
   6. Tolco Inc.
   7. Unistrut Corp.; Tyco International, Ltd.

B. Coatings: Manufacturer's standard finish, unless bare metal surfaces are indicated.

C. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.5 THERMAL-HANGER SHIELD INSERTS

A. Description: 100-psig- minimum, compressive-strength insulation insert encased in sheet metal shield.

B. Available Manufacturers:
   1. Carpenter & Paterson, Inc.
   2. ERICO/Michigan Hanger Co.
   3. PHS Industries, Inc.
   4. Pipe Shields, Inc.
   5. Rilco Manufacturing Company, Inc.
   6. Value Engineered Products, Inc.

C. Insulation-Insert Material for Cold Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate with vapor barrier.

D. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate.

E. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

F. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

G. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.6 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Available Manufacturers:
      a. Hilti, Inc.
      b. ITW Ramset/Red Head.
      c. Masterset Fastening Systems, Inc.
      d. MKT Fastening, LLC.
      e. Powers Fasteners.

B. Mechanical-Expansion Anchors: Insert-wedge-type [zinc-coated] [stainless] steel, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Available Manufacturers:
      a. B-Line Systems, Inc.; a division of Cooper Industries.
      b. Empire Industries, Inc.

c. Hilti, Inc.
d. ITW Ramset/Red Head.
e. MKT Fastening, LLC.
f. Powers Fasteners.

2.7 PIPE STAND FABRICATION

A. Pipe Stands, General: Shop or field-fabricated assemblies made of manufactured corrosion- resistant components to support outdoor and roof-mounted piping.

B. Compact Pipe Stand: One-piece plastic unit with integral-rod-roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
1. Available Manufacturers:
a. ERICO/Michigan Hanger Co.
b. MIRO Industries.

C. Low-Type, Single-Pipe Stand: One-piece plastic base unit with plastic roller, for roof installation without membrane penetration.
1. Available Manufacturers:
a. MIRO Industries.

D. High-Type, Single-Pipe Stand: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
1. Available Manufacturers:
a. ERICO/Michigan Hanger Co.
b. MIRO Industries.
c. Portable Pipe Hangers.
2. Base: Plastic.
3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuous-thread rods.
4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainless- steel, roller-type pipe support.

E. High-Type, Multiple-Pipe Stand: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
1. Available Manufacturers:
a. Portable Pipe Hangers.
2. Bases: One or more plastic.
3. Vertical Members: Two or more protective-coated-steel channels.
4. Horizontal Member: Protective-coated-steel channel.
5. Pipe Supports: Galvanized-steel, clevis-type pipe hangers.

F. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe support made from structural- steel shape, continuous-thread rods, and rollers for mounting on permanent stationary roof curb.

2.8 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, system of metal brackets, clips, and straps for positioning piping in pipe spaces for plumbing fixtures for commercial applications.

B. Available Manufacturers:
1. C & S Mfg. Corp.
2. HOLDRITE Corp.; Hubbard Enterprises.
3. Samco Stamping, Inc.

2.9 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural-steel shapes.

2.10 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Specific hanger and support requirements are specified in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use padded hangers for piping that is subject to scratching.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated stationary pipes, NPS 1/2 to NPS 30.
2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of 120 to 450 deg F pipes, NPS 4 to NPS 16, requiring up to 4 inches of insulation.
3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes, NPS 3/4 to NPS 24, requiring clamp flexibility and up to 4 inches of insulation.
4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes, NPS 1/2 to NPS 24, if little or no insulation is required.
5. Pipe Hangers (MSS Type 5): For suspension of pipes, NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.
6. Adjustable Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of noninsulated stationary pipes, NPS 3/4 to NPS 8.
7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 8.
8. Adjustable Band Hangers (MSS Type 9): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 8.
9. Adjustable Swivel-Ring Band Hangers (MSS Type 10): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 2.
10. Split Pipe-Ring with or without Turnbuckle-Adjustment Hangers (MSS Type 11): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 8.
11. Extension Hinged or 2-Bolt Split Pipe Clamps (MSS Type 12): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 3.
12. U-Bolts (MSS Type 24): For support of heavy pipes, NPS 1/2 to NPS 30.
13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
14. Pipe Saddle Supports (MSS Type 36): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange.
15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange and with U-bolt to retain pipe.
16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes, NPS 2-1/2 to NPS 36, if vertical adjustment is required, with steel pipe base stanchion support and cast-iron floor flange.
17. Single Pipe Rolls (MSS Type 41): For suspension of pipes, NPS 1 to NPS 30, from 2 rods if longitudinal movement caused by expansion and contraction might occur.

18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes, NPS 2-1/2 to NPS 20,

from single rod if horizontal movement caused by expansion and contraction might occur.

19. Complete Pipe Rolls (MSS Type 44): For support of pipes, NPS 2 to NPS 42, if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes, NPS 2 to NPS 24, if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes, NPS 2 to NPS 30, if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, NPS 3/4 to NPS 20.
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, NPS 3/4 to NPS 20, if longer ends are required for riser clamps.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I- beams for heavy loads, with link extensions.
11. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
12. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
    a. Light (MSS Type 31): 750 lb.
    b. Medium (MSS Type 32): 1500 lb.
    c. Heavy (MSS Type 33): 3000 lb.
13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.

15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

J. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
   2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
   3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

K. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
   2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.
   4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
   5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from hanger.
   6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from base support.
   7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from trapeze support.
   8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
      a. Horizontal (MSS Type 54): Mounted horizontally.
      b. Vertical (MSS Type 55): Mounted vertically.
      c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

L. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

M. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

N. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

O. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.2 HANGER AND SUPPORT INSTALLATION

A. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.

2. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported.
   Weld steel according to AWS D1.1.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled metal framing systems.

D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

E. Fastener System Installation:
   1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder- actuated tool manufacturer's operating manual.
   2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

F. Pipe Stand Installation:
   1. Pipe Stand Types except Curb-Mounting Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.
   2. Curb-Mounting-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. Refer to Division 7 Section "Roof Accessories" for curbs.

G. Pipe Positioning System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture. Refer to Division 15 Section "Plumbing Fixtures" for plumbing fixtures.

H. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

I. Equipment Support Installation: Fabricate from welded-structural-steel shapes.Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

J. Install lateral bracing with pipe hangers and supports to prevent swaying.

K. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

L. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.1 (for power piping) and ASME B31.9 (for building services piping) are not exceeded.

N. Insulated Piping: Comply with the following:
   1. Attach clamps and spacers to piping.
      a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
      b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
      c. Do not exceed pipe stress limits according to ASME B31.1 for power piping and ASME B31.9 for building services piping.
   2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is
      indicated. Fill interior voids with insulation that matches adjoining insulation.
      a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
   3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier.

Shields shall span an arc of 180 degrees.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
   a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
   b. NPS 4: 12 inches long and 0.06 inch thick.
   c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick.
   d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.
   e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick.
5. Pipes NPS 8 and Larger: Include wood inserts.
6. Insert Material: Length at least as long as protective shield.
7. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.3 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.4 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.5 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.6 PAINTING

A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Touch Up: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 9.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply

galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION

SECTION 23 05 48

VIBRATION AND SEISMIC CONTROLS

FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Elastomeric isolation pads and mounts.
   2. Restrained elastomeric isolation mounts.
   3. Freestanding and restrained spring isolators.
   4. Housed spring mounts.
   5. Elastomeric hangers.
   6. Spring hangers.
   7. Spring hangers with vertical-limit stops.
   8. Thrust limits.
   9. Pipe riser resilient supports.
   10. Resilient pipe guides.
   11. Seismic snubbers.
   12. Restraining cables.

B. Related Sections include the following:
   1. Refer to Sheet M1.1 “Vibration Isolation Schedule” if needed for additional clarification.

1.3 DEFINITIONS

A. Av: Effective peak velocity related acceleration coefficient.

B. OSHPD: Office of Statewide Health Planning & Development for the State of California. OSHPD assigns a unique anchorage preapproval "R" number to each seismic restraint it tests. The number describes a specific device applied as tested.

1.4 SUBMITTALS

A. Product Data: Include load deflection curves for each vibration isolation device.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Include the following:
   1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
   2. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system has been examined for excessive stress and that none will exist.
   3. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to
      structure and to supported equipment. Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment, and cantilever loads.
   4. Seismic-Restraint Details: Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.
   5. Submittals for Interlocking Snubbers: Include load deflection curves up to 1/2-inch

deflection in x, y, and z planes.

C. Welding certificates.

D. Air-Mounting System Performance Certification: Include natural frequency, load, and damping tests performed by an independent laboratory or acoustician.

E. Manufacturer Seismic Qualification Certification: Submit certification that all specified equipment will withstand seismic forces identified in "Performance Requirements" Article above. Include the following:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
      b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will
      be fully operational after the seismic event."
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.5 QUALITY ASSURANCE

A. Seismic-restraint devices shall have horizontal and vertical load testing and analysis performed according to OSHPD and shall bear anchorage preapproval "R" number, from OSHPD or another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer. Testing and calculations must include both shear and tensile loads and 1 test or analysis at 45 degrees to the weakest mode.

B. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code-- Steel."

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into base. Concrete, reinforcement, and formwork requirements are specified in Division 3.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
   1. Basis of Design Product: The design for each product is based on manufacturer named on the drawings. Subject to compliance with requirements, provide either named product or a comparable equivalent product by on of the other manufacturers specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 VIBRATION ISOLATORS

A. Manufacturers:
   1. CDI

2. Micrometal
3. Mason Industries, Inc.
4. M.W. Sausse.

B. Elastomeric Isolator Pads: Oil- and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern and galvanized steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to sizes that match requirements of supported equipment.
   1. Material: Standard neoprene.

C. Elastomeric Mounts Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements with factory-drilled, encapsulated top plate for bolting to equipment and with baseplate for bolting to structure. Color-code or otherwise identify to indicate capacity range.

D. Restrained Elastomeric Mounts: All-directional elastomeric mountings with seismic restraint.
   1. Materials: Cast-ductile-iron housing containing two separate and opposing, molded, bridge- bearing neoprene elements that prevent central threaded sleeve and attachment bolt from contacting the casting during normal operation.
   2. Neoprene: Shock-absorbing materials compounded according to the standard for bridge- bearing neoprene as defined by AASHTO.

E. Spring Isolators: Freestanding, laterally stable, open-spring isolators.
   1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
   2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
   3. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
   4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
   5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- thick, rubber isolator pad attached to baseplate underside. Baseplates shall limit floor load to 100 psig.
   6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

F. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic restraint.
   1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 1/4-inch- thick, elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
   2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
   3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
   4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
   5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

G. Housed Spring Mounts: Housed spring isolator with integral seismic snubbers.
   1. Housing: Ductile-iron or steel housing to provide all-directional seismic restraint.
   2. Base: Factory drilled for bolting to structure.
   3. Snubbers: Vertically adjustable to allow a maximum of 1/4-inch travel before contacting a resilient collar.

H. Elastomeric Hangers: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements bonded to steel housings with threaded connections for hanger rods. Color- code or otherwise identify to indicate capacity range.

I. Spring Hangers: Combination coil-spring and elastomeric-insert hanger with spring and insert in compression.
   1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or

reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene. Steel-washer-reinforced cup to support spring and bushing projecting through bottom of frame.

J. Spring Hangers with Vertical-Limit Stop: Combination coil-spring and elastomeric-insert hanger with spring and insert in compression and with a vertical-limit stop.
1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.
7. Adjustable Vertical Stop: Steel washer with neoprene washer "up-stop" on lower threaded rod.

K. Thrust Limits: Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop. Include rod and angle-iron brackets for attaching to equipment.
1. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.
7. Coil Spring: Factory set and field adjustable for a maximum of 1/4-inch movement at start and stop.

2.3 SEISMIC-RESTRAINT DEVICES

A. Manufacturers:
1. CDI
2. B-Line Systems, Inc.
3. Mason Industries, Inc.
4. M.W. Sausse
5. TOLCO Incorporated.
6. Unistrut Diversified Products Co.; Wayne Manufacturing Division.

B. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 40, plus or minus 5, with a flat washer face.

C. Seismic Snubbers: Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.

2. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of [40] [50] [60], plus or minus 5.

D. Restraining Cables: Galvanized steel aircraft cables with end connections made of steel assemblies that swivel to final installation angle and utilize two clamping bolts for cable engagement.

E. Anchor Bolts: Seismic-rated, drill-in, and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488/E 488M.

2.4 VIBRATION ISOLATION EQUIPMENT BASES

A. Manufacturers:
1. CDI
2. Mason Industries, Inc.
3. M.W. Sausse.

B. Steel Base: Factory-fabricated, welded, structural-steel bases and rails.
1. Design Requirements: Lowest possible mounting height with not less than 1-inch clearance above the floor. Include equipment anchor bolts and auxiliary motor slide bases or rails. Include supports for suction and discharge elbows for pumps.
2. Structural Steel: Steel shapes, plates, and bars complying with ASTM A 36/A 36M. Bases shall have shape to accommodate supported equipment.
3. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings

and to provide for anchor bolts and equipment support.

2.5 FACTORY FINISHES

A. Manufacturer's standard prime-coat finish ready for field painting.

B. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.
1. Powder coating on springs and housings.
2. All hardware shall be electrogalvanized. Hot-dip galvanize metal components for exterior use.
3. Baked enamel for metal components on isolators for interior use.
4. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install roof curbs, equipment supports, and roof penetrations as specified in Division 7 Section "Roof Accessories."

B. Install thrust limits at centerline of thrust, symmetrical on either side of equipment.

C. Install seismic snubbers on isolated equipment. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.

D. Install restraining cables at each trapeze and individual pipe hanger. At trapeze anchor

locations, shackle piping to trapeze. Install cables so they do not bend across sharp edges of adjacent equipment or building structure.

E. Install steel angles or channel, sized to prevent buckling, clamped with ductile-iron clamps to hanger rods for trapeze and individual pipe hangers. At trapeze anchor locations, shackle piping to trapeze. Requirements apply equally to hanging equipment. Do not weld angles to rods.

F. Install resilient bolt isolation washers on equipment anchor bolts.

3.3 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified testing agency to perform the following field quality-control testing:

B. Testing: Engage a qualified testing agency to perform the following field quality-control testing:

C. Testing: Perform the following field quality-control testing:
1. Isolator seismic-restraint clearance.
2. Isolator deflection.
3. Snubber minimum clearances.

3.4 ADJUSTING

A. Adjust isolators after piping systems have been filled and equipment is at operating weight.

B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height.
After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

C. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop.

D. Adjust air spring leveling mechanism.

E. Adjust active height of spring isolators.

F. Adjust snubbers according to manufacturer's written recommendations.

G. Adjust seismic restraints to permit free movement of equipment within normal mode of operation.

H. Torque anchor bolts according to equipment manufacturer's written recommendations to resist seismic forces.

3.5 CLEANING

A. After completing equipment installation, inspect vibration isolation and seismic-control devices.
Remove paint splatters and other spots, dirt, and debris.

3.6 VIBRATION ISOLATOR AND SEISMIC-RESTRAINT SCHEDULE

A. Supported or Suspended Equipment: As scheduled on drawings.

END OF SECTION

SECTION 23 05 53

IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:
   1. Equipment nameplates.
   2. Equipment markers.
   3. Equipment signs.
   4. Access panel and door markers.
   5. Pipe markers.
   6. Duct markers.
   7. Stencils.
   8. Valve tags.
   9. Valve schedules.
   10. Warning tags.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Valve numbering scheme.

C. Valve Schedules: For each piping system. Furnish extra copies (in addition to mounted copies) to include in maintenance manuals.

1.4 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

1.5 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal, with data engraved or stamped, for permanent attachment on equipment.
   1. Data:
      a. Manufacturer, product name, model number, and serial number.
      b. Capacity, operating and power characteristics, and essential data.
      c. Labels of tested compliances.
   2. Location: Accessible and visible.
   3. Fasteners: As required to mount on equipment.

B. Equipment Markers: Engraved, color-coded laminated plastic. Include contact-type, permanent adhesive.

1. Terminology: Match schedules as closely as possible.
2. Data:
   a. Name and plan number.
   b. Equipment service.
   c. Design capacity.
   d. Other design parameters such as pressure drop, entering and leaving conditions, and speed.
3. Size: 2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.

C. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, black surface, black phenolic core, with white melamine subcore, unless otherwise indicated. Fabricate in sizes required for message. Provide holes for mechanical fastening.
1. Data: Instructions for operation of equipment and for safety procedures.
2. Engraving: Manufacturer's standard letter style, of sizes and with terms to match equipment identification.
3. Thickness: 1/16 inch for units up to 20 sq. in. or 8 inches in length, and 1/8 inch for larger units.
4. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

D. Access Panel and Door Markers: 1/16-inch- thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.
1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.2 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.
1. Colors: Comply with ASME A13.1, unless otherwise indicated.
2. Lettering: Use piping system terms indicated and abbreviate only as necessary for each application length.
3. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.
4. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers at least three times letter height and of length required for label.
5. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Pretensioned Pipe Markers: Precoiled semirigid plastic formed to cover full circumference of pipe and to attach to pipe without adhesive.

C. Shaped Pipe Markers: Preformed semirigid plastic formed to partially cover circumference of pipe and to attach to pipe with mechanical fasteners that do not penetrate insulation vapor barrier.

D. Self-Adhesive Pipe Markers: Plastic with pressure-sensitive, permanent-type, self-adhesive back.

E. Plastic Tape: Continuously printed, vinyl tape at least 3 mils thick with pressure-sensitive, permanent-type, self-adhesive back.
1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.
2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

2.3 DUCT IDENTIFICATION DEVICES

A. Duct Markers: Engraved, color-coded laminated plastic. Include direction and quantity of airflow and duct service (such as supply, return, and exhaust). Include contact-type,

permanent adhesive.

2.4 STENCILS

A. Stencils: Prepared with letter sizes according to ASME A13.1 for piping; minimum letter height of 1-1/4 inches for ducts; and minimum letter height of 3/4 inch for access panel and door markers, equipment markers, equipment signs, and similar operational instructions.
   1. Stencil Material: Metal or fiberboard.
   2. Stencil Paint: Exterior, gloss, black, unless otherwise indicated. Paint may be in pressurized spray-can form.
   3. Identification Paint: Exterior, in colors according to ASME A13.1, unless otherwise indicated.

2.5 VALVE TAGS

A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2- inch numbers, with numbering scheme approved by Architect or Engineer. Provide 5/32-inch hole for fastener.
   1. Material: 0.032-inch- thick brass.
   2. Valve-Tag Fasteners: Brass wire-link or beaded chain; or S-hook.

2.6 VALVE SCHEDULES

A. Valve Schedules: For each piping system, on standard-size bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
   1. Valve-Schedule Frames: Glazed display frame for removable mounting on masonry walls for each page of valve schedule. Include mounting screws.
   2. Frame: Extruded aluminum.
   3. Glazing: ASTM C 1036, Type I, Class 1, Glazing Quality B, 2.5-mm, single-thickness glass.

2.7 WARNING TAGS

A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags; of plasticized card stock with matte finish suitable for writing.
   1. Size: 3 by 5-1/4 inches minimum.
   2. Fasteners: Brass grommet and wire.
   3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
   4. Color: Yellow background with black lettering.

PART 3 - EXECUTION

3.1 APPLICATIONS, GENERAL

A. Products specified are for applications referenced in other Division 23 Sections. If more than single-type material, device, or label is specified for listed applications, selection is Installer's option.

3.2 EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible. Include nameplates for the following general categories of equipment:
   1. Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.
   2. Pumps, compressors, chillers, condensers, and similar motor-driven units.
   3. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
   4. Fans, blowers, primary balancing dampers, and mixing boxes.

5. Packaged HVAC central-station and zone-type units.

B. Install equipment markers with permanent adhesive on or near each major item of mechanical equipment. Data required for markers may be included on signs, and markers may be omitted if both are indicated.
   1. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
   2. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
   3. Locate markers where accessible and visible. Include markers for the following general
      categories of equipment:
      a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
      b. Fire department hose valves and hose stations.
      c. Meters, gages, thermometers, and similar units.
      d. Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.
      e. Pumps, compressors, chillers, condensers, and similar motor-driven units.
      f. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
      g. Fans, blowers, primary balancing dampers, and mixing boxes.
      h. Packaged HVAC central-station and zone-type units.
      i. Tanks and pressure vessels.
      j. Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

C. Stenciled Equipment Marker Option: Stenciled markers may be provided instead of laminated- plastic equipment markers, at Installer's option, if lettering larger than 1 inch high is needed for proper identification because of distance from normal location of required identification.

D. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.
   1. Identify mechanical equipment with equipment markers in the following color codes:
      a. Green: For cooling equipment and components.
      b. Yellow: For heating equipment and components.
      c. Green and Yellow: For combination cooling and heating equipment and components.
      d. Brown: For energy-reclamation equipment and components.
   2. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
   3. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
   4. Include signs for the following general categories of equipment:
      a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
      b. Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.
      c. Pumps, compressors, chillers, condensers, and similar motor-driven units.
      d. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
      e. Fans, blowers, primary balancing dampers, and mixing boxes.
      f. Packaged HVAC central-station and zone-type units.
      g. Tanks and pressure vessels.

h. Strainers, filters, humidifiers, water-treatment systems, and similar equipment.

E. Stenciled Equipment Sign Option: Stenciled signs may be provided instead of laminated-plastic equipment signs, at Installer's option, if lettering larger than 1 inch high is needed for proper identification because of distance from normal location of required identification.

F. Install access panel markers with screws on equipment access panels.

3.3 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

B. Pipes with OD, Including Insulation, Less Than 6 Inches: Pretensioned pipe markers. Use size to ensure a tight fit.
   1. Pipes with OD, Including Insulation, 6 Inches and Larger: Shaped pipe markers. Use size to match pipe and secure with fasteners.

C. Stenciled Pipe Marker Option: Stenciled markers may be provided instead of manufactured pipe markers, at Installer's option. Install stenciled pipe markers with painted, color-coded bands or rectangles on each piping system.
   1. Identification Paint: Use for contrasting background.
   2. Stencil Paint: Use for pipe marking.

D. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations as follows:
   1. Near each valve and control device.
   2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
   3. Near penetrations through walls, floors, ceilings, and nonaccessible enclosures.
   4. At access doors, manholes, and similar access points that permit view of concealed piping.
   5. Near major equipment items and other points of origination and termination.
   6. Spaced at maximum intervals of 40 feet along each run. Reduce intervals to 20 feet in areas of congested piping and equipment.
   7. On piping above removable acoustical ceilings. Omit intermediately spaced markers.

3.4 DUCT IDENTIFICATION

A. Install duct markers with permanent adhesive on air ducts in the following color codes:
   1. Green: For cold-air supply ducts.
   2. Yellow: For hot-air supply ducts.
   3. Blue: For exhaust-, outside-, relief-, return-, and mixed-air ducts.
   4. ASME A13.1 Colors and Designs: For hazardous material exhaust.
   5. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

B. Stenciled Duct Marker Option: Stenciled markers, showing service and direction of flow, may be provided instead of laminated-plastic duct markers, at Installer's option, if lettering larger than 1 inch high is needed for proper identification because of distance from normal location of required identification.

C. Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 40 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.5 VALVE-TAG INSTALLATION

A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; plumbing fixture supply stops; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and

similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following:
   1. Valve-Tag Size and Shape:
      a. Cold Water: 1-1/2 inches, round.
      b. Hot Water: 1-1/2 inches, round.
      c. Fire Protection: 1-1/2 inches, round.
      d. Gas: 1-1/2 inches, round.
      e. Steam: 1-1/2 inches, round.
   2. Valve-Tag Color:
      a. Cold Water: Natural.
      b. Hot Water: Red.
      c. Fire Protection: Black.
      d. Gas: Green.
      e. Chilled Water: Blue.
      f. Condenser Water: Yellow.
      g. Heating Hot Water: Red.
   3. Letter Color:
      a. Cold Water: Black.
      b. Hot Water: White.
      c. Fire Protection: White.
      d. Gas: White.
      e. Chilled Water: White.
      f. Condenser Water: Black.
      g. Heating Hot Water: White.

3.6 VALVE-SCHEDULE INSTALLATION

A. Mount valve schedule on wall in accessible location in each major equipment room.

3.7 WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.8 ADJUSTING

A. Relocate mechanical identification materials and devices that have become visually blocked by other work.

3.9 CLEANING

A. Clean faces of mechanical identification devices and glass frames of valve schedules.

END OF SECTION

SECTION 23 05 93

TESTING, ADJUSTING AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Requirements Division 01, Division 23 Specification Sections, and Common Work Requirements for HVAC apply to the work specified in this Section.

1.2 SUMMARY

A. This Section includes the providing of labor, materials, equipment, and services necessary for complete testing, adjusting, balancing (TAB) of all heating, ventilating and air conditioning systems in accordance with the contract documents and all applicable codes and authorities having jurisdiction, for the following:

1. Air Systems: Balancing of air distribution systems including supply, return and exhaust systems, condensing units, all fan-coils and related equipment for:
    a. Constant-volume air systems.
    b. Variable-air-volume systems.
    c. Terminal devices for HVAC systems.
2. HVAC equipment quantitative-performance settings.
3. Vibration measuring.
4. Sound level measuring.
5. Indoor-air quality measuring.
6. Verifying that automatic control devices are functioning properly.
7. Reporting results of activities and procedures specified in this Section.
8. Required Controlled Inspection, including Equipment Use Permits.

1.3 DEFINITIONS

A. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

B. Balance: To proportion flows within the distribution system, including submains, branches, and terminals, according to indicated quantities.

C. Barrier or Boundary: Construction, either vertical or horizontal, such as walls, floors, and ceilings that are designed and constructed to restrict the movement of airflow, smoke, odors, and other pollutants.

D. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated.

E. NC: Noise criteria.

F. Procedure: An approach to and execution of a sequence of work operations to yield repeatable results.

G. RC: Room criteria.

H. Report Forms: Test data sheets for recording test data in logical order.

I. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

J. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

K. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

L. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

M. TAB: Testing, adjusting, and balancing.

N. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

O. Test: A procedure to determine quantitative performance of systems or equipment.

P. Testing, Adjusting, and Balancing (TAB) Firm: The entity responsible for performing and reporting TAB procedures.

1.4 SUBMITTALS

A. LEED Submittals:

1. Air Balance Report for LEED Prerequisite: Documentation of work performed for ASHRAE 62.1-latest edition, Section 7.2.2 - "Air Balancing."

2. TAB Report for LEED Prerequisite: Documentation of work performed for ASHRAE/IESNA 90.1-latest edition, Section 6.7.2.3 - "System Balancing."

B. Qualification Data: Within 30 days from Contractor's Notice to Proceed, submit 2 copies of evidence that TAB firm and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article. Contractor shall also submit Form TR 1 listing person designated to perform controlled inspection so as not to impede the obtaining of required building permits.

C. Contract Documents Examination Report: Within 30 days from Contractor's Notice to Proceed, submit 2 copies of the Contract Documents review report as specified in Part 3.

D. Strategies and Procedures Plan: Within 30 days from Contractor's Notice to Proceed, submit 2 copies of TAB strategies and step-by-step procedures as specified in Part 3 "Preparation" Article. Include a complete set of report forms intended for use on this Project.

E. Certified TAB Reports: Submit two copies of reports prepared, as specified in this Section, on approved forms certified by TAB firm.

F. Sample Report Forms: Submit two sets of sample TAB report forms.

G. Warranties specified in this Section.

H. At least fifteen (15) days prior to starting field work, submit three (3) copies of report forms filled out, including design flow values, installed equipment pressure drops and required air flow for air terminals. Submit a complete list of instruments proposed to be used, organized in appropriate categories and include data sheets for each. Indicate each manufacturer and model number, description and use when needed to further identify instrument, size or capacity range and latest calibration date.

1. Owner/Engineer will review submittals for compliance with Contract Documents, and will return one set marked to indicate discrepancies noted between data shown and Contract Documents, additional, or more accurate, instruments required and requests for recalibration of specific instruments.

2. Submit proposed method of balancing variable air volume systems to account for system diversity.

1.5 REFERENCE STANDARDS

A. Published Specifications' standards, tests or recommended methods of trade, industry or governmental organizations apply to work in this Section.

B. Unless otherwise indicated, all systems shall be balanced and adjusted in accordance with AABC - Associated Air Balance Council, NEBB - National Environmental Balance Bureau and SMACNA - Sheet Metal and Air Conditioning Contractors' National Association, Inc.

C. Comply with all applicable national, state and local codes and refer to Section 23 05 00 COMMON WORK RESULTS FOR HVAC for additional Reference Standards.

1.6 QUALITY ASSURANCE

A. Prior to start of testing, adjusting and balancing, verify that the systems installation is complete and in full operation. Verify that outside conditions are within reasonable range relative to design conditions and that doors and windows are in place or under normal traffic conditions. Ensure that lights are turned "on" for cooling load checks and are turned "off" for heating load checks.

B. Ensure that special equipment such as computers and electronic equipment are in full operation.

C. Dummy loads: When operation testing is performed before final computer and other equipment are installed, provide temporary electric heat loads in rooms, at no extra cost

to Owner. Capacity of heating devices shall be such as to equal full heat gain in rooms, with exact capacity and location as directed by the Owner. Provide heating devices, wiring, connecting fittings compatible with electric circuits, operating and safety controls and other devices, as required. Other heating mediums than electrical may be proposed for approval by Owner and/or Engineer.

D. Verify that requirements for preparation for testing and balancing have been met for elements of each of the systems which require testing.

E. End result of balancing of air systems shall be satisfactory relationship of air pressures, flow directions, room temperatures, etc., whether quantitative data on drawings result in these conditions or not. Make measurements and adjustments in addition to drawing indications if necessary to result in satisfactory air balance. Building air balance shall comprehend overall balance between all systems, whether or not drawing figures may have to be modified to achieve overall balance.

F. Make air balance measurements and adjustments for multiple operating conditions where areas are subject to variety of circumstances (doors open and/or shut, etc.).

1.7 SUBMITTALS

A. Furnish to Owner and/or Engineer documentation that the Air Balance Company is a member of the Associated Air Balance Council, or National Environmental Balancing Bureau and that it has satisfactorily balanced at least three systems of comparable type and size. Include list of such projects. Sample forms for use in compiling and recording test and balance data shall also be submitted.

B. Final submission shall include records and tabulations required hereinafter and certified by a registered professional mechanical engineer experienced in balancing HVAC systems.

C. At least fifteen (15) days prior to starting field work, submit three (3) copies of report forms filled out, including design flow values, installed equipment pressure drops and required CFM for air terminals. Submit a complete list of instruments proposed to be used, organize in appropriate categories and include data sheets for each. Indicate each manufacturer and model number, description and use when needed to further identify instrument, size or capacity range and latest calibration date.

1. Owner/Engineer will review submittals for compliance with Contract Documents, and will return one set marked to indicate discrepancies noted between data shown and Contract Documents, additional, or more accurate, instruments required and requests for re-calibration of specific instruments.

2. Submit proposed method of balancing variable air volume systems to account for system diversity.

D. At least fifteen (15) days prior to Contractor's request for final inspection, submit three (3) copies of final reports, on applicable reporting forms, for review.

1. Schedule testing and balancing of parts of systems which are delayed due to seasonal, climatic, occupancy, or other conditions beyond control of Contractor, as early as proper conditions will allow, after consultation with the Owner and/or Engineer.

2. Submit reports of delayed testing promptly after execution of those services.

3. Submit proposed method of balancing hydronic systems.

4. Each individual final reporting form must bear the signature of the person who recorded data and the signature of the Registered Professional Engineer Supervising air balance of the reporting organization.

   a. When more than one certified organization performs total air balance services, the firm having managerial responsibility shall make submittals.

   b. Identify the instruments of all types which were used, and the last date of calibration of each.

1.8 PROJECT REVIEW

A. Pre-Construction Review:

1. Review Contract Documents (drawings, specifications, bulletin, addenda), submittal data, shop drawings and automatic temperature control drawings.

2. Assure that design intent is clearly understood. Identify potential problems from standpoint of total system balance.

3. Review specifications for scope of work, special requirements and items that will make balancing difficult or impossible.

4. Review drawings for potential problems for total system balance, including location of balancing devices, lack of balancing devices, general system layout, architectural features and accessibility. Determine the most effective system balancing procedures and determine scheduling and coordination requirements.

5. Review submittal data for completeness of data, conformity with Contract Documents, special instructions for use of balancing devices, factors for flow meters, limitations affecting accuracy of measurements and equipment performance data and curves.

6. Review shop drawings for potential problems for total system balance, as specified above for review of Contract Drawings.

7. Review automatic temperature control drawings for thorough understanding of system functions and determining the most effective total system balancing procedure for minimum control manipulation. Avoid disturbing calibration of control devices and coordinate required control manipulation with Control Contractor.

8. Submit report recommending addition and/or relocation of balancing devices, including, but not limited to, volume dampers, balancing valves, flow metering devices for air and water, and pressure and temperature measuring points.

B. Construction Review: make on-site visits during progress of construction. Number of visits shall be as required to perform the functions specified below.

1. The purpose of the review is to identify potential problems for performing total system balance. Identify modification which will affect total system balance. Schedule and coordinate total system balance with other work. Identify conditions that could create hazardous environment for building occupants.

2. Typical activities: check that necessary balancing and measuring hardware are located properly, are accessible and installed correctly. Identify and evaluate variations from system design. Record data from equipment nameplates. Identify and report possible restrictions in systems, such as closed fire dampers, long runs of flexible duct, poorly designed duct fittings, questionable piping connections and others. Verify that construction progress will not delay total system balance. Identify best location for duct pitot tube traverses. Identify scaffolding needs.

C. Leakage testing shall be in accordance with AABC National Standards:

1. Perform before closing of shafts, ceiling and other areas where ductwork will not be accessible.

2. Leakage testing shall be observed by Owner/Engineer representatives. Test report shall be submitted to Owner/Engineer for approval.

D. Refer to AABC National Standards, Latest Edition.

PART 2 - PRODUCTS

2.1 GENERAL

A. Products and materials shall be as described in pertinent Sections of DIVISION NO. 23.

2.2 PREPARATION

A. Prepare a TAB plan that includes strategies and step-by-step procedures.

B. Complete system readiness checks and prepare system readiness reports. Verify the following:

1. Permanent electrical power wiring is complete.

2. Automatic temperature-control systems are operational.

3. Equipment and duct access doors are securely closed.

4. Balance, smoke, and fire dampers are open.

5. Isolating and balancing valves are open and control valves are operational.

6. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.

7. Windows and doors can be closed so indicated conditions for system operations can be met.

8. Ensure that special equipment such as computers, laboratory equipment, and electronic equipment are in full operation.

2.3 GENERAL PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in ASHRAE 111 ,AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems", NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems", SMACNA's TABB "HVAC Systems - Testing, Adjusting, and Balancing" and this Section.

1. Comply with requirements in the latest edition of ASHRAE 62.1, Section 7.2.2 - "Air Balancing."

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to insulation Specifications for this Project.

C. Mark equipment and balancing device settings with paint or other suitable, permanent identification material, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, to show final settings.

D. Take and report testing and balancing measurements in [inch-pound (IP)] [metric (SI)] [inch-pound (IP) and metric (SI)] units.

2.4 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Determine the best locations in main and branch ducts for accurate duct airflow measurements.

E. Check airflow patterns from the outside-air louvers and dampers and the return- and exhaust-air dampers, through the supply-fan discharge and mixing dampers.

F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

G. Verify that motor starters are equipped with properly sized thermal protection.

H. Check dampers for proper position to achieve desired airflow path.

I. Check for airflow blockages.

J. Check condensate drains for proper connections and functioning.

K. Check for proper sealing of air-handling unit components.

L. Check for proper sealing of air duct system.

2.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.

1. Measure fan static pressures to determine actual static pressure as follows:

   a. Measure outlet static pressure as far downstream from the fan as practicable and upstream from restrictions in ducts such as elbows and transitions.

   b. Measure static pressure directly at the fan outlet or through the flexible connection.

   c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from flexible connection and downstream from duct restrictions.

   d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.

2. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.

   a. Simulate dirty filter operation and record the point at which maintenance personnel must change filters.

3. Measure static pressures entering and leaving other devices such as sound traps, heat recovery equipment, and air washers, under final balanced conditions.

4. Compare design data with installed conditions to determine variations in design static pressures versus actual static pressures. Compare actual system effect factors with calculated system effect factors to identify where variations occur. Recommend corrective action to align design and actual conditions.

5. Obtain approval from Owner for adjustment of fan speed higher or lower than indicated speed. Make required adjustments to pulley sizes, motor sizes, and electrical connections to accommodate fan-speed changes.

6. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full cooling, full heating, economizer, and any other operating modes to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.

1. Measure static pressure at a point downstream from the balancing damper and adjust volume dampers until the proper static pressure is achieved.

   a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.

2. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

C. Measure terminal outlets and inlets without making adjustments.

1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

D. Adjust terminal outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using volume dampers rather than extractors and the dampers at air terminals.

1. Adjust each outlet in same room or space to within plus or minus 5 percent of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.

2. Adjust patterns of adjustable outlets for proper distribution without drafts.

2.6 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a maximum set-point airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set outside-air dampers at minimum, and return- and exhaust-air dampers at a position that simulates full-cooling load.

2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.

3. Measure total system airflow. Adjust to within +10% of indicated airflow.

4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.

5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.

    a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.

6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.

7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.

8. Record the final fan performance data.

C. Pressure-Dependent, Variable-Air-Volume Systems without Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Balance systems similar to constant-volume air systems.
2. Set terminal units and supply fan at full-airflow condition.
3. Adjust inlet dampers of each terminal unit to indicated airflow and verify operation of the static-pressure controller. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
4. Readjust fan airflow for final maximum readings.
5. Measure operating static pressure at the sensor that controls the supply fan, if one is installed, and verify operation of the static-pressure controller.
6. Set supply fan at minimum airflow if minimum airflow is indicated. Measure static pressure to verify that it is being maintained by the controller.
7. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.
    a. If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.
8. Measure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.

D. Pressure-Dependent, Variable-Air-Volume Systems with Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set system at maximum indicated airflow by setting the required number of terminal units at minimum airflow. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.
2. Adjust supply fan to maximum indicated airflow with the variable-airflow controller set at maximum airflow.
3. Set terminal units at full-airflow condition.
4. Adjust terminal units starting at the supply-fan end of the system and continuing progressively to the end of the system. Adjust inlet dampers of each terminal unit to indicated airflow. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
5. Adjust terminal units for minimum airflow.
6. Measure static pressure at the sensor.
7. Measure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.

PART 3 - EXECUTION

3.1 AIR SYSTEM BALANCING

A. Check that filters are installed clean and free of bypass, and are the type as specified. Make allowance for air filter resistance at time of tests. At design air quantity, the pressure drop across filter banks should be midway between the drops for clean and dirty filters. Submit written report that above was done.

B. In cooperation with the automatic control manufacturer, set adjustments of automatically operated dampers and air terminal boxes to operate as indicated. In cooperation with the automatic control manufacturer and the terminal box manufacturer, verify factory setting of air terminal boxes. Make adjustments required to produce design conditions. Submit written verification that all items listed above have been completed.

C. Fan testing: test and adjust fans speed to design requirements and test and record motors full load amperes.

D. Duct testing: make pitot tube traverse of main supply ducts and obtain design air quantities (cfm) at fans. Adjust main supply, return, and exhaust air ducts to proper design cfm. Adjust each zone supply, return and exhaust to proper design cfm's. Test and adjust recirculated air systems for design cfm's. Test and adjust outside air systems for design cfm's. Test and record suction and discharge systems' static pressures.

E. Air outlet balancing: test and adjust each diffuser, grille and register to within 5 percent of design requirements. Identify each grille, diffuser and register as to location size, type and manufacturer and submit in recorded tabulation with floor plan. Readings and tests of diffusers, grilles and registers shall include required velocity (fpm), test resultant velocity, required cfm, test resultant cfm after adjustments; all in accordance with manufacturers' ratings. Adjust diffusers, throw pattern, grilles and registers to minimize drafts. When balancing return air slots in lights, start with all slots open, and close down dampers as required nearest to return/exhaust air intakes above ceiling.

F. Record in tabulated form balance data by clearly identifying floors, zones, rooms and air outlet/inlet locations to correspond to those in the Contract Documents.

G. Temperature conditions; read and record the following:

1. Outside climatic conditions at time of testing, including DB and WB temperatures and whether it is sunny, cloudy, windy, etc.
2. Entering DB heating and cooling temperature.
3. Entering WB cooling temperature.
4. Leaving DB heating and cooling temperature.
5. Leaving WB cooling temperature.
6. DB temperature and velocity in occupied zones.

H. Sound level readings: take sound level readings at one or more diffusers in each zone approximately 5 feet above the floor. The allowable room sound-pressure level shall fall within range of specified allowable sound power level in the area. See Section Noise Control for the requirements.

1. 33 to 37 db.

I. Belt drive changes: make all changes in belts and sheaves required to obtain proper air balance.

1. At no extra cost to Owner.

2. At end of project, submit an accounting of the costs of additional drives. Upon approval of Owner and/or Engineer, these costs form part of change order to contract. Base accounting is based upon replaced drive material list price times a factor of 2.5 (or other rate as determined by Owner and/or Engineer).

3.2 CONTROL COORDINATION

A. Cooperate with automatic control installer and equipment installer in making adjustments to following items as required to accomplish indicated performance, including terminal air boxes, air valves, fan inlet vanes and adjustable and controllable pitch fan blades.

END OF SECTION

SECTION 23 33 00

DUCT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Indoor, concealed supply and outdoor air.
   2. Indoor, exposed supply and outdoor air.
   3. Indoor, concealed return located in unconditioned space.
   4. Indoor, exposed return located in unconditioned space.
   5. Indoor, concealed exhaust between isolation damper and penetration of building exterior.
   6. Indoor, exposed exhaust between isolation damper and penetration of building exterior.
   7. Outdoor, concealed supply and return.
   8. Outdoor, exposed supply and return.

B. Related Sections include the following:
   1. Division 23 Section "HVAC Insulation”
   2. Division 23 Section "Air Duct Accessories".
   3. Division 23 Section "Metal Ducts and Casings" for duct liners.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

1.4 QUALITY ASSURANCE

A. A. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test-response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
   2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.6 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment".

B. Coordinate clearance requirements with piping Installer for piping insulation application, duct Installer for duct insulation application, and equipment Installer for equipment insulation application. Before preparing piping and ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Products shall not contain asbestos, lead, mercury, or mercury compounds.

B. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

C. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

D. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Duct Liner: Refer to specification 233100 Metal Ducts and Casings, Section 2.3.

G. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type III with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. CertainTeed Corp.; Duct Wrap.
    b. Johns Manville; Microlite.
    c. Knauf Insulation; Duct Wrap.
    d. Manson Insulation Inc.; Alley Wrap.
    e. Owens Corning; All-Service Duct Wrap.

H. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type IA or Type IB. For duct and plenum applications, provide insulation with factory-applied FSK jacket. For equipment applications, provide insulation with factory-applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, provide one of the following:
    a. CertainTeed Corp.; Commercial Board.
    b. Johns Manville; 800 Series Spin-Glas.
    c. Knauf Insulation; Insulation Board.
    d. Owens Corning; Fiberglas 700 Series.

2.2 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.

B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. Childers Products, Division of ITW; CP-82.
    b. Foster Products Corporation, H. B. Fuller Company; 85-20.
    c. ITW TACC, Division of Illinois Tool Works; S-90/80.
    d. Marathon Industries, Inc.; 225.
    e. Mon-Eco Industries, Inc.; 22-25.

C. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. Childers Products, Division of ITW; CP-82.
    b. Foster Products Corporation, H. B. Fuller Company; 85-20.
    c. ITW TACC, Division of Illinois Tool Works; S-90/80.

d. Marathon Industries, Inc.; 225.
e. Mon-Eco Industries, Inc.; 22-25.

D. PVC Jacket Adhesive: Compatible with PVC jacket.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Dow Chemical Company (The); 739, Dow Silicone.
b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
c. P.I.C. Plastics, Inc.; Welding Adhesive.
d. Red Devil, Inc.; Celulon Ultra Clear.
e. Speedline Corporation; Speedline Vinyl Adhesive.

2.3 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.

B. Vapor-Barrier Mastic: Water based; suitable for indoor and outdoor use on below ambient services.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Childers Products, Division of ITW; CP-35.
b. Foster Products Corporation, H. B. Fuller Company; 30-90.
c. ITW TACC, Division of Illinois Tool Works; CB-50.
d. Marathon Industries, Inc.; 590.
e. Mon-Eco Industries, Inc.; 55-40.
f. Vimasco Corporation; 749.
2. Water-Vapor Permeance: ASTM E 96, Procedure B, 0.013 perm at 43-mil dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: ASTM D 1644, 59 percent by volume and 71 percent by weight.
5. Color: White.

2.4 SEALANTS

A. FSK and Metal Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Childers Products, Division of ITW; CP-76-8.
b. Foster Products Corporation, H. B. Fuller Company; 95-44.
c. Marathon Industries, Inc.; 405.
d. Mon-Eco Industries, Inc.; 44-05.
e. Vimasco Corporation; 750.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.

B. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Childers Products, Division of ITW; CP-76.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: White.

2.5 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.

C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Johns Manville; Zeston.
   b. P.I.C. Plastics, Inc.; FG Series.
   c. Proto PVC Corporation; LoSmoke.
   d. Speedline Corporation; SmokeSafe.
   2. Adhesive: As recommended by jacket material manufacturer.
   3. Color: White.
   4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
      a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.
   5. Factory-fabricated tank heads and tank side panels.

2.6 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
      b. Compac Corp.; 104 and 105.
      c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
      d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
   2. Width: 3 inches.
   3. Thickness: 11.5 mils.
   4. Adhesion: 90 ounces force/inch in width.
   5. Elongation: 2 percent.
   6. Tensile Strength: 40 lbf/inch in width.
   7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
      b. Compac Corp.; 110 and 111.
      c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
      d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
   2. Width: 3 inches.
   3. Thickness: 6.5 mils.
   4. Adhesion: 90 ounces force/inch in width.
   5. Elongation: 2 percent.
   6. Tensile Strength: 40 lbf/inch in width.
   7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive. Suitable for indoor and outdoor applications.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555.
      b. Compac Corp.; 130.

c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape.
d. Venture Tape; 1506 CW NS.

2. Width: 2 inches.
3. Thickness: 6 mils.
4. Adhesion: 64 ounces force/inch in width.
5. Elongation: 500 percent.
6. Tensile Strength: 18 lbf/inch in width.

D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
   b. Compac Corp.; 120.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF.
   d. Venture Tape; 3520 CW.
2. Width: 2 inches.
3. Thickness: 3.7 mils.
4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.

1. Verify that systems and equipment to be insulated have been tested and are free of defects.
2. Verify that surfaces to be insulated are clean and dry.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL APPLICATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of ducts and fittings.

B. Install insulation materials, vapor barriers or retarders, jackets, and thicknesses required for each item of duct system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Keep insulation materials dry during application and finishing.

G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

H. Install insulation with least number of joints practical.

I. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic.
   1. Apply insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and apply insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by the insulation material manufacturer.

J. Apply adhesives and mastics at the manufacturer's recommended coverage rate.

K. Apply insulation with integral jackets as follows:
   1. Pull jacket tight and smooth.
   2. Circumferential Joints: Cover with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip and spaced 4 inches o.c.
   3. Overlap jacket seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
   4. Vapor-Retarder Mastics: Where vapor retarders are indicated, apply mastic on seams and joints and at ends adjacent to duct flanges and fittings.

L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

O. Roof Penetrations: Apply insulation for interior applications to a point even with top of roof flashing.
   1. Seal penetrations with vapor-retarder mastic.
   2. Apply insulation for exterior applications tightly joined to interior insulation ends.
   3. Extend metal jacket of exterior insulation outside roof flashing at least 2 inches below top of roof flashing.
   4. Seal metal jacket to roof flashing with vapor-retarder mastic.

P. Exterior Wall Penetrations: For penetrations of below-grade exterior walls, terminate insulation flush with mechanical sleeve seal. Seal terminations with vapor-retarder mastic.

Q. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and floors.

R. Fire-Rated Wall and Partition Penetrations: Apply insulation continuously through penetrations of fire-rated walls and partitions.
   1. Firestopping and fire-resistive joint sealers are specified in Division 7 Section "Firestopping."

S. Floor Penetrations: Apply insulation continuously through floor assembly.
   1. For insulation with vapor retarders, seal insulation with vapor-retarder mastic where floor supports penetrate vapor retarder.

3.4 MINERAL-FIBER INSULATION APPLICATION

A. Blanket Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
   1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
   2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
   3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:

a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
b. On duct sides with dimensions larger than 18 inches, place pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
d. Do not overcompress insulation during installation.
e. Impale insulation over pins and attach speed washers.
f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface.

4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1-inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
   a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
   b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.
5. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of 18 inches o.c.
6. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
7. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

B. Board Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
   a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
   b. On duct sides with dimensions larger than 18 inches, space pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
   c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
   d. Do not overcompress insulation during installation.
   e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1-inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-

barrier mastic, and sealant at joints, seams, and protrusions.

a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.

b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.

5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.

6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.5 FIELD-APPLIED JACKET APPLICATION

A. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.
2. Install lap or joint strips with same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch-wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

B. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturer's recommended adhesive

1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

C. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.6 FINISHES

A. Insulation with ASJ or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."

1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
   a. Finish Coat Material: Interior, flat, latex-emulsion size.
2. Color: Final color as selected by University’s Representative. Vary first and second coats to allow visual inspection of the completed Work.
3. Do not field paint aluminum or stainless-steel jackets.

3.7 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:

1. Inspect ductwork, randomly selected by University’s Representative, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location(s) for each duct system defined in the "Duct

Insulation Schedule, General" Article.

C. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.8 DUCT INSUALTION SCHEDULE

A. Plenums and Ducts Requiring Insulation:
   1. Indoor, concealed supply and outdoor air.
   2. Indoor, exposed supply and outdoor air.
   3. Indoor, concealed return located in unconditioned space.
   4. Indoor, exposed return located in unconditioned space.
   5. Indoor, concealed exhaust between isolation damper and penetration of building exterior.
   6. Indoor, exposed exhaust between isolation damper and penetration of building exterior.
   7. Outdoor, concealed supply and return.
   8. Outdoor, exposed supply and return.

B. Items Not Insulated:
   1. Fibrous-glass ducts.
   2. Metal ducts with duct liner of sufficient thickness to comply with energy code and ASHRAE/IESNA 90.1.
   3. Factory-insulated flexible ducts.
   4. Factory-insulated plenums and casings.
   5. Flexible connectors.
   6. Vibration-control devices.
   7. Factory-insulated access panels and doors.

END OF SECTION

SECTION 23 07 19

HVAC PIPING INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Insulation Materials:
      a. Cellular glass.
      b. Flexible elastomeric.
   2. Adhesives.
   3. Mastics.
   4. Sealants.
   5. Factory-applied jackets.
   6. Field-applied jackets.
   7. Tapes.

B. Related Sections:
   1. Division 23 Section "Metal Ducts and Casings" for duct liners.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, thickness, and jackets (both factory and field applied, if any).

B. Qualification Data: For qualified Installer.

C. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

1.4 QUALITY ASSURANCE

A. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test-response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
   2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.6 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment".

B. Coordinate clearance requirements with piping Installer for piping insulation application, duct

Installer for duct insulation application, and equipment Installer for equipment insulation application. Before preparing piping and ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

1.7 SCHEDULING

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Duct Liner: Refer to specification 233100 Metal Ducts and Casings, Section 2.3.

G. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Cell-U-Foam Corporation; Ultra-CUF.
   b. Pittsburgh Corning Corporation; Foamglas Super K.
2. Block Insulation: ASTM C 552, Type I.
3. Special-Shaped Insulation: ASTM C 552, Type III.
4. Board Insulation: ASTM C 552, Type IV.
5. Preformed Pipe Insulation without Jacket: Comply with ASTM C 552, Type II, Class 1.
6. Preformed Pipe Insulation with Factory-Applied ASJ-SSL: Comply with ASTM C 552, Type II, Class 2.
7. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.

H. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials and Type II for sheet materials.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Aeroflex USA Inc.; Aerocel.
   b. Armacell LLC; AP Armaflex.
   c. RBX Corporation; Insul-Sheet 1800 and Insul-Tube 180.

2.2 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.

B. Flexible Elastomeric and Polyolefin Adhesive: Comply with MIL-A-24179A, Type II, Class I.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Aeroflex USA Inc.; Aeroseal.
      b. Armacell LCC; 520 Adhesive.
      c. Foster Products Corporation, H. B. Fuller Company; 85-75.
      d. RBX Corporation; Rubatex Contact Adhesive.

C. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Childers Products, Division of ITW; CP-82.
      b. Foster Products Corporation, H. B. Fuller Company; 85-20.
      c. ITW TACC, Division of Illinois Tool Works; S-90/80.
      d. Marathon Industries, Inc.; 225.
      e. Mon-Eco Industries, Inc.; 22-25.

D. PVC Jacket Adhesive: Compatible with PVC jacket.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Dow Chemical Company (The); 739, Dow Silicone.
      b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
      c. P.I.C. Plastics, Inc.; Welding Adhesive.
      d. Red Devil, Inc.; Celulon Ultra Clear.
      e. Speedline Corporation; Speedline Vinyl Adhesive.

2.3 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.

B. Vapor-Barrier Mastic: Water based; suitable for indoor and outdoor use on below ambient services.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Childers Products, Division of ITW; CP-35.
      b. Foster Products Corporation, H. B. Fuller Company; 30-90.
      c. ITW TACC, Division of Illinois Tool Works; CB-50.
      d. Marathon Industries, Inc.; 590.
      e. Mon-Eco Industries, Inc.; 55-40.
      f. Vimasco Corporation; 749.
   2. Water-Vapor Permeance: ASTM E 96, Procedure B, 0.013 perm at 43-mil dry film thickness.
   3. Service Temperature Range: Minus 20 to plus 180 deg F.
   4. Solids Content: ASTM D 1644, 59 percent by volume and 71 percent by weight.
   5. Color: White.

2.4 SEALANTS

A. Joint Sealants:
   1. Joint Sealants for Cellular-Glass, Phenolic, and Polyisocyanurate Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Childers Products, Division of ITW; CP-76.
      b. Foster Products Corporation, H. B. Fuller Company; 30-45.
      c. Marathon Industries, Inc.; 405.

d. Mon-Eco Industries, Inc.; 44-05.
e. Pittsburgh Corning Corporation; Pittseal 444.
f. Vimasco Corporation; 750.

B. FSK and Metal Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Childers Products, Division of ITW; CP-76-8.
b. Foster Products Corporation, H. B. Fuller Company; 95-44.
c. Marathon Industries, Inc.; 405.
d. Mon-Eco Industries, Inc.; 44-05.
e. Vimasco Corporation; 750.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.

C. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Childers Products, Division of ITW; CP-76.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: White.

2.5 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
4. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C 1136, Type II.
5. Vinyl Jacket: White vinyl with a permeance of 1.3 perms when tested according to ASTM E 96, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.6 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.

C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Johns Manville; Zeston.
b. P.I.C. Plastics, Inc.; FG Series.
c. Proto PVC Corporation; LoSmoke.
d. Speedline Corporation; SmokeSafe.
2. Adhesive: As recommended by jacket material manufacturer.
3. Color: White.
4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.

a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.

5. Factory-fabricated tank heads and tank side panels.

D. Metal Jacket:

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Childers Products, Division of ITW; Metal Jacketing Systems.
   b. PABCO Metals Corporation; Surefit.
   c. RPR Products, Inc.; Insul-Mate.
2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105 or 5005, Temper H-14.
   a. Sheet and roll stock ready for shop or field sizing.
   b. Finish and thickness are indicated in field-applied jacket schedules.
   c. Moisture Barrier for Indoor Applications: 1-mil- thick, heat-bonded polyethylene and kraft paper.
   d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene and kraft paper.
   e. Factory-Fabricated Fitting Covers:
      1) Same material, finish, and thickness as jacket.
      2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
      3) Tee covers.
      4) Flange and union covers.
      5) End caps.
      6) Beveled collars.
      7) Valve covers.
      8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

E. Self-Adhesive Outdoor Jacket: 60-mil- thick, laminated vapor barrier and waterproofing membrane for installation over insulation located aboveground outdoors; consisting of a rubberized bituminous resin on a crosslaminated polyethylene film covered with white stucco-embossed aluminum-foil facing.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Polyguard; Alumaguard 60.

F. PVDC Jacket for Indoor Applications: 4-mil- thick, white PVDC biaxially oriented barrier film with a permeance at 0.02 perms when tested according to ASTM E 96 and with a flame-spread index of 5 and a smoke-developed index of 20 when tested according to ASTM E 84.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Dow Chemical Company (The), Saran 540 Vapor Retarder Film.

2.7 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
   b. Compac Corp.; 104 and 105.
   c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
   d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
2. Width: 3 inches.
3. Thickness: 11.5 mils.
4. Adhesion: 90 ounces force/inch in width.

5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
b. Compac Corp.; 110 and 111.
c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
2. Width: 3 inches.
3. Thickness: 6.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive. Suitable for indoor and outdoor applications.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555.
b. Compac Corp.; 130.
c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape.
d. Venture Tape; 1506 CW NS.
2. Width: 2 inches.
3. Thickness: 6 mils.
4. Adhesion: 64 ounces force/inch in width.
5. Elongation: 500 percent.
6. Tensile Strength: 18 lbf/inch in width.

D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.
b. Compac Corp.; 120.
c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF.
d. Venture Tape; 3520 CW.
2. Width: 2 inches.
3. Thickness: 3.7 mils.
4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.
1. Verify that systems and equipment to be insulated have been tested and are free of defects.
2. Verify that surfaces to be insulated are clean and dry.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL APPLICATION REQUIREMENTS

A. Apply insulation materials, accessories, and finishes according to the manufacturer's written instructions; with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.

B. Refer to schedules at the end of this Section for materials, forms, jackets, and thicknesses required for each piping system.

C. Use accessories compatible with insulation materials and suitable for the service. Use accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Apply insulation with longitudinal seams at top and bottom of horizontal pipe runs.

E. Apply multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Seal joints and seams with vapor-retarder mastic on insulation indicated to receive a vapor retarder.

H. Keep insulation materials dry during application and finishing.

I. Apply insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by the insulation material manufacturer.

J. Apply insulation with the least number of joints practical.

K. Apply insulation over fittings, valves, and specialties, with continuous thermal and vapor-retarder integrity, unless otherwise indicated. Refer to special instructions for applying insulation over fittings, valves, and specialties.

L. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic.
   1. Apply insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor retarders are indicated, extend insulation on anchor legs at least 12 inches from point of attachment to pipe and taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.
   3. Install insert materials and apply insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by the insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect the jacket from tear or puncture by the hanger, support, and shield.

M. Insulation Terminations: For insulation application where vapor retarders are indicated, taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.

N. Apply adhesives and mastics at the manufacturer's recommended coverage rate.

O. Apply insulation with integral jackets as follows:
   1. Pull jacket tight and smooth.
   2. Circumferential Joints: Cover with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip and

spaced 4 inches o.c.

3. Longitudinal Seams: Overlap jacket seams at least 1-1/2 inches. Apply insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 4 inches o.c.
   a. Exception: Do not staple longitudinal laps on insulation having a vapor retarder.
4. Vapor-Retarder Mastics: Where vapor retarders are indicated, apply mastic on seams and joints and at ends adjacent to flanges, unions, valves, and fittings.
5. At penetrations in jackets for thermometers and pressure gages, fill and seal voids with vapor-retarder mastic.

P. Roof Penetrations: Apply insulation for interior applications to a point even with top of roof flashing.
   1. Seal penetrations with vapor-retarder mastic.
   2. Apply insulation for exterior applications tightly joined to interior insulation ends.
   3. Extend metal jacket of exterior insulation outside roof flashing at least 2 inches below top of roof flashing.
   4. Seal metal jacket to roof flashing with vapor-retarder mastic.

Q. Exterior Wall Penetrations: For penetrations of below-grade exterior walls, terminate insulation flush with mechanical sleeve seal. Seal terminations with vapor-retarder mastic.

R. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and floors.

S. Fire-Rated Wall and Partition Penetrations: Apply insulation continuously through penetrations of fire-rated walls and partitions.
   1. Firestopping and fire-resistive joint sealers are specified in Division 7 Section "Firestopping."

T. Floor Penetrations: Apply insulation continuously through floor assembly.
   1. For insulation with vapor retarders, seal insulation with vapor-retarder mastic where floor supports penetrate vapor retarder.

3.4 CELLULAR-GLASS INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:
   1. Secure each layer of insulation to pipe with wire, tape, or bands without deforming insulation materials.
   2. Where vapor retarders are indicated, seal longitudinal seams and end joints with vapor-retarder mastic.
   3. For insulation with factory-applied jackets, secure laps with outward clinched staples at 6 inches o.c.
   4. For insulation with factory-applied jackets with vapor retarders, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by the insulation material manufacturer and seal with vapor-retarder mastic.

B. Apply insulation to flanges as follows:
   1. Apply preformed pipe insulation to outer diameter of pipe flange.
   2. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation.
   3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of the same thickness as pipe insulation.
   4. Apply canvas jacket material with manufacturer's recommended adhesive, overlapping seams at least 1 inch, and seal joints with vapor-retarder mastic.

C. Apply insulation to fittings and elbows as follows:
   1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
   2. When premolded sections of insulation are not available, apply mitered sections of cellular-glass insulation. Secure insulation materials with wire, tape, or bands.

3. Cover fittings with heavy PVC fitting covers. Overlap PVC covers on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

D. Apply insulation to valves and specialties as follows:
1. Apply premolded segments of cellular-glass insulation or glass-fiber blanket insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation. For check valves, arrange insulation for access to strainer basket without disturbing insulation.
2. Apply insulation to flanges as specified for flange insulation application.
3. Use preformed standard PVC fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.
4. Use preformed heavy PVC fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.
5. For larger sizes where PVC fitting covers are not available, seal insulation with canvas jacket and sealing compound recommended by the insulation material manufacturer.

3.5 FLEXIBLE ELASTOMERIC INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:
1. Secure each layer of insulation to pipe with wire, tape, or bands without deforming insulation materials.
2. Where vapor retarders are indicated, seal longitudinal seams and end joints with vapor-retarder mastic.
3. For insulation with factory-applied jackets, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets with vapor retarders, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by the insulation material manufacturer and seal with vapor-retarder mastic.

B. Apply insulation to fittings and elbows as follows:
1. Install mitered sections of pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.6 FIELD-APPLIED JACKET APPLICATION

A. Apply glass-cloth jacket, where indicated, directly over bare insulation or insulation with factory-applied jackets.
1. Apply jacket smooth and tight to surface with 2-inch overlap at seams and joints.
2. Embed glass cloth between two 0.062-inch- thick coats of jacket manufacturer's recommended adhesive.
3. Completely encapsulate insulation with jacket, leaving no exposed raw insulation.

B. Foil and Paper Jackets: Apply foil and paper jackets where indicated.
1. Draw jacket material smooth and tight.
2. Apply lap or joint strips with the same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Apply jackets with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-retarder mastic.

C. Apply PVC jacket where indicated, with 1-inch overlap at longitudinal seams and end joints. Seal with manufacturer's recommended adhesive.

D. Apply metal jacket where indicated, with 2-inch overlap at longitudinal seams and end joints.

Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.7 FINISHES

A. Jacketed Insulation: Paint insulation finished as specified in Division 9 Section "Painting."

B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of the insulation manufacturer's recommended protective coating.

C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.

3.8 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
   1. Inspect pipe, fittings, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of fittings for each pipe service.

C. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements:

END OF SECTION

SECTION 23 09 00

INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 GENERAL DESCRIPTION

A. The Building Automation System shall be as indicated on the drawings and described in these specifications. System must be fully integrated and coordinated with mechanical equipment DDC controllers furnished and installed in the equipment manufacturer's factory as specified in those sections. The intent of the BAS is to integrate all mechanical equipment into one system for global monitoring, control, and alarming associated with the building. It is the BAS manufacturer's responsibility to provide all the design, engineering, and field coordination required to ensure all equipment sequence of operations are met as specified and the designated BAS operators have the capability of managing the building mechanical system to ensure occupant comfort while maintaining energy efficiency.

B. The BAS shall meet open standard protocol communication standards (As defined in System Communications Section) to ensure the system maintains "interoperability" to avoid proprietary arrangements that will make it difficult for the Owner to consider other BAS manufacturers in future projects.

C. Direct Digital Control (DDC) technology shall be used to provide the functions necessary for control of mechanical systems and terminal devices on this project.

D. Approved vendors, products and web services shall comply with SOC2 Type I as defined by the AICPA. SOC2 Type 1 compliance is a certification that confirms that a service provider has established and implemented effective controls to secure their clients' data in accordance with the Trust Services Criteria (TSC).

1. SOC2 Type 1 compliance provides assurance to customers that the service provider has established and implemented effective security controls and is committed to protecting their data.
2. To achieve SOC2 Type 1 compliance, the manufacturer shall have completed an independent audit to assess design and implementation of their controls, policies, and procedures.

E. The BAS shall accommodate simultaneous multiple user operation. Access to the control system data should be limited only by the security permissions of the operator role. Multiple users shall have access to all valid system data. An operator shall be able to log onto any workstation on the control system and have access to all appropriate data.

1.3 MANUFACTURERS

A. Trane Tracer®– Basis of Design.

1.4 QUALITY ASSURANCE

A. BAS Manufacturer Qualifications

1. The BAS manufacturer shall have an established business office within 50.00 miles of the project site and must provide 24 hours/day, 7 days/week response in the event of a customer warranty or service call.
2. The BAS Manufacturer shall have factory trained and certified personnel providing all engineering, service, startup, and commissioning field labor for the project from their local office location. BAS manufacturer shall be able to provide training certifications for all local office personnel upon request.
3. The BAS shall be provided by a single manufacturer and this manufacturer's equipment

must consist of operator workstation software, Web-based hardware/software, Open Standard Protocol hardware/software, Custom application Programming Language, Graphical Programming Language, Building Controllers, Custom Application Controllers, and Application Specific Controllers. All other products specified herein (i.e., sensors, valves, dampers, actuators, etc.) need not be manufactured by the BAS manufacturer listed in this specification.

4. Independent representatives of BAS manufacturers are not acceptable. BAS vendor must be corporate owned entity of BAS manufacturer.

1.5 CODES AND STANDARDS

A. Codes and Standards: Meet requirements of all applicable standards and codes, except when more detailed or stringent requirements are indicated by the Contract Documents, including requirements of this Section.
   1. Underwriters Laboratories: Products shall be UL-916-PAZX listed.
   2. National Electrical Code -- NFPA 70.
   3. Federal Communications Commission -- Part J.
   4. ASHRAE/ANSI 135-2012 (BACnet) - (System Level Devices) - Building Controllers shall conform to the listed version of the BACnet specification in order to improve interoperability with various building system manufacturers' control systems and devices.
   5. ASHRAE/ANSI 135-2012 (BACnet) - (Unit Level Devices) - Unit Controllers shall conform to the listed version of the BACnet specification in order to improve interoperability with various building system manufacturers' control systems and devices.

1.6 SYSTEM PERFORMANCE

A. Performance Standards. The BAS system shall conform to the following:
   1. Graphic Display. The system shall display a graphic with a minimum of 20 dynamic points. All current data shall be displayed within 10 seconds of the operator's request.
   2. Graphic Refresh. The system shall update all dynamic points with current data within 10 seconds.
   3. Object Command. The maximum time between the command of a binary object by the operator and the reaction by the device shall be 5 seconds. Analog objects shall start to adjust within 5 seconds.
   4. Object Scan. All changes of state and change of analog values shall be transmitted over the high-speed network such that any data used or displayed at a controller or workstation will be current within the prior 10 seconds.
   5. Alarm Response Time. The maximum time from when an object goes into alarm to when it is annunciated at the workstation shall not exceed 10 seconds.
   6. Program Execution Frequency. Custom and standard applications shall be capable of running as often as once every 5 seconds. The Contractor shall be responsible for selecting execution times consistent with the mechanical process under control.
   7. Programmable Controllers shall be able to execute DDC PID control loops at a selectable frequency from at least once every 5 seconds. The controller shall scan and update the process value and output generated by this calculation at this same frequency.
   8. Multiple Alarm Annunciations. All workstations on the network shall receive alarms within 5 seconds of each other.

1.7 SUBMITTALS

A. BAS manufacturer shall provide shop drawings and manufacturers' standard specification data sheets on all hardware and software being provided for this project. No work may begin on any segment of this project until the Engineer and Owner have reviewed submittals for conformity with the plan and specifications.
   1. Provide electronic submittal package in PDF format for review and approval. Dielectric fittings.

B. Quantities of items submitted shall be reviewed by the Engineer and Owner. Such review shall not relieve the BAS manufacturer of furnishing quantities required based upon contract

documents.

C. Provide the Engineer and Owner, any additional information or data which is deemed necessary to determine compliance with the specifications or which is deemed valuable in documenting and understanding the system to be installed.

D. All shop drawings shall be provided to the Owner electronically as .dwg or .dxf file formats once they have been approved and as-built drawings have been completed.

E. Submit the following within 90 days of contract award:
   1. A complete bill of materials of equipment to be used indicating quantities, manufacturers and model numbers.
   2. A schedule of all control valves including the valve size, pressure drop, model number (including pattern and connections), flow, CV, body pressure rating, and location.
   3. A schedule of all control dampers including damper size, pressure drop, manufacturer, and model number.
   4. Provide all manufacturers' technical cut sheets for major system components. When technical cut sheets apply to a product series rather than a specific product, the data specifically applicable to the project shall be highlighted or clearly indicated by other means. Include:
      a. Building Controllers
      b. Custom Application Controllers
      c. Application Specific Controllers

d. Auxiliary Control Devices
   5. Provide proposed Building Automation System architectural diagram depicting various controller types, workstations, device locations, addresses, and communication cable requirements
   6. Provide detailed termination drawings showing all required field and factory terminations, as well as terminal tie-ins to DDC controls provided by mechanical equipment manufacturers. Terminal numbers shall be clearly labeled.
   7. Provide a sequence of operation for each controlled mechanical system and terminal end devices.
   8. Provide a BACnet Protocol Implementation Conformance Statement (PICS) for each BACnet system level device (i.e. Building Controller & Operator Workstations) type. This defines the points list for proper coordination of interoperability with other building systems if applicable for this project.

F. Project Record Documents: Upon completion of installation, submit three (3) copies of record (as-built) documents. The documents shall be submitted for approval prior to final completion and include:
   1. Project Record Drawings - These shall be as-built versions of the submittal shop drawings. One set of electronic media including CAD .dwg and .pdf drawing files shall be provided.
   2. Testing and Commissioning Reports and Checklists signed off by trained factory (equipment manufacturers) and field (BAS) commissioning personnel.
   3. Operating and Maintenance (O & M) Manuals - These shall be as-built versions of the submittal product data. In addition to the information required for the submittals, Operating & Maintenance manual shall include:
      a. Procedures for operating the BAS including logging on/off, alarm management, generation of reports, trends, overrides of computer control, modification of setpoints, and other interactive system requirements.
      b. Explanation of how to design and install new points, new DDC controllers, and other BAS hardware.
      c. Documentation, installation, and maintenance information for all third party hardware/software products provided including personal computers, printers, hubs, sensors, valves, etc.
      d. Original issue media for all software provided, including operating systems, programming language, operator workstation software, and graphics software.
      e. Licenses, Guarantee, and Warranty documents for all equipment and systems.

G. Training Manuals: The BAS manufacturer shall provide a course outline and copies of training

manuals at least two weeks prior to the start of any corporate training class to be attended by the Owner.

1.8 WARRANTY REQUIREMENTS

A. BAS system labor and materials shall be warranted free from defects for a period of twelve (12) months after final completion acceptance by the Owner. BAS failures during the warranty period shall be adjusted, repaired, or replaced at no charge to the Owner. The BAS manufacturer shall respond to the Owner's request for warranty service within 24 hours of the initiated call and will occur during normal business hours (8AM-5PM).

B. At the end of the final start-up/testing, if equipment and systems are operating satisfactorily to the Owner and Engineer, the Owner shall sign certificates certifying that the BAS is operational, and has been tested and accepted in accordance with the terms of this specification. The date of Owner's acceptance shall be the start of the warranty period.

C. To ensure that the owner will have the most current operating system provided by the manufacturer, the BAS manufacturer shall include licensing and labor costs to facilitate software/firmware updates throughout the warranty period at no charge to the owner. These updates shall include upgrades for functional enhancements associated with the following: operator workstation software, project specific software, graphics, database, firmware updates, and all security related service packs. Written authorization by the Owner must be granted prior to the installation of these updates.

D. The BAS manufacturer shall provide a web-accessible Users Network for the proposed System and give the Owner free access to question/answer forum, user tips, upgrades, and training schedules for a one year period of time correlating with the warranty period.

1.9 OWNERSHIP OF PROPRIETARY MATERIAL

A. Project specific software and documentation shall become the owner’s property upon project completion.

1.10 OWNERSHIP OF PROPRIETARY MATERIAL

A. DDC: Direct digital control

B. I/O: Input/output.

C. MS/TP: Manager Subordinate / Token Passing.

D. POT: Portable Operator’s Terminal.

E. PID: Proportional plus integral plus derivative.

F. RTD: Resistance temperature detector.

G. BAS/ATC: Building Automation System/Automatic Temperature Controls.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Use new products that the manufacturer is currently manufacturing and that have been installed in a minimum of 25 installations. Do not use this installation as a product test site unless explicitly approved in writing by the owner or the owner’s representative. Spare parts shall be available for at least five years after completion of this contract.

2.2 SYSTEM COMMUNICATION

A. System Communications

1. Each workstation, building controller, and equipment controller communication interface shall utilize the BACnet™ protocol with an Ethernet (IEEE 802.3), Wi-Fi (IEEE 802.11), RS485 (EIA-485), or Zigbee® (802.15.4) physical interface and an appropriate data link

technology as defined in ANSI®/ASHRAE® Standard 135-2012. (e.g. BACnet over IP, BACnet over IPv6, BACnet SC, BACnet over MS/TP, BACnet Zigbee).

2. All system controllers shall be BTL listed as a BACnet Building Controller (B-BC) as defined in ANSI®/ASHRAE® Standard 135-2012.
3. All documented status and control points, schedule, alarm, and data-log services or objects shall be available as standard object types as defined in ANSI®/ASHRAE® Standard 135-2012.
4. Each System Controller shall communicate with a network of Custom Application and Application Specific Controllers utilizing one or more of the interfaces documented within Field Bus Communications below.
5. All Operator Workstations (B-OWS, B-AWS) and Building Controllers (B-BC) shall support BACnet Secure Connect (BACnet SC), a secure and encrypted datalink layer specifically designed for those networks.

B. Field Bus Communications
   1. BACnet™
      a. All equipment and plant controllers shall be BTL listed as a BACnet Application Specific Controller (B-ASC) or a BACnet Advanced Application Controller (B-AAC) as defined in ANSI®/ASHRAE® Standard 135-2012.
      b. All communication shall conform to ANSI®/ASHRAE® Standard 135-2012.
      c. System Controller shall function as a BACnet router to each unit controller providing a globally unique BACnet Device ID for all BACnet controllers within the system.
      d. BACnet Zigbee®
         i. Communication between System Controller and equipment/plant controllers shall utilize BACnet Zigbee as defined in ANSI®/ASHRAE® Standard 135-2012.
         ii. Each equipment controller wireless communication interface shall self-heal to maintain operation in the event of network communication failure.
         iii. Each zone sensor wireless communication interface shall be capable of many-to-one sensors per controller to support averaging, monitoring, and multiple zone applications. Sensing options shall include temperature, relative humidity, CO2, and occupancy.
      e. BACnet MS/TP
         i. Communication between System Controller and equipment/plant controllers shall utilize BACnet MS/TP as defined in ANSI®/ASHRAE® Standard 135-2012.

C. Variable Refrigerant Flow (VRF) Communications
   1. The VRF system shall communicate with the BAS using one of the following communications methods.
      a. The VRF system and the BAS shall utilize ANSI®/ASHRAE® Standard 135 (BACnet) protocol revision 12 or greater.
      b. Recognizing that VRF manufacturers utilize proprietary protocols to pass information between VRF equipment components. A gateway device is an accepted method to convert proprietary data to BACnet data. BACnet data shall conform to BACnet protocol revision 12 or greater.
      c. When a device is capable of data exchange with the BACnet protocol across non-IP network segments, the BACnet protocol shall be used to exchange data. If a device does not support the BACnet protocol an alternative protocol may be used. Data exchanged using the alternative protocol shall be converted to the BACnet protocol to allow integration to the BAS.
   2. To promote BAS interoperability, each instance of the following VRF system components shall be visible to the BAS network as a virtual BACnet device.
      a. Indoor equipment
      b. Outdoor equipment
      c. Refrigerant manifold devices
      d. Outdoor air ventilation systems
   3. Virtual BACnet device functionality shall conform to BACnet protocol revision 12 or greater and meet the minimum functionality defined by BACnet device profile B-ASC.

2.3 BUILDING CONTROLLER - OPERATOR INTERFACE

A. Provide Building Controller Web Interface

1. Manufacturer shall provide a user interface with time-of-day schedules, data collection, dashboards, reports and building summary, system applications, and self-expiring timed overrides. Manufacturer shall provide a published user and applications guide(s) that detail the system application operation, configuration, setup and troubleshooting.
2. The building controller web interface shall be accessible via a web browser without requiring any “plug-ins” (i.e. JAVA Runtime Environment (JRE), Adobe Flash).
3. User Roles
    a. The system shall include pre-defined “roles” that allow a system administrator to quickly assign permissions to a user.
    b. User logon/logoff attempts shall be recorded.

c. The system shall protect itself from unauthorized use by automatically logging off following the last keystroke. The delay time shall be user definable.

4. On-Line Help and Training

a. Provide a context sensitive, on line help system to assist the operator in operation and configuration of the system.

b. On-line help shall be available for all system functions and shall provide the relevant data for each particular screen.

5. Equipment & Application Pages
    a. The building controller web interface shall include standard pages for all equipment and applications. These pages shall allow an operator to obtain information relevant to the operation of the equipment and/or application, including:
        i. Alarms relevant to the equipment or application without requiring a user to navigate to an alarm page and perform a filter.
        ii. Historical Data (As defined in Trend Logs section of CONTROLLER SOFTWARE) for the equipment or application without requiring a user to navigate to a Data Log page and perform a filter.

6. Building Controller System Graphics.

a. The building operator web interface shall be graphically based and shall include at least one graphic per piece of equipment or occupied zone, graphics for each chilled water and hot water system, and graphics that summarize conditions on each floor of each building included in this contract. Indicate thermal comfort on floor plan summary graphics using colors to represent zone temperature relative to zone set point.

b. Graphic imagery – graphics shall use 3D images for all standard and custom graphics. The only allowable exceptions will be photo images, maps, schematic drawings, and selected floor plans.

c. Animation. Graphics shall be able to animate by displaying different Image lies for changed object status.

d. Alarm Indication. Indicate areas or equipment in an alarm condition using color or other visual indicator.

7. Graphics Library. Furnish a library of standard HVAC equipment such as chillers, air handlers, terminals, fan coils, unit ventilators, rooftop units, and VAV boxes, in 3-dimensional graphic depictions. The library shall be furnished in a file format compatible with the graphics generation package program.

8. Manual Control and Override
    a. Point Control. Provide a method for a user to view, override, and edit if applicable, the status of any object and property in the system. The point status shall be available by menu, on graphics or through custom programs.
    b. Temporary Overrides. The user shall be able to perform a temporary override wherever an override is allowed, automatically removing the override after a specified period of time.
    c. Override Owners. The system shall convey to the user the owner of each override for all priorities that an override exists.
    d. Provide a specific icon to show timed override or operator override, when a point, unit controller or application has been overridden manually.

9. Scheduling. - The scheduling application shall provide graphical representation of the day, week,

month and exception events.

10. Alarm/Event Notification

a. Alarm/Event Log. The operator shall be able to view all logged system alarms/events from any building operator web interface.

i. The operator shall be able to sort and filter alarms from events. Alarms shall be sorted in a minimum of 4 categories based on severity.

ii. The operator shall be able to acknowledge and add comments to alarms.

iii. Alarm/event messages shall use full language, easily recognized descriptors.

b. Alarm Suppression. Alarms shall be able to be suppressed based on load/source relationships to present the likely root cause to the building operator as described in ASHRAE Guideline 36. Load/Source relationships shall be configurable by the user through a web interface.

11. Reports and Logs

a. The building operator web interface shall provide a reporting package that allows the operator to select reports.

b. The building operator web interface shall provide the ability to schedule reports to run at specified intervals of time.

c. The following standard reports shall be available without requiring a user to manually configure the report:

i. All Points in Alarm Report: Provide an on demand report showing all current alarms.

ii. All Points in Override Report: Provide an on demand report showing all overrides in effect.

iii. Commissioning Report: Provide a one-time report that lists all equipment with the unit configuration and present operation.

iv. Points report: Provide a report that lists the current value of all points.

d. The controls vendor shall provide a hardening report that summarizes the port configuration details to ensure sites have not been exposed to the Internet in alignment with Cyber Security best practices.

B. Provide Mobile App Interface

1. Provide mobile (smart phone or tablet) interfaces to the building automation system, compatible with iOS and Android™ operating systems.

2. Controls manufacturer shall provide a phone/tablet interface with the ability to view/override status & setpoints, view/change schedules, view/acknowledge/comment on alarms, and view graphics for all spaces and equipment.

3. This phone/tablet interface shall resize itself appropriately for the size of the interface (i.e. no "pinching & zooming" required).

4. This phone/tablet interface shall function remotely from the facility while following IT security best-practices (e.g. no ports exposed to the internet).

5. The operator interface shall support system access on a mobile device via a mobile app.

2.4 BUILDING CONTROLLER SOFTWARE

A. Manufacturer shall provide standard applications to deliver HVAC system control. Standard applications include Time of Day Scheduling with Optimal Start/Stop, VAV Air Systems Control, Chiller Plant Control, Historical Trend Logs and Trim and Respond. Manufacturer shall provide system optimization strategies for functions such as fan pressure optimization and ventilation optimization.

B. Furnish the following applications software for building and energy management. All software applications shall reside and run in the system controllers. Editing of applications shall occur at the building operator interface.

1. Trend Logs

a. The system shall harvest trend logs for defined key measurements for each controlled HVAC device and HVAC application. Trend logs shall be captured for a minimum of 5 key operating points for each piece of HVAC equipment and HVAC application and stored for no less than 1 year at 15-minute intervals. Data Logs shall

be capable of being configured on an interval or change of value basis.

2.5 BUILDING / SYSTEM CONTROLLERS

A. There shall be one or more independent, standalone microprocessor based System Controllers to manage the global strategies described in CONTROLLER SOFTWARE section.

1. The controller shall provide a USB communications port for connection to a PC.
2. The operating system of the Controller shall manage the input and output communications signals to allow distributed controllers to share real and virtual point information and allow central monitoring and alarms.
3. All System Controllers shall have a real time clock and shall be able to accept a BACnet time synchronization command for automatic time synchronization.
4. Data shall be shared between networked System Controllers.
5. Serviceability – The System Controller shall have a display on the main board that indicates the current operating mode of the controller.

B. Controls manufacturer shall provide secure remote access to the Building Automation System (BAS). Secure remote access shall not require IP ports to be "exposed" (i.e. port-forwarded or external public IP addresses) to the Internet. Controls manufacturer shall update secure remote access software as necessary to follow cyber security best practices and respond to cyber security events.

2.6 ADVANCED APPLICATION CONTROLLERS

A. Advance Application Controllers shall be used to control all equipment or applications of medium and high complexity.

B. The Advanced Application Controller shall be capable of operating as a stand-alone controller or as a member of a Building Automation System (BAS).

C. When the Advanced Application Controller is operating as a member of a Building Automation System (BAS), the application controller shall operate as follows:

1. Application Controller will receive operation mode commands from the BAS network controller. The BAS commands shall include but not be limited to the follow: Occupied Heat/Cool, Unoccupied Heat/Cool, Morning Warm-up, / Pre-cool, Occupied Bypass).
2. Application Controller will provide equipment status parameters to the BAS through BACnet communication.
3. Application Controller will operate as a stand-alone controller in the event of communication failure with the BAS.
4. In case of communications failure, stand-alone operation shall use default values or last known values for remote sensors read over the network such as outdoor air temperature.

D. For Stand-Alone Operation of Advanced Application Controllers:

1. Shall operate a schedule in a standalone application using a Real Time Clock with a 7 day power backup.
   a. The Controller shall have a built in schedule (assessable with or without a display)
   b. Support will be for at least 3 schedules with up to 10 events for each day of the week.
   c. Each of the 3 schedules can be Analog, Binary or Multi-State
   d. The controller shall support a minimum of 25 exceptions each with up to 10 events.

E. For ease of troubleshooting, the Controller shall support data trend logging.

1. Trends shall be capable of being collected at a minimum sample rate of once every second
2. Shall be capable of trending all BACnet points used by controller
3. Trends shall be capable of being scheduled or triggered.
4. With a minimum of 20,000 trending points total on a controller

F. To meet the sequence of operation for each application, the Controller shall use library programs provided by the controller manufacturer that are either factory loaded or downloaded with service tool to the controller.

G. Environment. Controller hardware shall be suitable for the anticipated ambient conditions.

1. Operating conditions:

a. Temperature: -40°F to 158°F.
b. Relative Humidity: Between 5% to 100% RH (non-condensing).

2. Controllers used indoors shall be mounted in a NEMA 1 enclosure at a minimum.
3. Controllers used outdoors and/or in wet ambient shall be mounted within NEMA 4 type waterproof enclosures, and shall be rated for operation at -40° F to 158° F.

H. Input/Output: The Controller shall have on board or through expansion module all I/O capable of performing all functionality needed for the application. Controls provided by the equipment manufacture must supply the required I/O for the equipment. In addition other controls must meet the following requirements:

1. Shall support flexibility in valve type, the controllers shall be capable of supporting the following valve control types: 0-10VDC, 0-5VDC, 4-20mA, 24VAC - 2 position.
2. Shall support flexibility in sensor type, the Controller shall be capable of reading sensor input ranges of 0 to10V, 0 to 20mA, 50ms or longer pulses, 200 to 20Kohm and RTD input.
3. Shall support flexibility in sensor type, all Analog Outputs shall have the additional capability of being programmed to operate as Universal Inputs or Pulse Width Modulation Outputs.
4. Shall support flexibility in sensor type, the Controller and/or expansion modules shall support dry and wetted (24VAC) binary inputs.
5. The controller shall support pulse accumulator for connecting devices like energy meters.
6. In order to support a wide range of devices, the Controller's binary output shall be able to drive at least 10VA each.
7. Any unused I/O that is not needed for the functionality of the equipment shall be available to be used by custom programs on the Controller and by any other controller on the network.
8. The Controller shall provide 24VAC and 24VDC power terminals sensors and other devices required.
9. The Controller shall provide a dedicated static pressure input.

I. Input/Output Expandability – The Controller shall provide the following functionality in order to meet current and future application needs:

1. For the application flexibility, the Controller shall be capable of expanding to a total of at least 100 hardware I/O terminations.
2. Expansion I/O can be mounted up to 650 ft. (200m) from control.
3. To keep BACnet MS/TP network traffic to a minimum, expansion I/O must communicate via an internal controller communication bus (point expansion via the BACnet MS/TP network is not allowed).

J. Serviceability – The Controller shall provide the following in order to improve serviceability of the Controller.

1. Diagnostic LEDs for power/normal operation/status, BACnet communications, sensor bus communications, and binary outputs. All wiring connections shall be clearly labeled and made to be field removable.
2. Binary and analog inputs and outputs shall use removable connectors or be connected to terminal strip external to the control box.
3. Software service tool connection through the following methods: direct cable connection to the Controller, connection through another controller on BACnet link.
4. For safety purposes, the controller shall be capable of being powered by a portable computer's USB port for the purposes of configuration, programming and testing programs so that this work can be accomplished with the power off to the associated equipment.
5. The Controller software tool service port shall utilize standard off-the-shelf USB printer cable.
6. Capabilities to temporarily override the BACnet point values with built-in time expiration in the Controller.
7. To aid in service replacement, the Controller shall easily attached to standard DIN rail mounting.
8. For future expansion, the Controller shall be capable of adding sequence of operation programming utilizing service tools software with a graphical programming interface (editing or programming in line code is not permissible).

9. To aid in service replacement, the Controller shall allow for setting its BACnet address via controller mounted rotary switches that correspond to the numerical value of the address. (DIP switch methodologies are not allowed). Setting of the address shall be accomplished without the need of a service tool or power applied to the controller.
10. Controller data shall be maintained through a power failure.

K. Software Retention: All Controller operating parameters, setpoints, BIOS, and sequence of operation code must be stored in non-volatile memory in order to maintain such information for months without power.

L. Controller must meet the following Agency Compliance:
1. UL916 PAZX, Open Energy Management Equipment
2. UL94-5V, Flammability
3. FCC Part 15, Subpart B, Class B Limit
4. BACnet Testing Laboratory (BTL) listed as BACnet Advanced Application Controller (B-AAC)

2.7 APPLICATION SPECIFIC CONTROLLERS:

A. General Description
1. Application Specific Controllers (ASC) shall be microprocessor-based DDC controllers which, through hardware or firmware design, control specified equipment. They are not user programmable, but are customized for operation within the confines of the equipment they are designed to serve.
2. Zone Controllers are controllers that operate equipment that control the space temperature of single zone. Examples are controllers for VAV, Fan coil, Blower Coils, Unit Ventilators, Heat Pumps, and Water Source Heat Pumps.

B. The Application Specific Controller shall be capable of operating as a stand-alone controller or as a member of a Building Automation System (BAS).

C. When the Application Specific Controller is operating as a member of a Building Automation System (BAS), the application controller shall operate as follows:
1. Application Controller will receive operation mode commands from the BAS network controller. The BAS commands shall include but not be limited to the follow: Occupied Heat/Cool, Unoccupied Heat/Cool, Morning Warm-up, / Pre-cool, Occupied Bypass).
2. Application Controller will provide equipment status parameters to the BAS through BACnet communication.
3. Application Controller will operate as a stand-alone controller in the event of communication failure with the BAS.
4. In case of communications failure stand-alone operation shall use default values or last known values for remote sensors read over the network such as outdoor air temperature.

D. Stand-Alone Operation: Each piece of equipment specified in section “A” shall be controlled by a single controller and provide stand-alone control in the event that a BAS is not present.

E. Software
1. To meet the sequence of operation for each zone control, the controller shall use programs developed and tested by the controller manufacturer that are either factory loaded or downloaded with service tool to the controller.
2. For controlling ancillary devices and for flexibility to change the sequence of operation in the future, the controller shall be capable running custom programs written in a graphical programming language.

F. Environment: Controller hardware shall be suitable for the anticipated ambient conditions.
1. Storage: -55° to 203° F and 5 to 95% Rh, non-condensing.
2. Operating: -40° to 158° F and 5 to 95% Rh, non-condensing.
3. Controllers used indoors shall be mounted in a NEMA 1 enclosure at a minimum.
4. Controllers used outdoors and/or in wet ambient shall be mounted within NEMA 4 type waterproof enclosures, and shall be rated for operation at -40° to 158° F.

G. Input/Output:

1. For flexibility in selection and replacement of valves, the controllers shall be capable of supporting all of the following valve control types 0-10VDC, 0-5VDC, 4-20mA, 24VAC floating point, 24VAC - 2 position (Normally Open or Normally Closed).
2. For flexibility in selection and replacement of sensors, the controllers shall be capable of reading sensor input ranges of 0 to10V, 0 to 20mA, pulse counts, and 200 to 20Kohm.
3. For flexibility in selection and replacement of binary devices, the controller shall support dry and wetted (24VAC) binary inputs.
4. For flexibility in selection and replacement devices, the controller's shall have binary output which are able to drive at least 12VA each.
5. For flexibility in selection and replacement of motors, the controller shall be capable of outputting 24VAC (binary output), DC voltage (0 to 10VDC minimum range) and PWM (in the 80 to 100 Hz range).
6. For future needs, any I/O that is unused by functionality of equipment control shall be available to be used by custom program on the controller and by another controller on the network.
7. For future expansion and flexibility, the controller shall have either on board or through expansion, 20 hardware input/output points. Expansion points must communicate with the controller via an internal communications bus. Expansion points must be capable of being mounted up to 650ft. (200 m) from the controller. Expansion points that require the BACnet network for communication with the controller are not allowed.

H. Serviceability – The controller shall provide the following in order to improve serviceability of the controller.

1. Diagnostic LEDs shall indicate correct operation or failures/faults for all of the following: power, sensors, BACnet communications, and I/O communications bus.
2. All binary output shall have LED's indicating the output state.
3. All wiring connectors shall removable without the use of a tool.
4. Software service tool connection through all of the following methods: direct cable connection to the controller, connection through another controller on BACnet link
5. For safety purposes, the controller shall be capable of being powered by a portable computer for the purposes of configuration, programming, and testing programs so that this work can be accomplished with the power off to the equipment.
6. Capabilities to temporarily override of BACnet point values with built-in time expiration in the controller.
7. BACnet MAC Address shall be set using decimal (0-9) based rotary switches.
    a. Configuration change shall not be made in a programming environment, but rather by a configuration page utilizing dropdown list, check boxes, and numeric boxes.
8. For ease of troubleshooting, the Controller shall support BACnet data trend logging.
    a. With a minimum of 20,000 trending points total on controller
    b. Trends shall be capable of being collected at a minimum sample rate of once every second.
    c. Shall be capable of trending all BACnet points used by controller
    d. Trends shall be capable of being scheduled or triggered

I. Software Retention: All Zone Controller operating parameters, setpoints, BIOS, and sequence of operation code must be stored in non-volatile memory in order to maintain such information for months without power.

J. Application controller shall meet the following Agency Compliance:

1. UL916 PAZX, Open Energy Management Equipment
2. UL94-5V, Flammability
3. FCC Part 15, Subpart B, Class B Limit
4. BACnet Testing Laboratory (BTL) listed as BACnet Application Specific Controller (B-ASC)

2.8 INPUT/OUTPUT INTERFACE:

A. Hardwired inputs and outputs may tie into the system through building, custom application, or ASCs.

B. All input points and output points shall be protected such that shorting of the point to itself, to

another point, or to ground will cause no damage to the controller. All input and output points shall be protected from voltage up to 24V of any duration, such that contact with this voltage will cause no damage to the controller.

C. Binary inputs shall allow the monitoring of on/off signals from remote devices. The binary inputs shall provide a wetting current of at least 12 mA to be compatible with commonly available control devices and shall be protected against the effects of contact bounce and noise. Binary inputs shall sense “dry contact” closure without external power (other than that provided by the controller) being applied.

D. Pulse accumulation input objects. This type of object shall conform to all the requirements of binary input objects and also accept up to 10 pulses per second for pulse accumulation.

E. Analog inputs shall allow the monitoring of low voltage (0 to 10 VDC), current (4 to 20 mA), or resistance signals (thermistor, RTD). Analog inputs shall be compatible with and field configurable to commonly available sensing devices.

F. Binary outputs shall provide for on/off operation or a pulsed low-voltage signal for pulse width modulation control. Binary outputs on building and custom application controllers shall have status lights. Outputs shall be selectable for either normally open or normally closed operation.

G. Analog outputs shall provide a modulating signal for the control of end devices. Outputs shall provide either a 0 to 10VDC or a 4 to 20 mA signal as required to provide proper control of the output device. Analog outputs shall not exhibit a drift of greater than 0.4% of range per year.

H. Tri-State Outputs. Provide tri-state outputs (two coordinated binary outputs) for control of three-point floating type electronic actuators without feedback. Use of three-point floating devices shall be limited to zone control and terminal unit control applications (VAV terminal units, duct-mounted heating coils, zone dampers, radiation, etc.). Control algorithms shall run the zone actuator to one end of its stroke once every 24 hours for verification of operator tracking.

I. System Object Capacity. The system size shall be expandable to at least twice the number of input/ output objects required for this project. Additional controllers (along with associated devices and wiring) shall be all that is necessary to achieve this capacity requirement. The operator interfaces installed for this project shall not require any hardware additions or software revisions in order to expand the system.

2.9 POWER SUPPLIES:

A. Control transformers shall be UL listed. Furnish Class 2 current-limiting type or furnish overcurrent protection in both primary and secondary circuits for Class 2 service in accordance with NEC requirements. Limit connected loads to 80% of rated capacity.

1. DC power supply output shall match output current and voltage requirements. Unit shall be full-wave rectifier type with output ripple of 5.0 mV maximum peak-to-peak. Regulation shall be 1.0% line and load combined, with 100-microsecond response time for 50% load changes. Unit shall have built-in overvoltage and overcurrent protection and shall be able to withstand a 150% current overload for at least three seconds without trip-out or failure.
    a. Unit shall operate between 0°C and 50°C (32°F and 120°F). EM/RF shall meet FCC Class B and VDE 0871 for Class B and MIL-STD 810C for shock and vibration.
    b. Line voltage units shall be UL recognized and CSA approved.

2.10 AUXILLARY CONTROL DEVICES:

A. Electric damper/valve actuators

1. The actuator shall have electronic overload or digital rotation sensing circuitry to prevent damage to the actuator throughout the rotation of the actuator.
2. Where shown, for power-failure/safety applications, an internal mechanical, spring return mechanism shall be built into the actuator housing.
3. Proportional actuators shall accept a 0-10 VDC or 0-20 ma control signal and provide a 2-10 VDC or 4-20 ma operating range.
4. All non-spring return actuators shall have an external manual gear release to allow manual positioning of the damper when the actuator is not powered. Spring return actuators with more

than 60 in-lb. torque capacity shall have a manual crank for this purpose.

5. Actuators shall be provided with a conduit fitting and a minimum 1m electrical cable and shall be pre-wired to eliminate the necessity of opening the actuator housing to make electrical connections.
6. Actuators shall be Underwriters Laboratories Standard 873 listed.
7. Actuators shall be designed for a minimum of 60,000 full stroke cycles at the actuator's rated torque.

B. Binary Temperature Devices

1. Low-voltage space thermostat shall be 24 V, bimetal-operated, mercury-switch type, with either adjustable or fixed anticipation heater, concealed setpoint adjustment, 13°C to 30°C (55°F to 85°F) setpoint range, 1°C (2°F) maximum differential, and vented ABS plastic cover.
2. Line-voltage space thermostat shall be bimetal-actuated, open contact type, or bellows-actuated, enclosed, snap-switch type or equivalent solid-state type, with heat anticipator, UL listed for electrical rating, concealed setpoint adjustment, 13°C to 30°C (55°F to 85°F) setpoint range, 1°C (2°F) maximum differential, and vented ABS plastic cover.
3. Low-limit thermostats. Low-limit airstream thermostats shall be UL listed, vapor pressure type, with an element of 6 m (20 ft) minimum length. Element shall respond to the lowest temperature sensed by any 30 cm (1 ft) section. The low-limit thermostat shall be manual reset only.

C. Wired Temperature Sensors

1. Temperature sensors shall be RTD or thermistor.
2. Duct sensors shall be single point or averaging as shown. Averaging sensors shall be a minimum of 1.5 m (5 ft) in length per 1 m2 (10 ft2) of duct cross section.
3. Space sensors shall be equipped with setpoint adjustment, override switch, display, and/or communication port as shown on plans.
4. Provide matched temperature sensors for differential temperature measurement.

D. Wired Humidity Sensors

1. Duct and room sensors shall have a sensing range of 20% to 80%.
2. Duct sensors shall be provided with a sampling chamber.

E. Static Pressure Sensors

1. Sensor shall have linear output signal. Zero and span shall be field-adjustable.
2. Sensor sensing elements shall withstand continuous operating conditions plus or minus 50% greater than calibrated span without damage.

F. Low Limit Thermostats

1. Safety low limit thermostats shall be vapor pressure type with an element 6m [20 ft] minimum length. Element shall respond to the lowest temperature sensed by any one foot section.
2. Low limit shall be manual reset only.

2.11 WIRING AND RACEWAYS:

A. General: Provide copper wiring, plenum cable, and raceways as specified in the applicable sections of this specification.

B. All insulated wire to be copper conductors, UL labeled for 90°C (194°F) minimum service.

C. Fiber Optic Cable. Optical cables shall be duplex 900 mm tight-buffer construction designed for intra-building environments. The sheath shall be UL Listed OFNP in accordance with NEC Article 770. The optical fiber shall meet the requirements of FDDI, ANSI X3T9.5 PMD for 62.5/125 µm.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 Sections specifying piping systems.

1. Cut sleeves to length for mounting flush with both surfaces.
   a. Exception: Extend sleeves installed in floors of mechanical equipment areas or

other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:
   a. Steel Pipe Sleeves: For pipes smaller than NPS 6.
   b. Steel Sheet Sleeves: For pipes NPS 6 and larger, penetrating gypsum-board partitions.
   c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing.
      Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Refer to Division 7 Section "Sheet Metal Flashing and Trim" for flashing.
      1) Seal space outside of sleeve fittings with grout.
4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 7 Section "Joint Sealants" for materials and installation.

3.2 EXAMINATION:

A. The Contract Documents shall be thoroughly examined for coordination of control devices, their installation, wiring, and commissioning. Coordinate and review mechanical equipment specifications, locations, and identify any discrepancies, conflicts, or omissions that shall be reported to the Architect/Engineer for resolution before rough-in work is started.

B. The BAS manufacturer shall inspect the jobsite in order to verify that control equipment can be installed as required, and any discrepancies, conflicts, or omissions shall be reported to the Architect/Engineer for resolution before rough-in work is started.

3.3 PROTECTION:

A. The BAS installation contractor shall protect all work and material from damage by their work or personnel, and shall be liable for all damage thus caused.

B. The BAS manufacturer shall be responsible for their work and equipment until final inspection, testing, and acceptance. The BAS installing contractor shall protect their work against theft or damage, and shall carefully store material and equipment received on site that is not immediately installed. The Contractor shall close all open ends of work with temporary covers or plugs during storage and construction to prevent entry of foreign objects.

3.4 COORDINATION:

A. Site

1. Where the mechanical work will be installed in close proximity to, or will interfere with, work of other trades, the contractor shall assist in working out space conditions to make a satisfactory adjustment. If the contractor installs his/her work before coordinating with other trades, so as to cause any interference with work of other trades, the contractor shall make the necessary changes in his/her work to correct the condition without extra charge.
2. Coordinate and schedule work with all other work in the same area, or with work that is dependent upon other work, to facilitate mutual progress.

B. Submittals. Refer to the “Submittals,” section of this specification for requirements.

C. Test and Balance

1. The contractor shall furnish a single set of all tools necessary to interface to the control system for test and balance purposes.
2. The contractor shall provide training in the use of these tools. This training will be planned for a duration of 4 hours.
3. In addition, the contractor shall provide a qualified technician to assist in the test and balance

process, until the first 20 terminal units are balanced.

4. The tools used during the test and balance process shall be returned to the contractor at the completion of the testing and balancing.

D. Life Safety

1. Duct smoke detectors required for air handler shutdown shall be supplied under Section 26100 of this specification. The contractor shall interlock smoke detectors to air handlers for shutdown as described in the Sequences of Operation for this project.
2. Smoke dampers and actuators required for duct smoke isolation are provided under Section 26100. The contractor shall interlock these dampers to the air handlers as described in the Sequences of Operation for this project as applicable.
3. Fire/smoke dampers and actuators required for fire rated walls are provided under another Section 26100. Control of these dampers shall be by 26100

E. Coordination with Controls Specified in Other Sections or Divisions. Other sections and/or divisions of this specification include controls and control devices that are to be part of or interfaced to the control system specified in this section. These controls shall be integrated into the system and coordinated by the contractor as follows:

1. All communication media and equipment shall be provided as specified in the “Communication” section of this specification.
2. Each supplier of a controls product is responsible for the configuration, programming, start-up, and testing of that product to meet the sequences of operation described in this section.
3. The Contractor shall coordinate and resolve any incompatibility issues that arise between the control products provided under this section and those provided under other sections or divisions of this specification.

3.5 GENERAL WORKMANSHIP:

A. Install equipment, piping, wiring/conduit, parallel to building lines (i.e. horizontal, vertical, and parallel to walls) wherever possible.

B. Provide sufficient slack and flexible connections to allow for vibration of piping and equipment.

C. Install all equipment in readily accessible locations as defined by National Electric Code (NEC). Control panels shall be attached to structural walls or properly supported in a free-standing configuration, unless mounted in equipment enclosure specifically designed for that purpose. Panels shall be mounted to allow for unobstructed access for service.

D. Verify integrity of all control wiring to ensure continuity and freedom from shorts and grounds prior to commencing the startup and commissioning procedures.

E. All control device installation and wiring shall comply with Contract Documents, acceptable industry specifications, and industry standards for performance, reliability, and compatibility. Installation and wiring shall be executed in strict adherence to local codes and standard practices referenced in Contract Documents.

3.6 FIELD QUALITY CONTROL:

A. All work, materials, and equipment shall comply with the rules and regulations of applicable local, state, and federal codes and ordinances as identified in Contract Documents.

B. BAS manufacturer shall continually monitor the field installation for building code compliance and quality of workmanship. All visible piping and or wiring runs shall be installed parallel to building lines and properly supported.

C. BAS installing Contractor(s) shall arrange for field inspections by local and/or state authorities having jurisdiction over the work.

3.7 COMMUNICATION WIRING:

A. All cabling shall be installed in a neat and workmanlike manner. Follow manufacturer’s installation recommendations for all communication cabling.

B. Do not install communication wiring in raceway and enclosures containing Class 1 or other

Class 2 wiring.

C. Maximum pulling, tension, and bend radius for cable installation, as specified by the cable manufacturer shall not be exceeded during installation.

D. Contractor shall verify the integrity of the entire network following cable installation. Use appropriate test measures for each particular cable.

E. When a cable enters or exits a building, a lighting arrestor must be installed between the line and ground.

F. All runs of communication wiring shall be unspliced length when the length is commercially available.

G. All communication wiring shall be labeled to indicate origin and destination.

3.8 INSTALLATION OF SENSORS:

A. Sensors required for mechanical equipment operation shall be factory installed and wired as specified in mechanical equipment specifications. BAS manufacturer shall be responsible for coordinating these control devices and ensuring the sequence of operations will be met. Installation and wiring shall be in accordance with the BAS manufacturer's recommendations.

B. Sensors that require field mounting shall meet the BAS manufacturer’s recommendations and be coordinated with the mechanical equipment they will be associated.

C. Mount sensors rigidly and adequately for the environment the sensor will operate.

D. Room temperature sensors shall be installed on concealed junction boxes properly supported by the block wall framing. For installation in dry wall ceilings, the low voltage sensor wiring can be installed exposed and must meet applicable National and Local Electrical Codes.

E. All wires attached to wall mounted sensors shall be sealed off to prevent air from transmitting in the associated conduit and affecting the room sensor readings.

F. Install duct static pressure tap with tube end facing directly down-stream of air flow.

G. Install space static pressure sensor with static sensing probe applicable for space installation where applicable.

H. Sensors used in mixing plenums, and hot and cold decks shall be of the averaging type. Averaging sensors shall be installed in a serpentine manner horizontally across duct. Each bend shall be supported with a capillary clip.

I. Wiring for space sensors shall be concealed in building drywall. EMT conduit is acceptable within mechanical equipment and service rooms.

J. Install outdoor air temperature sensors on north wall complete with sun shield at manufacturer’s recommended location and coordinated with Engineer.

3.9 WARNING LABELS:

A. Permanent warning labels shall be affixed to all equipment that can be automatically started by the BAS system.

B. Permanent warning labels shall be affixed to all motor starters and all control panels that are connected to multiple power sources utilizing separate disconnects.

3.10 IDENTIFICATION OF HARDWARE AND WIRING:

A. All field wiring and cabling, including that within factory mounted, and wired control panels and devices for mechanical equipment, shall be labeled at each end within 2" of termination with a cable identifier and other descriptive information for troubleshooting, maintenance, and service purposes. BAS manufacturer to coordinate this labeling requirement with mechanical equipment manufacturer as it relates to controls.

B. Permanently label or code each point of field terminal strips to show the instrument or item served and correlate them to the BAS design drawings.

C. Identify control panels with minimum 1-cm letters on laminated plastic nameplates.

D. Identifiers shall match record documents. All plug-in components shall be labeled such that removal of the component does not remove the label.

3.11 CONTROLLERS:

A. Provide a separate DDC Controller for individual HVAC mechanical equipment. BAS manufacturer shall furnish and coordinate DDC controllers and control devices and ensure that installation and wiring adhere to BAS manufacturer's design recommendations. For those mechanical equipment units that do not have factory installed controls specified, the BAS manufacturer shall field mount controls and coordinate all installation and termination information to ensure the specified sequence of operations are met.

B. Building Controllers and Custom Application Controllers shall be selected to provide a minimum of 15% spare I/O point capacity for each point type (analog or digital) found at each location. If input points are not universal, 15% of each type is required. If outputs are not universal, 15% of each type is required. A minimum of one spare is required for each type of point used in each controller.

1. Future use of spare I/O point capacity shall require providing the field instrument and control device, field wiring, engineering, programming, and commissioning. No additional Controller boards or point modules shall be required to implement use of these spare points.

3.12 PROGRAMMING:

A. Provide sufficient internal memory for all controllers to ensure specified sequence of operations, alarming, trending, and reporting requirements are achieved. BAS manufacturer shall provide a minimum of 25% spare memory capacity for future use.

B. Point Naming: System point names shall be modular in design, allowing easy operator interface without the use of a written point index.

C. Software Programming

1. Provide programming for individual mechanical systems to achieve all aspects of the sequence of operation specified. It is the BAS manufacturer's responsibility to ensure all mechanical equipment functions and operates as specified in sequence of operations. Provide sufficient programming comments in controller application software to clearly describe each section of the program. The comment statements shall reflect the language used in the sequence of operations.

D. BAS Operator's Interface

1. When Operator Workstation is specified, provide color graphics for each piece of mechanical equipment depicting sufficient I/O to monitor and troubleshoot operation. Operator color graphics shall include Chiller Plant, Cooling Tower System, Boiler Plant, Air Handling Units, Rooftop Units, VAV Terminal Boxes, Fan Coil Units, Unit Ventilators, Heat Exchangers, Exhaust Fans, etc. These standard graphics shall depict all points dynamically as specified in the points list and/or indicated in sequence of operation.
2. The BAS manufacturer shall provide all the labor necessary to install, initialize, start up, and trouble-shoot all operator interface software and their functions as described in this section. This includes any operating system software, the operator interface data base, and any third party software installation and integration required for successful operation of the operator interface.

3. As part of this execution phase, the BAS manufacturer shall perform a complete test of the operator interface.

3.13 CONTROL SYSTEM CHECKOUT AND TESTING:

A. Start-up testing. All testing in this section shall be performed by the contractor and shall make up part of the necessary verification of an operating control system. This testing shall be completed before the owner's representative is notified of the system demonstration.

1. The contractor shall furnish all labor and test apparatus required to calibrate and prepare for service all of the instruments, controls, and accessory equipment furnished under this specification.
2. Verify that all control wiring is properly connected and free of all shorts and ground faults. Verify that terminations are tight.
3. Enable the control systems and verify calibration of all input devices individually. Perform calibration procedures according to manufacturer's recommendations.
4. Verify all binary output devices (relays, solenoid valves, two-position actuators and control valves, magnetic starter, etc.) operate properly and normal positions are correct.
5. Verify all analog output devices (I/Ps, actuators, etc) are functional, that start and span are correct, and that direction and normal positions are correct. The contractor shall check all control valves and automatic dampers to ensure proper action and closure. The contractor shall make any necessary adjustments to valve stem and damper blade travel.
6. Verify the system operation adheres to the sequences of operation. Simulate and observe all modes of operation by overriding and varying inputs and schedules. Tune all DDC loops and optimal start/stop routines.
7. Alarms and Interlocks

a. Check each alarm separately by including an appropriate signal at a value that will trip the alarm.
b. Interlocks shall be tripped using field contacts to check the logic, as well as to ensure that the fail-safe condition for all actuators is in the proper direction.
    c. Interlock actions shall be tested by simulating alarm conditions to check the initiating value of the variable and interlock action.

3.14 CLEANING:

A. The BAS manufacturer's installing contractor(s) shall clean up all debris resulting from their installation activities on a daily basis. The installation contractors shall remove all cartons, containers, crates, etc. under his control as soon as their contents have been removed. Waste shall be collected and placed in a location designated by the Owner, Construction Manager, General Contractor, and/or Mechanical Contractor.

B. At the completion of work in any area, the installation contractor shall clean all of their work, equipment, etc., making it free from dust, dirt and debris.

C. At the completion of work, all equipment furnished under this Section shall be checked for paint damage. Any factory finished paint that has been damaged shall be repaired to match the adjacent areas. Any metal cabinet or enclosure that has been deformed shall be replaced with new material and repainted to match the adjacent areas.

3.15 TRAINING:

A. Provide minimum of (8) hours of operator training throughout the contract period. Training shall consist of a minimum of (1) classroom training session. The training will be provided for personnel designated by the Owner.

B. These objectives will be divided into logical groupings; participants may attend one or more of these, depending on level of knowledge required:

1. Day-to-day BAS Operators
2. BAS Troubleshooting & Maintenance

C. Provide course outline and materials prior to scheduled training session. The instructor(s) shall provide one copy of training material per student.

D. The instructor(s) shall be factory-trained and experienced in teaching this technical material.

END OF SECTION

SECTION 23 23 00

REFRIGERANT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes refrigerant piping used for air-conditioning applications.

B. Related Sections include the following:

1. Division 7 Section "Roof Accessories" for roof curbs, piping supports, and roof penetration boots.
2. Division 7 Section "Through-Penetration Firestop Systems" for materials and methods for sealing pipe penetrations through fire and smoke barriers.
3. Division 7 Section "Joint Sealants" for materials and methods for sealing pipe penetrations through exterior walls.
4. Division 23 Section "Hangers and Supports for HVAC Piping and Equipment" for pipe supports and installation requirements.
5. Division 23 Section "Identification for HVAC Piping and Equipment" for labeling and identifying refrigerant piping.
6. Division 23 Section "HVAC Instrumentation and Controls" for thermostats, controllers, automatic-control valves, and sensors.

1.3 SUBMITTALS

A. Product Data: For each type of valve and refrigerant piping specialty indicated. Include pressure drop, based on manufacturer's test data, for thermostatic expansion valves, solenoid valves, and pressure-regulating valves.

B. Shop Drawings: Show layout of refrigerant piping and specialties, including pipe, tube, and fitting sizes, flow capacities, valve arrangements and locations, slopes of horizontal runs, oil traps, double risers, wall and floor penetrations, and equipment connection details. Show interface and spatial relationship between piping and equipment.

1. Refrigerant piping indicated is schematic only. Size piping and design the actual piping layout, including oil traps, double risers, specialties, and pipe and tube sizes, to ensure proper operation and compliance with warranties of connected equipment.

C. Welding Certificates: Copies of certificates for welding procedures and personnel.

D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

E. Maintenance Data: For refrigerant valves and piping specialties to include in maintenance manuals specified in Division 1.

1.4 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to ASME Boiler and Pressure Vessel Code: Section IX; "Welding and Brazing Qualifications."

B. ASHRAE Standard: Comply with ASHRAE 15, "Safety Code for Mechanical Refrigeration."

C. ASME Standard: Comply with ASME B31.5, "Refrigeration Piping."

D. UL Standard: Provide products complying with UL 207, "Refrigerant-Containing Components and Accessories, Nonelectrical"; or UL 429, "Electrically Operated Valves."

1.5 COORDINATION

A. Coordinate layout and installation of refrigerant piping and suspension system components with other construction, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

B. Coordinate pipe sleeve installations for foundation wall penetrations.

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

D. Coordinate pipe sleeve installations for penetrations in exterior walls and floor assemblies. Coordinate with requirements for firestopping specified in Division 7 Section "Through-Penetration Firestop Systems" for materials and methods for sealing pipe penetrations through fire and smoke barriers.

E. Coordinate pipe fitting pressure classes with products specified in related Sections.

PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

A. Drawn-Temper Copper Tube: ASTM B 280, Type ACR.

B. Annealed-Temper Copper Tube: ASTM B 88, Type L.

C. Wrought-Copper Fittings: ASME B16.22.

D. Wrought-Copper Unions: ASME B16.22.

E. Brazing Filler Metals: AWS A5.8, Classification BAg-1 (silver)

F. Flexible Connectors: 500-psig (3450-kPa) minimum operating pressure; seamless tin-bronze core, high-tensile bronze-braid covering, and solder-joint end connections; dehydrated, pressure tested, minimum 7 inches long

2.2 REFRIGERANTS

A. ASHRAE 34, R-123: Dichlorotrifluoroethane.

B. ASHRAE 34, R-134a: Tetrafluoroethane.

C. ASHRAE 34, R-22: Monochlorodifluoromethane.

D. ASHRAE 34, R-500: Azeotrope.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

A. Aboveground, within Building: Type ACR drawn-copper tubing.

3.2 PIPING INSTALLATION

A. Install refrigerant piping according to ASHRAE 15.

B. Basic piping installation requirements are specified in Division 23 Section "Common Work Results for HVAC".

C. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.

D. Arrange piping to allow inspection and service of compressor and other equipment. Install valves and specialties in accessible locations to allow for service and inspection.

E. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation. Use sleeves through floors, walls, or ceilings, sized to permit installation of full-thickness insulation.

F. Belowground, install copper tubing in protective conduit. Vent conduit outdoors.

G. Install copper tubing in rigid conduit in locations where copper tubing will be exposed to mechanical injury.

H. Slope refrigerant piping in accordance with air conditioning equipment manufacturer's recommendations.

I. Install unions to allow removal of solenoid valves, pressure-regulating valves, and expansion valves and at connections to compressors and evaporators.

J. When brazing, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion valve bulb.

K. Hanger, support, and anchor products are specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment".

L. Install the following pipe attachments:
1. Adjustable steel clevis hangers for individual horizontal runs less than 20 feet long.
2. Roller hangers and spring hangers for individual horizontal runs 20 feet or longer.
3. Pipe rollers for multiple horizontal runs 20 feet or longer, supported by a trapeze.
4. Spring hangers to support vertical runs.

M. Install hangers for copper tubing with the following maximum spacing and minimum rod sizes:
1. NPS 1/2: Maximum span, 60 inches; minimum rod size, 1/4 inch.
2. NPS 5/8: Maximum span, 60 inches; minimum rod size, 1/4 inch.
3. NPS 1: Maximum span, 72 inches; minimum rod size, 1/4 inch.
4. NPS 1-1/4: Maximum span, 96 inches; minimum rod size, 3/8 inch.
5. NPS 1-1/2: Maximum span, 96 inches; minimum rod size, 3/8 inch.
6. NPS 2: Maximum span, 96 inches; minimum rod size, 3/8 inch.
7. NPS 2-1/2: Maximum span, 108 inches; minimum rod size, 3/8 inch.
8. NPS 3: Maximum span, 10 feet; minimum rod size, 3/8 inch.
9. NPS 4: Maximum span, 12 feet; minimum rod size, 1/2 inch.

N. Install hangers for steel piping with the following maximum spacing and minimum rod sizes:
1. NPS 1/2: Maximum span, 84 inches; minimum rod size, 1/4 inch.
2. NPS 3/4: Maximum span, 84 inches; minimum rod size, 1/4 inch.
3. NPS 1: Maximum span, 84 inches; minimum rod size, 1/4 inch.
4. NPS 1-1/2: Maximum span, 108 inches; minimum rod size, 3/8 inch.
5. NPS 2: Maximum span, 10 feet; minimum rod size, 3/8 inch.
6. NPS 2-1/2: Maximum span, 11 feet; minimum rod size, 3/8 inch.
7. NPS 3: Maximum span, 12 feet; minimum rod size, 3/8 inch.
8. NPS 4: Maximum span, 14 feet; minimum rod size, 1/2 inch.

O. Support vertical runs at each floor.

3.3 PIPE JOINT CONSTRUCTION

A. Braze joints according to Division 23 Section "Common Work Results for HVAC".

B. Fill pipe and fittings with an inert gas (nitrogen or carbon dioxide) during brazing to prevent scale formation.

3.4 FIELD QUALITY CONTROL

A. Test and inspect refrigerant piping according to ASME B31.5, Chapter VI.
1. Test refrigerant piping, specialties, and receivers. Isolate compressor, condenser, evaporator, and safety devices from test pressure.
2. Test high- and low-pressure side piping of each system at not less than the lower of the design pressure or the setting of pressure relief device protecting high and low side of system.
   a. System shall maintain test pressure at the manifold gage throughout duration of test.
   b. Test joints and fittings by brushing a small amount of soap and glycerine solution over joint.
   c. Fill system with nitrogen to raise a test pressure of 150 psig or higher as required by authorities having jurisdiction.
   d. Remake leaking joints using new materials, and retest until satisfactory results are achieved.

3.5 ADJUSTING

A. Adjust thermostatic expansion valve to obtain proper evaporator superheat requirements.

B. Adjust high- and low-pressure switch settings to avoid short cycling in response to fluctuating suction pressure.

C. Adjust set-point temperature of the conditioned air or chilled-water controllers to the system design temperature.

D. Perform the following adjustments before operating the refrigeration system, according to manufacturer's written instructions:
   1. Open shutoff valves in condenser water circuit.
   2. Check compressor oil level above center of sight glass.
   3. Open compressor suction and discharge valves.
   4. Open refrigerant valves, except bypass valves that are used for other purposes.
   5. Check compressor-motor alignment, and lubricate motors and bearings.

3.6 CLEANING

A. Before installing copper tubing other than Type ACR, clean tubing and fittings with trichloroethylene.

B. Replace core of filter-dryer after system has been adjusted and design flow rates and pressures are established.

3.7 SYSTEM CHARGING

A. Charge system using the following procedures:
   1. Install core in filter-dryer after leak test but before evacuation.
   2. Evacuate entire refrigerant system with a vacuum pump to a vacuum of 500 micrometers. If vacuum holds for 12 hours, system is ready for charging.
   3. Break vacuum with refrigerant gas, allowing pressure to build up to 2 psig.
   4. Charge system with a new filter-dryer core in charging line. Provide full-operating charge.

END OF SECTION

SECTION 23 31 00

METAL DUCTS AND CASINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Related sections include the following:

1.2 SUMMARY

A. This Section includes metal ducts for supply, return, outside, and exhaust air-distribution systems in pressure classes from minus 2- to plus 10-inch wg. Metal ducts include the following:
   1. Rectangular ducts and fittings.
   2. Single-wall, round, and flat-oval spiral-seam ducts and formed fittings.

B. Related Sections include the following:
   1. Division 23 Section "Air Duct Accessories" for dampers, sound-control devices, duct- mounting access doors and panels, turning vanes, and flexible ducts.

1.3 DEFINITIONS

A. FRP: Fiberglass-reinforced plastic.

1.4 SYSTEM DESCRIPTION

A. Duct system design, as indicated, has been used to select size and type of air-moving and - distribution equipment and other air system components. Changes to layout or configuration of duct system must be specifically approved in writing by Architect. Accompany requests for layout modifications with calculations showing that proposed layout will provide original design results without increasing system total pressure.

1.5 SUBMITTALS

A. Shop Drawings: CAD-generated and drawn to 1/4 inch equals 1 foot scale. Show fabrication and installation details for metal ducts.
   1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
   2. Duct layout indicating sizes and pressure classes.
   3. Elevations of top and bottom of ducts.
   4. Dimensions of main duct runs from building grid lines.
   5. Fittings.
   6. Reinforcement and spacing.
   7. Seam and joint construction.
   8. Penetrations through fire-rated and other partitions.
   9. Equipment installation based on equipment being used on Project.
   10. Duct accessories, including access doors and panels.
   11. Hangers and supports, including methods for duct and building attachment, vibration isolation, and seismic restraints.

B. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
   1. Ceiling suspension assembly members.
   2. Other systems installed in same space as ducts.
   3. Ceiling- and wall-mounting access doors and panels required to provide access to dampers and other operating devices.

4. Ceiling-mounting items, including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

C. Welding certificates.

D. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. NFPA Compliance:
1. NFPA 90A, "Installation of Air Conditioning and Ventilating Systems."
2. NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."

B. Comply with NFPA 96, "Ventilation Control and Fire Protection of Commercial Cooking Operations," Ch. 3, "Duct System," for range hood ducts, unless otherwise indicated.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 SHEET METAL MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653/A 653M and having G90 coating designation; ducts shall have mill-phosphatized finish for surfaces exposed to view.

C. Carbon-Steel Sheets: ASTM A 366/A 366M, cold-rolled sheets; commercial quality; with oiled, matte finish for exposed ducts.

D. Stainless Steel: ASTM A 480/A 480M, Type 304.

E. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts.

F. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.3 DUCT LINER

A. Fibrous-Glass Liner: Comply with NFPA 90A or NFPA 90B and with NAIMA AH124.
1. Manufacturers:
a. CertainTeed Corp.; Insulation Group.
b. Johns Manville International, Inc.
c. Knauf Fiber Glass GmbH.
d. Owens Corning.
2. Materials: ASTM C 1071; surfaces exposed to airstream shall be coated to prevent erosion of glass fibers.
a. Thickness: 1 inch.
b. Thermal Conductivity (k-Value): 0.26 at 75 deg F mean temperature.
c. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
d. Liner Adhesive: Comply with NFPA 90A or NFPA 90B and with ASTM C 916.
e. Mechanical Fasteners: Galvanized steel suitable for adhesive attachment, mechanical attachment, or welding attachment to duct without damaging liner when applied as recommended by manufacturer and without causing leakage in

duct.

1) Tensile Strength: Indefinitely sustain a 50-lb- tensile, dead-load test perpendicular to duct wall.
2) Fastener Pin Length: As required for thickness of insulation and without projecting more than 1/8 inch into airstream.
3) Adhesive for Attaching Mechanical Fasteners: Comply with fire-hazard classification of duct liner system.

3. Mold Resistance: ASTM C 1338; ASTM G21; ASTM G22; surfaces exposed to airstream
shall be resistive to and not support mold, fungal, and bacterial growth.

2.4 SEALANT MATERIALS

A. Joint and Seam Sealants, General: The term "sealant" is not limited to materials of adhesive or mastic nature but includes tapes and combinations of open-weave fabric strips and mastics.

B. Joint and Seam Tape: 2 inches wide; glass-fiber-reinforced fabric.

C. Tape Sealing System: Woven-fiber tape impregnated with gypsum mineral compound and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.

D. Low VOC Solvent-Based Joint and Seam Sealant: One-part, nonsag, solvent-release-curing, polymerized butyl sealant formulated with a minimum of 75 percent solids.

E. Flanged Joint Mastic: One-part, acid-curing, silicone, elastomeric joint sealant complying with ASTM C 920, Type S, Grade NS, Class 25, Use O.

F. Flange Gaskets: Butyl rubber or EPDM polymer with polyisobutylene plasticizer.

2.5 HANGERS AND SUPPORTS

A. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
1. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
2. Exception: Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.

B. Hanger Materials: Galvanized sheet steel or threaded steel rod.
1. Hangers Installed in Corrosive Atmospheres: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
2. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards-Metal and Flexible" for steel sheet width and thickness and for steel rod diameters.
3. Galvanized-steel straps attached to aluminum ducts shall have contact surfaces painted with zinc-chromate primer.

C. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

D. Trapeze and Riser Supports: Steel shapes complying with ASTM A 36/A 36M.
1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
2. Supports for Stainless-Steel Ducts: Stainless-steel support materials.
3. Supports for Aluminum Ducts: Aluminum support materials unless materials are electrolytically separated from ducts.

2.6 RECTANGULAR DUCT FABRICATION

A. Fabricate ducts, elbows, transitions, offsets, branch connections, and other construction according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" and complying with requirements for metal thickness, reinforcing types and intervals, tie-rod applications, and joint types and intervals.
1. Lengths: Fabricate rectangular ducts in lengths appropriate to reinforcement and rigidity class required for pressure class.

2. Deflection: Duct systems shall not exceed deflection limits according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible."

B. Transverse Joints: Prefabricated slide-on joints and components constructed using manufacturer's guidelines for material thickness, reinforcement size and spacing, and joint reinforcement.
   1. Manufacturers:
      a. Ductmate Industries, Inc.
      b. Nexus Inc.
      c. Ward Industries, Inc.

C. Formed-On Flanges: Construct according to SMACNA's "HVAC Duct Construction Standards-- Metal and Flexible," Figure 1-4, using corner, bolt, cleat, and gasket details.
   1. Manufacturers:
      a. Ductmate Industries, Inc.
      b. Lockformer.
   2. Duct Size: Maximum 30 inches wide and up to 2-inch wg pressure class.
   3. Longitudinal Seams: Pittsburgh lock sealed with noncuring polymer sealant.

D. Cross Breaking or Cross Beading: Cross break or cross bead duct sides 19 inches and larger and 0.0359 inch thick or less, with more than 10 sq. ft. of nonbraced panel area unless ducts are lined.

E. Secure insulation between perforated sheet metal inner duct of same thickness as specified for outer shell. Use mechanical fasteners that maintain inner duct at uniform distance from outer shell without compressing insulation.
   1. Sheet Metal Inner Duct Perforations: 3/32-inch diameter, with an overall open area of 23 percent.

2.7 ROUND AND FLAT-OVAL DUCT AND FITTING FABRICATION

A. Diameter as applied to flat-oval ducts in this Article is the diameter of a round duct with a circumference equal to the perimeter of a given size of flat-oval duct.

B. Round, Spiral Lock-Seam Ducts: Fabricate supply ducts of galvanized steel according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible."

C. Flat-Oval, Spiral Lock-Seam Ducts: Fabricate supply ducts according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible. Fabricate ducts larger than 72 inches in diameter with butt-welded longitudinal seams.

D. Duct Joints:
   1. Ducts up to 20 Inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
   2. Ducts 21 to 72 Inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
   3. Ducts Larger Than 72 Inches in Diameter: Companion angle flanged joints per SMACNA "HVAC Duct Construction Standards--Metal and Flexible," Figure 3-2.
   4. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.
      a. Manufacturers:
         1) Ductmate Industries, Inc.
         2) Lindab Inc.
   5. Flat-Oval Ducts: Prefabricated connection system consisting of two flanges and one synthetic rubber gasket.
      a. Manufacturers:
         1) Ductmate Industries, Inc.
         2) McGill AirFlow Corporation.
         3) SEMCO Incorporated.

E. 90-Degree Tees and Laterals and Conical Tees: Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," with metal thicknesses specified

for longitudinal-seam straight ducts.

F. Diverging-Flow Fittings: Fabricate with reduced entrance to branch taps and with no excess material projecting from fitting onto branch tap entrance.

G. Fabricate elbows using die-formed, pleated, or mitered construction. Bend radius of die-formed, and pleated elbows shall be 1-1/2 times duct diameter. Unless elbow construction type is indicated, fabricate elbows as follows:
   1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," unless otherwise indicated.
   2. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from minus 2- to plus 2-inch wg:
      a. Ducts 3 to 36 Inches in Diameter: 0.034 inch.
      b. Ducts 37 to 50 Inches in Diameter: 0.040 inch.
      c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
      d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.
   3. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from 2- to 10-inch wg:
      a. Ducts 3 to 26 Inches in Diameter: 0.034 inch.
      b. Ducts 27 to 50 Inches in Diameter: 0.040 inch.
      c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
      d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.
   4. Flat-Oval Mitered Elbows: Welded construction with same metal thickness as longitudinal- seam flat-oval duct.
   5. 90-Degree, 2-Piece, Mitered Elbows: Use only for supply systems or for material-handling Class A or B exhaust systems and only where space restrictions do not permit using radius elbows. Fabricate with single-thickness turning vanes.
   6. Round Elbows 8 Inches and Less in Diameter: Fabricate die-formed elbows for 45- and 90- degree elbows and pleated elbows for 30, 45, 60, and 90 degrees only. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
   7. Round Elbows 9 through 14 Inches in Diameter: Fabricate gored or pleated elbows for 30, 45, 60, and 90 degrees unless space restrictions require mitered elbows. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
   8. Round Elbows Larger Than 14 Inches in Diameter and All Flat-Oval Elbows: Fabricate gored elbows unless space restrictions require mitered elbows.
   9. Die-Formed Elbows for Sizes through 8 Inches in Diameter and All Pressures 0.040 inch thick with 2-piece welded construction.
   10. Flat-Oval Elbow Metal Thickness: Same as longitudinal-seam flat-oval duct specified above.
   11. Pleated Elbows for Sizes through 14 Inches in Diameter and Pressures through 10-Inch wg:
       0.022 inch.

PART 3 - EXECUTION

3.1 DUCT APPLICATIONS

A. Static-Pressure Classes: Unless otherwise indicated, construct ducts according to the following:
   1. Main Supply Ducts: 4-inch wg, medium pressure.
   2. Supply Ducts (before Air Terminal Units): 4-inch wg, medium pressure.
   3. Supply Ducts (after Air Terminal Units): 2-inch wg, low pressure.
   4. Return Ducts (Negative Pressure): 2-inch wg, low pressure
   5. Exhaust Ducts (Negative Pressure): 2-inch wg, low pressure.

B. All ducts shall be galvanized steel except as follows:
   1. Range Hood Exhaust Ducts: Comply with NFPA 96.

a. Exposed: Type 304, stainless steel with finish to match kitchen equipment and range hood.
b. Weld and flange seams and joints.

2. Dishwasher Hood Exhaust Ducts:
a. Type 304, stainless steel with finish to match kitchen equipment and range hood.
Weld and flange seams and joints.

3.2 DUCT INSTALLATION

A. Construct and install ducts according to SMACNA's "HVAC Duct Construction Standards-Metal and Flexible," unless otherwise indicated.

B. Install round and flat-oval ducts in lengths not less than 12 feet unless interrupted by fittings.

C. Install ducts with fewest possible joints.

D. Install fabricated fittings for changes in directions, size, and shape and for connections.

E. Install couplings tight to duct wall surface with a minimum of projections into duct. Secure couplings with sheet metal screws. Install screws at intervals of 12 inches, with a minimum of 3 screws in each coupling.

F. Install ducts, unless otherwise indicated, vertically and horizontally and parallel and perpendicular to building lines; avoid diagonal runs.

G. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

H. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.

I. Conceal ducts from view in finished spaces. Do not encase horizontal runs in solid partitions unless specifically indicated.

J. Coordinate layout with suspended ceiling, fire- and smoke-control dampers, lighting layouts, and similar finished work.

K. Seal all joints and seams. Apply low VOC based sealant to male end connectors before insertion, and afterward to cover entire joint and sheet metal screws.

L. Electrical Equipment Spaces: Route ducts to avoid passing through transformer vaults and electrical equipment spaces and enclosures.

M. Non-Fire-Rated Partition Penetrations: Where ducts pass through interior partitions and exterior walls and are exposed to view, conceal spaces between construction openings and ducts or duct insulation with sheet metal flanges of same metal thickness as ducts. Overlap openings on 4 sides by at least 1-1/2 inches.

N. Fire-Rated Partition Penetrations: Where ducts pass through interior partitions and exterior walls, install appropriately rated fire dampers, sleeves, and firestopping sealant. Fire and smoke dampers are specified in Division 23 Section "Air Duct Accessories" Firestopping materials and installation methods are specified in Division 7 Section "Through-Penetration Firestop Systems."

O. Protect duct interiors from the elements and foreign materials until building is enclosed. Follow SMACNA's "Duct Cleanliness for New Construction."

P. Paint interiors of metal ducts, that do not have duct liner, for 24 inches upstream of registers and grilles. Apply one coat of flat, black, latex finish coat over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Division 9 painting Sections.

3.3 SEAM AND JOINT SEALING

A. Seal duct seams and joints according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for duct pressure class indicated.
1. For pressure classes lower than 2-inch wg, seal transverse joints.

B. Seal ducts before external insulation is applied.

3.4 HANGING AND SUPPORTING

A. Support horizontal ducts within 24 inches of each elbow and within 48 inches of each branch intersection.

B. Support vertical ducts at maximum intervals of 16 feet and at each floor.

C. Install upper attachments to structures with an allowable load not exceeding one-fourth of failure (proof-test) load.

D. Install concrete inserts before placing concrete.

E. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
   1. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.

3.5 CONNECTIONS

A. Make connections to equipment with flexible connectors according to Division 23 Section "Air Duct Accessories".

B. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.6 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections according to SMACNA's "HVAC Air Duct Leakage Test Manual" and prepare test reports:
   1. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
   2. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If pressure classes are not indicated, test entire system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
      Give seven days' advance notice for testing.
   3. Maximum Allowable Leakage: Comply with requirements for Leakage Class 3 for round and flat-oval ducts, Leakage Class 12 for rectangular ducts in pressure classes lower than and equal to 2-inch wg (both positive and negative pressures), and Leakage Class 6 for pressure classes from 2- to 10-inch wg.
   4. Remake leaking joints and retest until leakage is equal to or less than maximum allowable.

3.7 CLEANING NEW SYSTEMS

A. Mark position of dampers and air-directional mechanical devices before cleaning, and perform cleaning before air balancing.

B. Use service openings, as required, for physical and mechanical entry and for inspection.
   1. Create other openings to comply with duct standards.
   2. Disconnect flexible ducts as needed for cleaning and inspection.
   3. Remove and reinstall ceiling sections to gain access during the cleaning process.

C. Vent vacuuming system to the outside. Include filtration to contain debris removed from HVAC systems, and locate exhaust down wind and away from air intakes and other points of entry into building.

D. Clean the following metal duct systems by removing surface contaminants and deposits:
   1. Air outlets and inlets (registers, grilles, and diffusers).
   2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
   3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
   4. Coils and related components.

5. Return-air ducts, dampers, and actuators except in ceiling plenums and mechanical equipment rooms.
6. Supply-air ducts, dampers, actuators, and turning vanes.

E. Mechanical Cleaning Methodology:
1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet.
5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational.
   Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.

F. Cleanliness Verification:
1. Visually inspect metal ducts for contaminants.
2. Where contaminants are discovered, re-clean and reinspect ducts.

END OF SECTION

SECTION 23 33 00

AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Backdraft dampers.
   2. Volume dampers.
   3. Volume damper remote control cable assemblies.
   4. Turning vanes.
   5. Duct-mounting access doors.
   6. Flexible connectors.
   7. Flexible ducts.
   8. Duct accessory hardware.
   9. Duct silencers.

B. Related Sections include the following:
   1. Division 28 Section "Fire Alarm" for duct-mounting fire and smoke detectors.
   2. Division 23 Section "HVAC Instrumentation for electric and pneumatic damper actuators.

1.3 SUBMITTALS

A. Product Data: For the following:
   1. Backdraft dampers.
   2. Volume dampers.
   3. Turning vanes.
   4. Flexible connectors.
   5. Flexible ducts.
   6. Duct Accessory hardware.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   1. Special fittings.
   2. Manual-volume damper installations.

C. Coordination Drawings: Reflected ceiling plans, drawn to scale and coordinating penetrations and ceiling-mounting items. Show ceiling-mounting access panels and access doors required for access to duct accessories.

1.4 QUALITY ASSURANCE

A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.

2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 SHEET METAL MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated.

B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653/A 653M and having G90 coating designation; ducts shall have mill-phosphatized finish for surfaces exposed to view.

C. Stainless Steel: ASTM A 480/A 480M.

D. Aluminum Sheets: ASTM B 209, alloy 3003, temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.

E. Extruded Aluminum: ASTM B 221, alloy 6063, temper T6.

F. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

G. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.3 BACKDRAFT DAMPERS

A. Manufacturers:
1. Air Balance, Inc.
2. Greenheck.
3. Penn Ventilation Company, Inc.
4. Ruskin Company.

B. Description: Multiple-blade, parallel action gravity balanced, with center-pivoted blades of maximum 6-inch width, with sealed edges, assembled in rattle-free manner with 90-degree stop, steel ball bearings, and axles; adjustment device to permit setting for varying differential static pressure.

C. Frame: 0.052-inch- thick, galvanized sheet steel, with welded corners and mounting flange.

D. Blades: 0.025-inch- thick, roll-formed aluminum.

E. Blade Seals: Vinyl or Neoprene.

F. Blade Axles: Galvanized steel.

G. Tie Bars and Brackets: Galvanized steel.

H. Return Spring: Adjustable tension.

2.4 VOLUME DAMPERS

A. Manufacturers:
1. Air Balance, Inc.
2. METALAIRE, Inc.
3. Nailor Industries Inc.
4. Penn Ventilation Company, Inc.
5. Ruskin Company.

B. General Description: Factory fabricated, with required hardware and accessories. Stiffen damper blades for stability. Include locking device to hold single-blade dampers in a fixed position without vibration. Close duct penetrations for damper components to seal duct consistent with pressure class.
1. Pressure Classes of 3-Inch wg or Higher: End bearings or other seals for ducts with axles full length of damper blades and bearings at both ends of operating shaft.

C. Standard Volume Dampers: Multiple- or single-blade, parallel- or opposed-blade design as indicated, standard leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications.

1. Steel Frames: Hat-shaped, galvanized sheet steel channels, minimum of 0.064 inch thick, with mitered and welded corners; frames with flanges where indicated for attaching to walls and flangeless frames where indicated for installing in ducts.
2. Roll-Formed Steel Blades: 0.064-inch- thick, galvanized sheet steel.
3. Aluminum Frames: Hat-shaped, 0.10-inch- thick, aluminum sheet channels; frames with flanges where indicated for attaching to walls; and flangeless frames where indicated for installing in ducts.
4. Roll-Formed Aluminum Blades: 0.10-inch- thick aluminum sheet.
5. Extruded-Aluminum Blades: 0.050-inch- thick extruded aluminum.
6. Blade Axles: Galvanized steel.
7. Bearings: Oil-impregnated bronze.
8. Tie Bars and Brackets: Galvanized steel.

D. Low-Leakage Volume Dampers: Multiple- or single-blade, parallel- or opposed-blade design as indicated, low-leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications.
1. Steel Frames: Hat-shaped, galvanized sheet steel channels, minimum of 0.064 inch thick, with mitered and welded corners; frames with flanges where indicated for attaching to walls and flangeless frames where indicated for installing in ducts.
2. Roll-Formed Steel Blades: 0.064-inch- thick, galvanized sheet steel.
3. Blade Axles: Galvanized steel.
4. Bearings: Oil-impregnated bronze thrust or ball.
5. Blade Seals: Vinyl or Neoprene.
6. Jamb Seals: Cambered stainless steel.
7. Tie Bars and Brackets: Galvanized steel.

E. Jackshaft: 1-inch- diameter, galvanized-steel pipe rotating within pipe-bearing assembly mounted on supports at each mullion and at each end of multiple-damper assemblies.
1. Length and Number of Mountings: Appropriate to connect linkage of each damper in multiple-damper assembly.

F. Damper Hardware: Zinc-plated, die-cast core with dial and handle made of 3/32-inch- thick zinc- plated steel, and a 3/4-inch hexagon locking nut. Include center hole to suit damper operating-rod size. Include elevated platform for insulated duct mounting.

2.5 VOLUME DAMPER CONTROL CABLE ASSEMBLIES

A. Manufacturer:
1. Young Regulator Company.

B. Concealed Ceiling Regulator:
1. Damper controller and cable shall be concealed above the ceiling. Cable to consist of Bowden cable .054" stainless steel control wire encapsulated in 1-16" flexible galvanized spiral wire sheath. Control kit shall consist of 2-5/8" diameter die cast aluminum housing with 3" diameter zinc plated (polished chrome is optional) cover and 14 gauge steel rack and pinion gear drive converting rotary motion to push-pull motion. Control shaft shall be D-style flatted and 1/4" diameter with 265-degree rotation providing graduations for positive locking and control, and 1-1/2" linear travel capability. Control kit is designed to be imbedded in the ceiling flush with the finished surface. Control kit shall be manually operated using Young Regulator Model 030-12 wrench. Control kit shall be Young Regulator Model 270-301.

C. Controller Mounted in Plenum of Slot Diffusers:
1. Damper controller and cable shall be concealed above the ceiling. Cable to consist of Bowden cable .054" stainless steel control wire encapsulated in 1/16" flexible galvanized spiral wire sheath. Control kit shall be designed for use with internally or externally controlled round or rectangular dampers and shall consist of 14 gauge steel rack and pinion gear drive converting rotary motion to push-pull motion. Control shaft shall be D-style flatted and 1/4" diameter with 265-degree rotation providing 1-1/2" linear travel capability. Control kit mounting bracket to be field mounted on ceiling

framework, behind grilles on or inside plenum slot diffusers and other various types of diffusers. Control kit shall be manually operated using Young Regulator Model 030-12 wrench. Control kit shall be Young Regulator Model 270-275.

2. Damper(s) to be constructed of heavy duty galvanized steel spiral shell design with rolled-in stiffening beads for superior rigidity. Spiral shell shall have one crimped end and one straight end for ease of installation. Damper to include "V" style 20 gauge galvanized steel blade secured with 1/2" diameter steel shafts and high strength Teflon bushings requiring no lubrication. Damper shall include all necessary hardware to ensure compatibility with Bowden remote cable control system. Damper(s) shall be Young Regulator Model 5020-CC.

2.6 TURNING VANES

A. Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for vanes and vane runners. Vane runners shall automatically align vanes.

B. Manufactured Turning Vanes: Fabricate 1-1/2-inch- wide, double-vane, curved blades of galvanized sheet steel set 3/4 inch o.c.; support with bars perpendicular to blades set 2 inches o.c.; and set into vane runners suitable for duct mounting.
   1. Manufacturers:
      a. Ductmate Industries, Inc.
      b. Duro Dyne Corp.
      c. METALAIRE, Inc.
      d. Ward Industries, Inc.

C. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.

2.7 FLEXIBLE CONNECTORS

A. Manufacturers:
   1. Ductmate Industries, Inc.
   2. Duro Dyne Corp.
   3. Ventfabrics, Inc.
   4. Ward Industries, Inc.

B. General Description: Flame-retardant or noncombustible fabrics, coatings, and adhesives complying with UL 181, Class 1.

C. Metal-Edged Connectors: Factory fabricated with a fabric strip 3-1/2 inches wide attached to two strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Select metal compatible with ducts.

D. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
   1. Minimum Weight: 26 oz./sq. yd..
   2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
   3. Service Temperature: Minus 40 to plus 200 deg F.

E. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
   1. Minimum Weight: 24 oz./sq. yd..
   2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling.
   3. Service Temperature: Minus 50 to plus 250 deg F.

2.8 FLEXIBLE DUCTS

A. Manufacturers:
   1. Casco Silentflex II.

B. Insulated Flexible Duct: UL 181, Class 1 with:
   1. Non-woven nylon liner.
   2. Steel spring wire helix.
   3. Polyethylene vapor barrier jacket.

4. Adjustable metal male/female collars.
5. Pressure rating 1-1/2 in. positive to 1/2 in. negative.
6. Maximum Air Velocity: 4,000 fpm (continuous).
7. Temperature Range: 20 deg. F to 200 deg. F.

C. Flexible Duct Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action, in sizes 3 through 18 inches to suit duct size.

2.9 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

2.10 DUCT SILENCERS

A. Manufacturers:
1. Industrial Acoustics Company (IAC)
2. Commercial Acoustics.
3. Vibro-Acoustics.

B. General Description: Factory-fabricated and -tested, round or rectangular silencers with performance characteristics and physical requirements as indicated.

C. Fire Performance: Adhesives, sealants, packing materials, and accessory materials shall have fire ratings not exceeding 25 for flame-spread index and 50 for smoke-developed index when tested according to ASTM E 84.

D. Rectangular Units: Fabricate casings with a minimum of 0.034-inch- thick, solid galvanized sheet metal for outer casing and 0.022-inch- thick, ASTM A 653/A 653M, G60, perforated galvanized sheet metal for inner casing.

E. Round Units:
1. Outer Casings:
   a. ASTM A 653/A 653M, G60, galvanized sheet steel.
   b. Up to 24 Inches in Diameter: 0.034 inch thick.
   c. 26 through 40 Inches in Diameter: 0.040 inch thick.
   d. 42 through 52 Inches in Diameter: 0.052 inch thick.
   e. 54 through 60 Inches in Diameter: 0.064 inch thick.
   f. Casings fabricated of spiral lock-seam duct may be one size thinner than that indicated.
2. Interior Casing, Partitions, and Baffles:
   a. ASTM A 653/A 653M, G60, galvanized sheet steel.
   b. At least 0.034 inch thick and designed for minimum aerodynamic losses.

F. Sheet Metal Perforations: 1/8-inch diameter for inner casing and baffle sheet metal.

G. Fill Material: Inert and vermin-proof fibrous material, packed under not less than 5 percent compression.
1. Erosion Barrier: Polymer bag enclosing fill and heat-sealed before assembly.

H. Fabricate silencers to form rigid units that will not pulsate, vibrate, rattle, or otherwise react to system pressure variations.
1. Do not use nuts, bolts, or sheet metal screws for unit assemblies.
2. Lock form and seal or continuously weld joints.
3. Suspended Units: Factory-installed suspension hooks or lugs attached to frame in quantities and spaced to prevent deflection or distortion.
4. Reinforcement: Cross or trapeze angles for rigid suspension.

I. Source Quality Control:
1. Acoustic Performance: Test according to ASTM E 477.
2. Record acoustic ratings, including dynamic insertion loss and self-noise power levels with

an airflow of at least 2000-fpm face velocity.

3. Leak Test: Test units for airtightness at 200 percent of associated fan static pressure or 6- inch wg static pressure, whichever is greater.

PART 3 - EXECUTION

3.1 APPLICATION AND INSTALLATION

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.

B. Provide duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Install backdraft dampers on exhaust fans or exhaust ducts nearest to outside and where indicated.

D. Install volume dampers in ducts with liner; avoid damage to and erosion of duct liner.

E. Provide balancing dampers at points on supply, return, and exhaust systems where branches lead from larger ducts as required for air balancing. Coordinate requirements with TAB contractor. Install at a minimum of two duct widths from branch takeoff.

F. Where volume damper adjustment is not readily accessible through finished ceilings, provide volume damper remote control cable adjustment. Locate concealed ceiling regulators in coordination with Architect.

G. Provide test holes at fan inlets and outlets and elsewhere as indicated.

H. Install fire and smoke dampers, according to manufacturer's UL-approved written instructions.

I. Install duct access doors to allow for inspecting, adjusting, and maintaining accessories and terminal units as follows:
   1. On both sides of duct coils.
   2. Downstream from volume dampers and equipment.
   3. Adjacent to fire or smoke dampers, providing access to reset or reinstall fusible links.
   4. To interior of ducts for cleaning; before and after each change in direction, at maximum 50- foot spacing.
   5. On sides of ducts where adequate clearance is available.

J. Install the following sizes for duct-mounting, rectangular access doors:
   1. One-Hand or Inspection Access: 8 by 5 inches.
   2. Two-Hand Access: 12 by 6 inches.
   3. Head and Hand Access: 18 by 10 inches.
   4. Head and Shoulders Access: 21 by 14 inches.
   5. Body Access: 25 by 14 inches.
   6. Body Plus Ladder Access: 25 by 17 inches.

K. Install the following sizes for duct-mounting, round access doors:
   1. One-Hand or Inspection Access: 8 inches in diameter.
   2. Two-Hand Access: 10 inches in diameter.
   3. Head and Hand Access: 12 inches in diameter.
   4. Head and Shoulders Access: 18 inches in diameter.
   5. Body Access: 24 inches in diameter.

L. Install the following sizes for duct-mounting, pressure relief access doors:
   1. One-Hand or Inspection Access: 5 inches in diameter.
   2. Two-Hand Access: 10 inches in diameter.
   3. Head and Hand Access: 13 inches in diameter.
   4. Head and Shoulders Access: 19 inches in diameter.

M. Label access doors according to Division 23 Section "Identification for HVAC Piping and Equipment".

N. Install flexible connectors immediately adjacent to equipment in ducts associated with fans and motorized equipment supported by vibration isolators.

O. For fans developing static pressures of 5-inch wg and higher, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

P. Connect diffusers or light troffer boots to low pressure ducts directly or with minimum 60-inch lengths of flexible duct clamped or strapped in place.

Q. Connect flexible ducts to metal ducts with adhesive plus sheet metal screws.

R. Install duct test holes where indicated and required for testing and balancing purposes.

3.2 ADJUSTING

A. Adjust duct accessories for proper settings.

END OF SECTION

SECTION 23 34 23

HVAC POWER VENTILATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Roof mounted downblast centrifugal exhaust fan.
2. Ceiling-mounted fans.
3. In-line centrifugal fans.

1.3 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base air ratings on actual site elevations.

B. Operating Limits: Classify according to AMCA 99.

1.4 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated and include the following:

1. Certified fan performance curves with system operating conditions indicated.
2. Certified fan sound-power ratings.
3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
4. Material gages and finishes, including color charts.
5. Dampers, including housings, linkages, and operators.
6. Roof Curbs
7. Fan Speed Controllers.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
2. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
3. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

C. Maintenance Data: For power ventilators to include in maintenance manuals specified in Division 1.

D. Coordination Drawings: Reflected ceiling plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Roof framing and support members relative to duct penetrations.
2. Ceiling suspension assembly members.
3. Size and location of initial access modules for acoustical tile.

4. Ceiling-mounted items including light fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. AMCA Compliance: Products shall comply with performance requirements and shall be licensed to use the AMCA-Certified Ratings Seal.

C. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

D. UL Standard: Power ventilators shall comply with UL 705.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver fans as factory-assembled unit, to the extent allowable by shipping limitations, with protective crating and covering.

B. Disassemble and reassemble units, as required for moving to final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

1.7 COORDINATION

A. Coordinate size and location of structural-steel support members.

B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3 Section "Cast-in-Place Concrete."

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis of Design Product: The design for each product is based on manufacturer named on the drawings. Subject to compliance with requirements, provide either named product or a comparable equivalent product by on of the other manufacturers specified.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Roof-mounted Downblast Centrifugal Exhaust Fans
    a. Greenheck Fan Corp.
    b. Cook, Loren Company.
    c. Twin City Fan Company.
2. Ceiling-Mounting Fans:
    a. Greenheck Fan Corp.
    b. Cook, Loren Company.
    c. Twin City Fan Company.
3. In-Line Centrifugal Fans:
    a. Broan Mfg. Co., Inc.
    b. Greenheck Fan Corp.
    c. Cook, Loren Company.

2.2 ROOF-MOUNTED DOWNBLAST CENTRIFUGAL EXHAUST FAN

A. Description:
   1. Downblast fan shall be for roof mounted applications
   2. Maximum continuous operating temperature is 180 Fahrenheit
   3. Each fan shall bear a permanently affixed manufacture's engraved metal nameplate containing the model number and individual serial number.

B. Wheel:
   1. Constructed of composite.
   2. Non-overloading, backward inclined centrifugal
   3. Statically and dynamically balanced in accordance to AMCA Standard 204-05
   4. The wheel cone and fan inlet will be matched and shall have precise running tolerances for maximum performance and operating efficiency.

C. Electronically Commutated Motor:
   1. Motor enclosures: Open type.
   2. Motor to be a DC electronic commutation type motor (ECM) specifically designed for fan applications.
   3. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and pre-wired to the specific voltage and phase.
   4. Internal motor circuitry to convert AC power supplied to the fan to DC power to operate the motor.
   5. Motor shall be speed controllable down to 20% of full speed (80% turndown). Speed shall be controlled by either a potentiometer dial mounted at the motor or by a 0-10 VDC signal.
   6. Motor shall be a minimum of 85% efficient at all speeds.

D. Housing:
   1. Motor cover, shroud, curb cap, and lower windband shall be constructed of heavy gauge aluminum
   2. Shroud shall have an integral rolled bead for extra strength
   3. Shroud shall be drawn from a disc and direct air downward
   4. Lower windband shall have a formed edge for added strength
   5. Motor cover shall be drawn from a disc
   6. All housing components shall have final thicknesses equal to or greater then preformed thickness.
   7. Curb cap shall have pre-punched mounting holes to ensure correct attachment
   8. Rigid internal support structure
   9. Leak proof

E. Housing Supports and Drive Frame:
   1. Drive frame assemblies shall be constructed of heavy gauge steel and mounted on vibration isolators

F. Vibration Isolation:
   1. Rubber isolators
   2. Sized to match the weight of each fan

G. Options/Accessories:
   1. Birdscreen:
      a. Material Type: Galvanized
      b. Protects fan discharge
   2. Roof Curbs:
      a. Types: GPI
      b. Mounted onto roof with fan
      c. Material: Galvanized
   3. Curb Seal:
      a. Typically mounted between the fan curb cap and the roof curb
   4. Dampers:

a. Type: Gravity
b. Prevents outside air from entering back into the building when fan is off
c. Balanced for minimal resistance to flow
d. Galvanized frames with prepunched mounting holes

5. Finishes:
   a. Types: [None] [Permatector] [Hi-Pro Polyester] [Macropoxy with UV top coat]
6. Hinge Kit:
   a. Aluminum hinges
   b. Allows the fan to tilt away for access to wheel and ductwork for inspection and cleaning
7. Hinge Base:
   a. Aluminum hinges
   b. Hinges and restraint cables are mounted to a base (sleeve)
   c. Allows the fan to tilt away for access to wheel and ductwork for inspection and cleaning

2.3 DIRECT DRIVE CEILING MOUNTED CENTRIFUGAL EXHAUST FAN

A. General Description:
   1. Base fan performance at standard conditions (density 0.075 Lb/ft3)
   2. Ceiling mounted applications
   3. Performance capabilities up to 200 cubic feet per minute (cfm) and static pressure to 1 inches of water gauge
   4. Fans are available in nineteen sizes (50 - 1550 unit sizes)
   5. Maximum operating temperatures is 130 Fahrenheit
   6. Sound levels as low as 0.8 AMCA sones
   7. UL/cUL listed for above bathtub exhaust
   8. Fans are UL/cUL listed 507 - Electric Fans
   9. Each fan shall bear a permanently affixed manufacture's nameplate containing the model number and individual serial number
B. Wheel:
   1. Forward curved centrifugal wheel
   2. Constructed of galvanized steel or calcium carbonate filled polypropylene
   3. Statically and dynamically balanced in accordance to AMCA Standard 204-05
C. Motors:
   1. Motor enclosures shall be open driproof (ODP), opening in the frame body and or end brackets
   2. Motors are permanently lubricated sleeve bearing type to match with the fan load and furnished at the specific voltage and phase
   3. Motor shall be mounted on vibration isolators and be accessible for maintenance
   4. Thermal overload protection
D. Housing:
   1. Constructed of heavy gauge galvanized steel
   2. Interior shall be lined with 0.5 inches of acoustical insulation
   3. Profile as low as 7 inches
E. Plastic Backdraft Damper:
   1. Prevents air from entering back into the building when fan is off
   2. Eliminates rattling or unwanted backdrafts
F. Outlet:
   1. Type of outlet: Round
   2. Field rotatable from horizontal to vertical discharge
   3. Duct collar shall include backdraft damper
G. Mounting Brackets:
   1. Fully adjustable for multiple installation conditions
H. Options/Accessories:

1. Speed Controls:
    a. Controls the fan's output
    b. Fan can be adjusted to 60 percent of full speed.
2. Vibration Isolation:
    a. For suspended installations
    b. Includes prepunched hole for ease of installation and shall have all hardware to mount one unit.

I. Certifications: Fan shall be manufactured at an ISO 9001 certified facility. Fan shall be listed by Underwriters Laboratories (UL 705) and UL listed for Canada (cUL 705). For restaurant applications, fan shall be listed by Underwriters Laboratories (UL 762) and UL listed for Canada (Power Ventilator for Restaurant Exhaust Appliances). Fan shall bear the AMCA certified ratings seal for air performance.

2.4 IN-LINE CENTRIFUGAL FAN

A. General Description:
1. Base fan performance at standard conditions (density 0.075 Lb/ft3)
2. Performance capabilities up to 5,025 cubic feet per minute (cfm) and static pressure to 2.0 inches of water gauge.
3. Fans are available in thirteen sizes with nominal wheel diameters ranging from 8 inches through 16 inches (60 - 160 unit sizes)
4. Normal operating temperature up to 130 Fahrenheit.
5. Applications include: intake or make-up air systems
6. Each fan shall bear a permanently affixed manufacture's nameplate containing the model number and individual serial number

B. Wheel:
1. Constructed of aluminum.
2. Wheel type to be non-overloading, backward inclined centrifugal wheel
3. Statically and dynamically balanced in accordance to AMCA Standard 204-05.
4. The wheel cone and fan inlet will be matched and shall have precise running tolerances for maximum performance and operating efficiency.
5. Single thickness blades are securely riveted or welded to a heavy gauge back plate and wheel cone.

C. Electronically Commutated Motor:
1. Motor enclosures: Open type.
2. Motor to be a DC electronic commutation type motor (ECM) specifically designed for fan applications.
3. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and pre-wired to the specific voltage and phase.
4. Internal motor circuitry to convert AC power supplied to the fan to DC power to operate the motor.
5. Motor shall be speed controllable down to 20% of full speed (80% turndown). Speed shall be controlled by either a potentiometer dial mounted at the motor or by a 0-10 VDC signal.
6. Motors can achieve up to 95% efficiency, model and horsepower dependent.

D. Housing/Cabinet Construction:
1. Construction material: Aluminum
2. Square design constructed of heavy gauge galvanized steel, aluminum or painted steel

E. Inlet Cone:
1. Construction material: Galvanized

F. Housing Supports and Drive Frame:
1. Housing supports are constructed of structural steel with formed flanges.
2. Drive Frame is constructed of structural steel with formed flanges.

G. Options/Accessories:
1. MERV 13 filter.

2. Damper:
   a. Type: Gravity
   b. Galvanized frames with prepunched mounting holes
   c. Balanced for minimal resistance to flow

2.5 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210, "Laboratory Methods of Testing Fans for Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install power ventilators level and plumb.

B. Vibration- and seismic-control devices are specified in Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment".
   1. Secure vibration and seismic controls to concrete bases using anchor bolts cast in concrete base.

C. Secure roof-mounting fans to roof curbs with cadmium-plated hardware. Refer to Division 7 Section "Roof Accessories" for installation of roof curbs.

D. Ceiling Units: Suspend units from structure; use steel wire or metal straps.

E. Vibration-control devices are specified in Division 23 Section "Mechanical Vibration Controls and Seismic Restraints."

F. Install units with clearances for service and maintenance.

G. Label units according to requirements specified in Division 23 Section "Identification for HVAC Piping and Equipment".

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in other Division 23 Sections.

Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Division 23 Section "Air Duct Accessories".

B. Install ducts adjacent to power ventilators to allow service and maintenance.

C. Ground equipment.

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Equipment Startup Checks:
   1. Verify that shipping, blocking, and bracing are removed.
   2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
   3. Verify that cleaning and adjusting are complete.

4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Verify lubrication for bearings and other moving parts.
6. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
7. Disable automatic temperature-control operators.

B. Starting Procedures:
1. Energize motor and adjust fan to indicated rpm.
2. Measure and record motor voltage and amperage.

C. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new units, and retest.

D. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

E. Shut unit down and reconnect automatic temperature-control operators.

F. Refer to Division 23 Section " Commissioning of HVAC" for testing, adjusting, and balancing procedures.

G. Replace fan and motor pulleys as required to achieve design airflow.

H. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Lubricate bearings.

3.5 CLEANING

A. On completion of installation, internally clean fans according to manufacturer's written instructions.

Remove foreign material and construction debris. Vacuum fan wheel and cabinet.

B. After completing system installation, including outlet fitting and devices, inspect exposed finish.

Remove burrs, dirt, and construction debris and repair damaged finishes.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain power ventilators.
1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
2. Review data in maintenance manuals. Refer to Division 1 Section "Closeout Procedures."
3. Review data in maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
4. Schedule training with Owner, through Architect, with at least seven days' advance notice.

END OF SECTION

SECTION 23 37 13

DIFFUSERS, REGISTERS, AND GRILLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes ceiling- and wall-mounted diffusers, registers, and grilles. (Refer to Sheet M004 “HVAC Equipment Schedules 3” if needed for additional clarification.)

B. Related Sections include the following:
   1. Division 8 Section "Louvers and Vents" for fixed and adjustable louvers and wall vents, whether or not they are connected to ducts.
   2. Division 23 Section "Duct Accessories" for fire and smoke dampers and volume-control dampers not integral to diffusers, registers, and grilles.
   3. Section "Acoustics".

1.3 SUBMITTALS

A. Product Data: For each product indicated, include the following:
   1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
   2. Diffuser, Register, and Grille Schedule: Indicate Drawing designation, room location, quantity, model number, size, and accessories furnished.

B. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
   1. Ceiling suspension assembly members.
   2. Method of attaching hangers to building structure.
   3. Size and location of initial access modules for acoustical tile.
   4. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
   5. Duct access panels.

C. Samples for Initial Selection: For diffusers, registers, and grilles with factory-applied color finishes.

D. Samples for Verification: For diffusers, registers, and grilles, in manufacturer's standard sizes to verify color selected.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Products: Subject to compliance with requirements, provide one of the products specified.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 GRILLES AND REGISTERS

A. Adjustable Sidewall Supply:
   1. Product: Product: Price 500
   2. Manufacturers:
      a. Price Industries.
      b. Titus.

B. Steel supply grilles shall be of the sizes and mounting types shown on the plans and outlet schedule. The deflection blades shall be available parallel to the long or short dimension of the grille. Construction shall be of steel with a 1-1/4 inch wide border on all sides. Screw holes shall be countersunk for a neat appearance. Corner shall be welded with full penetration resistance welds.

C. Deflection blades shall be contoured to a specifically designed and tested cross-section to meet published test performance data. Blades shall be spaced on 3/4-inch centers. Blades shall have steel friction pivots on both ends to allow individual blade adjustment without loosening or rattling. Plastic blade pivots are not acceptable.

D. Optional opposed-blade volume damper shall be constructed of heavy gauge steel. Damper must be operable from the face of the grille. The grille finish shall be #26 white. The finish shall be an anodic acrylic paint, baked at 315°F for 30 minutes. The pencil hardness must be HB to H. The paint must pass a 100-hour ASTM B117 Corrosive Environments Salt Spray Test without creepage, blistering, or deterioration of film. The paint must pass a 250-hour ASTM D870 Water Immersion Test. The paint must also pass the ASTM D2794 Reverse Impact Cracking Test with a 50-inch pound force applied.

E. The manufacturer shall provide published performance data for the grille. The grille shall be tested in accordance with ANSI/ASHRAE Standard 70-1991.

F. The manufacturer shall provide published performance data for the grille. The grille shall be tested in accordance with ANSI/ASHRAE Standard 70-1991

G. Return and Exhaust Register:
   1. Product: Price 520
   2. Manufacturers:
      a. Price Industries.
      b. Titus.
   3. The fixed deflection blades shall be available parallel to the long or short dimension of the grille. Construction shall be of steel with a 11/4-inch wide border on all sides. Screw holes shall be countersunk for a neat appearance. Corners shall be welded with full penetration resistance welds.
   4. Deflection blades shall be contoured to a specifically designed and tested cross-section to meet published test performance data. Blades shall be firmly held in place by mullions from behind the grille and fixed to the grille by welding in place. Blade deflection angle shall be available at 35°.
   5. Optional opposed-blade volume damper shall be constructed of heavy gauge steel. Damper must be operable from the face of the grille.
   6. The grille finish shall be #26 white. The finish shall be an anodic acrylic paint, baked at 315° F for 30 minutes. The pencil hardness must be HB to H. The paint must pass a 100-hour ASTM B117 Corrosive Environments Salt Spray Test without creepage, blistering, or deterioration of film. The paint must pass a 250-hour ASTM D870 Water Immersion Test. The paint must also pass the ASTM D2794 Reverse Impact Cracking Test with a 50-inch pound force applied.
   7. The manufacturer shall provide published performance data for the grille. The grille shall be tested in accordance with ANSI/ASHRAE Standard 70-1991.

2.3 DIFFUSER OUTLETS & INLETS

A. Louver Face Diffuser:
   1. Product: Price MCD
   2. Manufacturers:
      a. Price Industries.
      b. Titus.
   3. Ceiling diffusers shall be for adjustable discharge pattern. These diffusers shall consist of an outer frame assembly of the sizes and mounting types shown on the plans and outlet schedule. A square or rectangular inlet shall be an integral part of the frame

assembly and a transition piece shall be available to facilitate attachment of round duct. An inner core assembly consisting of fixed deflection louvers shall be available in one-, two-, three-, or four-way horizontal discharge patterns. Diffusers shall include adjustable vanes to provide full vertical projection as well as horizontal projection. The inner core assembly must be removable in the field without tools for easy installation, cleaning, or damper adjustment.

4. The finish shall be #26 white. The finish shall be an anodic acrylic paint, baked at 315° F for 30 minutes. The pencil hardness must be HB to H. The paint must pass a 100-hour ASTM B117 Corrosive Environments Salt Spray Test without creepage, blistering, or deterioration of film. The paint must pass a 250-hour ASTM D870 Water Immersion Test. The paint must also pass the ASTM D2794 Reverse Impact Cracking Test with a 50-inch pound force applied.
5. Optional damper shall be constructed of heavy gauge steel. Damper must be operable from the face of the diffuser by removing the spring loaded inner core assembly.
6. The manufacturer shall provide published performance data for the diffuser. The diffuser shall be tested in accordance with ANSI/ASHRAE Standard 70-1991.

2.4 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas where diffusers, registers, and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install diffusers, registers, and grilles level and plumb.

B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practicable. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.3 ADJUSTING

A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION

SECTION 23 40 00

HVAC AIR CLEANING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes factory-fabricated air-filter devices and media used to remove particulate matter from air for HVAC applications. Filters shall meet MERV 13 requirements.

1.3 SUBMITTALS

A. Product Data: Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.

B. Shop Drawings: Include plans, elevations, sections, and details to illustrate component assemblies and attachments.

1. Show filter ultra low leak rack assembly, dimensions, materials, and methods of assembly of components.
2. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages.
3. Wiring Diagrams: Power, signal, and control wiring.

C. Operation and Maintenance Data: For each type of filter and rack to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air filters and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with ARI 850.

D. Comply with ASHRAE 52.1 and ASHRAE 52.2 for method of testing and rating air-filter units.

E. Comply with NFPA 70 for installing electrical components.

F. Comply with NFPA 90A and NFPA 90B.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Provide one complete set of filters for each filter bank. If system includes prefilters, provide only prefilters.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Air Filters, Electrostatic Air Cleaners, and Filter-Holding Systems:
   a. TFM
2. Filter Gages:
   a. Airguard Industries, Inc.
   b. Dwyer Instruments, Inc.

2.2 DISPOSABLE PANEL FILTERS

A. Description: Factory-fabricated, viscous-coated, flat-panel-type, disposable air filters with holding frames.

B. Media: Interlaced glass fibers sprayed with nonflammable adhesive and anti-microbial agent.

C. Frame: Galvanized steel with metal grid on outlet side, steel rod grid on inlet side, hinged, and with pull and retaining handles.

D. Duct-Mounting Frames: Welded, galvanized steel with gaskets and fasteners and suitable for bolting together into built-up filter banks.

2.3 EXTENDED-SURFACE, DISPOSABLE PANEL FILTERS

A. Description: Factory-fabricated, dry, extended-surface filters with holding frames.

B. Media: Fibrous material formed into deep-V-shaped pleats with anti-microbial agent and held by self-supporting wire grid.

C. Media and Media-Grid Frame: Galvanized steel.

D. Duct-Mounting Frames: Welded, galvanized steel with gaskets and fasteners, and suitable for bolting together into built-up filter banks.

2.4 EXTENDED-SURFACE, NONSUPPORTED-MEDIA FILTERS

A. Description: Factory-fabricated, dry, extended-surface, self-supporting filters with holding frames.

B. Media: Fibrous material constructed so individual pleats are maintained in tapered form by flexible internal supports under rated-airflow conditions and anti-microbial agent.

C. Filter-Media Frame: Galvanized steel.

D. Duct-Mounting Frames: Welded epoxy coated aluminum with gaskets and fasteners, and suitable for bolting together into built-up filter banks.

2.5 FRONT- AND REAR-ACCESS FILTER FRAMES

A. Framing System: Epoxy coated aluminum framing members with access for either upstream (front) or downstream (rear) filter servicing, cut to size and prepunched for assembly into modules. Vertically support filters prevent deflection of horizontal members without interfering with either filter installation or operation.

B. Prefilters: Incorporate a separate track, removable from front or back.

C. Sealing: Factory-installed, positive-sealing device for each row of filters to ensure seal between gasketed filter elements to prevent bypass of unfiltered air.

2.6 FILTER GAGES

A. Description: Diaphragm type with dial and pointer in metal case, vent valves, black figures on white background, and front recalibration adjustment.

1. Diameter: 4-1/2 inches.
2. Range: 0- to 2.0-inch wg.

B. Accessories: Static-pressure tips, tubing, gage connections, and mounting bracket.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install filter frames according to manufacturer's written instructions.

B. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.

C. Install filters in position to prevent passage of unfiltered air.

D. Install filter gage for each filter bank.

E. Install filter gage static-pressure tips upstream and downstream from filters to measure pressure drop through filter. Mount filter gages on outside of filter housing or filter plenum in an accessible position. Adjust and level inclined gages.

F. Coordinate filter installations with duct and air-handling unit installations.

G. Electrical wiring and connections are specified in Division 26 Sections.

H. Ground equipment according to Division 26 Section "Grounding and Bonding."

3.2 CLEANING

A. After completing system installation and testing, adjusting, and balancing air-handling and air- distribution systems, clean filter housings and install new filter media.

END OF SECTION

SECTION 23 75 00

ENERGY RECOVERY VENTILATOR

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This section includes Energy Wheel Air-to-Air Energy Recovery Ventilators for rooftop installation.

1.3 SUBMITTALS

A. Product Data: For each type or model include the following:

1. Complete fan performance curves for both Supply Air and Exhaust Air, with system operating conditions indicated, as tested in an AMCA Certified Chamber.
2. Energy wheel performance data for both summer and winter operation.
3. Motor ratings, electrical characteristics and motor and fan accessories.
4. Combined efficiency data per ARI Guideline V-2003 for each model. Data shall include RER, COP, Unitary Net Cooling, Unitary EER and CEF.
5. Material types and gauges of all component pieces and assemblies.
6. Dimensioned drawings for each type of installation, showing isometric and plan views, to include location of attached ductwork and service clearance requirements.
7. Estimated gross weight of each installed unit.
8. Installation, Operating and Maintenance manual (IOM) for each model.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain unit with all appurtenant components or accessories from a single manufacturer.

B. For the actual fabrication, installation, and testing of work under this section, use only thoroughly trained and experienced workers completely familiar with the items required and with the manufacturer's current recommended methods of installation.

C. Product Options: Drawings must indicate size, profiles and dimensional requirements of Energy Recovery Units and are to be based on the specific system indicated. Refer to Division 1 Section "Product Requirements".

D. Certifications

1. Energy Wheel shall be AHRI Certified, per Standard 1060.

1.5 COORDINATION

A. Coordinate size and location of all building penetrations required for installation of each unit and associated plumbing and electrical systems.

B. Coordinate sequencing of construction of associated plumbing, HVAC, electrical supply, roofing contractor.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: 1 set(s) of MERV 13 disposable supply air filters and 1 set(s) MERV 8 disposable exhaust air filters for each unit.
2. One set of fan belts.
3. One set of energy wheel belts.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with specifications contained within this document, manufacturers offering products that may be incorporated into the work include, but are not limited to:

1. Greenheck Fan Corporation

2.2 MANUFACTURED UNITS

A. Unit shall be fully assembled at the factory and consist of an insulated metal cabinet, energy wheel, motorized intake damper, motorized exhaust damper, curb assembly, filter assembly for intake and exhaust air, supply air blower assembly, exhaust air blower assembly and an electrical control center. All specified components and internal accessories factory installed and tested and prepared for single-point high voltage connection.

2.3 CABINET

A. Materials: Formed double wall insulated metal cabinet, fabricated to permit access to internal components for maintenance.

1. Outside casing: 18 gauge, galvanized (G90) steel meeting ASTM A653 for components that do not receive a painted finish.
2. Internal assemblies: 18 gauge, galvanized (G90) steel except for motor supports which shall be minimum 14 gauge galvanized (G90) steel.

B. Access doors shall be hinged.

C. Shall have factory-installed duct flanges on all duct openings.

D. Cabinet Insulation: Comply with NFPA 90A and NFPA 90B and erosion requirements of UL 181.

1. Materials: Fiberglass insulation. If insulation other than fiberglass is used, it must also meet the Fire Hazard Classification shown below.
   a. Thickness: 1 inch (25 mm)
   b. Fire Hazard Classification: Maximum flame spread of 25 and smoke developed of 50, when tested in accordance with ASTM C 411.
   c. Location and application: Full coverage of entire cabinet exterior to include walls, roof and floor of unit. Insulation shall be of semi-rigid type and installed between inner and outer shells of all cabinet exterior components.

E. Energy wheel: Energy wheel shall be of total enthalpy, rotary air-to-air type and shall be an element of a removable energy wheel cassette. The cassette shall consist of a galvanized steel framework (designed to produce laminar air flow through the wheel), an energy wheel as specified and a motor and drive assembly. The cassette shall incorporate a pre-tensioned urethane drive belt with a five year warranty. The wheel media shall be a polymer film matrix in a stainless steel framework and be comprised of individual segments that are removable for servicing. Non-segmented energy wheels are not acceptable. Silica gel desiccant shall be permanently bonded to the polymer film and shall be designed and constructed to permit cleaning and servicing. The energy wheel is to have a five year warranty. Performance criteria are to be as specified in AHRI Standard 1060, complying with the Combined Efficiency data in the submittal.

F. Supply Air and Exhaust Air blower assemblies: Blower assemblies consist of an electric motor and a belt driven blower. Assembly shall be mounted on heavy gauge galvanized rails and further mounted on 1.125 inch thick neoprene vibration isolators.

G. Control panel / connections: Energy Recovery Ventilator shall have an electrical control center where all high and low voltage connections are made. Control center shall be constructed to permit single-point high voltage power supply connections.

H. Frost control: none.

I. Motorized dampers / Exhaust Air, Intake Air, Motorized dampers of low leakage type shall be factory installed.

J. Curb Assembly: A curb assembly made of 14 gauge galvanized steel shall be provided by the factory for assembly and installation as part of this division. The curb assembly shall provide perimeter support of the entire unit. Curb assembly shall enclose the underside of the unit and shall be sized to fit into a recess in the bottom of the unit. Contractor shall be responsible for coordinating with roofing contractor to ensure curb unit is properly flashed to provide protection against weather/moisture penetration. Contractor shall provide and install appropriate insulation for the curb assembly.

2.4 BLOWER

A. Blower section construction, Supply Air and Exhaust Air: Belt drive motor and blower shall be assembled onto a 14 gauge galvanized steel platform and must have neoprene vibration isolation devices.

B. Blower assemblies: Shall be statically and dynamically balanced and designed for continuous operation at maximum rated fan speed and horsepower.

C. Centrifugal blower housing: Formed and reinforced steel panels to make curved scroll housing with shaped cutoff.

D. Forward curved blower (fan) wheels: Galvanized or aluminum construction with inlet flange and shallow blades curved forward in direction of airflow. Mechanically attached to shaft with set screws.

E. Blower performance shall be factory tested for flow rate, pressure, power, air density, rotation speed and efficiency. Ratings are to be established in accordance with AMCA 210, "Laboratory Methods of Testing Fans for Rating".

2.5 MOTORS

A. General: Blower motors greater than 3/4 horsepower shall be "NEMA Premium" unless otherwise indicated. Minimum compliance with EPAct minimum energy-efficiency standards for single speed ODP and TEFC enclosures is not acceptable. Motors shall be heavy-duty, permanently lubricated type to match the fan load and furnished at the specified voltage, phase and enclosure. Drives shall be sized for a minimum of 150% of driven horsepower and pulleys shall be fully machined cast-type, keyed and fully secured to the fan wheel and motor shafts. Electric motors of ten horsepower or less shall be supplied with an adjustable drive pulley. Comply with requirements in Division 23 05 13, matched with fan load.

B. Fan motors shall be 60 cycle, 1 phase 230 volts.

2.6 UNIT CONTROLS

A. The unit shall be constructed so that it can be controlled by a factory-supplied controller or it can be monitored and controlled by a Building Management System (BMS).

B. Sensors

1. Dirty filter sensor
2. Temperature Sensors - OAI EAD RAI OAD
3. Relative Humidity Sensor - OAH RAH

2.7 FILTERS

A. Unit shall have permanent metal filters located in the outdoor air intake and shall be accessible from the exterior of the unit. MERV 13 disposable pleated filters shall be provided in the intake air stream and MERV 8 filters in the exhaust air stream.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to start of installation, examine area and conditions to verify correct location for compliance with installation tolerances and other conditions affecting unit performance. See unit IOM.

B. Examine roughing-in of plumbing, electrical and HVAC services to verify actual location and compliance with unit requirements. See unit IOM.

C. Proceed with installation only after all unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Installation shall be accomplished in accordance with these written specifications, project drawings, manufacturer's installation instructions as documented in manufacturer's IOM, Best Practices and all applicable building codes.

3.3 CONNECTIONS

A. In all cases, industry Best Practices shall be incorporated. Connections are to be made subject to the installation requirements shown above.

1. Duct installation and connection requirements are specified in Division 23 of this document.

2. Electrical installation requirements are specified in Division 26 of this document.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory authorized service representative to inspect field assembled components and equipment installation, to include electrical and piping connections. Report results to A/E in writing. Inspection must include a complete startup checklist to include (as a minimum) the following: Completed Start-Up Checklists as found in manufacturer's IOM.

3.5 START-UP SERVICE

A. Engage a factory authorized service representative to perform startup service. Clean entire unit, comb coil fins as necessary, and install clean filters. Measure and record electrical values for voltage and amperage. Refer to Division 23 "Testing, Adjusting and Balancing" and comply with provisions therein.

3.6 DEMONSTRATION AND TRAINING

A. Engage a factory authorized service representative to train owner's maintenance personnel to adjust, operate and maintain the entire unit. Refer to Division 01 Section Closeout Procedures and Demonstration and Training.

END OF SECTION

SECTION 23 74 16

ROOFTOP PACKAGED HEAT PUMP UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This section includes Packaged Heat Pump System for rooftop installation.

1.3 SUBMITTALS

A. Product Data:

1. Provide literature that indicates dimensions, capacities, ratings, performances, gauges and finishes of materials, electrical characteristics and connection requirements.
2. Provide data of filter media, performance, framing and assembly.
3. Provide coil performance data and fan performance data.
4. Submit sound power level data for fan outlet, fan inlet and casing radiation at rated capacity.
5. Submit electrical requirements for power supply wiring including wiring diagrams for control wiring.

1.4 QUALITY ASSURANCE

A. Cooling capacity shall be rated in accordance with current ANSI/AHRI Standard 210/240.

B. Unit shall be UL or ETL listed and designed to conform to ANSI/ASHRAE Standard 15 Safety Code for Mechanical Refrigeration.

C. ANSI/NFPA 70: National Electrical Code.

D. Provide units with Minimum EER of 11, COP 3.4 rated at AHRI conditions and calculated in accordance with AHRI Standard 210/240.

E. The unit roof curbs shall conform to NRCA standards.

F. Insulation and adhesive shall meet NFPA 90A and 90B requirements for flame spread and smoke generation.

G. Unit casing shall be capable of withstanding ASTM B117 500-hour salt spray test.

H. Each unit shall be run tested at factory per ANSI/ASHRAE 37 and provided with a certificate indicating tested pressures, amperages, dates, and inspector.

1.5 WARRANTY

A. Compressors shall be provided with manufacturer's five-year warranty, replacement only.

B. Manufacturer shall warrant all parts for a period of five years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with specifications contained within this document, manufacturers offering products that may be incorporated into the work include, but are not limited to:

1. Trane

B. Furnish packaged Heat Pump unit for rooftop installation. Unit shall be self-contained, completely factory assembled, with complete internal wiring and controls. Unit shall also be provided with a fully piped refrigerant circuit, fully charged with a refrigerant that is not scheduled for phase out. Unit

shall be field configurable for down-flow or horizontal discharge. Cooling and heating capacities, electrical characteristics, and operating conditions shall be as indicated on Drawings.

2.2 UNIT CABINET

A. Galvanized steel with baked enamel finish on external surfaces that are exposed to weather.

B. Interior surfaces exposed to conditioned and return air streams shall be insulated with a minimum ½-inch thick, 1-pound density foil-faced cleanable insulation.

C. Cabinet top cover shall be of one-piece construction or where seams exist, shall be double hemmed and gasket sealed.

D. Cabinet panels shall be hinged access panels for filter, compressors, evaporator fan, and control box areas. Each panel shall use multiple quarter-turn latches. Each major external hinged access panel shall be permanently attached to the rooftop unit. Panels shall also include tiebacks.

E. Return air filters shall be accessible through a hinged access panel and be on a track using standard size filters.

F. Holes shall be provided in base rails (minimum 16 gage) for rigging shackles and level travel and movement during overhead rigging operations.

G. Unit shall have a factory-installed internally sloped condensate drain pan, providing a minimum ¾-inch NPT connection to prevent standing water from accumulating. Pan shall be fabricated of high impact polycarbonate material or stainless steel and shall slide out for cleaning or maintenance. An alternate vertical drain (¾-inch NPT) connection shall also be available. Drain pans shall conform to ASHRAE 62 self-draining provisions.

2.3 COMPRESSORS

A. Unit shall be furnished with single (If single compressor is used, then it shall be Two Stage type) or fully hermetic scroll compressors with internal vibration isolators.

B. Compressors shall be provided with service access valves.

C. Compressor motors shall be cooled by refrigerant passing through motor windings.

D. Compressors shall be provided with line break thermal and current overload protection.

E. Compressors shall be provided with crankcase heaters, internal high-pressure and temperature protection.

2.4 REFRIGERANT CIRCUITS

A. Thermostatic expansion valve (TXV) with removable power element or Electronic Expansion Valve (EEV).

B. Refrigerant strainer.

C. Service gage connections on suction, discharge, and liquid lines.

D. Solid core bi-flow refrigerant filter driers.

E. High-pressure safety switch.

F. Low-pressure safety switch.

G. Minimum off-time relay.

2.5 EVAPORATOR AND CONDENSER COILS

A. Condenser Coils:

1. Spine Fin condenser coil shall be continuously wrapped, corrosion resistant aluminum with minimum brazed joints. This coil is 3/8-inch OD seamless aluminum tubing glued to a continuous aluminum fin. Coils are lab tested to withstand 2,000 pounds of pressure per square inch. The outdoor coil provides low airflow resistance and efficient heat transfer. The coil is protected on four sides by louvered panels.

B. Evaporator Coils:

1. All aluminum micro channel, extruded tubes, mechanically bonded to aluminum fins and factory pressure and leak tested at 480-650 psig.

2.6 FANS AND MOTORS

A. Indoor Fan: Direct drive, forward curved, centrifugal wheel in a Composite Vortica Blower housing. Motor shall have thermal overload protection. Permanently lubricated motor bearings. Motor/blower assembly isolated from the unit with rubber mounts.

B. Condenser Fan: Direct-drive, draw thru propeller type. Weather-proofed permanent split capacitor fan motor shall have built-in thermal overload and permanently lubricated motor bearings.

2.7 CONTROLS, SAFETIES AND DIAGNOSTIC POINTS

A. Unit Controls: Unit shall be furnished with self-contained, BACnet MS/TP Direct Digital Controls.

1. Controls shall be factory-installed.
2. Controls shall operate with zone control systems as needed.
3. Controls shall furnish built-in diagnostics for thermostat/sensor commands for staged heating and cooling, evaporator-fan operation, and economizer operation.
4. Controls shall be furnished with a 5-minute time delay between modes of operation.
5. Control circuit shall be protected by a fuse on 24-V transformer side.
6. Control shall incorporate passive infrared detection for sensing occupancy in space serve.

B. Compressor high temperature, high current, internal overloads, internal thermostat.

1. Compressor reverse rotation protection.
2. Loss-of-charge/low-pressure switch.
3. Freeze-protection thermostat, evaporator coil.
4. High-pressure switch.
5. Internal relief valve.
6. Anti-recycle relay, or time cycle device to prevent rapid cycling of compressor after any off cycle.

C. Operating Characteristics:

1. Unit shall be capable of starting and operating at 125 degrees F ambient outdoor temperature, meeting maximum load criteria of AHRI Standard 210/240 or 360 at plus or minus 10 percent voltage.
2. Compressor with standard controls shall be capable of operation down to 25 degrees F ambient outdoor temperature.

2.8 FILTERS

A. Provide filter section with factory-installed low-velocity, throwaway, 4-inch (if available), or 2-inch thick high capacity, MERV 13 Class 2, filters of commercially available sizes unless noted otherwise on the drawings.

B. Filter face velocity shall not exceed 300 fpm at nominal airflows.

C. Filter section shall allow installation of standard size air filter.

D. Return air filters shall be accessible through a hinged or tool-less access panel.

2.9 Furnish programmable digital thermostat with following features:

A. Heat, cool, automatic changeover.

B. Occupied/ Unoccupied modes.

C. With built-in PIR occupancy sensor.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas under which Work of this Section will be performed. Correct conditions detrimental to proper and timely completion of Work. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Installation shall be accomplished in accordance with these written specifications, project drawings, manufacturer's installation instructions as documented in manufacturer's IOM, Best Practices and all applicable building codes.

B. Downflow Packaged Units: Install unit on a prefabricated mounting frame or curb secured directly to roof. Follow manufacturers recommended installation manuals. Submit Shop Drawings for review by Architect.

C. Horizontal Flow Packaged Units: Install unit on platform or prefabricated mounting frame or curb secured directly to roof designed to suit roof conditions and requirements of provided unit. Submit Shop Drawings for review by Architect.

3.3 CONNECTIONS

A. In all cases, industry Best Practices shall be incorporated. Connections are to be made subject to the installation requirements shown above.

1. Duct installation and connection requirements are specified in Division 23 of this document.
2. Electrical installation requirements are specified in Division 26 of this document.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory authorized service representative to inspect field assembled components and equipment installation, to include electrical and piping connections. Report results to A/E in writing. Inspection must include a complete startup checklist to include (as a minimum) the following: Completed Start-Up Checklists as found in manufacturer's IOM.

3.5 START-UP SERVICE

A. System shall be started up and initially operated with components operating. During this test, various strainers or filters shall be periodically cleaned until no further accumulation of foreign material occurs. Adjust safety and automatic control instruments as required to provide proper operation and control sequence.

3.6 DEMONSTRATION AND TRAINING

A. Engage a factory authorized service representative to train owner's maintenance personnel to adjust, operate and maintain the entire unit. Refer to Division 01 Section Closeout Procedures and Demonstration and Training.

END OF SECTION

SECTION 23 81 26

SPLIT-SYSTEM AIR-CONDITIONERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes split-system air-conditioning and heat pump units consisting of separate evaporator-fan and compressor-condenser components. Units are designed for exposed or concealed mounting, and may be connected to ducts.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For split-system air-conditioning units to include in emergency, operation, and maintenance manuals.

F. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of split-system units and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Energy-Efficiency Ratio: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

D. Coefficient of Performance: Equal to or greater than prescribed by ASHRAE 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings."

E. Units shall be designed to operate with HCFC-free refrigerants.

1.5 COORDINATION

A. Coordinate size and location of concrete bases for units. Cast anchor-bolt inserts into bases.

Concrete, reinforcement, and formwork are specified in Division 03 Section "Cast-in-Place Concrete."

B. Coordinate size, location, and connection details with roof curbs, equipment supports, and roof penetrations specified in Division 07 Section "Roof Accessories."

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Mitsubishi Electronics America, Inc.; HVAC Division.
2. Trane Company (The); Unitary Products Group.

2.2 WALL-MOUNTING, EVAPORATOR-FAN COMPONENTS

A. Cabinet: Enameled steel with removable panels on front and ends in color selected by Architect, and discharge drain pans with drain connection.

B. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with thermal-expansion valve.

C. Fan: Direct drive, centrifugal fan.

D. Fan Motors: Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC Equipment."

1. Special Motor Features: Multitapped, multispeed with internal thermal protection and permanent lubrication.

E. Filters: Permanent, cleanable.

2.3 AIR-COOLED, COMPRESSOR-CONDENSER COMPONENTS

A. Casing: Steel, finished with baked enamel in color selected by Architect, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.

B. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation.

Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.

1. Compressor Type: Scroll.
2. Two-speed compressor motor with manual-reset high-pressure switch and automatic-reset low-pressure switch.
3. Refrigerant Charge: R-407C.

C. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with liquid subcooler.

D. Heat Pump Components: Reversing valve and low-temperature air cut-off thermostat.

E. Fan: Aluminum-propeller type, directly connected to motor.

F. Motor: Permanently lubricated, with integral thermal-overload protection.

G. Low Ambient Kit: Permits operation down to 45 deg F.

H. Mounting Base: Polyethylene.

2.4 ACCESSORIES

A. Control equipment and sequence of operation are specified in Division 23 Sections "Instrumentation and Control for HVAC" and "Sequence of Operations for HVAC Controls."

B. Thermostat: Low voltage with subbase to control compressor and evaporator fan.

C. Thermostat: Wireless infrared functioning to remotely control compressor and evaporator fan, with the following features:

1. Compressor time delay.
2. 24-hour time control of system stop and start.
3. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating

mode, and fan speed.

4. Fan-speed selection, including auto setting.

D. Automatic-reset timer to prevent rapid cycling of compressor.

E. Refrigerant Line Kits: Soft-annealed copper suction and liquid lines factory cleaned, dried, pressurized, and sealed; factory-insulated suction line with flared fittings at both ends.

F. Additional Monitoring:

1. Monitor constant and variable motor loads.
2. Monitor variable frequency drive operation.
3. Monitor economizer cycle.
4. Monitor cooling load.
5. Monitor air distribution static pressure and ventilation air volumes.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install units level and plumb.

B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

C. Install ground-mounting, compressor-condenser components on 4-inch- thick, reinforced concrete base; 4 inches larger on each side than unit. Concrete, reinforcement, and formwork are specified in Division 03 Section "Cast-in-Place Concrete." Coordinate anchor installation with concrete base.

D. Install ground-mounting, compressor-condenser components on polyethylene mounting base.

E. Install roof-mounting compressor-condenser components on equipment supports specified in Division 07 Section "Roof Accessories." Anchor units to supports with removable, cadmium-plated fasteners.

F. Install seismic restraints.

G. Install compressor-condenser components on restrained, spring isolators. Refer to Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."

H. Install and connect precharged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

1. Water Coil Connections: Comply with requirements in Division 23 Section "Hydronic Piping." Connect to supply and return coil with shutoff-duty valve and union or flange on the supply connection and with throttling-duty valve and union or flange on the return connection.
2. Remote Water-Cooled Condenser Connections: Comply with requirements in Division 23 Section "Hydronic Piping." Connect to supply and return with shutoff-duty valve and union or flange on the supply connection and with throttling-duty valve and union or flange on the return connection.
3. Steam Coil Connections: Comply with requirements in Division 23 Section "Steam and Condensate Heating Piping." Connect to steam piping with shutoff valve and union or flange; for condensate piping, starting from the coil connection, connect with union or flange, strainer, trap, and shutoff valve.

B. Install piping adjacent to unit to allow service and maintenance.

C. Duct Connections: Duct installation requirements are specified in Division 23 Section "Metal Ducts." Drawings indicate the general arrangement of ducts. Connect supply and return ducts to split-system air-conditioning units with flexible duct connectors. Flexible duct connectors are

specified in Division 23 Section "Air Duct Accessories."

D. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

E. Electrical Connections: Comply with requirements in Division 26 Sections for power wiring, switches, and motor controls.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION

SECTION 23 81 29

VARIABLE REFRIGERANT FLOW HVAC SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes variable refrigerant volume heat pump units consisting of separate evaporator-fan and compressor-condenser components. Units are designed for exposed or concealed mounting and may be connected to ducts.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For variable refrigerant volume heat pump units to include in emergency, operation, and maintenance manuals.

F. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. The units shall be listed by Electrical Testing Laboratories (ETL) and bear the ETL label.

B. All wiring shall be in accordance with the National Electrical Code (N.E.C.).

C. The units shall be manufactured in a facility registered to ISO 9001 and ISO14001 which is a set of standards applying to environmental protection set by the International Standard Organization (ISO).

D. All units must meet or exceed the 2010 Federal minimum efficiency requirements and the ASHRAE 90.1 efficiency requirements for VRF systems. Efficiency shall be published in accordance with the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) Standard 1230.

E. System start-up supervision shall be a required service to be completed by the manufacturer or a duly authorized, competent representative that has been factory trained in system configuration and operation. The representative shall provide proof of manufacturer certification indicating successful completion within no more than two (2) years prior to system installation. This certification shall be included as part of the equipment and/or controls submittals.

1.5 DELIVERY, STORAGE AND HANDLING

A. Unit shall be stored and carefully handled according to the manufacturer’s recommendations.

1.6 COORDINATION

A. Coordinate size and location of concrete bases for units. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork are specified in Division 03 Section "Cast-in-Place Concrete."

B. Coordinate size, location, and connection details with roof curbs, equipment supports, and roof penetrations specified in Division 07 Section "Roof Accessories."

1.7 WARRANTY

A. The CITY MULTI units shall be covered by the manufacturer’s limited warranty for a period of one

(1) year parts and seven (7) year compressor to the original owner from date of installation.

B. Installing contractor shall meet manufacturer requirements to obtain extended manufacturer's limited parts and compressor warranty for a period of ten (10) years to the original owner from date of installation. This warranty shall not include labor.

C. Manufacturer shall have a minimum of fifteen (15) years continuous experience providing VRF systems in the U.S. market.

D. All manufacturer technical and service manuals must be readily available for download by any local contractor should emergency service be required.

E. Registering and sign-in requirements which may delay emergency service reference are not allowed.

F. The CITY MULTI VRF system shall be installed by a contractor with extensive CITY MULTI install and service training. The mandatory contractor service and install training should be performed by the manufacturer.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Trane-Mitsubishi.

2.2 OUTDOOR UNIT

A. General: The outdoor unit is designed specifically for use with VRV series components.

1. The outdoor unit modules shall be air-cooled, direct expansion (DX), multi-zone units used specifically with VRF components described in this section. The outdoor unit modules shall be equipped with a single compressor which is inverter-driven and multiple circuit boards—all of which must be manufactured by the branded VRF manufacturer. Each outdoor unit module shall be completely factory assembled, piped and wired and run tested at the factory.
2. Outdoor unit shall have a sound rating no higher than 59 dB(A). If an alternate manufacturer is selected, any additional material, cost, and labor to meet published sound levels shall be incurred by the contractor.
3. Refrigerant lines from the outdoor unit to the indoor units shall be insulated in accordance with the installation manual.
4. The outdoor unit shall have the capability of installing the main refrigerant piping through the bottom of the unit.
5. The outdoor unit shall have an accumulator with refrigerant level sensors and controls.
6. The outdoor unit shall have a high pressure safety switch, over-current protection, crankcase heater and DC bus protection.
7. VRF system shall meet performance requirements per schedule and be within piping limitations & acceptable ambient temperature ranges as described in respective manufacturers' published product catalogs. Non-published product capabilities or performance data are not acceptable.
8. The outdoor unit shall be capable of guaranteed operation in heating mode down to -13°F ambient temperatures and cooling mode up to 115°F without additional restrictions on line length & vertical separation beyond those published in respective product catalogs. Models with capacity data for required temperature range published as "for reference only" are not considered capable of guaranteed operation and are not acceptable. If an alternate manufacturer is selected, any additional material, cost, and labor to meet ambient operating range and performance shall be incurred by the contractor.
9. The outdoor unit shall have a high efficiency oil separator plus additional logic controls to ensure adequate oil volume in the compressor is maintained. Oil return sequences must be enabled only during extended periods of reduced refrigerant flow to ensure no disruption to correct refrigerant flow to individual zones during peak loads. Systems which might engage oil return sequence based on hours of operation risk oil return during inopportune periods are

not allowed. Systems which rely on sensors (which may fail) to engage oil return sequence are not allowed.

10. VRF four-legged outdoor unit mounting systems shall be provided by manufacturer. Stand shall be made from 7 gauge plate steel with thermally fused polyester powder coat finish that meets ASTM D3451-06 standards. Stands shall be provided with galvanized mounting hardware and meets all ASCE 7 overturning safety requirement.

B. Unit Cabinet:
   1. The casing(s) shall be fabricated of galvanized steel, bonderized and finished.
   2. Outdoor unit components shall be coated with the Seacoast Protection Coating (Brine Spray – BS coating) to protect from premature corrosion due to a seacoast environment. Coating shall be applied to components before original outdoor unit assembly to ensure manufacturer quality standards are not compromised and shall meet the following minimum requirements:
      a. ≥85µm thermoset polyester-resin powder coating on External Front Panel
      b. ≥70µm thermoset polyester-resin powder coating on External Panel Base, Pillar, Compressor Cover, Fan Motor Support, Electrical Box
      c. ≥1µm cellulose and polyurethane-resin coating on heat exchanger fins
      d. ≥10µm polyurethane coating on printed circuit boards
   3. The outdoor unit shall be tested in compliance with ISO9277 such that no unusual rust shall develop after 960 hours of salt spray testing.
   4. Panels on the outdoor unit shall be scratch free at system startup. If a scratch occurs the salt spray protection is compromised and the panel should be replaced immediately.

C. Fan:
   1. Each outdoor unit module shall be furnished with direct drive, variable speed propeller type fan(s) only.
   2. All fan motors shall have inherent protection, have permanently lubricated bearings, and be completely variable speed.
   3. All fans shall be provided with a raised guard to prevent contact with moving parts.

D. Coil:
   1. The outdoor coil shall be of nonferrous construction with lanced or corrugated fins on copper tubing.
   2. The coil fins will have a factory applied corrosion resistant blue-fin finish.
   3. The coil shall be protected with an integral metal guard.
   4. Refrigerant flow from the outdoor unit shall be controlled by means of an inverter driven compressor.

E. Compressor:
   1. Each outdoor unit module shall be equipped with only inverter driven scroll hermetic compressors. Non inverter-driven compressors, which may cause inrush current (demand charges) and require larger generators for temporary power shall not be allowed.
   2. Crankcase heat shall be provided via induction-type heater utilizing eddy currents from motor windings. Energy-wasting “belly-band” type crankcase heaters are not allowed.
   3. Compressor shall have an inverter to modulate capacity.
   4. The compressor shall be equipped with an internal thermal overload.

F. Electrical:
   1. The outdoor unit electrical power shall be 208/230 volts, 1-phase, 60 hertz per equipment schedule.
   2. The outdoor unit shall be controlled by integral microprocessors.
   3. The control circuit between the indoor units and the outdoor unit shall be 24VDC completed using a 2-conductor, twisted pair shielded cable to provide total integration of the system.

2.3 4-WAY CEILING-RECESSED CASSETTE WITH GRILLE FOR 2X2 GRID INDOOR UNIT

A. Unit:

1. The indoor unit shall be a four-way cassette style indoor unit that recesses into the ceiling with a ceiling grille. The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, an emergency operation function and a test run switch. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory. The unit shall be suitable for use in plenums in accordance with UL1995 ed 4.

B. Unit Cabinet:

1. The cabinet shall be a compact 22-7/16” wide x 22-7/16” deep so it will fit within a standard 24” square suspended ceiling grid.
2. The cabinet panel shall have provisions for a field installed filtered outside air intake.
3. Four-way grille shall be fixed to bottom of cabinet allowing two, three or four-way blow.

C. Fan:

1. The indoor fan shall be an assembly with a turbo fan direct driven by a single motor.
2. The indoor fan shall be statically and dynamically balanced to run on a motor with permanently lubricated bearings.
3. The indoor fan shall be capable of three (3) speed settings, Low, Mid, and High.
4. The indoor unit shall have an adjustable air outlet system offering 4-way airflow, 3-way airflow, or 2-way airflow.
5. The indoor unit vanes shall have 5 fixed positions and a swing feature that shall be capable of automatically swinging the vanes up and down for uniform air distribution.
6. Grille shall include an optional “3D i-see” sensor, or equal, to work in conjunction with indoor unit control sequence to prevent unnecessary cooling or heating in unoccupied areas of the zone without decreasing comfort levels. Sensor must detect occupancy (not simply motion) and location of occupants by measuring size & temperature of objects within a 39’ detecting diameter (based on 8.8ft mounting height) with 1,856 or more measuring points.

D. Filter:

1. Return air shall be filtered by means of a long-life MERV13 filter.

E. Coil:

1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing. The tubing shall have inner grooves for high efficiency heat exchange. All tube joints shall be brazed with phos-copper or silver alloy.
2. The coils shall be pressure tested at the factory.
3. The unit shall be provided with an integral condensate lift mechanism that will be able to raise drain water 19-3/4” inches above the condensate pan.

F. Electrical:

1. The unit electrical power shall be 208/230 volts, 1-phase, 60 hertz.
2. The system shall be capable of satisfactory operation within voltage limits of 187-228 volts (208V/60Hz) or 207-253 volts (230V/60Hz).

G. Controls:

1. Indoor unit shall compensate for the higher temperature sensed by the return air sensor compared to the temperature at level of the occupant when in HEAT mode. Disabling of compensation shall be possible for individual units to accommodate instances when compensation is not required.
2. Control board shall include contacts for control of external heat source. External heat may be energized as second stage with 1.8°F – 9.0°F adjustable deadband from set point.
3. Indoor unit shall include no less than four (4) digital inputs capable of being used for customizable control strategies.

4. Indoor unit shall include no less than three (3) digital outputs capable of being used for customizable control strategies.
5. A factory-installed drain pan sensor shall provide protection against drain pan overflow by sensing a high condensate level in the drain pan. Should this occur, the control shuts down the indoor unit before an overflow can occur. A thermistor error code will be produced should the sensor activate indicating a fault which must be resolved before the unit re-starts.

2.4 1-WAY CEILING-RECESSED CASSETTE WITH GRILLE INDOOR UNIT

A. Unit:

1. The one-way cassette indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, an emergency operation function and a test run switch. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory. The unit shall be suitable for use in plenums in accordance with UL1995 ed 4.

B. Unit Cabinet:

1. The one-way grille shall be fixed to bottom of cabinet allowing for one-way airflow.

C. Fan:

1. The indoor fan shall be an assembly with one line-flow fan direct driven by a single motor with permanently lubricated bearings.
2. The indoor fan shall consist of four (4) speeds, Low, Mid1, Mid2, and High.

D. Filter:

1. Return air shall be filtered by means of a long-life MERV13 filter.

E. Coil:

1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing. The tubing shall have inner grooves for high efficiency heat exchange. All tube joints shall be brazed with phos-copper or silver alloy.
2. The coils shall be pressure tested at the factory.
3. The unit shall be provided with an integral condensate lift mechanism able to raise drain water 23 inches above the condensate pan.

F. Electrical:

1. The unit electrical power shall be 208/230 volts, 1-phase, 60 hertz.
2. The system shall be capable of satisfactory operation within voltage limits of 187-228 volts (208V/60Hz) or 207-253 volts (230V/60Hz).

G. Controls:

1. Indoor unit shall compensate for the higher temperature sensed by the return air sensor compared to the temperature at level of the occupant when in HEAT mode. Disabling of compensation shall be possible for individual units to accommodate instances when compensation is not required.
2. Control board shall include contacts for control of external heat source. External heat may be energized as second stage with 1.8°F – 9.0°F adjustable deadband from set point.
3. Indoor unit shall include no less than four (4) digital inputs capable of being used for customizable control strategies.
4. Indoor unit shall include no less than three (3) digital outputs capable of being used for customizable control strategies.
5. A factory-installed drain pan sensor shall provide protection against drain pan overflow by sensing a high condensate level in the drain pan. Should this occur, the control shuts down the indoor unit before an overflow can occur. A thermistor error code will be produced should the sensor activate indicating a fault which must be resolved before the unit re-starts.

2.5 VERTICAL/HORIZONTAL DUCTED (MULTI-POSITION AIR HANDLER)

A. Unit:

1. The multi-position indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, and an auto restart function. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory. The unit shall be suitable for use in air handling spaces in accordance with Section 18.2 of UL 1995 4th Edition, be tested in accordance with ANSI/ASHRAE 193 and have less than 2% air leakage at maximum airflow setting.

B. Unit Cabinet:

1. The cabinet shall include a fixed bottom return, a fixed vertical discharge supply and be pre-painted, pre-insulated, 22 gauge galvanized steel.

C. Fan:

1. The indoor unit fan shall be an assembly with a single, statically and dynamically balanced direct drive fan with a high efficiency DC motor with permanently lubricated bearings.
2. The fan shall have 3-speeds with the capability to operate between 0.3-0.8 In.WG selectable.

D. Filter:

1. The unit shall have a 1” filter rack with a MERV13 filter.

E. Coil:

1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing. The tubing shall have inner grooves for high efficiency heat exchange. All tube joints shall be brazed with phos-copper or silver alloy.
2. The coils shall be pressure tested at the factory.

F. Electrical:

1. The unit electrical power shall be 208/230 volts, 1-phase, 60 hertz.
2. The system shall be capable of satisfactory operation within voltage limits of 187-228 volts (208V/60Hz) or 207-253 volts (230V/60Hz).

G. Controls:

1. Control board shall include contacts for control of no less than two stages of external heat. The first stage of external heat may be energized when the space temperature is 2.7°F from set point for between 10-25 minutes (user adjustable). The second stage of external heat may be energized when the first stage has been active for no less than 5 minutes and the space temperature has not risen by more than 0.9°F.
2. Indoor unit shall include no less than four (4) digital inputs capable of being used for customizable control strategies.
3. Indoor unit shall include no less than three (3) digital outputs capable of being used for customizable control strategies.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install units level and plumb.

B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

C. Install ground-mounting, compressor-condenser components on 4-inch- thick, reinforced concrete base; 4 inches larger on each side than unit. Concrete, reinforcement, and formwork are specified in Division 03 Section "Cast-in-Place Concrete." Coordinate anchor installation with concrete base.

D. Install ground-mounting, compressor-condenser components on polyethylene mounting base.

E. Install seismic restraints.

F. Install compressor-condenser components on restrained, spring isolators. Refer to Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."

G. Install and connect precharged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.2 FIELD-INSTALLED REFRIGERANT PIPING

A. Connect pre-charged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

B. Install piping adjacent to unit to allow service and maintenance.

C. Piping shall be copper with joints brazed with 15% silver, silphos brazing rod.

D. Elbows shall be of the long radius type.

E. Liquid and vapor piping shall be insulated with 3/4-inch-thick closed cell rubberized insulation.

F. Piping shall be secured to structure with straps, taking care to ensure that the liquid line does not contact the structure and that the insulation is not torn.

G. Piping shall be purged with dry nitrogen prior to evacuation and charging with refrigerant.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

C. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Remove malfunctioning units, replace with new components, and retest.

D. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

E. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

F. Remove and replace malfunctioning units and retest as specified above.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION

SECTION 26 01 00

BASIC MATERIALS AND METHODS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Addenda, Alternates, Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specifications collectively apply to work of this Section.

1.02 WORK INCLUDED

A. The specifications and drawings are intended to cover a complete installation of systems. The omission of expressed reference to any item of labor or material for the proper execution of the work in accordance with present practice of the trade shall not relieve the Contractor from providing such additional labor and materials.

B. All labor, materials, appliances, tools, equipment, facilities, transportation and services necessary for and incidental to performing all operations in connection with furnishing, delivery and installation of electrical system, complete, as shown on the drawings and/or specified herein. Work includes but is not necessarily limited to the following:

1. Conduits for all wiring systems, unless otherwise specifically noted.

2. All electrical wiring and connections to equipment furnished under other sections of Specifications.

3. All wiring and conduit for Air Conditioning and Heating and Ventilating systems, and electrical equipment in Plumbing Section of work.

4. Time clocks and contactors for control of lighting and air conditioning.

5. Pull wires in conduit runs indicated as conduit only (CO).

6. Building electrical wiring, conduits, outlet boxes, junction boxes, convenience outlets, switches, plates and all miscellaneous items of electrical equipment, apparatus and material specified and/or shown on Drawings.

7. Disconnect switches, magnetic motor starters and manual motor starters.

8. All required grounds.

9. Parking lot poles, luminaries and lamps.

10. All anchors, chases, sleeves and supports for electrical equipment.

11. Excavation necessary for execution and completion of electrical work.

12. Required backing, supports and blocking for lighting fixtures.

13. Complete Fire Alarm and Detection System.

14. Computer Network Wiring System – j-box and conduit only.

15. Tests of entire system.

16. Lighting fixtures complete with lamps and required accessories.

17. Guarantees.

18. Temporary power for building construction.

19. Temporary lighting during construction.

20. Complete connections to all motors, apparatus, electrically operated devices, etc., as shown on Drawings.

21. Circuits, switches, starters and connections for all exhaust fans, blowers and heaters.

22. Flashing of conduits through roof.

23. Shop Drawings.

24. In these specifications, Fire Alarm, CCTV, Television, Intrusion Alarm, etc. are referred to as Auxiliary Systems or Signal Systems.

1.03 GUARANTEE

A. In addition to guarantee required in Division 1 or specifically specified elsewhere, all materials and equipment provided and installed under this Division of Specifications shall be guaranteed by Contractor in writing for a period of one year from date of acceptance of work by Owner. Should any trouble develop during this period due to defective materials or faulty workmanship, the Contractor shall furnish all necessary labor and materials to correct the trouble without costs to Owner.

B. Guarantee complete and perfect operation of entire system and that all apparatus will perform in accordance with detailed drawings and Specifications.

C. Guarantee that all equipment will be supported in such a way as to be free from objectionable vibration and noise.

D. Guarantee that all licenses and royalties for use of any patented feature of system will be paid before acceptance of system.

1.04 GENERAL REQUIREMENTS

A. Codes: Construct project in accordance with following codes and regulations.

1. 2022 California Electrical Code, Title 24 C.C.R.
(2020 National Electrical Code of the National Fire Protection Association, NFPA)

2. 2022 California Mechanical Code, Title 24 C.C.R.
(2021 Uniform Mechanical Code of the International Association of Plumbing and Mechanical Officials, IAPMO)

3. 2022 California Plumbing Code, Title 24 C.C.R.
(2021 Uniform Plumbing Code of the International Association of Plumbing and Mechanical Officials, IAPMO)

4. 2022 California Energy Code, Title 24 C.C.R.

5. 2022 California Historical Building Code, Title 24 C.C.R.

6. 2022 California Fire Code, Title 24 C.C.R.
(2021 International Fire Code of the International Code Council)

7. 2022 California Existing Building Code, Title 24 C.C.R.
(2021 International Existing Building Code of the International Code Council, with amendments)

8. 2022 California Green Building Standards Code (CALGreen Code), Title 24 C.C.R.

9. 2022 California Referenced Standards Code, Title 24 C.C.R.

10. Local codes and ordinances.

Keep a copy of applicable code available at Site while performing work of this Section. Nothing in these Drawings and Specifications to be construed as authority to violate codes and ordinances. Conflict with applicable regulations to be resolved at Contractor's expense before installation.

B. Permits, Fees and Inspections: Obtain and pay for all necessary permits and fees required by any constituted authority having jurisdiction including utilities. Arrange and pay for all required inspections or examinations and deliver certificates of inspection to Architect.

C. Record Drawings:

1. Provide record drawings for work of this Section.

2. Keep up-to-date a complete "As-Built" record set of blueline prints corrected daily and showing every change from original Drawings and Specifications and exact "As-Built" locations, sizes, and kinds of equipment.

3. Prints for this purpose may be obtained from Architect at cost of printing. Keep this set of Drawings on job and use only as a record set.

4. Drawings to serve as work progress sheets. Make neat and legible notations in red ink thereon daily as work proceeds, showing work as actually installed. Drawings to be available at all times for inspection and kept at a location designated by Architect.

5. On completion of work, obtain one set of prints from Architect at cost of printing, and note neatly in scale all changes on record set. Deliver complete set of prints together with one set of blueline prints to Architect together with Contractor's name, address and phone number. Incorrect, non-legible or non-reproducible drawings will not be accepted.

D. Selection and Ordering of Equipment and Materials: Within two weeks after award of Contract, arrange for purchase and delivery of all light fixtures, equipment and materials required in ample quantities and at proper time. Inform Architect immediately of any inability to obtain suitable delivery of any equipment or material. Send copy of letter verifying date of purchases to Architect.

E. Shop Drawings and Material Lists:

1. Submit material lists and shop drawings as called for in Division 1, and as supplemented by this Division, and with sufficient promptness to ensure that overall work of project will not be delayed.

2. Submit six copies of a list of materials and equipment manufacturers that Contractor intends to use.

3. Provide shop drawings for following:

a. Panelboards.

b. Parking lot poles and luminaries.

c. Lighting fixtures, lamps and necessary accessories.

d. Time switches.

e. Contactors.

f. Emergency Power System – Inverter Unit.

g. Fuses.

h. Flush floor boxes covers and carpet flanges.

i. Disconnect switches.

j. Lighting control devices

k. Photovoltaic collectors

l. Fire alarm systems

m. EV Chargers

n. Magnetic Motor Starters

o. LED Light Fixture Drivers

4. Do not fabricate work until reviewed shop drawings for work have been received from Architect. Work fabricated or erected in advance of reviewed shop drawings will be at risk of Contractor.

5. Architect's or Engineer's review of shop drawings does not relieve Contractor of responsibility for errors including details, dimensions, or materials, as well as conformance with requirements of Drawings and Specifications.

6. Shop drawings will be checked by Architect and Engineer for conformance to design as a convenience to Contractor. Dimensions will not be checked. Should interferences become evident, notify Architect immediately so that matter may be resolved prior to proceeding with fabrication.

7. No reimbursement based on a claim that work was placed in accordance with dimensions shown on a reviewed shop drawing will be allowed for removing or replacing work already in place.

8. Make available a copy of every reviewed shop drawing at Project Site.

9. Submit shop drawings in coherent groups; e.g., all lighting fixtures at one time.

10. Submit actual samples of specified equipment or material to Architect for review when requested.

F. Substitution and Approval of Material:

1. Base all bids and proposals only upon materials, construction and equipment named or described in specification and/or shown on drawing. Should a Contractor wish to use other equipment than that specified, he shall submit proposed substitution by

fully describing equipment he prefers to use and by listing credit or additional cost to his bid as a separate item should substitution be acceptable.

2. All equipment and materials proposed for substitution shall be similar in design and equal in quality and function to those specified herein or on drawings. Contractor (not sales vendor) shall demonstrate his proposed substitution and shall specifically note all differences between item specified and proposed substitution. Actual samples and test data, certified by an independent testing laboratory, shall be submitted when requested.

3. Each substitution will be given consideration, but without any obligation expressed or implied on part of Architect to change named requirements of specification. Only one substitution for each item of equipment will be permitted. Contractor assumes sole responsibility for performance and space requirements for substitute equipment. Decision of Architect shall be final as to whether or not substitution is acceptable.

G. Terminology:

1. Term "provide" used on Drawings and elsewhere in the Specifications shall be considered to mean "furnish and install".

2. Term "UL" means Underwriters Laboratories Inc.

H. Workmanship: See supplementary Conditions, Architect is sole judge of whether execution is in a workmanlike manner.

I. Safety Conditions: Be responsible in preventing energized switches, circuit breakers or circuits from being turned to "On" position during construction period. Be responsible for damages to personnel and/or property resulting from contact with energized circuits, switches, circuit breakers, busses or other electrical apparatus. Construct all electrical work with electrical system de-energized in area. At no time permit work on equipment or apparatus with energized circuits.

J. Verification of Dimensions: All scaled and figured dimensions are approximate and are given for estimating purposes only. Before proceeding with work carefully check and verify all dimensions and sizes and assume all responsibility for fitting of materials and equipment to other parts of equipment and to structure. Where apparatus and equipment have been indicated on drawings, dimensions have been taken from typical equipment of class indicated. Carefully check drawings and see that equipment will fit into spaces provided.

K. Locations:

1. Locations of conduits, outlets, apparatus and equipment indicated on drawings are approximate only and shall be changed to meet architectural and structural conditions as required.

2. Install conduit and equipment in a manner and in locations avoiding all obstructions,

preserving headroom, keeping openings and passageways clear and readily accessible for maintenance and repairs. Make changes in locations of conduit or equipment which may be necessary to accomplish this. Drawings are essentially diagrammatic to extent that many offsets, bends, special fittings and exact locations are not indicated. Examine all drawings prepared by manufacturers, suppliers and installers of all equipment including air conditioning and plumbing fixture shelving, for requirements and locations of equipment and outlets.

3. Should any structural interferences prevent installation of outlets, setting of cabinets for lighting panelboards, running of conduits, or installation of other electrical equipment at locations shown on Drawings, necessary minor deviations therefore as determined by Engineer may be permitted. In event changes in indicated locations or arrangements are necessary due to developed conditions in building's construction or rearrangement of furnishings or equipment, Owner shall be permitted to move any junction box or utility outlet a distance of 10' and such changes shall be made without extra cost providing change is ordered before work is installed. Submit an estimate of cost or credit for other changes and proceed only upon written authority of Architect.

4. Be cautioned that diagrams showing electrical connections are diagrammatic only and must not be used for obtaining lineal runs of wiring or conduit. Wiring diagrams do not necessarily show exact physical arrangement of equipment.

5. Locations of outlets, lighting fixtures, cabinets, panelboards, apparatus, motors, mechanical equipment, etc., shown on Electrical Drawings is only approximate. Do not scale them from Electrical Drawings.

6. Verify locations of outlets, lighting fixtures, equipment etc., with Architectural Drawings of interior and exterior details and finish, and coordinate location of electrical work with mechanical and other equipment.

7. Locate lighting fixtures as per reflected ceiling plans prepared by Architect.

L. These Specifications and attendant Drawings are intended to cover a complete and operable electrical system. Follow Drawings and Specifications and execute all work according to true intent and meaning. Should any error or omission exist in either or both of these Drawings and Specifications, or conflict one with another, have same explained and adjusted by Engineer before submitting bid price for electrical work; otherwise at own expense, supply proper materials and labor to completely install same, make good any damage to or defect in work of results obtained therefore caused by such error, omission or conflict. Most restrictive, greater quantity or size, better quality or other superior condition of all representations shall prevail. It is intended that outlets be located symmetrical with Architectural elements notwithstanding fact that locations indicated on Drawings may be distorted for clarity.

M. Omission of expressed reference in Drawings or Specifications to any item of labor or material necessary for proper execution of work in accordance with present good practice of trade will not relieve Contractor from providing such additional labor and materials.

N. Job Visits by Engineer: Periodic visits to job by Engineer is for express purpose of verifying compliance by Contractor with contract documents. Such visits by Engineer shall not be construed as construction supervision. Neither shall such visits be construed to make Engineer responsible for providing a safe place for performance of work by Contractor or Contractor's employees or safety of supplies of Contractor or his subcontractors.

O. Cooperation with Others: Organize work that will harmonize with work of all trades so that all work may proceed as expeditiously as possible. Be responsible for correct placement of work and connection of work to all related trades.

P. Protection of Finish: Provide adequate means for protecting all finished parts of materials and equipment against damage from any cause during progress of work and until acceptance by Architect. Cover all material and equipment in storage and during construction in such a manner that no finished surfaces will be damaged, marred or splattered with paint. Keep moving parts perfectly clean and dry. No paint spraying will be permitted in building. Replace or refinish damaged material or equipment including face plates or panels without additional costs to Owner.

Q. Cleaning Equipment and Premises: Thoroughly clean all parts of materials, equipment and exposed parts such as receptacles and panelboards, of cement, plaster and other materials. Remove all oil and grease spots with a non-inflammable cleaning solvent. Brush exposed metal work with steel brushes to remove rust and other spots and leave smooth and clean. During progress of work, carefully clean up and leave premises and all portions of building free from debris. At completion of work, remove all waste materials and debris resulting, leaving everything in a complete and satisfactory condition.

R. Cutting and Patching: Include all cutting and patching in bid. Do not cut any structural members without first having received written permission from Architect. Cutting of round openings which can be done by use of a rotary drill shall be done by Contractor requiring same. Cutting and patching finish work shall be performed by workmen of the respective trade.

S. Conditions at Site: Visit Job Site and become familiar with all existing conditions within scope of work and include in Bid Proposal allowance for these conditions. Verify exact locations of services prior to construction. Notify all other Contractors of these utility locations.

T. Documents: Read all relevant documents, become familiar with job, scope of work, type of general construction, Architectural, Structural, Mechanical and Electrical Drawings and Specifications. Also become familiar with purpose for which these Drawings have been prepared and become cognizant of all details involved.

U. Acceptance: Before work will be accepted, demonstrate to Owner and Architect that entire installation is complete and in proper operating condition and Contract has been fully and properly executed. Following items shall be prepared and submitted to Architect:

1. Two copies of all test results required under this Division.

2. Two copies of local and/or state code enforcing authorities final inspection certificates.

3. Copies of as-built record drawings as required.

4. Notify Architect in writing when installation is complete and that a final inspection of this work can be performed. In event defects or deficiencies are found during this final inspection they shall be corrected to satisfaction of Architect before final acceptance can be issued.

5. Two Maintenance and Operating Manuals as required.

V. Field Inspections: Provide proper facilities for access of Owner or Owner's representative to conveniently examine and inspect all portions of work covered in this Contract at any and all reasonable hours.

W. Completing Work: At completion of work, remove all waste materials and debris resulting from work, leaving everything in a complete and satisfactory condition.

X. Electrical Superintendent: Include services of a qualified electrical foreman capable of interpreting intent of Drawings and Specifications, to study Plans, Specifications and references, and coordinate all requirements with other trades, authorized to make decisions and issue instructions; be constantly in charge of work and available at job site at all times and at final inspection. Instruct Owner's representative for proper operation and recommend maintenance of all systems.

Y. Maintenance and Operating Manuals:

1. Before completion and acceptance of work, furnish Owner with two complete sets of operating and maintenance instruction manuals. Bind each set in durable hardboard binder and index.

2. Compile data for manuals upon approval of material list and sketches so as not to delay final approval of work installed. Operating manuals to contain all pertinent data relating to electrical installation such as fixture cuts, manufacturer's approval, shop drawings, sketches, wiring diagrams and equipment operating instructions.

3. Instruct Owner's operating personnel with electrical operating procedures before work is considered complete.

Z. Extra Work or Costs to This Contractor Due to Other Contractors or Trades: Adjusted between this Contractor and offending Contractor at no extra cost to Owner. Notify Architect before such extra work is done.

AA. Tests:

1. Upon completion of work and adjustment of all equipment, all systems shall be

tested under direction of Owner's representative to demonstrate that all equipment furnished and installed and/or connected under provision of these Specifications shall function electrically in manner required. All tests shall be completed prior to final inspection of project.

2. All systems shall test free from short circuits and grounds and shall be free from mechanical and electrical defects. All circuits shall be tested for proper neutral connection.

3. All instrumentation and personnel required for testing shall be furnished by Contractor.

BB. Noise Control:

1. Perform electrical work to a manner in minimize transmission of noise and preserve acoustical properties of building structure.

2. Where equipment is mounted on vibration isolators, use flexible connections to reduce transmission of noise.

3. Where conduits pass through sleeves in interior walls, floors, or ceilings, completely fill space between each conduit and its sleeve to provide an airtight seal.

4. Use glass fiber material, "Duxseal" compound, for acoustic seals.

CC. Seismic Bracing Standards: All pipes, cable trays, conduits, etc. shall be supported and braced in accordance with SMACNA “Seismic Restraint Manual, Guidelines for Mechanical Systems”, including Appendix B, “Additional Requirements for OSHPD” and “Addendum no. 1, September 2000”. Comply with CBC, where requirements are more stringent than SMACNA, including, but not limited to the following:

1. Pipes and conduit shall be braced to resist the forces prescribed in California Building Code.

2. Where possible, pipes, conduit and their connections shall be constructed of ductile materials (copper, ductile iron, steel or aluminum and brazed, welded, or screwed connections.) Pipes, conduits and their connections, constructed of nonductile materials (e.g., cast iron, no-hub pipe and plastic), shall have the brace spacing reduced to one-half of the spacing allowed for ductile material in accordance with California Building Code or SMACNA Seismic Restraint Manual.

3. Seismic restraints may be omitted for the following conditions:

a. All piping suspended by individual hangers 12 inches or less in length from the top of the pipe to the bottom of the structural support for the hanger.

b. All electrical conduit less than 2.5 inches trade size.

4. For rigidly supported, electrical conduit, or cable trays, the product of $C_a I_p$ need not to exceed 1.2 for any value of I_p.

5. All Trapeze assemblies supporting, cable trays and conduit shall be braced to resist the forces and relative displacements per ASCE 7 Chapter 13, considering the total weight of the elements on the trapeze.

6. Conduit supported by a trapeze where none of these elements would individually be braced need not be braced if connection to the pipe/conduit of directional changes do not restrict movement of the trapeze. If this flexibility is not provided, bracing will be required when the aggregate weight of the pipes and conduit exceed 10 pounds/foot. The weight shall be determined assuming all pipes and conduits are filled with water.

DD. Bracing Standards Application: Comply with bracing standards by evaluating the complete installation of all utilities and equipment, and providing a comprehensive solution based on Contractor's layout, coordination withal other trades, and with the structural design and all other provisions for incorporating systems into the buildings. Show bracing products and layout in shop drawing submittals. The following criteria apply to the bracing of all systems:

1. The design parameters for determining the Total
Design Lateral Force shall be as designated on the structural drawing.

2. Seismic Hazard Levels (SHL) shall be as designated on structural drawings.

3. Contractor shall submit documentation for each condition, which is not specifically covered in the SMACNA manual, including piping configurations and conditions, structural systems, structural connection methods, and other issues regarding the application of the standards.

4. Provide expansion anchors, sized per SMACNA guidelines, for use in concrete.

5. For connections to structural steel, wood framing, etc. provide bolted or welded connections, sized per SMACNA guidelines.

6. Seismic bracing components consisting of structural shapes.

7. Seismic bracing cable shall be galvanized steel, conforming to ASTM A603, zinc-coated with minimum 0.4 ounces/sf, pre-stretched, 7 x 19 strand, sized per SMACNA guidelines.

EE. In hard ceiling space where access to j-boxes, detectors, etc is required, provide ceiling access panel, fire-rated typical.

END OF SECTION

SECTION 26 02 00
GENERAL ELECTRICAL REQUIREMENTS

PART 1- - GENERAL

1.1 DESCRIPTION:

A. Related Work:

1. 01811 Commissioning Requirements
2. 01813 Prefunctional Checklists
3. 260560 Electrical Systems Commissioning
4. 260570 Electrical Testing Requirements

B. Electrical subcontractor shall attend the Commissioning pre-construction meeting and other required meetings to facilitate coordination and execution of the commissioning scope.

C. Provide pre-functional checklists and complete functional testing under the supervision of the commissioning authority, including preparation of data in form templates. Provide qualifying calibrated instrumentation needed for the prescribed testing procedures.

D. Provide the services of specialized technicians for testing and validation. Technicians may be supplied by the equipment suppliers or from qualified independent testing services.

E. Systems that shall be commissioned are:

1. Lighting system and controls
2. Fire Life and Safety system using Chief's 4 testing procedures

F. Detailed descriptions of electrical commissioning requirements are provided in Section 01810.

G. Comply with all provisions of the General Conditions, Supplementary Conditions and General Requirements as applicable to work of all Sections of Division 26 concerning definitions, guarantees, submittals, as-builts, clean-up, etc.

H. Examine all Technical Sections for work required to be included in work in Sections of Division 26 - Electrical Work.

I. All work of this Division shall be coordinated with work of other trades.

1.2 SCOPE

A. Required: Provide all labor, materials, equipment, tools and appliances required to furnish and install all electrical work shown on the Contract Drawing and herein specified in the Sections of Division 16 complete and operable but not limited to the following:

1. All construction power and lighting and power for testing equipment and systems through

final acceptance of test.

2. Complete lighting and power system(s) including branch circuits, outelets, fixtures, switches, controllers, and auxiliary equipment.

3. Complete distribution system(s) including panelboards, feeders, and auxiliary equipment.

4. New outdoor light pole and pole mounted light fixture.

5. Complete Grounding System.

6. Distribution for emergency power system including but not limited to a central battery inverter, lighting panelboard and branded circuit wiring.

7. Control wiring and devices for equipment specified in Sections of Division 26 and other Technical Sections, except where specifically indicated or noted otherwise on the Contract Drawings or in the Specifications.

8. Complete and Operable Fire Alarm System.

9. Connection and testing of electrical equipment and controls specified in Division 26 and other technical sections, except where specifically indicated or noted elsewhere on the Contract Drawing or in the Specifications.

10. Applicable excavating, trenching and backfilling.

11. Demolition of existing electrical systems as shown on the plans.

12. Complete and operable Photovoltaic System and Battery Energy Storage System to be design build by contractor.

13. Complete and Operable EV Charging stations.

1.3 WORK NOT INCLUDED

A. Furnishing all electrical or partially electrically devices related uniquely to mechanical equipment and only as specified in the Mechanical Division 23.

B. Furnishing and installing of all motors.

1.4 RELATED WORK

A. Preparation of Soils Reports, refer to Division 31 EARTHWORK.

B. Painting of exposed raceways and equipment in Division 9.

C. Ventilation and exhaust systems.

D. Air conditioning system controls in Division 23.

E. Commissioning requirements in Division 1.

F. Municipal Facilities Electrical Commissioning Requirements in Division 26.

G. Municipal Facilities Electrical Testing Requirements in Division 26.

1.5 LEGAL REQUIREMENTS AND STANDARDS

A. Required: Comply with the latest, as applicable and effective, during the progress of Contracted Work.

1. Latest Los Angeles City Electrical, Fire and Building Codes and U.B.C. Supplement.

2. California State Administrative Code, Title 24, State Building Standard.

3. (CAL/OSHA) California State Occupational Safety and Health Act.

4. California State Fire Marshal Standards.

5. Los Angeles City Department of Water and Power.

6. U.L. - Underwriters Laboratories Inc.

7. NEC - National Electric Code.

8. ASTM - American Society of Testing and Materials.

9. Current publications of the National Fire Protection Association.

10. National and American Standards Association.

B . General Compliance as Applicable

1. Drawings and specification requirements shall govern where they exceed Code requirements.

2. Where requirements between governing Codes and Regulations vary, the more restrictive provision shall apply.

3. Nothing contained in Contract Documents shall be construed as authority or permission to disregard or violate legal requirements.

1.6 GENERAL REQUIREMENTS

A. Permits and Inspections:

1. Apply and pay for all required electrical work (construction and installation) prescribed by legally constituted public authorities.

2. Arrange and pay for all required inspections or examinations and shall deliver "certifications" of such inspections to the City Engineer prior to acceptance of the electrical work. Obtain approved plans from the Los Angeles City Department of Building and Safety.

B. Site Inspections:

1. Carefully examine the job-site and existing facilities and compare the Contract Drawings for work coordination.

2. By act of submitting bid, it will be deemed the Contractor has made required inspections and has accepted such job-site conditions and has made allowances thereof in the preparation of "Bid" figures.

C. Verification of Dimensions: All dimensions (scaled, figured or noted) are approximate, given for estimating purposes. Before proceeding with work Contractor shall carefully check and verify all dimensions, sizes, etc. and shall assume full responsibility for proper fitting in and attachment of all materials and equipment to other equipment and to the structure.

D. Examination of the Contract Drawings:

1. Carefully study Contract Drawings and Specifications to verify if any work as laid out or indicated is contrary to or in conflict with applicable Codes and Standards. Report to the City Engineer such data prior to submittal of Bid(s).

2. The City Engineer will then instruct the Contractor on how to proceed.

3. By the act of submitting a "Bid" or "Proposal" Contractor is deemed to have made such study and has accepted all job-site conditions.

E. Substitutions:

1. Items, articles or products named on the Contract Drawings and in the Specifications are intended to establish a standard of quality and required functional performance.

2. If the Contractor desires to propose a substitution or alternate, submit a complete list with detailed specifications and manufacturer's data which differ from those specified within thirty-five (35) days after award of Contract for approval or rejection by the City Engineer.

3. If such submittals are not approved, use specified materials and equipment throughout the Electrical Work.

F. Interpretations:

1. Make all requests for interpretations of the Contract Drawings and/or Specifications to the Contractor through the Architect or City Engineer.

2. Manufacturer's or Supplier's requests for interpretations will be referred to the Contractor.

G. Submittals: Conform to applicable provisions of Section 01330 of the General Requirements and as hereinafter specified.

1. Prepare, review and coordinate schedule of submittals, determining necessary lead time for preparation, submitting, checking, and ordering and delivering materials and equipment to the job-site for timely arrival and conformance with the overall Construction schedule.

2. All submittals will be checked for general compliance with Specifications only. Contractor will be responsible for deviations from the Drawings or Specifications and for errors or omissions of any sort in the Submittals.

3. Shop drawings shall be submitted in completed groups of materials (i.e., all lighting fixtures or all switchgear, etc.). The Contractor shall add and sign the following paragraph on all equipment and materials submitted for review.

a. "It is hereby certified that the (equipment) (material) shown and marked in this submittal is that proposed to be incorporated into the project; is in compliance with the Contract Drawings and Specifications and can be installed in the allocated spaces".

b. Failure to add the above written statement for compliance will result in return of submittals to be reviewed.

4. All required submittals on electrical items and equipment shall include complete catalog information such as construction ratings, insulation systems, including manufacturer's certification that items or equipment meet or exceed U.L. and Trade Standards, and the Specifications.

5. Equipment Floor Plans: Submit after approval of material and/or equipment is secured. Prepare for each electrical equipment room drawn to 1/2" = 1'0" scale. Layout drawing shall be to exact scale.

* 6. Materials list of items and equipment proposed to be provided for the work of this Division 26 and shall include the following as applicable:

a. Central battery inverter.

b. Panelboards and breakers.

c. Conduits.

d. Conductors.

e. Electrical equipment layout at 1/2" = 1'-0" scale indicating exact dimensions of equipment, clearances, housekeeping pads.

f. Disconnect switches, pull boxes and fuses.

g. Lighting fixtures.

h. Fire alarm and detection system.

i. Control devices, standard and special receptacles, switches and finish device plates.

j. Cabinets for signal and telephone systems, special terminals and cabinets.

k. All fabricated equipment.

l. EV charging stations

m. Time clocks, contactors, control switches, etc. including wiring diagrams and sequence of operation.

n. Grounding Systems.

o. Cable Trays.

p. Photovoltaic System

q. Battery Energy Storage System

H. Special Submissions:

1. Test Reports for the Following:

a. Ground fault devices.

b. Megger Readings: Ground system, motors, feeders and switchgear.

c. Voltage Readings: Distribution, service and motors.

d. Fire alarm system.

2. Maintenance service and operating manuals for all equipment.

3. Items as outlined in other Sections.

I. "No Exceptions Taken": Be responsible for equipment ordered and/or installed prior to receipt of shop drawings returned from the City Engineer bearing the Electrical Engineer's stamp of "No Exceptions Taken". Corrections or modifications to equipment as noted on shop drawings shall be performed or equipment removed from the job site at request of City Engineer without additional compensation.

J. Disapprovals: Any article or equipment supplied by the Contractor disapproved by the Architect or City Engineer as not conforming to the Specifications or not of proper quality or grade or suitability shall be deleted and suitable article or equipment be provided in lieu thereof in conformance with the Specifications at no added cost to the City.

K. Terminology: Generally speaking throughout this Division 16 of the Specifications when the words "or equal" or other words of similar intent and meaning are used implying judgment or decision is to be exercised, it is understood that it is the judgment, discretion, or decision of the City Engineer to which reference is made.

Note: Specifier should name at least two manufacturers plus the words "or equal".

L. Modification of Contract Drawings: In each case where proposed substitute material or equipment will require changes to the design of the Project as indicated on the drawings, for proper installation or operation, appropriate proposed revision drawings prepared and signed by a licensed Engineer shall be furnished by the Contractor for approval by the City Engineer. Make such drawings sufficiently complete for the proper installation and operation of the proposed substitute materials or equipment, and for construction by all of the involved trades of the proposed revisions. The cost of the drawings and the proposed revised construction shall be borne by the Contractor.

M. Record Drawings: Provide in strict accordance with applicable provisions of Section 30 in the GENERAL CONDITIONS of these Specifications concerning accurate locations of raceways, cable runs, outlets and equipment. See also applicable provisions of Section 01783-RECORD (as-built) Drawings of the GENERAL REQUIREMENTS of these Specifications.

N. Operation and Maintenance Manuals: Prior to final acceptance of Contracted Work by the City, furnish 4 bound copies of operation and maintenance manuals for all electrical equipment, as required in this Section. The contents shall include description of equipment, names of manufacturers, parts lists, model numbers, maintenance schedules, location of nearest facility for replacement parts or service, wiring and connection diagrams, internal schematic drawings, and other electrical/mechanical data necessary for operation and maintenance.

1.7 QUALITY ASSURANCE

A. General:

1. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture.

2. Supply all equipment and accessories new, free from defects and listed by Underwriters' Laboratories, Inc. or bearing its label. Special or custom equipment must bear the label of laboratory recognized by the City of Los Angeles Department of Building and Safety.

3. Supply all equipment and accessories in compliance with the applicable standards listed in Article 1. 5 of this Section and with all applicable National, State and Local codes.

4. All items of a given type shall be the product of the same manufacturer.

B. Labor: Use adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and completely familiar with specifications, requirements and methods needed for proper performance of the work of Electrical Division 26.

C. Superintendence: Provide an experienced Superintendent to be in charge of erection and/or installation of electrical work together with journeymen helpers to properly unload, erect, connect, adjust, operate and test the work involved to provide a neat, workmanlike and operable installation.

1.8 LOCATION

A. The location of apparatus and equipment indicated on the Contract Drawings are approximate only and shall be changed to meet the Architectural and Structural conditions as required.

B. Any change in work which has not been installed shall be made by the Contractor without additional compensation, except changes which are caused by Architectural changes which increase or decrease the size of apparatus or materials specified or indicated on the drawings. The Contractor shall submit a detailed breakdown cost estimate of, or credit for, such changes and shall proceed only upon the written authority of the Architect and Engineer.

C. All apparatus and equipment shall be furnished and installed in a manner and in locations avoiding all obstructions, preserving head room, and keeping openings and passageways clear. Changes shall be made in locations of equipment and materials which may be necessary in order to accomplish this.

D. The drawings are essentially diagrammatic to the extent that many offsets, bends, special fittings, and exact locations are not indicated. The Contractor shall carefully study the Contract Drawings and premises in order to determine the best methods, exact location, routes, and building obstructions, etc., and shall install all apparatus and equipment in the available location.

1.9 CUTTING AND PATCHING

A. Conform to provisions of Section 01731 of the General Requirements.

B. The Contractor shall do all drilling, cutting and patching of the general construction work existing or new, rough finish and trim, which may be required for the installation of electrical equipment. All patching shall be of the same materials, workmanship and finish as the original work, and shall accurately match all surrounding work.

C. All cutting and patching shall be as approved by the Architect or his authorized representative.

1.10 PROTECTION OF WORK

A. The Contractor shall protect all work, material and equipment from damage from any cause whatsoever, and shall provide adequate and proper storage facilities during the progress of the Work. Contractor shall provide for the safety and good condition of all work until final acceptance of the work by the City, and replace all damaged or defective work, materials and equipment before requesting final acceptance.

B. The Contractor shall be held responsible for the protection and correction of the work of all trades from smears, splashes, stain or damages that might occur in the progress of the work.

1.11 WORK COORDINATION

A. The Contractor shall so order electrical work that progress will harmonize with that of other trades so that all work may proceed as expeditiously as possible.

B. So far as possible, the work has been indicated on the Contract Drawings in such positions as to suit and accommodate the work of the other trades, but the work as indicated is largely diagrammatic, and the correct finish position of all equipment and materials cannot always be indicated. Therefore, the Contractor is hereby made directly responsible for the correct placing of electrical work and the proper location and connection of electrical work in relation to the work of other trades.

1.12 JOB SAFETY

A. The Contractor shall be solely and completely responsible for the condition of the premises on which the work is performed and for the safety of all persons and property on the site during performance of the Contract. These requirements shall not be limited to normal working hours, but shall apply continuously.

B. Contractor shall conform to all governing safety regulations.

PART 2 -- PRODUCTS

2.1 MATERIALS

A. All materials, items and equipment furnished under this Contract shall be new, recently manufactured and available locally.

B. All materials shall comply with applicable legal requirements and standards hereinbefore specified in this Section 26 02 00.

C. The label of listing by UL shall appear on all materials and equipment for which standards have been established by that agency.

D. Where local or other authorities having jurisdiction have established label or approval requirements, furnish all materials and equipment with either the required labels affixed or the necessary written approval.

E. Examine the Drawings and Specifications and determine the work to be performed by the electrical and other trades. Provide the type and quantity of electrical materials and equipment necessary to complete this work and all systems in proper operation, tested and ready for use.

F. Provide and install all incidental items not indicated on the Drawings nor mentioned in the Specifications that belong to the work described or are required for complete systems.

2.2 MATERIALS LISTING

A. Required: See Subsection 1. 6 G 6 of this Section 26 02 00.

PART 3 - - EXECUTION

3.1 UTILITY SERVICES

A. Every effort has been made to determine as accurately as possible the requirements of the electrical and telephone services. However, before submitting bid, the Contractor shall verify the locations shown on the plans and shall include sufficient funds for material, labor and utility fees for installation of an approved utility service.

B. Before any work is performed on these facilities, verify all electrical, civil, architectural and structural, dimensional and other requirements related to these facilities with the serving utility companies.

C. Should any major changes to the work indicated be necessary to complete the power and telephone systems, notify the City Engineer at once and cease all work affected until approval for required modifications has been obtained from the City Engineer.

3.2 WORK RESPONSIBILITIES

A. The drawings indicate diagrammatically the desired locations or arrangement of conduit runs, outlets, equipment, etc., and are to be followed as closely as possible. Proper judgment must be exercised in executing the work so as to secure the best possible installation in the available space and to overcome local difficulties due to space limitations or interference with structural conditions. The Contractor is responsible for the correct placement and coordination of electrical work in relation to the work of other trades. Advise appropriate trade as to locations of access panels.

B. Locations shown on architectural plans and elevations shall take precedence over electrical plan locations, but where a major conflict is evident; notify the Architect or City Engineer for instructions.

C. In the event changes in the indicated locations or arrangement are necessary due to developed conditions in the building construction or rearrangement of furnishings or equipment, such changes shall be made without extra cost, providing the change is ordered before the conduit runs, etc., and work directly connected to same are installed and no extra materials are required.

D. Where equipment is furnished by others, verify dimensions and the correct location of this equipment before proceeding with the roughing in of connections.

E. Lighting fixtures and equipment disconnects in mechanical spaces and elevator machine rooms and pits are shown in their approximate locations only. Do no install outlets, switches, equipment disconnects or fixtures until mechanical piping and ductwork are installed; then lights shall be installed in locations best suited for equipment arrangement or as directed by the City Engineer. Verify exact locations of elevator equipment disconnects, switches, receptacles and fixtures in elevator machine room and pits with the elevator equipment installer before rough in.

F. All scaled and figured dimensions are approximate of typical equipment of the class indicated. Before proceeding with any work, carefully check and verify all dimensions, sizes, etc., with the drawings to see that the equipment will fit into the spaces provided without violation of applicable codes.

G. Should any changes to the work indicated on the Drawings or described in the Specifications be necessary in order to comply with the above requirements, notify the City Engineer immediately and cease work for all parts of the Contract Work which are affected until approval for any required modifications to the construction has been obtained from the City Engineer.

H. Be responsible for any cooperative work which must be altered due to lack of proper supervision or failure to make proper provisions in time. Such changes shall be under the direction of the City Engineer and shall be made to their satisfaction.

I. Perform all work with competent and skilled personnel. Conform to provisions of Subsection 1. 7B of this Section.

J. All work, including aesthetic as well as electrical and mechanical aspects of the work, shall be of the highest quality consistent with the best practices of the trade.

K. Replace or repair, without additional compensation, any work which, in the opinion of the City Engineer does not comply with these requirements.

3.3 GENERAL INSTALLATION (AS APPLICABLE)

* For special requirements, refer to specific equipment under other sections.

A. Unless otherwise specified elsewhere in the Specifications, do all excavating necessary for the proper installation of the electrical work in accordance with the "Earthwork" Section 02220.

B. Locations of Openings: Obtain approval for all chases, shafts and openings required for the installation of the electrical work. Cutting or drilling in any structural member is prohibited without written approval of the Architect or City Engineer. Furnish access panels as required.

C. Finish Around Sleeves: Rough edges shall be finished smooth. Space between conduit and sleeves where conduit passes through exterior walls shall be sealed to permit movement of conduit but prevent entrance of water. Space between conduit and sleeves where conduit passes through fire rated interior walls and slabs shall be sealed with approved materials to provide a fire barrier conforming to the requirements of the governing authorities having jurisdiction, use Dow Corning 3-6548 RTV silicone foam or equal by General Electric if so approved by the applicable and/or authorities having jurisdiction of the job site.

D. Wherever conduit extends through roof, furnish and install flashings in accordance with City Engineer's directions.

E. Be responsible for all cutting and patching which may be required for the proper installation of the electrical work. Work shall be performed by the trade originally installing same and paid for under this Section of the work.

F. Protect all work, materials and equipment from damage from any cause whatever and provide adequate and proper storage facilities during the progress of the work. Storage outdoors shall be weather protected and shall include space heaters to prevent condensation. Provide for the safety and good condition of all work until final acceptance of the work by the City Engineer and replace all damaged or defective work, materials and equipment before requesting final acceptance at no added cost to the City.

G. Conduit and Equipment to be installed: Clean thoroughly to remove plaster, spattered paint, cement and dirt on both exterior and interior.

H. Conduit and Equipment to be painted: Clean all conduits exposed to view in completed structure by removing plaster and dirt. Remove grease, oil and similar material from conduit and equipment by wiping with clean rags and suitable solvents in preparation for paint.

I. All Items with Factory Finish: Remove cement, plaster, grease and oil, and leave all surfaces, including cracks and corners, clean and polished. Touch up any scratched or bare spots to match finish. Factory finish may be approved as prime coat by the Architect (see "Painting" Section).

J. Site Cleaning: Remove from site all packing cartons, scrap materials and other rubbish relating to electrical installation.

K. Electrical equipment and materials exposed to public and in finished areas shall be finish-painted after installation to coordinate with surrounding walls. Surfaces shall be thoroughly cleaned for receiving painting. Paint color coordination shall be as directed by the Architect or City Engineer. Paint shall be identical to that on adjacent surfaces to insure proper matching of quality and color with surrounding areas.

3.4 EXCAVATION, CUTTING AND PATCHING

A. All excavating, trenching and backfilling required for the work of this Division shall conform to the applicable requirements of the "Earthwork" Division 31 in the Project Specifications. All excavating and backfilling connected with electrical work, repaving all cuts and providing and maintaining all protective measures for the electrical work excavation required by the governing authorities having jurisdiction shall be performed as a part of the work of this Division.

B. At a time in advance of the work, verify all openings indicated on the Drawings. Should the work of this division require it, furnish new instruction as to requirements for these openings, subject to the Architect's approval. All cutting, patching and reinforcement of the building (subject to the City Engineer's approval) shall be performed under the Section of the Specifications under which the work was originally performed, but the coat shall be an obligation of the Contractor.

3.5 TESTS

A. Conduct resistance to ground tests by qualified personnel to measure resistance to ground at all grounding electrodes. Make tests before slabs of affected areas are poured in order that corrective measures, if requested, may be taken. Submit to the City Engineer a report showing the results of these measurements. If the resistances exceed values specified elsewhere, perform all corrective measures as directed by the City Engineer at no additional cost to City.

B. Prior to energizing any motors, measure the service voltage for phase balance and report immediately to the City Engineer if unbalance exceeds 1% from means.

C. Measure the three-phase voltage at no load and at maximum load conditions and submit to the City Engineer a report showing the results of these measurements.

D. Upon completion of the work and adjustment of all equipment, conduct an operating test for approval at such time as the Architect directs. Conduct the test in the presence of an authorized representative of the State. Demonstrate all systems and equipment to operate in accordance with all requirements of the Contract documents and to be free from all electrical and mechanical defects. Provide all systems free from short circuits and grounds and show an insulation resistance between phase conductors and ground not less than the requirements of the governing electric code. Test all circuits for proper neutral connections.

E. Complete all tests prior to final inspection of project, including corrective work based on the results of the tests.

F. Perform special tests on systems and equipment as specified herein in other sections of this division, using personnel qualified to perform such tests.

G. Measure voltage on secondary side of all transformers with full load connected and adjust taps to provide rated secondary voltage.

H. Submit to the City Engineer a report showing test voltage of L-N on the secondary's of all transformers.

3.6 PROTECTION

A. Besides the provisions of Subsection 1.10 of this Section comply with the following:

1. Protect all finish parts of the materials and equipment against damage during the progress of the work and until final completion and acceptance. Cover all materials and equipment in storage and during construction in such a manner that no finished surfaces will be damaged or marred. Keep all moving parts clean, dry and lubricated.

3.7 PRELIMINARY OPERATIONS

A. Required**:** Should the City require that any portion of the systems or equipment be operated prior to the final scheduled dates for completion and acceptance of the work, the Contractor shall consent. Such operation shall be under the direct supervision of, and at the expense of the Contractor, and shall not be construed as an acceptance of any of the work by the City.

3.8 CLEANING UP

A. Conform to applicable provisions of Section 01740 of the General Requirements and the following as applicable.

B. Upon completion of the work and at various times during the progress of the work, remove from the building all surplus materials, rubbish and debris resulting from the work of this division and leave the involved portions of the job-site in a neat, clean and acceptable conditions.

C. Thoroughly clean all switchgear, apparatus, exposed conduit, metal work and accessories for the work of this Division of cement, plaster and other deleterious materials; remove all grease and oil spots with cleaning solvent; carefully wipe all surfaces and scrape all cracks and corners clean.

D. Thoroughly polish all chromium and all plated work. Remove all dirt and stains from lighting fixtures.

E. Leave the entire installation in a neat, clean and usable condition.

3.9 COMPLETION

A. The work will not be reviewed for final acceptance until operating and maintenance data, manufacturer's literature, panel directories and nameplates specified herein have been approved and properly posted or installed and final cleaning of equipment and premises has been completed.

B. When the installation is complete and all adjustments have been made, operate the systems for a period of one week, during which time demonstrate to the City Engineer that the systems are completed and operating in conformance with the Specifications.

3.10 GUARANTEE

A. Conform to applicable provisions of the GENERAL CONDITIONS of these Specifications.

B. Required: Except as may be specified under other sections in the Specifications, guarantee all equipment furnished under the specifications for a period of one year from date of acceptance against defective workmanship and material, and improper installation. Upon notification of failure, correct deficiency immediately and without cost to the City.

C. Standard warranty of manufacturer shall apply for replacement of parts after expiration of the above period. Manufacturer shall furnish replacement parts to the City or his service agency as directed. Furnish to the City Engineer printed manufacturer's warranties complete with material included and expiration dates, upon completion of project.

3.11 OPERATING AND MAINTENANCE DATA

A. Required: Submit to the City Engineer, complete and at one time, prior to acceptance of the installation, 10 copies of manufacturer's instructions for operation and maintenance of electrical equipment, including replacement parts lists. Each set to be bound in an indexed loose leaf ring binder with permanent cover and permanent identification on back.

3.12 RECORD DRAWINGS

A. Required: Conform to the provisions of Subsection 1. 6 M of this Section and as noted hereinafter as applicable.

B. Provide and maintain in good order at the field office a complete set of electrical contract prints. All changes to the contract shall be clearly recorded on this set of prints and initialed by the Contractor on a weekly basis. At the end of the project transfer all changes, using same symbols, to one set of Mylar transparencies. Obtain Mylar transparencies from the Architect at Contractor's cost.

C. Accurately indicate and dimension all underground conduit runs and conduit stub-outs and all pullboxes from building walls on all Record Drawings.

D. Upon completion of the work and as a prerequisite to issuance of certificate for final payment, deliver one complete set of final prints of the mylars and the Mylar originals themselves.

E. Initial and identify name and telephone number of installing Contractor on all sheets as being a correct and accurate record of the installation. This also includes, but is not limited to, fire alarm

and control systems.

3.13 INSPECTION AND ACCEPTANCE PROCEDURES

The City Engineer will submit observation reports periodically during the construction phase detailing Contract deficiencies. The Contractor is responsible for making all corrections immediately to avoid delaying other trades. Final acceptances of the project will not be made until all items have been corrected.

3.14 FINAL ACCEPTANCE OF ELECTRICAL SYSTEMS

A. Prior to Final Acceptance of operating electrical systems Contractor shall do the following, as applicable:

1. Provide materials of the type and quality specified and as necessary for proper operation, tested and ready for use.

2. Deliver to the City Engineer the "as-built" transparency and set of prints as "Record Drawings".

3. Furnish the required operating and maintenance data/manuals.

4. Clean-up of the project pertaining to this Division of the work, as hereinbefore noted in Subsection 3. 8 of this Division.

5. After installation has been completed and adjustments made, operate the system for a period of one week, during which time, demonstrate to the City Engineer that all systems are complete and operating in conformance with Contract documents.

6. Conduct all tests required and as specified in Sections of this Division and submit test reports and corrective actions taken.

7. Submission of all warranties and guarantees.

B. Final Acceptance of Electrical Work Shall Be Contingent On The Following:

1. Contractor replacing defective materials and workmanship.

2. Upon completion of work and adjustments made, Contractor shall conduct an operating test for each system for approval at such time as City Engineer directs. Conduct test in presence of authorized representative of the City Engineer demonstrate that systems and equipment do operate in accordance with requirements of the Contract documents and are free from electrical and mechanical defects.

3. Contractor shall provide the necessary training programs and instructions to the City's representative.

4. Submit copies of manufacturer's instructions and maintenance of electrical equipment including replacement parts lists. Each set shall include one set of shop drawings of equipment installed.

3.15 SUBMITTALS FOR CHANGE ORDERS

A. General: When changes are made during the construction phase, deletions and additions shall be presented in a manner that will indicate the cost of each item of material and corresponding

labor. Overhead and profit makeup shall be then added in accordance with the requirements of the GENERAL CONDITIONS.

1. Unit costs shall apply in event of changes, additions and deletions to the contract, as follows:

2. Submit with Bid Costs a unit cost, covering one hour of labor, including all applicable supervision, nonproductive labor, burdens, benefits, insurance, taxes, direct and indirect job expenses including drawings, engineering, temporary power, warehouse, tools, equipment, clean-up, bonds, overhead and profit, charged for labor. Unit cost of labor shall be applicable for duration through completion of the project.

3. Material unit costs shall be based on the latest edition of "Electrical Trade Book", published by Trade Service Publications, Inc. Unit cost shall be taken from extreme right-hand column.

4. Labor unit quantities, for specific items required, shall be those listed in the third column from the National Electrical Contractors' Association, Inc., "NECA Manual of Labor Units".

END OF SECTION

SECTION 26 05 19

WIRE AND CABLE-RATED 600 VOLT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Addenda, Alternates, Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specifications collectively apply to work of this Section.

1.02 DESCRIPTION

A. Work includes but is not limited to the following:

1. Building wire.

2. Ground Conductors.

3. Wiring connections and terminations.

4. Conductor Identification.

B. Related Work:

1. Section 26 01 00 - Basic Materials and Methods.

2. Section 26 05 33 - Conduit.

3. Section 26 05 53 – Identification for Electrical Systems.

4. Section 26 05 26 - Grounding.

PART 2 - PRODUCTS

2.01 BUILDING WIRE

A. Wires shall be single conductor type THHN/THWN insulated with polyvinyl chloride and covered with a protective sheath of nylon, rated at 600 volts. Wires may be operated at 90 degrees C. maximum continuous conductor temperature in dry locations, and 75 degrees C. in wet locations and shall be listed by UL Standard 83 for thermoplastic insulated wires, listed by Underwriter's Laboratories (UL) for installation in accordance with Article 310 of the California Electrical Code (CEC). Conductors shall be solid copper for 10 AWG and smaller conductors, and stranded copper for 8 AWG and larger conductors. Conductors shall be insulated with PVC and sheathed with nylon. Wires shall be identified by surface markings indicating manufacturer's identification, conductor size and metal, voltage rating, UL symbol, type designations and optional rating. Indentations for lettering are not permitted. Wires shall be tested in accordance with the requirements of UL standard for types THWN, or THHN.

B. Conductors shall be solid Class B or stranded Class C, annealed uncoated copper in accordance with UL standards, or another Nationally Recognized Testing Laboratory (NRTL).

C. Control Circuits: Copper, stranded conductor 600 volt insulation, THWN/5

D. Minimum branch circuit wiring: No. 12 AWG copper, 600 volt insulation.

E. For conductors installed in exposed conduit outside of buildings and conduit within or just under roofing material, provide type XHHW.Control Circuits for Mechanical Equipment: Use 600 volt Underwriters' type THWN conductors except where subject to abnormally high temperatures such as on or near boilers. Under these conditions, use type FEPB.

F. Conductor for Door Status and Lock: Stranded jacketed twisted pair for Class 2 or 3 systems, No. 18 A.W.G. size.

G. Conductors for Fire Protective Signaling Systems: Solid No. 14 A.W.G. size minimum.

2.02 GROUND CONDUCTORS

A. Equipment ground: Insulated conductor green in color.

B. Isolated circuit ground: Insulated conductor green in color.

C. Ground Wires: Bare copper or with green colored insulation.

2.03 CONDUCTOR ARRANGEMENT AND IDENTIFICATION

A. Ties: T & B "Ty-rap" or 3M Company.

B. Lacing: Nylon twine.

C. Markers: Adhesive type, Brady.

2.04 CONDUCTORS

A. All Wire: New and delivered to job site in unbroken packages.

B. Each package shall bear Underwriter's and Manufacturer's labels and seals indicating date of manufacture and maximum allowable voltage.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Wires shall not be installed until debris and moisture is removed from conduits, boxes, and cabinets. Wires stored at site shall be protected from physical damage until they are installed and walls are completed.

B. Wire-pulling compounds furnished as lubricants for installation of conductors in raceways shall be compounds approved and listed by UL, NRTL, or equal. Oil, grease, graphite, or similar substances are not permitted. Pulling of 2 AWG or larger conductors shall be performed with a cable pull machine. Any runs shorter than 50 feet are exempt. When pulling conductors, do not exceed manufacturer’s recommended values

C. At outlets for light, power, and signal equipment, pigtail splices with 8-inch circuit conductor leads for connection to fixtures, equipment, and devices.

D. Pressure cable connectors, pre-insulated 3M Scotchlok, Hubbell Power, O-Z/Gedney or equal, Y, R or B spring-loaded twist-on type, may be furnished in splicing number 8 AWG or smaller wires for wiring systems; except public address and telephone systems.

E. Joints, splices, taps, and connections to switchboard neutral, bonding or grounding conductors, conductors to ground busses, and transformer connections for wires 6 gage and larger shall be performed with high-pressure cable connectors approved for installation with copper conductors. Connectors shall be insulated with heavy wall heat shrink WCSM, or cold-applied roll-on sleeve RVS. Insulation level shall be a minimum of 600V and joints, splices, and taps shall be qualified to ANSI C 119.1, UL, NRTL, or equal listed mechanical pressure connections.

F. Connections to any bussing and high-press cable connectors shall be securely bolted together with corrosion-resistant plated carbon steel, minimum grade five machine screws secured with constant pressure-type locking devices.

G. Connection of any bonding or grounding conductors shall be securely bolted together with corrosion-resistant plated carbon steel, minimum grade five machine screws secured with constant pressure-type locking devices.

H. Wire switchboards, panel cabinets, pull boxes, and other cabinets except public address, shall be neatly grouped and tied in bundles with nylon ties at 10-inch intervals. In switchboards, panels and terminal blocks, wires shall be fanned out to terminals. If bundles are longer than 24 inches, a maximum of nine current carrying conductors may be bundled together.

I. Install conductor lengths with a minimum length within the wiring space. Conductors must be long enough to reach the terminal location in a manner that avoids strain on the connecting lug.

J. Maintain the conductor required bending radius.

K. Neutral conductors larger than 6 gage, which are not color identified throughout their entire length, shall be taped, painted white, or taped white where they appear in switchboards, cabinet, gutters or pull boxes. Neutral conductors 6 gage and smaller shall be white color identified throughout their entire length.

L. Fire alarm and clock wiring shall be continuous from terminal cabinets or from equipment to each device. Splices are not permitted between devices and/or terminal cabinets at junction and pull boxes. Wiring shall be terminated at terminal blocks or devices only.

M. Wiring systems shall be free from short circuits and grounds, other than required grounds. The contractor shall be responsible for the testing of feeder and branch circuit conductor's insulation resistance. The insulation of the conductors shall be tested prior to connections to any panelboards, switchboards, variable frequency drives, lighting control systems, ballasts, and wiring devices such as but not limited to GFI receptacles, TVSS receptacles, or equipment. Insulation testing of panelboards and switchboards shall be independently performed from the insulation testing of any conductors as specified in other sections of this specification.

1. Utilize the services of an approved independent testing laboratory to perform megger time-resistance insulation testing of feeder conductors. Tests must be conducted with wires disconnected at both ends.

    a. Provide calibration program records to assure the testing instrument to be within rated accuracy. The test equipment accuracy shall be in accord with the requirements stated by the National Institute of Standards and Technology (NIST).

    b. Test equipment shall be provided with a label stating the date of last calibration. As a minimum the equipment shall have been calibrated within the past 12 months.

    c. Test reports shall include the following:

1)Identification of the testing organization.
2)Equipment identification.
3)Ambient conditions.
4)Identification of the testing technician.
5)Summary of project.
6)Description of equipment being tested.
7)Description of tests.
8)Test results.
9)Analysis, interpretation and recommendations.

3.02 COLOR CODES

A. General Wiring:

1. Color code conductor insulation as follows:

SYSTEM VOLTAGE		
Conductor	208Y/120	480Y/277
Phase A	Black	Brown
Phase B	Red	Orange
Phase C	Blue	Yellow
Neutral	White	White

Neutrals shall be colored-distinguished if circuits of two voltage systems are used in the same raceway.

2. For phase and neutral conductors 6 gage or larger, permanent plastic-colored tape may be furnished to mark conductor end instead of coded insulation. Tape shall cover not less than 2 inches of conductor insulation within enclosure.

B. Signal Systems: Wires for signal systems shall be color-coded. Except where otherwise specified, color-coding shall be as follows:

SYSTEM	COLOR CODE
Fire Alarm Horns	Pink (+) and Gray (-)
Fire Alarm Strobes	Orange (+) and Blue (-)
Un-Interruptible 24 Volt Power (Annunciator, Water Flow, and Audible Device)	Yellow (+) and White (-) Note: A single white wire may be common to both
Interruptible 24 Volt Power (4 wire smoke detectors, duct detectors)	Brown (+) and White (-) Note: A single white wire may be common to both
Switch-Leg Sprinkler Bell (Between water flow and audible device)	Violet (+) and White (-)
Door Holding Magnets (Non Power Limited)	Black (+) and White (-)

3.03 FEEDER IDENTIFICATION

A. Feeder wires and cables shall be identified at each point the conduit run is broken by cabinet, box, gutter, etc. Where terminal ends are available, identification shall be by means of heat shrink wire markers, which provide terminal strain relief. Markers shall be by Tyco Electronics, Panduit, Brady Perma-Sleeve, or equal. Identification in other areas shall be by means of wrap-around tape markers from Tyco Electronics, Panduit, Brady Perma-Code or equal. Markers shall include feeder designation, size, and description.

3.04 SPLICES

A. Make splices for No. 8 A.W.G. and smaller conductors with twist-on type pressure connectors suitable for the number and size of conductors. Connectors shall be Ideal Industries Inc., "Wingnut" or equal.

B. Make splices for No. 6 A.W.G. and larger conductors with bronze split-bolt or solderless compression type connectors requiring the use of a pressure tool. Connectors shall be wrapped with varnished cambric prior to taping, where tape is used as the insulating medium.

C. Make "pigtail" type splices at multiple conductor terminations for lighting fixtures, switches, receptacles, and other devices or outlets, to provide for connection of a single set of circuit conductors to the device or load. This requirement shall not apply to line and load conductors connected to GFCI type receptacles.

D. Install each feeder conductor without splice or joint, from equipment terminal to equipment terminal, except as specifically indicated otherwise on the Drawings.

3.5 MISCELLANEOUS (AS APPLICABLE)

A. Make all branch circuit and fixture joints for #10 AWG and smaller wire with UL approved connectors, listed for 600 volts. Provide Minnesota Mining and Manufacturing Co. insulated "Scotch locks", Ideal Co. "Wing-Nut", or T&B Burndy Co. "Piggy" connectors.

B. Make all branch circuit joints of #8 AWG and larger with screw pressure lugs, and insulate with electrical tape to 150% of the insulating value of the conductor insulation.

C. Tape all connections made with non-insulated type connectors with half-lapped, rubber-type tape, to 1-1/2 times the thickness of the conductor insulation, then cover with Scotch #33 tape.

D. Each circuit must correspond to the branch circuit number indicated on the panel schedule shown on the drawings except where departures are approved by the Architect.

E. Neatly group or tape together wiring within equipment enclosures.

F. Where conductors in conduit pass through exterior walls, a sealing compound of moisture-resistant material shall be applied in the ends of the conduits to seal around the conductors.

G. Megger tests shall be taken on all feeder conductors and on all conductors for motors over 15 HP. Tests shall be made in presence of the City's representative and prior to connection of equipment. Written reports of results shall be submitted to the City Engineer. Conductors testing below manufacturer's standard shall be replaced

3.05 PROTECTION

A. Protect the Work of this section until Substantial Completion.

3.06 CLEANUP

A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 05 26

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1: GENERAL

1.01 Provide required grounding.

1.02 SYSTEM DESCRIPTION

A. All metallic objects on the premises that enclose electrical conductors or that are likely to be energized by electrical currents shall be effectively grounded.

B. All metal equipment parts such as enclosures, raceways, and equipment grounding conductors and all earth grounding electrodes shall be solidly joined together into a continuous electrically conductive system.

C. All metallic systems shall be solidly interconnected to the electrical system as provided by the service entrance and for each grounded separately derived system that is installed.

D. A separately derived A.C. source shall be grounded to the equipment grounding conductor and to a separate made electrode.

E. Electrical continuity to ground metal raceways and enclosures, isolated from equipment ground by use of non-metallic conduit or fittings, shall be provided by a green insulated grounding conductor of approved size within each raceway connected to isolated metallic raceways, or enclosures at each end. Each flexible conduit shall be provided with a green insulated grounding conductor of approved size. In addition to using metallic conduits as ground, provide a ground wire sized per code in every conduit.

F. Cold water or other utility piping systems shall not be used as the only source of grounding electrodes. Grounding electrodes shall be "made electrodes" specified as follows:

1. Grounding electrodes as specified in Part 2 of this Specification.

2. Concrete enclosed electrode, which is made up of at least 20'-0" of #4 AWG, minimum size, copper conductor, encased by at least 2" of concrete, located within or near bottom of a concrete foundation, or footing, which is in direct contact with earth. Footing rebar must be connected to copper wire using approved connections. An external electrode as specified in Article 2.01, Paragraph B of this Specification Section must be installed and connected to foundation or footing rebar.

G. Non-current-carrying metal parts of high voltage equipment enclosure, signal and power conduits, switchboard and panelboard enclosures, motor frames, equipment cabinets, and metal frames of buildings shall be permanently and effectively grounded.

H. Metallic or semi-conducting shields, and lead sheaths of cables operating at high voltage, shall be permanently and effectively grounded at each splice and termination.

I. Neutral of service conductors shall be grounded as follows:

1. Neutral shall be grounded at only one point within site for the incoming service.

Preferable location of grounding point shall be at service switchboard, or main switch.

2. Equipment and conduit grounding conductors shall be bonded to that grounding point.

3. If other buildings are served from a switchboard or panelboard in another building, power supply is classified as a feeder and not as a service.

4. Equipment grounding conductor is carried from switchboard to each individual building. At building, grounding conductor is bonded with power equipment enclosures, metal frames of building, etc., to "made electrode" for that building.

5. Neutral of feeder shall not be grounded.

J. If there is a distribution transformer at a building, secondary neutral conductor shall be grounded to "made electrode" serving building.

K. If applicable within every building, main switchboard or panel, shall be bonded to a 1" or larger cold water line with a 1" conduit with one #6 wire. Metallic piping systems (gas, fire sprinkler, etc.) shall be bonded to cold water line with 3/4" conduit with one #8 wire.

PART 2: PRODUCTS

2.01 YARD BOXES

A. Yard boxes shall be precast concrete and shall be approximately 14" wide, 19" long, and 12" deep (outside dimensions), or larger, if necessary, to obtain required clearances. Boxes shall be equipped with bolt-down, checkered, cast iron covers and a cast iron frame cast into box. Yard boxes shall be Brooks 36 or approved equal.

2.02 ELECTRODES

A. "Made" electrodes shall be approved copper-clad steel ground rods, minimum 3/4" diameter, 10'-0" long.

2.03 GROUND ENHANCEMENT MATERIAL

A. Ground enhancement material as manufactured by Erico Electrical Products shall be used packed inside a 3" diameter hole around ground rod. Manufacturer's installation instructions must be followed for each ground rod installation.

PART 3: EXECUTION

3.01 ELECTRICAL DEVICES

A. Grounding electrodes shall be located in nearest usable planting area, where not otherwise indicated on Drawings, and each electrode shall terminate within a concrete yard box installed flush with finish grade. In planting areas, concrete yard box shall be 2" above planting surfaces.

B. If concrete enclosed electrode is used, grounding wire shall terminate to a suitable copper plate with grounding lugs.

C. Grounding rods shall be driven to a depth of not less than 8'-0". A permanent ground enhancement material as manufactured by Erico Electrical Products shall be used at each ground rod to improve grounding effectiveness. The manufacture's guidelines shall be used for each installation.

D. Grounding electrodes shall have a resistance to ground of not more than 10 ohms.

E. When using grounding rods, if resistance to ground exceeds 25 ohms, 2 or more rods connected in parallel shall be provided to meet grounding resistance requirement.

F. Ground rods shall be separated from one another by not less than 10'-0"

G. Parallel grounding rods shall be connected together with approved fittings and approved grounding conductors in galvanized rigid steel conduit, buried not less than 12" below finish grade.

H. Electrical Contractor shall include in his bid, cost of services of an approved independent testing laboratory, to test grounding resistance of all made electrodes, ground rods, and bonding of building steel, water pipes, gas pipes and other utility piping. Tests to be performed are as follows:

1. Visually and mechanically examine ground system connections for completeness and adequacy.

2. Perform "fall of potential" tests on each ground rod or ground electrode where suitable locations are available per IEEE Standard No. 81, Section 8.2.1.2. Where suitable locations are not available, measurements will be referenced to a known dead earth or reference ground.

3. Perform the two point method test per IEEE No. 81, Section 8.2.1.1 to determine ground resistance between ground rod and building steel, and utility piping - such as water, gas and panelboard grounds. Metal railings at building entrances and at handicapped ramps shall also be tested.

4. Test shall be conducted in presence of the District Electrical Inspector.

I. Three copies of test results shall be submitted to the District Electrical Inspector. Test results shall be submitted on an official form from the independent testing laboratory showing project location, test engineer, test conditions, test equipment data, ground system layout or diagram, and final test results.

END OF SECTION

SECTION 26 05 29

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Addenda, Alternates, Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specifications collectively apply to work of this Section.

1.02 DESCRIPTION

A. Work includes but is not limited to the following:

1. Conduit and equipment supports.

2. Fastening hardware.

B. Related Work:

1. Division 3 - Concrete.

2. Section 26 01 00 - Basic Materials and Methods.

3. Section 26 05 33 - Conduit.

4. Section 26 05 19 - Wire and Cable.

5. Section 26 05 34 - Boxes.

6. Section 26 24 13 - Service Switchboards and Distribution Sections.

7. Section 26 24 16- Panelboards.

8. Section 26 51 00 - Lighting Fixtures.

1.03 QUALITY ASSURANCE

A. Support systems shall be adequate for weight of equipment and conduit, including wiring, which they carry.

1.04 COORDINATION

A. Coordinate size, shape and location of concrete pads, concrete work - Section 03 30 00.

PART 2: PRODUCTS

2.01 MATERIAL

A. Support Channel: Galvanized.

B. Hardware: Corrosion resistant.

C. Concrete: See Division 3.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Fasten hanger rods, conduit clamps, and outlet and junction boxes to building structure using beam clamps, or spring steel clips.

B. Use toggle bolts or hollow wall fasteners in hollow masonry, plaster, or gypsum board partitions and walls; expansion anchors or preset inserts in solid masonry walls; self-drilling anchors or expansion anchor on concrete surfaces; sheet metal screws in sheet metal studs; and wood screws in wood construction.

C. Do not fasten supports to piping, ductwork, mechanical equipment, or conduit, or to any vibrating equipment.

D. Do not use powder-actuated anchors.

E. Do not drill structural steel members without Structural Engineers approval.

F. Fabricate supports from structural steel or steel channel, rigidly welded or bolted to present a neat appearance. Use hexagon head bolts with spring lock washers under all nuts.

G. Install surface-mounted cabinets and panelboards with minimum of four anchors.

H. Bridge studs top and bottom with channels to support flush-mounted cabinets and panelboards in stud walls.

END OF SECTION

SECTION 26 05 33

CONDUIT

PART 1: GENERAL

1.01 RELATED DOCUMENTS

A. Addenda, Alternates, Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-01 Specifications collectively apply to work of this Section.

1.02 DESCRIPTION

A. Work includes but is not limited to the following:

1. Rigid metal conduit and fittings.
2. Intermediate metal conduit and fittings.
3. Electrical metallic tubing and fittings.
4. Flexible metal conduit and fittings.
5. Liquidtight flexible metal conduit and fittings.
6. Non-metallic conduit and fittings.

PART 2: PRODUCTS

2.01 RIGID STEEL CONDUIT AND FITTINGS

A. Rigid Steel Conduit: Hot dipped galvanized inside and out, galvanized threads, mild steel, zinc coated, inside and outside protective coating. Standard lengths: 10'-0".

B. Bushings: Threaded insulated metallic type except sizes 1" and smaller may be non-metallic type. Setscrew bushings are not acceptable.

C. Couplings, elbows, bends and other fittings: Same material and finish as rigid steel conduit. All shall be threaded type.

2.02 RIGID ALUMINUM CONDUIT AND FITTINGS

A. Not allowed-No exceptions

2.03 INTERMEDIATE METAL CONDUIT (IMC) AND FITTINGS

A. Conduit: Galvanized steel, zinc coated, protective coating inside and out.

B. Fittings and Conduit Bodies: Use fittings and conduit bodies specified above for rigid steel conduit.

C. Conduit: May be used in lieu of rigid steel conduit where permitted by code, except in concrete, underground, runs longer than 100 feet for all power feeders with conduit greater than 2 inches.

2.04 ELECTRICAL METALLIC TUBING (EMT) AND FITTINGS

A. Conduit: Hot dipped galvanized or sherardized inside and out, zinc coated with protective enamel coating inside. Provide bushings at ends of conduits.

B. Connectors: Steel, insulated, bused tap-on or wrench tightened compression type. (Couplings similar) Indentor or screw type not acceptable.

C. Conduit: May be used in lieu of rigid steel conduit where permitted by code, except exposed, in concrete and for runs more than 100' for all power feeders with conduit greater than 2 inches.

2.05 FLEXIBLE METAL CONDUIT AND FITTINGS

A. Conduit: Steel single strip, hot dipped galvanized on all 4 sides prior to fabrication. Flexible aluminum conduit will not be allowed.

B. Connectors: Die cast with ridges that thread into conduit. (Binding screw type connectors are not acceptable.)

C. Conduit: May be used in lieu of rigid steel conduit where specifically indicated; at connections to vibrating equipment; at drops to light fixtures from J-boxes; at locations judged by Architect impractical to use rigid conduit. Maximum length for any application shall be 6 feet.

2.06 LIQUIDTIGHT FLEXIBLE CONDUIT AND FITTINGS

A. Conduit: Steel, single strip, hot dipped galvanized on 4 sides prior to fabrication.

B. Connectors: Insulated, special Appleton "STN" Series.

C. Jacket: Liquidtight, polyvinyl chloride plastic.

D. Conduit: Use for final connection to motor terminal boxes and transformers. Use at exterior locations, damp locations, wet locations and for flex connections in kitchen, restrooms and similar areas.

2.07 PLASTIC CONDUIT AND FITTINGS

A. Conduit: Extruded, virgin polyvinyl chloride compound, Schedule 40, heavy wall, in 10'-0" lengths with couplings.

B. Fittings: Non-threaded type couplings.

C. Conduit: May be used underground only. Vertical elbows and risers of all sizes shall be rigid steel with 20 mil bonded PVC coating.

2.08 CONDUIT SUPPORTS

A. Conduit Clamps, Straps, and Supports: Steel or malleable iron. Clamps: Unistrut Nos. P111 thru P1124, Kindorf No. C105. Straps: One or two hole as required.

B. Conduit hangers, racks and trapezes: Steel, threaded rods, channel iron "U" shaped racks equal to "Unistrut".

C. Individual conduit hangers: Steel, threaded rods with malleable iron split rings.

D. Hanger rods: 3/8" minimum diameter for 2" and smaller conduit, factory made. 1/2" minimum for 2-1/2" and larger conduit.

E. Wire supports: 12 gauge zinc coated iron tie wire, or 16 gauge galvanized double annealed steel tie wire.

2.09 CONDUIT ROOF JACKS AND FLASHING

A. Roof Jacks:

1. For Single Conduits Through Roof: Stonemen Stormtite Series #1100-4; seamless 4 pound lead flashing assembly, 8" skirt, steel reinforced varipitch boot; caulk type cast iron counterflashing sleeve, with vandalproof set screws, and Perma-seal waterproofing compound.

2. Sleeves for Conduits: Sleeves shall be adjustable type, of 26 gage galvanized iron, Adjust-to Crete Co. Adjust-to-Crete, or Jet Line Products Inc. Jet-Line, or equal.

3. Where conduit enters a building through a concrete foundation below grade, or ground water level, or where it is necessary to seal around a conduit where it passes through a concrete floor or wall, provide O-Z/Gedney Type FSK Thru Wall and Floor Seal, or equal.

2.10 CONDUIT PULLING CORDS

A. Pull Wire: No. 12 galvanized iron or nylon pull wire rated 250 pounds tensile strength.

2.11 CONDUIT FITTINGS, ELLS AND BUSHINGS

A. Special conduit fittings: Crouse-Hinds "Condulets" or Appleton "Unilets".

B. Ells: Same quality, same finish and same make as conduit.

C. Bushings: Thomas & Betts or approved equal.

D. Seismic separations and expansion joints: OZ type "AX" complete with bonding strap and clamps. At exterior locations use OZ type "EX".

2.12 CONDUIT SEALS AND SEALING COMPOUND

A. Vertical seals: Crouse Hinds type "EYD" or Appleton type "SF".

B. Horizontal Seals: Crouse Hinds type "EYS" or Appleton type "ESU".

C. Sealing compound: Crouse Hinds "CHICO" or Appleton "APELCO".

D. Fireproofing Compound: Dow Corning No. 3-6548 RTV or equal by 3M Company or Nelson.

2.13 UNDERGROUND SPACERS FOR PVC CONDUIT

A. Spacers: PVC, interlocking type, intermediate and base styles.

B. Sizes: For 2" to 4" conduit.

C. Manufacturer: Carlon or approved equal.

2.14 SPECIAL UNDERGROUND COUPLINGS FOR PVC CONDUIT

A. Expansion couplings: PVC type to expand up to 4".

B. Couplings: Socket type for joining PVC conduit.

C. Adapters: Socket type at one end for PVC conduit and threaded female type at other end for metallic connection.

2.15 PLASTIC CONDUIT CEMENT

A. Solvent weld cement: Fast drying, brush-on type.

2.16 MC CABLE

A. Metal Clad (MC) cable system is allowed as per approved plans..

PART 3: EXECUTION

3.01 CONDUIT SIZING, ARRANGEMENT, AND SUPPORT

A. Arrange conduit to maintain headroom and present a neat appearance.

B. Unless indicated otherwise, conceal conduit within or behind finished walls and ceiling.

C. Route exposed conduit and conduit above accessible ceilings parallel and perpendicular to walls and adjacent piping.

D. Maintain minimum 6 inch clearance between conduit and piping. Maintain 12 inch clearance between conduit and heat sources such as flues, steam pipes, and heating appliances.

E. Arrange conduit supports to prevent distortion of alignment by wire pulling operations. Fasten conduit using galvanized straps, lay-in adjustable hangers, clevis hangers, or bolted split stamped galvanized hangers.

F. Group conduit in parallel runs where practical and use conduit rack constructed of steel channel with conduit straps or clamps. Provide space for 25 percent additional conduit.

G. Do not fasten conduit with wire or perforated pipe straps. Remove all wire used for temporary conduit support during construction, before conductors are pulled.

H. Do not support conduit from any equipment subject to vibration. Support from structural members only.

I. Structural Considerations for Conduit Routing:

1. Where conduits are to pass through or will interfere with any Structural member, or where notching, boring or cutting of the structure is necessary, or where special openings are required through walls, floors, footings, or other buildings elements, to accommodate the electrical work, such work shall conform to State Building Code.

2. Where conduits are terminated in groups at panelboards, switchboards and signal cabinets, etc., provide templates or spacers to hold conduits in proper position and to preserve alignment. Conduits terminating at signal cabinets shall enter cabinets in following approved locations only: Conduits entering top, side, and bottom of cabinets shall be aligned in a single row, centered 2" from rear of cabinet; conduits entering back of cabinet shall be aligned in a single row centered 2" from top of cabinet. Conduits shall not be spaced closer than 3" on centers.

3. 1" and smaller conduits above metal lath ceilings shall be tied to ceiling channels. 1-1/4" conduits above metal lath ceilings shall be rigidly suspended with pipe hangers or pipe racks or shall be secured to superstructure with factory made pipe straps. Conduits in metal lath or steel stud partitions, shall be tied to furring channels or studs. In ceiling spaces and in partitions, tie wires shall be spaced not more than 5'-0" apart, shall hold conduit tight against channels and studs at point of tie and shall not bear any of weight of conduit. Tie wire shall be #16 gage galvanized double annealed steel tie wire.

4. Where auxiliary supports, saddles, brackets,, etc., are required to meet special conditions they shall be made rigid and secure before conduit is attached thereto.

5. Conduit in ceiling spaces, in stud walls and under floors shall be supported with factory made pipe straps or shall be suspended with pipe hangers or pipe racks. Pipe straps shall be attached to and shall hold conduit tight at point of support against ceiling and floor joists, rafters, and wall studs, or 2" x 4" headers fitted between joists or wall studs.

6. Conduits installed on exposed steel trusses and rafters shall be fastened with factory made conduit straps or clamps which shall hold conduit tight against supporting member at point of support.

7. Conduits under buildings shall be strapped with factory made conduit straps to underside of concrete floor or joists, or wood floor joists, or shall be suspended with pipe hangers or pipe racks. Conduits under building shall not rest on ground but shall be suspended from building or shall be buried below surface of ground. 1" and larger conduits under buildings shall be suspended with conduit hangers or racks.

8. Pipe hangers for individual conduits shall be factory made, consisting of a pipe ring and threaded suspension rod. Pipe ring shall be malleable iron, split and hinged, and shall securely hold conduit, or shall be springable wrought steel. Rings shall be bolted to or interlocked with suspension rod socket. Rods shall be 3/8" for 2" conduit hangers and smaller and shall be 1/2" for 2-1/2" conduit hangers and larger.

9. Pipe racks for groups of parallel conduits and for supporting total weights not exceeding 500 pounds shall be trapezed type and shall consist of a cross channel, Steel City Kindorf #B-900, Unistrut #P-1000 suspended with a 3/8" minimum diameter steel rod at each end. Each rod shall be fastened with nuts, top and bottom to cross channel and with a square washer on top of channel. Each conduit shall be clamped to top for cross channel with conduit clamps, Steel City Kindorf #C-105 or Unistrut Nos. P-1111 through P-1124. Conduits shall not be stacked one on top of another, but a maximum of 2 tiers maybe on same rack providing an additional cross channel is installed. Where a pipe rack is to be longer than 18", or if weight it is to support exceeds 500 pounds, submit details of installation to the Architect for approval.

10. Factory-made pipe straps shall be one or 2-hole formed galvanized clamps, heavy

duty type, except where otherwise specified.

11. Hangers straps, rods, or pipe supports under concrete shall be attached to inserts set at time concrete is poured. Under wood use bolts, lag bolts, or lag screws; under steel joists or trusses use beam clamps.

3.02 CONDUIT INSTALLATION

A. Cut conduit square using a saw or pipe cutter; de-burr cut ends.

B. Bring conduit to the shoulder of fittings and couplings and fasten securely.

C. Use conduit hubs or sealing locknuts for fastening conduit to cast boxes, and for fastening conduit to sheet metal boxes in damp or wet locations.

D. Install no more than equivalent of two 90- degree bends between boxes for conduits 2" diameter and larger, three for conduit under 2" diameter. Locate pull boxes as required.

E. Use conduit bodies to make sharp changes in direction, as around beams.

F. Use hydraulic one-shot conduit bender or factory elbows for bends in conduit larger than 2 inch size.

G. Avoid moisture traps where possible; where unavoidable, provide junction box with drain fitting at conduit low point.

H. Support rigid, intermediate and thin wall conduit at 8'-0" maximum on centers and 3'-0" from junction boxes.

I. Support flexible and liquidtight flexible conduit at 4'-0" maximum on centers and 12" from junction boxes.

J. PVC conduit: Use underground only. Encase in 3” concrete (2000 psi) envelope except under building.

K. Provide No. 12 AWG insulated conductor or suitable pull string in empty conduit, except sleeves and nipples.

L. Install expansion-deflection joints where conduit crosses building expansion or seismic joints.

M. Where conduit penetrates fire-rated walls and floors, seal opening around conduit with UL listed fire barrier, "3M" calk or equal.

N. Route conduit to roof mounted devices and equipment through roof jacks. Provide flashing/roof jacks for all new and existing conduits which penetrate roof to appropriate Roofing Section(s) for installation.

O. Run conduit to equipment on roof concealed in attic space. Penetrate roof at equipment locations only.

P. For conduits to roof mounted HVAC equipment, penetrate roof with roof jacks outside footprint of HVAC units. Do not penetrate roof inside HVAC units.

Q. Do not use aluminum conduit below grade, cast in concrete or in masonry in contact with earth.

R. Conduit underground may be rigid conduit and in these conditions shall be given two heavy coatings of a suitable primer and a single half lapped layer of protective plastic tape. Primer and tape shall be "Scotchrap" No. 50 tape. Primer and tape shall be "Scotchrap" Primer or Trantex V-10 tape and Dutch Brand Primer. Primer and tape shall be in strict accordance with manufacturer's instructions. As an alternate, conduit and fittings shall have a PVC bonded coating (40 mil thickness minimum) by Occidental Coating Company.

S. Where conduit is installed underground, under slabs on grade, exposed to weather or in wet locations, make joints liquidtight and gastight.

T. For underground or underslab conduit, apply a heavy coat of Pabco P & B No. 2 paint to all surfaces within 6" each side of fittings and to areas where wrenches or other tools have been applied. On exposed conduit, repair scratches and other defects with galvanizing repair stick, Enterprise Galvanizing "Galvabar".

U. Cut threads on rigid conduit to standard taper and to a length such that all bare metal exposed by threading operation will be completely covered by couplings or fittings used. In addition, cut lengths of thread such that all joints will become secure and wrench tight just preceding point where conduit ends would butt together in couplings and where conduit ends would butt into ends or shoulders of other fittings. Securely tighten all threaded connections.

V. Encase all underground primary and secondary electric service conduits in concrete envelopes with a minimum 3” cover all around from end-to-end. Provide concrete with a compressive strength of not less than 2,000 psi at 28 days of age. Provide red concrete encasement for systems over 600-volt. Space multiple conduit not less than 3” apart. Use factory made conduits spacers to stagger connections or couplings for neater installation. Tie conduit to spacers and anchor system to prevent dislodgement. Provide personnel to inspect during pouring to prevent displacement of conduit.

W. Make joints in rigid conduit installed in concrete or masonry liquid-and-gas-tight, with red lead and oil, or other approved joint compound and engage not less than five threads.

X. Keep bends and offsets in conduit runs to an absolute minimum. Replace all deformed, flattened or kinked conduit. Provide large radius factory made bends or power bend rigid metal conduit of 1-1/4" trade size or larger.

Y. Place sleeves for electrical conduit passing through walls, beams or slabs before concrete is poured (exception-floor slabs on earth). Where conduit passes through suspended floor slabs, outside of chases, sleeves shall be standard weight black steel pipe extending 1-1/2" above the finished floor level. Sleeves at other locations shall be either lightweight galvanized steel tube, or galvanized sheet steel, with a minimum thickness of 24 USSG. Clearance between conduit and sleeves shall be not less than 1/2". Sleeves through outside walls below grade shall be caulked tight. Caulk with oakum and mastic to obtain watertight joint.

Z. Penetration Membrane: Where penetration cannot be avoided, cut and re-seal membrane at point of penetration.

AA. Provide minimum 3/4" conduit size underground.

BB. Run exposed conduit parallel with or at right angles to building line, beams, or ceilings. Place symmetrical bends or metal boxes at changes in direction or taps.

CC. Stub from each panel which is flush mounted in a wall, from top of panel a minimum of 3-3/4" conduits to nearest ceiling space or other accessible locations and cap for future use. Tag to

indicate panel origination.

DD. Independently support conduit rising from floor for motor connections if over 24" above floor. Support shall not be a motor or duct work which may transmit vibrations.

EE. Provide pull wire in all conduit runs indicated as conduit only (C.O.).

FF. Do not run conduit closer than 12" to any hot water pipe, steam pipe, heater flue or vent.

GG. Terminate conduit stub-ups through floor for connection to equipment of junction boxes in couplings flush with top of concrete slab floor.

HH. Within building, bury underground conduit a minimum of 6" below bottom of slab.

II. Use rigid metal conduit where legally required, where exposed to weather, where located in unheated areas, or where subject to mechanical injury, here defined as exposed conduit less than 7'-6" above floor in areas accessible to anyone other than authorized operating or maintenance personnel.

JJ. Where a conduit from one structure crosses to another structure, e.g., from a building to an arcade or from one arcade to another arcade, use a section of liquid-tight flex conduit at the crossing with sufficient slack to allow the two structures to move during an earthquake without breaking the conduit. For stub up to relocatable buildings, provide liquid-tite flex from stub up to first box on back of building.

KK. Provide PVC deflection - expansion joint fittings where underground run passes through expansion joint or is necessary for seismic conditions.

LL. Provide a green insulated ground wire in all flexible conduit runs regardless of length.

MM. Wipe plastic conduit (PVC) clean before joining. Apply even coat of cement to entire area to be inserted into fitting. Let joint cure for 20 minutes minimum. Use approved solvent-weld cement specifically manufactured for purpose. Threading of PVC conduit is prohibited.

NN. Install an equipment ground (green) insulated conductor in each non-metallic conduit.

OO. Do not install PVC conduit above grade for any reason. Seal both ends of all PVC conduit runs at each junction box or conduit interruption with sealant. Seal steel conduit risers to panelboards, switchboards, or pullboxes from underground PVC conduit runs.

PP. Flash and counterflash all conduit runs passing through roof.

QQ. Use electrical metallic tubing above grade in dry locations only and where not subject to mechanical injury or otherwise prohibited. Concrete and masonry in contact with earth are not considered dry locations.

RR. Use liquid tight flexible conduit for final connections to motors and vibrating equipment. Use flexible conduit where required for equipment servicing for connections to recessed lighting fixtures from nearby accessible junction boxes, and for concealed runs in dry locations where structural conditions prevent use of other types of conduit.

SS. For conduits for computer cables and coax cables, use large radius bends. Do not use j-box or pull box to change direction. Install boxes at straight conduit sections only and sweep conduit to make turns. Do not use condulet fittings to change directions.

TT. Minimum radius for conduits designated for computer LAN wiring, coax cable wiring, data

wiring, fibre-optics wiring, and TV cable wiring shall be as follows:

3/4"C	-	12"
1"C	-	12"
1-1/4"C	-	18"
2"C	-	24"
2-1/2"C	-	24"
3"C	-	30"
3-1/2"C	-	30"
4"C	-	30"
5"C	-	36"
6"C	-	42"

UU. Size all conduits as legally required or larger where indicated or preferred. Where portions of a conduit run are increased in size, for whatever reason, make all remaining portions in that run same size.

VV. Mark all underground conduit stub-outs with a 6 inch square by 2 foot deep concrete block with an embedded brass nameplate indicating the origin of conduit.

WW. Do not cut concrete, masonry or structural members except where approved by Architect.

XX. Empty raceways over 10 feet long : provide with fish or pull wire ,galvanized steel or nylon rope

YY. Underground Requirements:

1. Except for branch circuit conduits and auxiliary system branch circuits within a building, all conduits installed underground shall be entirely encased in concrete (2000 psi), 3" thick on all sides with multiple conduits spaced not less than 3" apart, except where otherwise specified. Provide approved conduit spacers as required to prevent any deflection of conduits when concrete is placed and to preserve position and alignment of conduits in concrete. Conduits shall be tied to spacers. Anchors shall be installed to prevent floating of conduits during pouring of concrete. Red concrete shall be used to encase conduits of systems operating above 600 volts. To protect conduits from underground to surface wall mounted panels, terminal cabinets, etc., encase conduits in 3" high concrete curb.

2. Assemble sections of conduit with approved fittings and stagger all joints. Cut ends of conduit shall be reamed to remove all rough edges. Joints in all conduits shall be made liquid-tight. All bends at risers shall be completely below surface where possible.

3. Two or more conduit runs in a common trench shall be separated by at least 3" of concrete. Conduit runs installed in a common trench with other utility lines and water, gas, sew lines, shall be separated from such lines by at least 12" horizontally. Power conduits shall be separated from low voltage signal conduits by 6" of concrete.

4. Slope underground conduits between two pull boxes towards one of the boxes to avoid water and moisture trap. For underground conduits coming out of a building, slope conduits towards the first pull boxes. Take care to install underground conduits such that water cannot travel through underground pull boxes and conduits back into a building. Prevention method shall include but not limited to installing pull boxes with draining provision where conduits enter building, sealing both ends of each conduit water tight, etc.

5. Provide electronic markers to identify conduit stub locations at property lines, as required by electric service utility company.

6. All underground conduit systems for use by service utility company shall meet all requirements of utility company.

7. Raceways Located Underground, Beyond Building:

   a. Minimum 24-inches top cover, 30-inches in areas subject to heavy vehicular traffic.

   b. Slope away from building.

   c. Building entry and preceding manhole:

   d. Plug empty raceways.

   e. Seal cables in raceways with terminators:

   f. Similar to O.Z. type CRC Series.

   g. Manhole Entries: Through end bells perpendicular to entering wall.

   h. Anchor raceways to prevent movement.

   i. After Installation: Pass stiff bristle, mandrel (85 percent of raceway diameter) and plug.

   j. Placement: Over well-tamped trench bottom and on concrete blocks, five feet on centers. Provide non-metallic spacers.

   k. Joints: Minimum six inches apart and staggered.

   l. Provide watertight joints

3.03 EXCAVATION AND BACKFILL

A. Include all excavation and backfilling required for work under this Section.

1. Bury underground conduit at least 24 inches below finished grade to top of conduit encasement.

2. Underground branch circuit conduit, within building limits, 6" below bottom of slab unless specifically indicated otherwise in these specifications.

3. After installation of work has been inspected and approved, backfill trenches with clean earth, moistened and layer tamped to same compaction density as specified for both building and site locations under "Earthwork".

B. Locate existing underground pipes by use of electronic locating devices and exercise utmost care in excavation work. Contractor is responsible for satisfactory repair of any underground utility line damaged as result of his excavation.

C. Trenches or any other excavation required for installation of electrical work, which are

outside of barricaded working area, shall be barricaded at all times with continuous portable barricades. At completion of work, remove barricades from site. Backfill trenches and excavations outside of barricaded working area immediately after approval of conduit work by Inspector.

D. Where asphalt concrete has been cut, backfill up to existing grade.

E. Do not start excavations until approval is obtained from Inspector.

END OF SECTION

SECTION 26 05 34

BOXES

PART 1: GENERAL

1.01 RELATED DOCUMENTS

A. Addenda, Alternates, Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specifications collectively apply to work of this Section.

1.02 DESCRIPTION

A. Work includes but is not limited to the following:

1. Wall and ceiling outlet boxes.
2. Pull and junction boxes.
3. Sealant.

B. Related Work:

1. Section 26 01 00 - Basic Materials and Methods.
2. Section 26 05 33 - Conduit
3. Section 26 27 26 - Wiring Devices.

PART 2: PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS-OUTLET BOXES:

A. Raco

B. Steel City

C. Bowers

2.02 BOXES

A. outlet boxes, except as otherwise required by construction, devices or wiring, as follows:

1. Stamped or Welded Steel, 4-Inches, Square or Octagon For Lighting Fixtures: 1-1/2 inch deep above ceiling, 3 inch deep in slab, and 2-1.8 inch deep in wall.
2. In Wall For Receptacles and Switches: 4 inches square or octagon by 1-1/2 inch deep with raised covers and fixture studs where required. Through-the-wall type not permitted.
3. In Wall For Telephone or Data: 5-inches square or octagon by 2-1/8 inch deep with raised covers and fixture studs where required. Through-the-wall type not permitted.

4. Galvanized Cast-Iron or Aluminum With Threaded Hubs: 4 inch round, 2-inch deep on ceiling, and 4-inch square, 2-inch deep on wall.

5. Boxes For Outdoors and Damp Locations: Weatherproof, cast metal.

6. In Hazardous Locations: Cast, copper-free aluminum.

7. Boxes Without Fixture or Device: Provide with blank cover.

8. Offset back-to-back outlets with minimum six-inch separation except in "Acoustic partitions" where back-to-back outlets are not allowed. Refer to detail 5, architectural drawing sheet.

9. Boxes in "Acoustic Partitions" shall be provided as detailed on architectural drawing sheet.

B. Floor Boxes: Unless otherwise noted, galvanized cast iron with stainless steel covers and flanges, suitable for conduit and devices indicated. Walkerbox 880 Series or equal.

1. See also Section 26 27 26 wiring devices for special outlet boxes.

2. For additions to existing areas, match existing.

3. Zinc die cast boxes are not permitted.

2.03 ACCEPTABLE MANUFACTURERS-FLOOR BOXES

A. Hubbell

B. Walker Parkersburg

C. Steel City

2.04 PULL AND JUNCTION BOXES

A. Interior and non-weatherproof boxes shall be constructed of blue or galvanized steel with ample laps, spot welded, and shall be rigid under torsional and deflecting forces. Boxes shall have auxiliary angle iron framing where necessary to ensure rigidity. Covers shall be fastened to box with a sufficient number of brass machine screws to ensure continuous contact all around. Flush type boxes shall be drilled and tapped for cover screws at Site if boxes are not installed plumb. All surfaces of pull and junction boxes and covers shall be given one coat of metal primer, and one coat of aluminum paint.

B. Weatherproof pull and junction boxes shall conform to foregoing for interior boxes with following modifications: Cover of flush mounting boxes shall have a weather-tight gasket cemented to and trimmed even with cover all around. Surface or semi-flush mounting pull and junction boxes shall be UL approved as rain-tight and shall be complete with threaded conduit hubs. All exposed portions of boxes shall be galvanized and finished with a prime coat and coat of baked-on gray enamel.

C. All junction and pull-boxes shall be rigidly fastened to the structure and shall not depend on conduits for support.

D. Underground Concrete Pull Boxes:

1. Precast Concrete Pull Boxes. Concrete pull boxes shall be traffic type, reinforced for HS20-44 Traffic bridge loading, precast concrete. Pull boxes with inside dimensions 2'-0"x 3'-0" x 3'-0"D

shall consist of a base section, top ring and cover. Base section shall have a minimum of two 10"x10" knockouts in each 3'-0" side, and one 20"x20" knockout in each 2'-0" side. Pull boxes with inside dimension 4'-0 x 4'-0"x 4'- 0"D or larger shall consist of a base section, mid section, topping, and cover. Base section shall have a minimum of two 8"x 16" knockouts on each of two opposite sides, and one 20" x 20" knockout on each of the other two opposite sides. All pull boxes shall have a minimum of 6" diameter sump knockout, and 1" diameter ground rod knockout. In each pull box, furnish and install cable racks on walls. Each rack shall be equipped with 3 porcelain cable holders on a vertical steel mounting bar. Each pull box shall have 3/4" diameter pull irons. Covers shall be traffic type consisting of steel safety plate bolted to frame. Covers shall be marked "Electrical", "Power" "Telephone", "Signal" or "Ground", as required. Pull boxes shall be as manufactured by Quickset, or approved equal. Knockout requirements as stated above is minimum requirement. Contractor is responsible for providing pull boxes with the proper knockouts to accept the conduits as shown on the drawings. Depth of pull boxes as shown is the minimum requirement. Provide deeper pull boxes as required to accommodate conduits and minimum conduit cover requirements. All conduits must enter pull boxes in a straight horizontal line.

2. Provide end bells in all duct entrances. Terminate each metal conduit with insulated bushing having grounding terminal, O.Z. Type "Big"

3. Place pulling irons on opposite walls and below horizontal centerlines of ducts and bricked-up openings, and in bottom. Install pulling irons with each end hooked around a reinforcing bar.

4. Remove floor drain knockout and provide a depth of 24 inches of crushed rocks below box extending a minimum of 12 inches beyond all 4 sides.

5. Identify all power and signal cables by tagging in all manholes and pull boxes. Tie securely to cables with nylon cord or insulated type TW wire. Tie so that turns of wires do not form a closed electrical circuit, loop wires all around pull box perimeter at least one time to allow for slack in the wire run. All cables, power or signal must be supported by the cable racks. Cables shall not be resting on the bottom of a pull box.

6. Top of steel plate shall have a minimum co-efficient of static friction of 0.5 for either wet or dry conditions, when tested for any shoe sole material. Testing and certification of the friction factor shall be conducted by an independent testing laboratory approved by the engineer, under the direction of a registered Civil or Quality Engineer. Testing shall conform to ASTM D1047 or F489 or F609, or other procedure approved by the Engineer.

7. Manufactured by: Associated Concrete Products, Inc., Brooks Products, Inc., or equal

E. Underground utility boxes shall be reinforced concrete with non-setting shoulders to prevent settlement following installation. Boxes shall be furnished with cast iron cover with finger hole, size as indicated on Drawings. Utility boxes shall be as manufactured by Quickset, or approved equal.

F. Manholes, vaults and pull-boxes required by utility company, and installed by Electrical Contractor, shall meet all requirements of utility company.

G. Cast Metal Boxes for Outdoor and Wet Location Installations: Type 4 and Type 6, flat-flanged, surface-mounted junction box, UL listed as rain-tight. Galvanized cast iron OR Cast aluminum box and cover with ground flange, neoprene gasket, and stainless steel cover screws.

2.05 ACCEPTABLE MANUFACTURERS-SEALANT

A. Crouse Hinds "CHICO"

B. Permacel

C. Ductseal

2.06 ACCEPTABLE MANUFACTURERS - FIRE PROOFING SEALANT

A. Dow Corning

B. 3M Company

C. Nelson

PART 3: EXECUTION

3.01 COORDINATION OF BOX LOCATIONS

A. Provide electrical boxes as shown on Drawings, and as required for splices, taps, wire pulling, equipment connections, and code compliance.

B. Electrical box locations shown on Contract Drawings are approximate unless dimensioned. Verify exact location of floor boxes and outlets in offices and work areas with Owner's representative prior to rough-in.

C. Locate and install boxes to allow access.

D. Locate and install to maintain headroom and to present a neat appearance.

3.02 OUTLET BOX INSTALLATION

A. Unless otherwise noted on plan or specifically allowed by the Engineer, conceal all boxes flush in wall or in ceiling space above drop ceiling. In finished areas and where it is not possible to conceal conduits and boxes, for example, on existing concrete wall, provide Wiremold type metallic surface raceways and boxes.

B. Do not install boxes back-to-back in walls. Provide minimum 6 inch separation, except provide minimum 24 inch separation in acoustic-rated walls.

C. Provide knockout closures for unused openings.

D. Support boxes independently of conduit except for cast box that is connected to two rigid metal conduits, both supported within 12 inches of box.

E. Use multiple-gang boxes where more than one device are mounted together; do not use sectional boxes. Provide barriers to separate wiring of different voltage systems.

F. Install boxes in walls without damaging wall insulation.

G. Coordinate mounting heights and locations of outlets mounted above counters, benches, and backsplashes.

H. Position outlets to locate lighting fixtures as shown on reflected ceiling plans.

I. In inaccessible ceiling areas, position outlets and junction boxes within 6 inches of recessed

lighting fixture, to be accessible through lighting fixture ceiling opening.

J. Provide recessed outlet boxes in finished areas; secure boxes to interior wall and partition studs. Accurately position to allow for surface finish thickness. Use stamped steel stud bridges for flush outlets in hollow stud wall, and adjustable steel channel fasteners for flush ceiling outlet boxes. Install plaster rings to interface with equipment to be mounted thereon.

K. Align wall-mounted outlet boxes for switches, thermostats, and similar devices.

L. Provide cast outlet boxes in exterior locations and wet locations. Provide cast bell-boxes at interior locations where box is exposed to view. (do not use regular 4/s or handy box with exposed knockouts and unfinished appearances for these interior exposed applications).

M. Where boxes are installed in fire rated ceiling or walls, be responsible for preserving integrity of B fire rating as required.

N. In fire-rated wall, use 4" square deep boxes. Do not aggregate more than 100 square inches of boxes for any 100 square feet of wall or partitions. Separate outlet boxes on opposite sides of walls or partition by a minimum horizontal distance of 24 inches. Where the separation cannot be achieved due to site condition, provide 2-hour rated fire-proof material behind boxes to maintain fire rating of walls.

O. Flush boxes used for support lighting fixtures or other equipment shall be securely fastened to two structural support members unless embedded in masonry or concrete. Do not use powder-driven fastening devices unless specifically approved by the City Engineer.

3.03 PULL AND JUNCTION BOX INSTALLATION

A. Locate pull boxes and junction boxes above accessible ceilings or in unfinished areas.

B. Support pull and junction boxes independent of conduit.

END OF SECTION

SECTION 26 05 53
ELECTRICAL IDENTIFICATION

PART 1 -- GENERAL

1.1 SCOPE

A. Required: Furnish and install nameplates and warning sign where indicated on the Contract Drawings or herein specified.

B. Comply with the General Conditions, General Requirements and Section **26 02 00** of this Division 26 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

C. Work includes but is not necessarily limited to the following:

1. Nameplates and warning signs permanently installed on all electrical equipment and devices including, but not limited to, the following items:

   a. Transformers, switchboards, motor control centers, panelboards, variable frequency drives, pullboxes, cabinets and motors.

   b. Enclosures for all separately enclosed devices including, but not limited to, disconnect switches, circuit breakers, contactors, time switches control stations and relays, fire alarm panels and lighting control panel.

   c. Wall switches not within sight of outlet controlled.

   d. Special systems such as, but not limited to, telephone, fire alarm, warning and signal systems. Identification shall be at each equipment rack, terminal cabinet, control panel, annunciator and pullbox.

   e. Devices mounted within and part of equipment including circuit breakers, switches, control devices, control transformers, relays, indication devices and instruments.

D. Related Work:

1. Section 26 01 00 - Basic Materials and Methods.

2. Section 26 05 33 - Conduit.

3. Section 26 05 19 - Wire and Cable -Rated 600 Volt.

4. Section 26 05 34 - Boxes.

5. Section 26 24 13 - Service Switchboards and Distribution Sections.

6. Section 26 28 16 - Disconnect Switches.

7. Section 26 05 26 - Grounding.

8. Section 26 24 16 - Panelboards.

9. Section 26 09 25 – Lighting Controls

PART 2 -- PRODUCTS

2.1 NAMEPLATE DESIGNATIONS SHALL CLEARLY STATE

A. Manufacturer's nameplate including equipment design rating of current, voltage, KVA, HP, bus bracing rating or as applicable.

B. Equipment nameplates designating system usage and purpose, system nominal voltage, equipment rating in KVA, amperes, HP and RPM as applicable. Designation data per drawings shall be supplied with Shop Drawings approval.

C. Panelboard nameplates showing panel designation, voltage, phase and source.

2.2 MANUFACTURERS DEVICE NAMEPLATES

Device usage, purpose, or circuit number; manufacturer and electrical characteristic ratings including the following:

A. Circuit Breakers: Voltage, continuous current, maximum interrupting current and trip current.

B. Switches: Voltage, continuous current, horsepower or maximum current switching. If fused, include nameplate stating "Fuses must be replaced with current limiting type of identical characteristics".

C. Contactors: Voltage, continuous current, horsepower or interrupting current, and whether "mechanically held" or "electrically held".

D. Motors: Rated voltage, full load amperes, frequency, phases, speed, horsepower, code letter rating, time rating, type of winding, class and temperature.

E. Controllers: Voltage, current, horsepower and trip setting of motor running overcurrent protection.

F. Motor Control Centers: Horizontal and vertical bus ratings.

2.3 MATERIALS

A. For Nameplates**:** Three layer laminated plastic or Micarta with engraved black letters over white background.

B. For Emergency Equipment: Use engraved white letters over red background.

C. For Warning Signs: Minimum 18 gauge steel with red lettering on white porcelain enamel finish.

PART 3 -- EXECUTION

3.1 MOUNTING

Nameplates shall be mounted by self-tapping, threaded stainless steel screws and bolts, or by rivets. Adhesive types are not acceptable.

3.2 MINIMUM LETTER HEIGHTS ON NAMEPLATES (AS APPLICABLE)

A. Panelboards, Switchboards and Motor Control Centers and Special Systems Enclosures: 1/4 inch identifies equipment designation; 3/16 inch identifies voltage rating and source.

B. Individual Circuit Breakers, Switches, and Motor Starters in Panelboards, Switchboards, and Motor Control Centers: 1/4 inch identifies circuit and load served, including location.

C. Individual Circuit Breakers, Enclosed Switches, and Motor Starters: 1/4 inch identify load served.

D. Transformers: 1/4 inch identifies equipment designation; 3/16 inch identifies primary and secondary voltages, primary source and secondary load. Include location of primary source or secondary load if remote from transformer.

3.3 WARNING SIGNS

A. Warning signs shall be permanently mounted with stainless steel screws or nickel-plated brass bolts.

B. Warning signs to read "DANGER - HIGH VOLTAGE", with letters 1-1/2 inch high, 1/4 inch stroke minimum.

C. Provide warning sign on all doors or immediately next to door for equipment rooms or closets containing equipment energized above 150 volts to ground.

END OF SECTION

SECTION 26 05 60
ELECTRICAL SYSTEMS COMMISSIONING

PART 1 – GENERAL

1.1 DESCRIPTION

A. The purpose of this section is to specify Division 26 responsibilities in the commissioning process which are being directed by the CA. Other electrical systems testing are required under the direction of the CM.

B. The list of commissioned equipment and systems is found in Section 01810, Part 1.12.

C. Commissioning requires the participation of Division 16 to ensure that all systems are operating in a manner consistent with the Contract Documents. The general commissioning requirements and coordination are detailed in Division 01. Division 26 shall be familiar with all parts of Division 01 and the commissioning plan issued by the CA and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

1.2 RESPONSIBILITIES

1.2.1 Electrical Contractors. The commissioning responsibilities applicable to the electrical contractor are as follows (all references apply to commissioned equipment only):

1.2.1.1 Construction and Acceptance Phases

1.2.1.1.1 Include the cost of commissioning in the contract price, if not yet let.

1.2.1.1.2 In each purchase order or subcontract written, include requirements for submittal data, O&M data and training.

1.2.1.1.3 Attend a commissioning kickoff meeting and other necessary meetings scheduled by the CA to facilitate the construction process.

1.2.1.1.4 Contractors shall provide normal cut sheets and shop drawing submittals to the CA of commissioned equipment.

1.2.1.1.5 Provide additional requested documentation, prior to normal O&M manual submittals, to the CA for development of start-up and functional testing procedures.

1.2.1.1.5.1 Typically this will include detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, full details of any owner-contracted tests, fan and pump curves, full factory testing reports, if any, and full warranty information, including all responsibilities of the Owner to keep the warranty in force clearly identified. In addition, the installation

and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Commissioning Agent.

1.2.1.1.5.2 The Commissioning Agent may request further documentation necessary for the commissioning process.

1.2.1.1.5.3 This data request may be made prior to normal submittals.

1.2.1.1.6 Provide a copy of the O&M manuals submittals of commissioned equipment, through normal channels, to the CA for review and approval.

1.2.1.1.7 Contractors shall assist (along with the design engineers) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures

1.2.1.1.8 Provide assistance to the CA in preparation of the specific functional performance test procedures specified in Section 260570. Subs shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests.

1.2.1.1.9 Develop a full start-up and initial checkout plan using manufacturer's start-up procedures and the prefunctional checklists from the CA. Submit manufacturer's detailed start-up procedures and the full start-up plan and procedures and other requested equipment documentation to CA for review.

1.2.1.1.10 During the startup and initial checkout process, execute and document the electrical-related portions of the prefucntional checklists provided by the CA for all commissioned equipment.

1.2.1.1.11 Perform and clearly document all completed startup and system operational checkout procedures, providing a copy to the CA.

1.2.1.1.12 Address current A/E punch list items before functional testing.

1.2.1.1.13 Provide skilled technicians to execute starting of equipment and to execute the functional performance tests. Ensure that they are available and present during the agreed upon schedules and for sufficient duration to complete the necessary tests, adjustments and problem-solving.

1.2.1.1.14 Perform functional performance testing under the direction of the CA for specified equipment in Section 260570 and 01810. Assist the CA in interpreting the monitoring data, as necessary.

1.2.1.1.15 Correct deficiencies (differences between specified and observed performance) as interpreted by the CA, CM and A/E and retest the equipment.

1.2.1.1.16 Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built

conditions.

1.2.1.1.17 During construction, maintain as-built red-line drawings for all drawings and final CAD as-builts for contractor-generated coordination drawings. Update after completion of commissioning (excluding deferred testing). Prepare red-line as-built drawings for all drawings and final as-builts for contractor-generated coordination drawings.

1.2.1.1.18 Provide training of the Owner's operating personnel as specified.

1.2.1.1.19 Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

1.2.1.2 Warranty Period

1.2.1.2.1 Execute seasonal or deferred functional performance testing, witnessed by the CA, according to the specifications.

1.2.1.2.2 Correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

1.2.2 Electrical Designer/Engineer

1.2.2.1 Refer to Section 01810 for the responsibilities of the Electrical Designer/Engineer.

1.3 RELATED WORK

1.3.1 Refer to Section 01810 for systems to be commissioned and Section 260570 for functional testing requirements.

PART 2 -- PRODUCTS

1.4 TEST EQUIPMENT

1.4.1 Division 26 shall provide all test equipment necessary to fulfill the testing requirements of this Division (i.e. light meters).

PART 3 -- EXECUTION

3.1 SUBMITTALS

A. Division 26 shall provide submittal documentation relative to commissioning to the CA as requested by the CA. Refer to Section 01810 Part 3.3 for additional Division 26 requirements.

3.2 STARTUP

3.2.1 The electrical contractors shall follow the start-up and initial checkout procedures listed in the Responsibilities list in this section and in 01810 Part 3.4. Division 26 has start-up responsibility and is required to complete systems and sub-systems so they are fully functional, meeting the design objectives of the Contract Documents. The

commissioning procedures and functional testing do not relieve or lessen this responsibility or shift that responsibility partially to the commissioning agent or Owner.

3.2.2 Functional testing is intended to begin upon completion of a system. Functional testing may proceed prior to the completion of systems, or sub-systems at the discretion of the CA and CM. Beginning system testing before full completion does not relieve the Contractor from fully completing the system, including all prefunctional checklists as soon as possible.

3.3 FUNCTIONAL PERFORMANCE TESTS

3.3.1 Refer to Section 01810 Part 1.12 for a list of systems to be commissioned and to Part 3.5 for a description of the process and to Section 260570 for specific details on the required functional performance tests.

3.4 TESTING DOCUMENTATION, NON-CONFORMANCE AND APPROVALS

3.4.1 Refer to Section 01810 Part 3.6 for specific details on non-conformance issues relating to prefunctional checklists and tests.

3.4.2 Refer to Section 01810 Part 3.5 for issues relating to functional performance tests.

3.5 OPERATIONS AND MAINTENANCE (O&M) MANUALS

3.5.1 Division 26 shall compile and prepare documentation for all equipment and systems covered in Division 26 and deliver to the GC for inclusion in the O&M manuals, according to Section 01810.

3.5.2 The CA shall receive a copy of the O&M manuals for review.

3.6 TRAINING OF OWNER PERSONNEL

3.6.1 The GC shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed. Refer to Section 01810 for additional details.

3.6.2 The CA shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment. Refer to Section 01810 for additional details.

3.6.3 Electrical Contractor. The electrical contractor shall have the following training responsibilities:

3.6.3.1 Provide the CA with a training plan two weeks before the planned training according to the outline described in Section 01810, Part 3.8.

3.6.3.2 Provide designated Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned electrical equipment or system.

3.6.3.3 Training shall start with classroom sessions, if necessary, followed by hands on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.

3.6.3.4 During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will

be repaired or adjusted as necessary and the demonstration repeated.

3.6.3.5 The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment is required. More than one party may be required to execute the training.

3.6.3.6 The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

3.6.3.7 Training shall include:

3.6.3.7.1 Use the printed installation, operation and maintenance instruction material included in the O&M manuals.

3.6.3.7.2 Include a review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.

3.6.3.7.3 Discuss relevant health and safety issues and concerns.

3.6.3.7.4 Discuss warranties and guarantees.

3.6.3.7.5 Cover common troubleshooting problems and solutions.

3.6.3.7.6 Explain information included in the O&M manuals and the location of all plans and manuals in the facility.

3.6.3.7.7 Discuss any peculiarities of equipment installation or operation.

3.6.3.7.8 The format and training agenda in Guidelines for Commissioning HVAC Systems, ASHRAE, 1989R, 1996 is a recommended reference.

3.6.3.7.9 Classroom sessions shall include the use of overhead projections, slides, video and audio taped material as might be appropriate.

3.6.3.8 Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and maintenance of all pieces of equipment.

3.6.3.9 The electrical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.

3.6.3.9.1 Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.

3.6.3.9.2 Duration of Training. The electrical contractor shall provide training on each piece of equipment according to the following schedule.

Hours	System
4	Lighting controls, controllers, and schedules
2	Occupancy sensors and photo sensors

3.7 DEFERRED TESTING

3.7.1 Refer to Section 01810, Part 3.9 for requirements of deferred testing.

3.8 WRITTEN WORK PRODUCTS

3.8.1 Written work products of Contractors will consist of the startup and initial checkout plan described in Section 01810 and the filled out startup, initial checkout and pre-functional checklists.

END OF SECTION

SECTION 26 05 70
ELECTRICAL TESTING REQUIREMENTS

PART 1 – GENERAL

1.1 INCLUDED SYSTEMS AND EQUIPMENT

A. The following is a list of the equipment and system test requirements included in this section:

1. Lighting sweep controls (weekday, weekend, and holiday schedules).

2. Occupancy sensors.

3. Photo sensors (indoor and outdoor).

4. Lighting controllers (indoor and outdoor).

1.2 DESCRIPTION

1.2.1 This section specifies the functional testing requirements for Division 26 systems and equipment. From these requirements, the Commissioning Authority (CA) shall develop step-by-step procedures to be executed by the Subs. The general functional testing process, requirements and testing methods definitions are described in Section 01810. The test requirements for each piece of equipment or system contain the following:

1.2.1.1 The contractors responsible to execute the tests, under the direction of the CA.

1.2.1.2 A list of the integral components being tested.

1.2.1.3 Prefunctional checklists associated with the components.

1.2.1.4 Functions and modes to be tested.

1.2.1.5 Required conditions of the test for each mode.

1.2.1.6 Special procedures.

1.2.1.7 Required methods of testing.

1.2.1.8 Required monitoring.

1.2.1.9 Acceptance criteria.

1.2.1.10 Sampling strategies allowed.

1.3 PREREQUISITES

1.3.1 The following applicable generic prerequisite checklist items are required to be listed on each written functional test form and be completed prior to functional testing.

1.3.1.1 All related equipment has been started up and calibrated and start-up reports and prefunctional checklists submitted and approved ready for functional testing. Sample prefunctional checklists can be found in Section 01813. These are samples and for reference only. Final prefunctional checklists will be provided as part of the Construction Phase Commissioning Plan.

1.3.1.2 All A/E punchlist items for this equipment corrected.

1.3.1.3 These functional test procedures reviewed and approved by installing contractor.

1.3.1.4 Safeties and operating ranges reviewed by the CA.

1.3.1.5 Test requirements and sequences of operation attached.

1.3.1.6 Schedules and set points attached.

1.3.1.7 Record of all values for pre-test set points changed to accommodate testing has been made and a check box provided to verify return to original values (control parameters, limits, delays, lockouts, schedules, etc.).

PART 2 PRODUCTS

NOT USED.

PART 3 EXECUTION

1.4 LIGHTING SWEEP CONTROLS

1.4.1 Parties Responsible to Execute Functional Test

1.4.1.1 Lighting Controls contractor: operate the controls

1.4.1.2 Electrical contractor: assist in testing sequences

1.4.1.3 CA: to witness, direct and document testing.

1.4.2 Prerequisites

1.4.2.1 The applicable prerequisite checklist items listed in the beginning of Section 26570 shall be listed on each functional test form and checked off prior to functional testing.

1.4.3 Functions / Modes Required To Be Tested and Test Methods

1.4.3.1 The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable.	Verbal discussion of features
2. Power failure and battery backup and power-up restart functions.	Demonstration
3. Security and access codes.	Demonstration
4. Verify override duration setting.	Demonstration
5. Scheduling features fully functional and setup, including weekdays, weekends, and holidays.	Observation in terminal screens or printouts
SWEEP FUNCTIONS	
1. 50% of the zones with a minimum of 2 zones per controller or relay must be verified by turning on at least 25% of the lights in the zone and witnessing an actual sweep.	Either
OVERRIDE FUNCTIONS	
1. Manual occupant overrides: 25% of the local override switches, with a minimum of 4 switches must be verified by turning the override switches ON after a sweep and seeing the lights turn back on. 100% of the remainder of the switches should be sight verified to be in place.	Either

1.4.4 Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the sweep controls, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

1.4.5 Sampling Strategy for Identical Units

1. Sample the units per the above table. If 10% of the units in the first sample fail the functional performance tests, test another 10% of the group (the 2nd sample). If 10% of the units in the 2nd sample fail, test all remaining units in the whole group, fully at the contractor's expense.

1.5 OCCUPANCY SENSORS

A. Parties Responsible to Execute Functional Test

1. Electrical contractor: assist in testing sequences
2. CA: to witness, direct and document testing.

B. Prerequisites

1. All occupancy sensor calibration and set points shall be verified prior to functional testing.

2. The applicable prerequisite checklist items listed in the beginning of Section 16570 shall be listed on each functional test form and checked off prior to functional testing.

C. Functions / Modes Required To Be Tested and Test Methods

1. The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, calibrated, debugged and fully operable.	Verbal discussion of features
2. Occupant over-ride functions and duration setting.	Demonstration
OCCUPANCY SENSOR FUNCTIONS	
1. Test the sequence of operation for all features and modes.	Manual
2. Verify that the controls and sensors are not easily overridden or disabled by occupants.	Visual inspection
3. Verify that the occupancy sensor is in an adequate location and is not being affected by obstructions.	Visual inspection

D. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the dimming controls, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

E. Sampling Strategy for Identical Units

1. Each occupancy sensor and its controlled zone must be tested (no sampling).

1.6 PHOTO SENSORS

A. Parties Responsible to Execute Functional Test

1. Electrical contractor: assist in testing sequences

2. CA: to witness, direct and document testing.

B. Prerequisites

1. All photo sensor calibration and set points shall be verified prior to functional testing.

2. The applicable prerequisite checklist items listed in the beginning of Section 16570 shall be listed on each functional test form and checked off prior to functional testing.

C. Functions / Modes Required To Be Tested and Test Methods

1. The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, calibrated, debugged and fully operable (indoor and outdoor sensors).	Verbal discussion of features
PHOTO SENSOR FUNCTIONS	
1. Test the sequence of operation for all features and modes (weekday, weekend, and holiday schedules) and interlocks with time clocks, if any.	Manual
2. Verify that the controls and sensors are not easily overridden or disabled by occupants.	Visual inspection
3. Verify that the photo sensor is in an adequate location and is not being affected by obstructions.	Visual inspection
DIMMING FUNCTIONS	
1. Verify that dimming does not cause lower than specified light levels in adjacent “non-dimmed” spaces.	

D. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the dimming controls, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

E. Sampling Strategy for Identical Units

1. Each photo sensor and its controlled zone must be tested (no sampling).

END OF SECTION

SECTION 26 05 73
SHORT CIRCUIT AND COORDINATION REPORT

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall prepare a power system analysis of short circuit calculations, a protective device coordination study and arc flash hazard analysis in accordance with the requirements of these Specifications and as shown.

B. The studies shall include all portions of the electrical distribution system for normal and standby power sources down to and including the (208 V) distribution system.

C. The work to be provided by the CONTRACTOR shall include protection studies for motors supplied with solid state overload and overcurrent protection devices.

D. The work to be provided by the CONTRACTOR shall include an evaluation of harmonic distortion and the furnishing and installation of filters and any other equipment as may be required for harmonic suppression.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The Work of the following Sections applies to the work of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this work.

1. Section **262413** Switchboard

2. Section **262416** Panelboard
3.
4. Section **262813** Fuse

5. Section **262818** Disconnect Switches

6. Section **260200** General Electrical requirements

7. Section **260570** Electrical Testing Requirements

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the current provisions of the following codes and standards.

1. Codes:

LAECCity of Los Angeles Electrical Code, latest adopted edition,

2. Commercial Standards:

ANSI/IEEE 141	Recommended Practice for Electrical Power Distribution for Industrial Plants
ANSI/IEEE 242	Recommended Practice for Protection and Coordination Industrial and Commercial Power Systems.

ANSI C 37.5	Calculations of Fault Currents for Application of Power Circuit Breakers
ANSI C-37.13	Low-Voltage AC Power Circuit Breaker (600-Volt Insulation Class)
IEEE 1584	IEEE Guide for Performing Arc Flash Hazard Calculations

1.3 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with Section **26 01 00-** Basic materials and methods and as specified herein.

B. The power system analysis shall be submitted to the ENGINEER prior to receiving final approval of the distribution equipment shop drawings and/or release of equipment for manufacture; approval from the ENGINEER may be obtained for a preliminary submittal of sufficient detail to ensure that device selection will be adequate. Preliminary submittal shall indicate the computer program for use in performing the work of this Section.

C. Final settings of Protective device shall be approved by the ENGINEER prior to project acceptance and shall be based on the results of the power system analysis.

D. Arc flash calculations based upon actual overcurrent device clearance.

E. The CONTRACTOR shall indicate in the submittal, changes to the protection scheme or equipment selection that will result in improved system reliability and safety.

1.4 QUALITY ASSURANCE

A. Organization's Qualifications:

1. Short circuit studies, protective device evaluation studies, and protective device coordination studies shall be performed by the arch flash analysis manufacturer or by an electrical testing service regularly engaged in the short circuit and protective device coordination studies for a period of at least 15 years. The study shall utilize proven computer programs for power system analysis. The studies shall be signed by the professional electrical engineer, registered in the State of California, responsible for the studies.

PART 2 -- PRODUCTS

2.1 GENERAL

A. The organization of the study shall include a single-line and an impedance diagram of the power system. This diagram shall identify all components considered in the study and the ratings of all power devices (this includes, but is not limited to: transformers, circuit breakers, relays, fuses, busses, and cables). The resistance and reactances of all cables shall be identified in the impedance diagram. The study shall contain, from the service utility company, all written data regarding maximum available short circuit current, voltage, and X/R ratio of the utilities' power system.

2.2 SHORT CIRCUIT STUDY

A. The short circuit study shall be performed with the aid of a digital computer program and shall be in accordance with ANSI C 37.5, IEEE Standard 242, and IEEE Standard 141.

2.3 PROTECTIVE DEVICE EVALUATION STUDY

A. A protective device evaluation study shall be performed to determine the adequacy of circuit breakers, molded case switches, automatic transfer switches, and fuses. Any problem areas or inadequacies in the equipment due to prospective short-circuit currents shall be promptly brought to the ENGINEER's attention.

2.4 PROTECTIVE DEVICE COORDINATION STUDY

A. A protective device coordination study shall be performed to provide the necessary calculations required to select or check the selection of power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated current transformers, and low-voltage breaker trip characteristics and settings. The results of the study shall govern the final selection of the protective devices.

2.5 TIME/CURRENT COORDINATION CURVES

A. As a minimum, the time/current coordination curves for the power distribution system shall include the following on 5-cycle log-log graph paper:

1. Time/current curves for each protective relay or fuse showing graphically that the settings will provide protection and selectivity within industry standards. Each curve shall be identified, and tap and time dial settings shall be specified.

2. Time/current curves for each device shall be positioned to provide the maximum selectivity to minimize system disturbances during fault clearing.

3. Time/current curves and points for cable and equipment damage.

4. Circuit interrupting device operating and interrupting times.

5. Indicate maximum fault values on the graph.

6. Sketch of bus and breaker arrangement.

7. Magnetizing inrush points of transformers.

8. All restrictions of the ANSI and LAEC shall be adhered to and proper coordination intervals and separation of characteristics curves shall be maintained.

9. Thermal limits of motors 250 hp and above.

2.6 ARC FLASH HAZARD ANALYSIS

A. CONTRACTOR shall perform arc flash hazard analysis according to IEEE 1584 equations presented in NFPA 70E-2020, Annex D. Safe working distance boundary shall consider incident energy of 1.2 cal/cm^2.

PART 3 -- EXECUTION

3.1 PROTECTIVE DEVICE TESTING, CALIBRATION AND ADJUSTMENT

A. The CONTRACTOR shall provide the services of a qualified field engineer and necessary tools and equipment to test, calibrate, and adjust the protective relays and circuit breaker trip devices as

recommended in the power system analysis. The qualifications of the field engineer shall be subject to review and approval by the ENGINEER.

3.2 STUDY REPORTS

A. The results of the power system analysis shall be submitted summarized in a final report. The report shall include, but not limited to the following:

1. Single-line diagram
2. Impedance diagram
3. Tabulation of all protective devices, which shall be identified on the single-line diagram
4. Time/current coordination curves
5. Computerized fault current calculations
6. Specific recommendations, if any
7. Test instrumentation, condition and connections, as applicable, for each study
8. Arc flash report.

3.3 ARC FLASH LABELS

A. CONTRACTOR for the arc flash hazard analysis shall provide 3.5” by 5” thermal transfer type label of high adhesive polyester for each location analyzed. Labels shall be machine printed.

B. All labels shall be based on recommended overcurrent device settings and will be provided after the result of analysis have been presented to the ENGINEER and accepted as final.

C. Labels shall include the following information:

1. Location Designation
2. Nominal Voltage
3. Flash Protection Boundaries
4. Hazard Risk Category
5. Incident Energy
6. Working Distance

END OF SECTION

SECTION 26 24 14
PANELBOARDS

PART 1 -- GENERAL

1.1 SCOPE

A. Required: Provide and install complete equipment including circuit breakers and panelboards as indicated on the Contract Drawings and herein specified.

B. Comply with the General Conditions, General Requirements and the requirements of Section 26 02 00 of this Division 26 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1. Section 26 05 60 " Municipal Facilities Electrical Commissioning Requirements " for commissioning requirements.

2. Section 16570 " Municipal Facilities Electrical Testing Requirements" for testing requirements.

1.3 QUALITY ASSURANCE

A. Comply with applicable provisions of Subsection 1.2 of Section 260200.

B. Conform to the applicable provisions of Subsection 1.6 of Section 260200 related to legal requirements and standards including NEMA, ANSI and IEEE Standards, NFPA 70, and Federal Specifications.

1. 4 SUBMITTALS

A. Submit under the provisions of Section 01330.

B. Product Data: For each type of panelboard, overcurrent protective device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

C. Maintenance Data: For panelboards and components to include in maintenance manuals specified in Division 1. In addition to requirements specified in Section 01770, "Closeout Procedures," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

2. Time-current curves, including selectable ranges for each type of overcurrent protective device.

PART 2 -- PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Cabinets to House Panelboards: Cabinets shall be formed of galvanized metal, chemically cleaned, and all breaks in galvanizing shall be painted with metallic aluminum paint.

Minimum size: 20 inches wide by 5-3/4 inches deep. Trims and doors shall be chemically cleaned. Provide ANSI synthetic alkalyd factory enamel finish on the exterior and interior of panels. Provide for circuit directory behind door with glass or heavy plastic protection. Cabinets shall be flush or surface mounted type as indicated with screw cover, hinged doors with flush lock keyed to operate from one key. Cabinets greater than three feet shall have three trim bolts on each side.

B. Identification: Each panelboard shall have an exterior engraved laminated plastic nameplate identifying the panelboard as designated on the Drawings and indicating voltage, phases, and number of system conductors. For example:

"Panel A 277/480V. 3ph, 4W". Lettering shall be white on black finish and 3/16 inch high minimum. Nameplates shall be affixed with a minimum of two escutcheon pins or screws. Each circuit breaker shall have a permanent metal or plastic number to identify each circuit. A circuit schedule card and holder shall be mounted on the inside of the door and covered with plastic.

C. Protective Devices:

1. Protective devices, main, branch or sub-feed shall be thermal-magnetic-molded-case circuit breakers, bolt-on type ampacities as scheduled on Drawings. Provide single handle, common trip for two and three-pole units. Handle ties are not acceptable

2. Circuit Breakers, 250A and Larger: Adjustable magnetic trip setting

3. Electronic Circuit Breakers, 400A and Larger: RMS sensing; field-replaceable rating plug; with the following field-adjustable settings:

   a. Instantaneous trip.

   b. Long- and short-time pickup levels.

   c. Long- and short-time time adjustments.

   d. Ground-fault pickup level, time delay, and I^2t response. Where indicated on the drawings.

4. GFCI Circuit Breakers: Single- and two-pole configurations with 5-mA trip sensitivity, where indicated on the lighting and appliance panelboards.

5. Molded-case circuit breakers shall be suitable for application; Rype SWD for switching fluorescent lighting loads; Type HACR for heating, air-conditioning, and refrigerating equipment.

D. Electrical Equipment Adjacent to Panelboards: Where scheduled provide a separate cabinet with screw cover and hinged door with flush lock keyed alike with panelboard. A single cabinet may be used when a compartment (with appropriate barriers) under separate lockable door and cover is provided.

E. Finish: As specified for service switchboards in Section 260270 service and distribution switchboards.

2.2 ACCEPTABLE MANUFACTURE

A. Eaton

B. General electric

C. Square D

D. Siemens

2.3 DISTRIBUTION PANELBOARDS

A. Each distribution panelboard shall be a deadfront, deadrear, U.L. listed, circuit breaker type with copper buses and comply with Federal Specification W-P-115a. Construction shall be NEMA Class I. Electrical ratings shall be as indicated on the Drawings.

B. Series-connected or "integrated equipment" short circuit ratings shall not be applied in lieu of, or to comply with, short circuit and interrupting capacity ratings indicated on the Drawings unless specifically approved by the City Engineer. Provide fronts with flush cylinder tumbler locks, trim clamps, and concealed hinges.

C. Double doors or doors over 48 inches high shall have 3 point latching. Provide 2 keys for each panelboard. Furnish panelboards with main lugs or main circuit breakers and all other circuit breakers as indicated on the drawings. Each circuit breaker shall be provided with a means for individual padlocking. Distribution panelboards shall be Square D. Co. I-line type or equal.

2.4 LIGHTING AND APPLIANCE PANELBOARDS

A. Each lighting and appliance panelboard shall be a U.L. listed circuit breaker type with copper buses and meet Federal Spec. W-P115a. Electrical ratings shall be as indicated on the Drawings. Series connected or "integrated equipment" ratings shall not be applied in lieu of or to comply with short circuit and interrupting ratings indicated on the Drawings, unless specifically approved by the City Engineer. Provide fronts with flush cylinder tumbler locks, trim clamps, and concealed hinges. Provide two keys for each panelboard. Furnish panelboards with main lugs or main circuit breakers and all circuit breakers as indicated on the Drawings.

B. **Each circuit breaker shall be provided with a means for individual padlocking.**

2.5 FABRICATION AND FEATURES

A. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.

B. Directory Card: With transparent protective cover, mounted inside metal frame, inside panelboard door.

C. Bus: Hard-drawn copper, 98 percent conductivity.

D. Main and Neutral Lugs: Mechanical type suitable for use with conductor material.

E. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment ground conductors; bonded to box.

F. Future Devices: Mounting brackets, bus connections, and necessary appurtenances required for future installation of devices.

G. Isolated Equipment Ground Bus: Adequate for branch-circuit equipment ground conductors; insulated from box, where indicated on the Drawings.

H. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads, where indicated on the Drawings.

I. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor. Provide back, sides and removable front.

J. Feed-through Lugs: Mechanical type suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device, where indicated on the Drawings.

PART 3 -- EXECUTION

3.1 GENERAL INSTALLATION OF PANELBOARDS

A. Install equipment square, level and secure to the building structure by bolting.

B. Align top of adjacent panelboards unless specifically noted otherwise. Install panelboards over 29 inches high to mount highest protective device handle a maximum of 6'-6" or 5'-6" for panelboards up to 29 inches high, except where adjacent to taller panelboards.

C. Flush enclosures shall be installed with the front edge flush with combustible finish surfaces and not more than 1/4 inch behind noncombustible finish surfaces, and shall be secured to framing or blocking except where embedded in masonry or concrete.

D. Provide weather-proof gaskets on trims and doors of panelboards located in mechanical areas.

3.2 OTHER APPLICABLE REQUIREMENTS

A. Provide a typewritten circuit directory for each branch circuit. Obtain City facility room numbers and use in final directory.

B. Provide a schematic diagram and sequence of operation for control devices installed under separate door adjacent to panelboards.

C. Install nameplates in accordance with provisions noted in Section 26 05 53 – Electrical Identification.

D. Provide filler plates for all unused spaces.

E. Stub five 3/4-inch empty conduits from each flush mounted panelboard into accessible ceiling space and cap for future use. Stub four 1-inch empty conduits into raised floor space or below slab not on grade

F. Wiring in Panelboard Gutters: Arrange conductors into groups and bundle and wrap with wire ties after completing load balancing.

G. Equip each circuit breaker fire alarm, security and control circuits with a locking device.

3.3 COMMISSIONING

A. Spot check breaker settings against Short Circuit Study

B. Spot check phase balance after system is under load. Ensure proper, thorough and accurate identification of load. Trip breakers and validate load identified. Test GFI breakers.

C. Receptacle Polarity Test: Spot check receptacles installed or reconnected under this contract with a receptacle circuit tester. Tester shall test for open ground, reverse polarity, open hot, open neutral, hot and ground reversed, hot or neutral and hot open.

D. Check circuit labeling by de-energizing circuits while circuit tester is in the receptacle. Labeling shall be checked on the load/receptacle and at the breaker

3.4 CLEANING

A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

END OF SECTION

SECTION 26 27 26

WIRING DEVICES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Addenda, Alternates, Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specifications collectively apply to work of this Section.

1.02 DESCRIPTION

A. Work includes but is not limited to the following:

1. Controls
2. Receptacles.
3. Device plates and box covers.

B. Related Work:

1. Section 26 01 00 - Basic Materials and Methods.
2. Section 26 05 34 - Boxes.
3. Section 26 05 53 - Identification for Electrical Systems.
4. Section 26 05 26 - Grounding.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS – WALL SWITCHES

A. Hubbell Company.

B. Legrand.

C. Leviton.

2.02 WALL SWITCHES

A. Switches shall be self-grounding, color coded, silent or quiet type, and rated 120-277 Volts AC, 20 ampere rating, totally enclosed, where installed in AC systems Bakelite or composition base with "T" rating for AC loads, standard toggle handle, side wired only and binding screw terminals with screwdriver slot

B. Provide screw type; push-in type connections not acceptable.

C. All switches shall be specification grade and meet Federal Spec. W-S-896E.

2.03 ACCEPTABLE MANUFACTURERS - RECEPTACLES

A. Hubbell Company.

B. Legrand.

C. Leviton.

2.04 RECEPTACLES

A. Convenience and Straight-blade Receptacles: NEMA Configuration 5-15R: Decorator Spec Grade, White.

B. Convenience and Straight-Blade Receptacles: NEMA configuration 5-20R: Decorator Spec Grade, White.

C. GFI Receptacles: Duplex convenience receptacle with integral ground fault current interrupter, NEMA 5-20R, Decorator Spec Grade, White. Unit shall comply with UL 2003 GFCI requirements including lockout action.

D. Receptacles: Highest specification grade.

E. All receptacles shall be specification grade and meet Federal Spec. WC 596 E.

F. Provide screw terminal type receptacles. Push-in type connections are not acceptable

G. Special outlets of other types shall be as indicated on the Contract Drawings. .

2.05 ACCEPTABLE MANUFACTURERS - WALL PLATES (Match manufacturer of Device)

A. Harvey Hubbell Company.

B. Pass and Seymour.

C. Leviton.

D. TayMac.

E. Match manufacturer of switches and receptacles.

2.06 WALL PLATES

A. Weatherproof Cover Plates: Receptacles in wet locations shall be installed with an outlet enclosure clearly marked “Suitable for Wet Locations While In Use”. There must be a gasket between the enclosure and the mounting surface, and between the cover and base to assure a proper seal. The enclosure must employ stainless steel mounting hardware and enclosure shall be recessed where possible and by TayMac Corporation or equal.

B. Highest specification grade

2.07 CONTROLS

A. Required: For all equipment furnished in this and other divisions, as required by Code, and as indicated on the Contract Drawings and in the specifications. All devices shall be listed by U.L. or another approved testing laboratory.

B. Types:

1. Circuit Breakers: Thermal-magnetic with interrupting and trip ratings as indicated on the drawings. Equip each breaker with a device for individual padlocking. Circuit breakers shall meet Federal Specifications W-C-375B.

2. Enclosed Safety Switches: Shall be externally operable, heavy duty "tease-proof", fusible and nonfusible with number of poles and ratings as indicated on the Contract Drawings.Provide suitable rejection type fuse holders for Class R fuses. Switches shall me Federal Spec. W-S-865C. Switches shall be as manufactured by Square D Co. or equal.

3. Fuses: All fuses shall meet U.L. Standard 198. Provide a label within each fuse enclosure indicating fuse replacement type and ratings. Provide one complete set of each type and rating of fuses and limiters, as spares. Fuses shall be one of the following types:

a. Current-limiting Class L; Bussman KRP-C or KTU.

b. Current-limiting Class J; Bussman JKS or JHC.

c. Dual element Class RK-1; Bussman KTS-R or KTN-R.

d. Dual element Class RK-5; Bussman FRS-R or FRN-R.

e. Low Peak dual element Class RK-5; Bussman LPS-R or LPN-R.

f. For secondary protection of control transformers rated 500 V.A. and 50 volts, or less; Bussman FNQ fuses with HPS-D or HPL-B fuse holder or equal.

g. Fuses for direct-current circuits shall be identified for the use.

h. Other required fuses, if not specified, shall be standard nonrenewable type Bussman FRN or FRS for circuits where available fault current is 10,000 amperes or less.

4. Terminal connection blocks shall be provided in switch and circuit breaker enclosures in which grounded (neutral) conductors are installed.

5. Identification: Identify all control and disconnecting devices by engraved laminated plastic nameplates designating the equipment controlled, except where device plates are engraved.

a. Motors and other equipment shall be suitably and durably identified to correspond to the control or disconnecting device. Nameplate lettering shall be white on black finish and 1/8 inch high minimum.

b. Marking shall be as indicated on the drawings or as approved by the City Engineer. Nameplates shall be affixed with a minimum of two escutcheon pins

or screws.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install wall switches 48 inches above floor to top of wall box, “OFF” position down. Verify mounting height with Architect prior to installation. unless otherwise noted on contract drawings

B. Install convenience receptacles 18 inches above floor, or as noted on drawings, grounding pole on bottom.

C. Install specific-use receptacles at heights shown on Contract Drawings.

D. Install galvanized steel plates on outlet boxes and junction boxes in unfinished areas, above accessible ceilings, and on surface-mounted outlets in non-public places.

E. Install devices and wall plates flush and level.

F. Provide etched plates with 3/16” high black letters for:

1. Outlets where voltage is other than 120 volt.

2. When switch controls device other than lighting fixture.

3. When switch is located out of sight of unit being controlled.

4. Lock switches.

5. Where more than one switch occurs under a common plate.

6. Air Distribution System control switches.

G. Install plates with all four edges in continuous contact with finished wall surfaces without use of mats or similar devices.

H. Provide blank cover plates for all boxes as required.

END OF SECTION

SECTION 26 28 16
SWITCHES, DISCONNECT AND SAFETY

PART 1 -- GENERAL

1.1 SCOPE

A. Work Included: Not limited to the following:

1. Fabricate, provide and install disconnect and safety type switches where indicated on the Contract Drawing and hereinafter specified.

2. Comply with General Conditions, the General Requirements and the requirements of Section 260200 of this Division 26 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to the work of this Section.

3. Examine all other Sections for work related to those Sections which are required to be included as work under this Section.

1.2 QUALITY ASSURANCE

A. Conform to applicable provisions of Subsection 1.7 of Section 260200 – General Electrical Requirements.

B. Conform to applicable Codes and NEMA, ANSI, UL and IEEE Standards, Federal Specification W-S-865,

1.3 SUBMITTALS

Conform to applicable provisions of Section 01330 of Division 1 - General Requirements and Subsection 1.6 G of Section 260200.

PART 2 -- PRODUCTS

2.1 GENERAL

A. APPROVED MANUFACTURERS:

1. Appleton;

2. Eaton;

3. Schneider Electric;

4. Or equal.

B. Disconnect Switches: Provide with devices enabling the switch to be locked in the open or closed positions.

C. Manual Motor Switches: Tumbler type rated 3HP, 208 Volts three phase or single phase with or without overload heaters as required to protect equipment served.

D. Externally Operable Safety Switches: To have quick-make, quick-break mechanism, capable of

switching 10 times switch rating, with cover interlock to prevent opening with switch in ON position and defeat mechanism for maintenance.

E. Switches: Shall be Heavy Duty (HD) type unless otherwise indicated. Provide NEMA 1 enclosures for interior locations, NEMA 3R enclosures for exterior or wet locations, NEMA 4X 316 SS for corrosive locations and NEMA 7 for hazardous locations. Provide with number of poles, ampacity, voltage and HP rating, fusible or nonfusible as indicated.

F. Fusible Switches: Shall be Heavy Duty (HD) type. Equip them with rejection clips for UL Class R fuses. Switches having a dual rating when used with dual element fuses shall have a rating so indicated.

G. 600 Amperes or Less Fuses: UL Class RKI with a minimum interrupting rating of 200,000 Amperes, Bussmann "Low-Peak Type" or equal.

PART 3 -- EXECUTION

3.1 GENERAL INSTALLATION

A. Locations: Install switches, disconnects and safety where indicated on the Contract Drawings.

B. Fastenings: Securely fasten switches to structural members or unistrut support as directed by the manufacturer.

C. Manual Motor Starters: Install flush mounted for switching motors 3HP and smaller in finished areas. Install surface mounted in equipment rooms and non-finished areas. Where installed above inaccessible ceilings provide access panels.

END OF SECTION

SECTION 26 33 23
EMERGENCY INVERTER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes single-phase, on-line, Central Lighting Inverter system.

1.3 SUBMITTALS

A. Submit under the provisions of Section 01330.

B. Product Data: Include data on features, components, ratings, and performance for each product specified in this Section.

C. Shop Drawings: Detail fabrication, internal and interconnecting wiring, and installation of emergency lighting inverter system. Include dimensioned plan, elevation views, and details of control panels. Show access and clearance requirements. Differentiate between field-installed and factory-installed wiring and components.

D. Product Certificates: Signed by manufacturers of central lighting inverter systems certifying that the products furnished comply with requirements.

E. Qualification Data: For firms and persons specified in the "Quality Assurance" Article.

F. Factory Test Reports: Comply with specified requirements.

G. Field Test Reports: For tests specified in Part 3.

H. Maintenance Data: For system and products to include in the maintenance manuals specified in Division 1. Include the following:

1. Lists of spare parts and replacement components recommended to be stored at the Project site for ready access.

2. Detailed operating instructions covering operation under both normal and abnormal conditions.

I. Warranties: Special warranties specified in this Section.

1.4 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent testing agency with the experience and capability to conduct the testing indicated without delaying the Work, as documented according

to OSHA criteria for accreditation of testing laboratories, Title 29, Part 1907; or a full member company of the International Electrical Testing Association.

1. Testing Agency's Field Supervisor: Person currently certified by the Inter-National Electrical Testing Association or the National Institute for Certification in Engineering Technologies, to supervise on-site testing specified in Part 3.

B. Comply with NFPA 70.

C. Source Limitations: Obtain central lighting inverter system, including components, from a single manufacturer with responsibility for entire system.

D. Listing and Labeling: Provide central lighting inverter system specified in this Section that are listed and labeled as a factory-assembled unit.

1. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.

2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

E. Comply with UL 1778 and UL 924.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver equipment in fully enclosed vehicles after specified environmental conditions have been permanently established in spaces where equipment is to be placed.

B. Store equipment in spaces with environments that are controlled within manufacturer's ambient temperature and humidity tolerances for non-operating equipment.

1.6 WARRANTY

A. General Warranty: The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Myers

2. Or approved equal.

2.2 MANUFACTURED UNITS

A. Description: Factory fabricated in one cabinet. Automatic system operating functions include the following:

1. Normal Conditions: Supply the lighting load with power conditioned and regulated by the inverter's solid state electronics. The solid state electronics regulates inverter's output voltage to within specified limits. The rectifier maintains the batteries in a fully charged state.

2. Emergency Conditions: Upon loss of input power or when power exceeds the specified input limits, the control logic shall transfer to battery operation and disconnect the input line. The transfer to battery shall be an uninterrupted or "no break" power transfer. The inverter shall supply power from the batteries and through the solid state electronics to the lighting loads. The output shall be sinusoidal and within specified limits. If power is not restored before the batteries become discharged, the inverter shall completely shut down, protecting the batteries from possible damage.

3. Recharge: Upon restoration of input power and before the batteries are completely discharged, the inverter shall automatically return to normal operation. This retransfer to normal operation shall be uninterrupted. The battery charger shall automatically recharge the batteries to full capacity. The battery charger shall recharge the batteries as set forth in UL 924.

B. Load Description: Supply power without noise, vibration, pulsation of load, or abnormal output or visual appearance for the following loads types, in any combination and at any percentage of unit capacity.

1. LED fixtures

2. Exit signs

2.3 SYSTEM SERVICE CONDITIONS

A. Environmental Conditions: Operate continuously in the following environmental conditions without mechanical or electrical damage or degradation of operating capability:

1. Ambient Temperature: 0 to 40 deg C.

2. Relative Humidity: 0 to 95 percent, non-condensing.

4. Altitude: Sea level to 6000 feet (1829 m).

2.4 SYSTEM CHARACTERISTICS

A. Minimum Duration of Supply: 90 minutes, if rated full load is being supplied solely from the battery.

B. System Performance When Supplied from Battery: Performance under steady-state and transient-load conditions remains within specified tolerances throughout minimum duration of supply from battery specified.

C. Input Voltage and Frequency Tolerance: System steady-state and transient output performance remains within specified tolerances when steady-state ac input voltage varies plus or minus 10 percent from nominal voltage; when steady-state input frequency varies plus or minus 5 percent from nominal voltage; and when the THD of input voltage is 15 percent, and the largest single harmonic component is a minimum of 5 percent of the fundamental value.

2.5 PERFORMANCE EFFICIENCIES

A. Minimum overall system efficiency, when operated within indicated nominal input- and output-voltage and frequency limits, shall be more than 90%

B. Maximum Acoustical Noise: 58 dB, "A" weighting, emanating from the system under any condition of normal operation, measured 1 meter from the nearest surface of the enclosure.

C. Maximum Output-Voltage Regulation for No Load to Full Load: Plus or minus 4 percent of the full range of battery voltage.

D. Output Frequency: 60 Hz, plus or minus 0.5 Hz when on Inverter.

E. Maximum Harmonic Distortion of Output-Voltage Waveform: 10 percent THD with Linear Load.

2.6 SYSTEM COMPONENTS, GENERAL

A. Solid State Electronics: The Solid State Electronics shall provide regulation and conditioning from incoming power aberrations. Power to the critical lighting load shall be supplied by the Solid State Electronics whether the Inverter is in normal mode or emergency mode. The output wave shape shall be sinusoidal for all modes of operation.

B. Battery Subsystem: Sealed, maintenance-free batteries shall be provided. The batteries shall have an expected life of ten (10) years. The batteries shall be fully wired and contained within a freestanding battery cabinet. Battery run time at 100% full load shall be no less than ninety (90) minutes.

C. Inverter: The Inverter shall convert DC power supplied from the batteries into AC power.

D. Charger: A battery charger shall be provided. The battery charger shall maintain the batteries at full charge. The battery charger shall be sized such that it recharges the batteries as set forth in UL 924.

E. Power Connections: The Inverter input and output shall be hardwired. A main output circuit breaker shall be provided. This circuit breaker provides overcurrent protection and a means to easily disconnect power from the lighting system.

F. Monitoring Subsystem: The Inverter shall be furnished with a system status indicator panel.This panel shall have the following enunciators:

1. Green LED for AC Line Present

2. Green LED Battery Charger Charging in 20% increments

3. Green LED for Inverter Output Status

4. Amber LED for Inverter on Battery Operation

5 Red LED Low Battery Condition in 20% increments

6 Red LED for Alarm

2.7 SOURCE QUALITY CONTROL

A. Factory test complete CBI, including battery, before shipment. Include the following tests:

1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.

2. Full-load test.

3. Transient-load response test.

4. Overload test.

5. Power failure test.

6. Efficiency test at 50, 75, and 100 percent loads.

B. Report test results. Include the following data:

1. Description of input source and output loads to be used. Describe actions required to simulate source load variation and various operating conditions and malfunctions.

2. List of indications, parameter values, and system responses considered satisfactory for each test action. Include tabulation of actual observations during test.

3. List of instruments and equipment required to duplicate factory tests in the field for those tests required to be repeated there.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Maintain minimum workspace at equipment according to manufacturer's written instructions and NFPA 70.

B. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer's wiring diagrams, unless otherwise indicated.

C. The system shall carry a full 2-year manufacturer’s warranty. This warranty shall be included with the inverter submittal information.

3.2 IDENTIFICATION

A. Identify components according to Division 26 Section "Electrical Identification."

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Supervision of unit installation, connections, pretests, and adjustments by a factory-authorized service representative. Report results in writing.

B. Supervised Adjusting and Pre-testing: Under supervision of a factory-authorized service representative, pretest system functions, operations, and protective features. Adjust to ensure

operation complies with specifications. Load the system using a variable-load bank simulating kVA, kW, and power factor of loads for which unit is rated.

C. Tests: Perform tests listed below by an independent testing agency meeting the qualifications specified in the "Quality Assurance" Article. Perform tests according to the manufacturer's written instructions. Load the system using a variable-load bank to simulate kVA, kW, and power factor of loads for the unit's rating. Use instruments calibrated, within the previous 6 months, according to NIST standards.

1. Simulate malfunctions to verify protective device operation.

2. Test duration of supply on emergency, low-battery voltage shutdown, and transfers and restoration due to normal source failure.

3. Test harmonic content of input and output current less than 25, 50, and 100 percent of rated loads.

4. Test output voltage under specified transient-load conditions.

5. Test efficiency at 50, 75, and 100 percent rated loads.

6. Test alarm panel functions.

E. Retest: Correct deficiencies and retest until specified requirements are met.

3.4 CLEANING

A. On completion of installation, inspect system components. Remove paint splatters and other spots, dirt, and debris. Repair scratches and mars of finish to match original finish. Clean components internally using methods and materials recommended by manufacturer.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel as specified below:

1. Train Owner's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, and preventive maintenance.

2. Review data in the operation and maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."

3. Schedule training with Owner, through Architect, with at least 7 days' advance notice.

END OF SECTION

SECTION 26 51 00
LIGHTING FIXTURES

PART 1 -- GENERAL

1.1 SCOPE

A. Furnish and install lighting fixtures, lamps and ballasts as indicated on the Contract Drawings and specified hereinafter.

B. Comply with the General Conditions, General Requirements and the requirements of Section 16020 of this Division 16 concerning definitions, guarantees, submittals, as-builts, etc. as applicable to work of this Section.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1. Section 260560 " Electrical Commissioning Requirements " for commissioning requirements.

2. Section 260570 " Electrical Testing Requirements" for testing requirements.

1.3 SUBMITTALS

A. Conform to applicable provisions of Section 01330 of the General Requirements and of Subsection 1.6 of Section 260200.

B. Conform to the following as applicable:

1. Ballast catalog indicating lamp wattage, input watts, sound rating, power factor and type of ballast, as well as levels of total harmonic distortion.

2. Photocell data indicating switching capacity, means of adjusting the lighting pickup level and enclosure.

3. Regarding pole-mounted fixtures provide complete data on the pole material, finish, handpole anchoring and fixture attachment and support method for interior fixtures weighing over fifty pounds.

4. Substitutions for specified fixtures, etc. shall be based upon quality of specified fixture construction, light distribution, appearance and maintenance.

5. Provide pictures or cuts of all lighting fixtures with photometric data and isofootcandle curves.

1. 4 QUALITY ASSURANCE

A. Conform to applicable provisions of Subsection 1. 7 in Section 260200.

B. Work of this Section shall comply with applicable legal requirements and standards specified in Subsection 1.6 in Section 260200 and the following:

1. Standards of the Certified Ballast Manufacturer's Association.

2. NFPA 70

C. Demonstrations:

1. Exterior lighting system operation shall be demonstrated during the hours of darkness to indicate that fixtures are properly focussed, photocell operation is correct, and that fixture switching functions as intended. Similar requirements shall apply to interior lighting. Through demonstration, the CONTRACTOR shall also verify that panel schedules properly indicate the lighting outlets connected to each circuit.

2. Lighting demonstration shall occur within 2 weeks prior to project acceptance.

1.5 CLEANING PROCEDURES

A. Comply with applicable provisions of Section 01740 of the General Requirements.

B. Clean fixture lenses, diffusers and reflectors just prior to time specified for required demonstrations noted above in 1.3C.

C. Clean damaged finish of fixture trim, including poles and support brackets, prior to required refinishing.

D. Before installation of louvers, diffusers or lenses clean reflector surfaces and lamps of all lighting fixtures of accumulated dust, dirt, grease, plaster, paint, etc.

1. 6 WARRANTY

A. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provision of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Special Warranties for LED drivers: Written warranty, executed by manufacturer agreeing to replace LED drivers that fail in materials or workmanship within specified warranty period.

1. Special Warranty Period for LED drivers: Five years from date of manufacture, but not less than four years from date of Substantial Completion.

PART 2 -- PRODUCTS

2.1 LIGHTING SYSTEMS GENERAL REQUIREMENTS

A. Lighting fixtures shall have all parts and fittings necessary for complete and proper installation.

B. Where both catalog numbers and narrative descriptions are indicated, the narrative description requirements shall take precedence and prevail.

C. All fixtures of one type shall be one manufacturer and of identical finish and appearance.

D. Fixture types shall be as indicated on the Contract Drawings. However, if the fixture type is not shown, the bid shall be based on installing fixtures specified in similar areas.

F. Recessed fixtures in suspended ceilings shall be free of light leaks below ceiling and shall have adequate ventilation and clearance.

G. Fixtures in exterior locations, wash-down areas, wet or moist locations shall bear a UL label for installation in wet or moist areas or locations.

H. All exposed metal parts of exterior lighting fixtures shall be stainless steel or anodized aluminum with specified finish over. Screws and fastening shall be stainless steel.

I. Complete units and all electrical components for LED fixtures shall bear the Underwriters' Laboratories, Inc. or IBEW and Electrical Testing Laboratory labels.

2. 2 LED FIXTURES

A. See Lighting Fixture Schedule on contract drawings.

2. 3 EXIT SIGNS

A. General Requirements: Comply with UL 924 and the following:

1. Sign Colors and Lettering Size: See Lighting Fixture Schedule on contract drawings.

2.4 LIGHTING CONTROLS

A. General: Lighting control system shall be per contract drawings

2.5 FOUNDATIONS

Install required number and type of reinforced concrete pole bases as indicated on the Contract Drawings.

PART 3 -- EXECUTION

3. 1 INSTALLATION OF LIGHTING FIXTURES (LUMINARIES)

A. General:

1. Install fixtures in a manner recommended by the fixture manufacturer and accepted by the City Engineer.

2. Furnish and install all additional ceiling bracing, hanger supports, and other structural reinforcements to the building and to concrete pole bases required to properly and safely mount luminaires, all acceptable to the City Engineer.

3. Be responsible for handling the luminaires, installing plumb and level, and keeping luminaires clean.

4. Where luminaires are wall mounted and a mounting height is indicated in the Luminaire Schedule or on the Contract Drawings, the height is from the bottom of the luminaire to finished floor or finished grade, whichever is applicable, unless otherwise noted on contract drawing

5. Where luminaires are pendant-mounted and a mounting height is indicated in the Luminaire Schedule or on the Contract Drawings, the height is from the bottom of the luminaire to finished floor, unless otherwise noted on contract drawing

6. Provide each luminaire outlet box with a galvanized luminaire stud to fit the luminaire selected.

7 Provide pendant-mounted luminaires with swivel type hangers and canopies as approved by the city ENGINEER. Finish hangers and canopies to match luminaires, unless otherwise noted.

8 After construction is completed, remove all labels and other markings, wash dirty luminaires inside and out with a nonabrasive mild soap or cleaner. Clean luminaire plastic lenses with antistatic cleaners only. Touch up all painted surfaces of luminaires with high-grade exterior enamel, and poles with paint supplied by manufacturer.

B. Finished Areas:

1. Locate luminaires where shown on the Architectural Reflected Ceiling Plans and Site Plan

2. Install all luminaires straight and true with reference to adjacent walls and where mounted on tiled ceilings; locate luminaires symmetrically with the tile pattern as shown on the Drawings. In all cases, locate centerlines of luminaires either on centerline of tile or on joint between adjacent tile runs, as best suits luminaire spacing shown.

3. Provide surface-mounted luminaires, not accepted for installation on combustible low-density cellulose fiberboard, with accepted spacers to mount luminaires 1-1/2-inches from the ceiling surface.

4. Provide flush and recessed luminaires installed in ceilings with junction boxes located at least 1-foot from luminaires. Provide wiring from junction box to luminaire of temperature rating as required by the luminaire in not less than 4-feet, but no more than 6-feet of flexible steel conduit. In concealed locations, install junction boxes to be accessible by removing luminaire.

5. Install all recessed luminaires tight with the finished surface so that no spill light will show between the ceilings and the sealing rings, and furnish plaster frames when required by ceiling construction.

6. All fixtures installed in gypsum board ceilings or plaster soffits shall be provided with metal frames. Fixtures in concrete shall be steel housing with bitumastic paint finish. Fixtures shall be compatible with type of ceiling.

7. Exterior fixtures requiring exposed exterior boxes shall be mounted on approved cast boxes equipped with suitable gaskets.

8. Support recessed LED fixtures to building structure independently of ceiling system with steel wires 12 AWG at each corner suspended of each fixture. Wires to have 1/4 inch slack.

9. All adjustable lighting fixtures shall be aimed (during non-daylight hours) and set to the satisfaction of, and in the presence of, the City Engineer.

C. Unfinished Areas:

1. Install all luminaires straight and true with reference to adjacent walls and structural members. Locate luminaires symmetrically in the pattern shown on the Contract Drawings.

2. Coordinate luminaire locations with other utility systems (e.g., Plumbing, HVAC). Relocate luminaires to avoid conflict with these other systems and to avoid blockage of luminaire light output per city engineer's direction.

3. 2 STEMS

A. Required:

1. Stem hung fixtures shall be provided with ball swivels located at the canopies and rockers (at the fixtures) allowing minimum 45 degree swing from the vertical. Stems shall be of 3/8" ID minimum pipe and shall be finished to match the lighting fixture.

3.3 INSTALLATION OF LAMPS

A. After installation clean all lamps.

3. 4 MISCELLANEOUS (AS APPLICABLE)

A. Provide all metal shims, spacers and/or mounting bolts or devices, where necessary, in order to permit surface mounted fixtures to be pulled tight to ceiling supports or backing without causing ceiling tiles to be raised out of place.

B. Louvers, diffusers or lenses shall not be installed in lighting fixtures until such time as all glazing has been completed and all construction work involving plastering, grinding, sanding, painting, etc., and final clean-up sweeping and dusting have been completed by the Contractor as noted in Subsection 1. 4 of this Section.

C. Reflector surfaces and lamps in all lighting fixtures shall be thoroughly cleaned of accumulated dust, dirt, plaster, paint, etc., before the installation of the louvers, diffusers or lenses.

D. After completion of this portion of the work, it shall be the responsibility of the Contractor to clean and/or repair any damage to the finished building caused by this work, to the complete satisfaction of the Architect at no added cost to the City.

3.5 INSTALLATION OF LED DRIVERS

A. Install in strict accordance with manufacturer's recommendations.

3.6 LIGHTING CONTROL

A. Install all lighting control devices per contract drawings

3.7 FIELD QUALITY CONTROL

A. Inspect each installed fixture for damage. Replace damaged fixtures and components.

B. Advance Notice: Give dates and times for field tests.

C. Provide instruments to make and record test results.

D. Tests: As follows:

1. Verify normal operation of each fixture after installation.

2. Emergency Lighting: Interrupt electrical supply to demonstrate proper operation.

3. Verify normal transfer to battery source and retransfer to normal.

4. Verify actuation and termination on photocell, timer, or other control function, as applicable, and in coordination with required testing per Section 16570.

5. Report results in writing.

E. Malfunctioning Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.

F. Corrosive Fixtures: Replace during warranty period.

3.09 COMMISSIONING (FOR LIGHTING CONTROL SYSTEMS)

A. Spot check the lighting systems start up and ensure that the all lamps are operational and fixtures are clean.

B. Spot check occupancy sensor placement and test reliability of activation/deactivation.

C. Test photocells for functionality and accuracy

D. Spot check switches to ensure proper operation and circuiting

E. Spot check lighting schedules to ensure they are programmed per the ENGINEER direction.

F. Test operation of circuits by changing system date and time to cause various circuits to switch modes. For rooms with occupancy sensors, validate the circuit energizes with occupancy in the space after the lights have been swept off. Test warning flicker prior to off sweep.

G. For exterior fixtures, simulate night mode to validate function. Measure and record light level to ensure they meet the requirements and are generally provide adequate security. Check for excessive light level fluctuations or dark spots.

END OF SECTION

SECTION 28 31 00
LIFE SAFETY FIRE ALARM SYSTEMS

PART 1 -- GENERAL

1.1 SCOPE

A. Required: Furnish all labor, materials, equipment, services, permits, fees and transportation necessary for and/or reasonably incidental to the Construction and completion of life safety fire alarms systems.

B. Comply with the General Conditions, General Requirements and the requirements of Section 260200 of this Division 26 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

C. Work Includes, but is not limited to the following:

1. Life safety fire alarm detection and signaling system.
2. Plan check approval.
3. Furnishing and installation of equipment and devices.
4. Wiring in conduit, and connections.
5. Interface with elevator controls.
6. Interface with security system CPU.
7. Conduit, wire and connections for control and status of H&V motors, smoke dampers, for shutdown and smoke exhaust.
8. Conduit, wire, and connections for control and status of book conveyor fire dampers.
9. Testing, cleaning, and adjusting of completed work.
10. Wiring diagrams, shop drawings, equipment data.
11. Complete maintenance and off-site fire monitoring service for one year. Proposal for subsequent maintenance contract and monitoring service.
12. All work and material for complete and operable systems as indicated or specified.
13. Record drawings.
14. Permits, inspections, fees. See General Conditions.
15. Identification and instruction.
16. Coordination with other trades in the project.
17. Furnishing of special back boxes for installation under electrical section.
18. Install at least one automatic smoke detector in each enclosed room, connecting to the main Fire Alarm Control Panel.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 260100 - Basic Materials and Methods.

B. Section 260533 - Conduit

C Section 260519 - Wire and Cable

C. Section 262726- Wiring Devices

D. Section 260553-Electrical Identification

E. Section "Painting"-Painting, except shop finishing and field touch-up

F. Division 23-HVAC and fire protection systems

G. Temporary service (General Conditions).

H. Section "Elevators"-Elevators and elevator controls

J. Section 260560-Electrical Commissioning Requirements

K. Section 260570-Electrical Testing Requirements

1.3 LEGAL REQUIREMENTS AND STANDARDS

A. Legal: Conform to all applicable requirements of California State, Los Angeles City Fire and Building Departments concerning life safety and smoke control systems and requirements of local authorities having jurisdiction. See Sub-Section 1.5 of Section 260200 – Municipal Facilities General Electrical Requirements.

B. Standards: Comply with guidelines of the Electronics Industries Association, the National Fire Protection Association (NFPA) and Underwriters Laboratories (U.L.).

1.4 APPROVALS

The Fire Alarm System shall be Design-Build by the contractor. Prepare complete plans, risers, wiring diagrams, battery calculations, Voltage drop calculations and installation drawings for the fire alarm system. Obtain City Fire Department and Building Department approval for fire alarm system after incorporating all shop drawing review comments. Install system per final approved drawings.

1.5 QUALITY ASSURANCE

A. Manufacturer: Company specializing in smoke detection and fire alarm systems with five years documented experience.

B. Installer:

1. Submit evidence of completion and satisfactory operation of five projects of equal scope for the specified systems.

2. Submit evidence that installers are factory authorized agents.

3. Submit letter from equipment manufacturers indicating intent to maintain local service organizations or direct factory service.

4. Installers to be prepared to offer a service contract on expiration of guarantee.

1.6 SUBMITTALS

A. Comply with applicable provisions of Sections 01330 & 260200.

B. Shop Drawings:

1. Provide schematic layout, floor plan, drawings indicating location of all components and equipment, required size and location of conduit and outlets and type and quantity of system conductors. Include voltage drop calculations and battery calculations.

2. Riser Diagram.

3. Include wiring diagrams for overall system and components.

4. Include physical and electrical characteristics of equipment to indicate conformance with the Specifications.

5. Describe system characteristics and function.

C. Data Sheets: Show California State Fire Marshall Listing, U.L. listing, equipment ratings, dimensions and finishes.

D. Manufacturer's Certificate: Note that system meets or exceeds specified requirements.

E. Test Procedures: Provide one copy for necessary review.

F. Operating and Maintenance Instruction Manual:

1. Conform to applicable provisions of Subsection 1. 6N of Section 260200.

2. Manual shall include the following:

a. Operational description.

b. Coded cabling plan.

c. Two wire circuit diagrams.

d. Wiring destination schedule.

e. Schematic component diagrams and PC board layouts.

f. Maintenance and alignment procedures.

1.7 COORDINATION

Refer to the electrical and mechanical drawings and specifications to determine quantities and location of devices and required scope of work and coordinate work with mechanical and electrical installers. Provide function described under mechanical section Sequence of Control, for fire and/or emergency conditions. Submit cable requirements to elevator supplier. Submit conduit requirements to electrical installer. For self-contained door release, coordinate with door supplier.

1.8 SYSTEM DESCRIPTION

A. General: System to be listed by Underwriters Laboratories and the California State Fire Marshal, designed to meet the functional requirements of NFPA 72A, 72B, 72D

B. Features:

1. "Main fire Alarm control panel with graphic annunciator as located on the Contract Drawings.

2. Remote annunciators at the main entry.

3. Alarm/trouble point transmitters.

4. Manual alarm reporting stations.

5. Ionization smoke detectors.

6. Ionization smoke detectors in elevator lobbies, elevator machine rooms and the top of each elevator hoistway. Provide two contacts on elevator lobby detectors. Wire one to fire alarm panel and second to elevator control panel.

7. Fan duct smoke detectors.

8. Smoke detectors in ducts at smoke dampers.

9. Power supply for smoke damper motors.

10. Combination fixed temperature/rate of rise heat detectors.

11. Electromagnetic door hold open devices as required.

12. Combination horn/visual alarm signal devices. Visual alarm signal devices.

13. Connection to sprinkler water flow and pressure switches.

14. Sprinkler valve supervision.

15. Cabling and connections.

16. Interface with the standby generator and day tank for alarm and status reporting and control.

17. Provision for connection to off-site central station via leased telephone lines.

18. Interface with the HVAC system for duct Detector “shut-off”

19. Interface with the elevator system for elevator capture, status and control.

20 Interface with the fire protection system (sprinklers) for alarm and trouble reporting.

21 Operating and supervising electrical power for the system at 120-volt single phase, three wire from the emergency system to the fire command center. Internal battery back up, sized for
24 hours of standby and 5 minutes of alarm

1.9 SYSTEM OPERATION

A. System to be the active interrogate/respond type alarm system, 24 volt DC non-coded, positive, non-interfering, successive operation, in which all devices are constantly sending status signals to the main fire control command center from remote data transmitter panels approximately every one second. A change in status to be reported twice to determine that it is a valid signal, and be automatically and permanently recorded. The requirements in NFPA 72B for 60 hours standby power to be met by the emergency standby generator system.

B. Wiring, equipment and devices for alarm initiation, annunciation, and audible signaling to be continuously supervised for open circuits, shorts or grounds (trouble). Each alarm initiating device circuit to be provided with illuminated and audible annunciation of both trouble and alarm conditions. Non-illumination indicates a normal condition. Wiring to the equipment in one conduit, the return portion of the loop in the second conduit. Wiring between reporting devices to the field equipment cabinets to be Class "B" wiring in conduit, with end-of-line device.

C. Any alarm or trouble condition to sound an audible signal at the fire command center and the remote annunciator. Signal to be silenced by a momentary contact switch which shall transfer the signal to a visual indicator. Subsequent trouble conditions to cause the signal to resound and in turn may be silenced. Upon restoration to normal, the trouble signal silencing indicator to extinguish automatically.

D. Activation of any automatic or manual alarm initiating device to cause the following to occur:

1. Sound an audible alarm and illuminate the visual indicator for zone and type of alarm at the fire command center and the remote annunciator.

2. Sound, by building of origin, the slow whoop alarm signal over the system speakers and activate the visual signal devices.

3. Transmit signal to release the electromagnetic hold open devices on corridor doors by floor.

4. Transmit signal to close smoke dampers.

5. Transmit alarm signal to the central station office, via autodialer.

E. System not to incorporate a time delay for any of the alarm initiating devices.
All alarms to be considered confirmed alarms.

F. Ionization type smoke detectors in the elevator lobbies interfaced with the elevator controls system for recall of elevators to first floor under fire alarm conditions, and report to fire central station.

G. Detection and reporting of fire conditions to be accomplished by the following basic methods:

1. Manual stations.

2. Smoke detectors.

3. Heat detectors.

4. Duct detectors.

5. Water flow switches.

H. Fire alarm system inputs to be further subdivided as follows, for a more defined indication of the location and nature of the fire or trouble condition:

1. Manual station. By floor and zone.

2. Smoke detector in elevator shaft. By device.

3. Smoke detector in an elevator lobby. By device.

4. Smoke detectors at smoke dampers. By device.

5. Smoke and/or heat detector in mechanical and electrical rooms. By floor and room.

6. Door held open detector. By floor and location.

7. Tamper switch and Water flow or pressure switch. By floor and zone.

8. Sprinkler valve position indication. By floor and zone.

I. Alarm condition to override trouble indication. Trouble indication to reappear after alarm reset.

J Selective manual testing of any device point in the system to determine normal trouble or alarm status

K. Remote annunciator to duplicate annunciation from the main fire alarm control panel.

L. System to be capable of manual operation in the event of malfunction of the central processor. Supplier to include a statement in the system shop drawing submittal explaining the manual operating capability of the system. Provide redundant processor to duplicate primary processor function.

M. Sequence of Operation Under Alarm Condition:

1. Sound an audible alarm at the main fire control command center and the remote annunciator and simultaneously illuminate the visual indicator for zone and type of alarm.

2. Manual acknowledge switch operation, to illuminate alarm acknowledge light and silence and audible signal. Visual indicator for zone of alarm to remain illuminated. New alarm to re-sound the audible alarm and repeat sequence.

3. Transmit signal to off-site central station office.

4. Correction of alarm condition to provide return to normal status and to print out.

5. Sound building alarm as described in "System Features and Operation."

N. Sequence of Operation for Supervision:

1. The following trouble conditions to sound an audible alarm and illuminate the visual trouble zone indicator at the main fire control command center and the remote annunciators:

a. Malfunction or trouble in any equipment or component of the fire alarm system.

b. Opens, shorts or grounds in the fire alarm system wiring.

c. Closed sprinkler system valve.

d. Removal of any fire alarm detection or reporting device.

e. Wet system water flow switch - tamper switch.

2. Manual acknowledge switch operation, to illuminate trouble acknowledge light and silence audible signal. Visual indicator for zone of trouble to remain illuminated.

O. HVAC Interface: Coordinate system function with sequence of control described in the mechanical section.

P. Operation: All components connected in accordance with the manufacturer's instructions to provide a complete and operable system.

1.10 LOADS OF EQUIPMENT AND COMPONENTS

A. Follow Electronics Industries Association Standard where applicable.

B. Provide fuse protection for equipment and spare fuses.

C. Design systems for operation at 120 volts, normal or emergency power as indicated, 60 Hz nominal input.

D. Operating voltage dissipated by resistors shall not exceed 25% of ratings.

E. Operating voltage of capacitors shall not exceed 80% of rated voltage.

F. Operating loads and voltages on transistors and solid-state devices shall not exceed manufacturer's recommendation for normal full load operation.

G. Use electronic components of types and rating commonly available from stock of established commercial distribution.

1.11 GUARANTEE

A. Conform to applicable provisions of the General Conditions.

B. Service technicians and replacement components for the system shall be available locally from a service representative of the manufacturer who is able to provide evidence of technical training and authorization by the manufacturer.

C. For a period of one year from date of final acceptance, the system shall be under full guarantee for materials and labor at no cost to the City. The system shall be under a service contract with a

technician authorized by the manufacturer. Replacement parts and labor shall be readily available during normal business hours while the service contract is in effect. A complete system inspection and test shall be performed at five months and again at eleven months after final acceptance. Tests shall include all smoke detector sensitivity settings.

D. Any component failures shall be remedied to the satisfaction of the Owner.

E. A continuing service contract shall be offered at time of bid to commence at the expiration of warranty included with the system.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Manufacturers: Equipment descriptions refer to the Edwards System Technology . Equivalent systems conforming to the Specifications are acceptable.

B. Provide materials and equipment of new and recent manufacture, UL labeled and/or listed for specific use.

C. The system and equipment described and furnished under these Specifications are to be the standard product of the manufacturer specified for each system. All reference to model numbers and other pertinent information herein is intended to establish the standards of performance, quality, and appearance.

D. System and equipment proposed as equivalent to that specified shall conform to the standards herein. Contractor and Manufacturer to supply evidence of having produced and installed similar equipment for at least five years, and list systems of equal scope rendering satisfactory service. Obtain the Project Manager's approval in writing ten working days prior to bidding equipment other than as specified. Submit the manufacturer's name, model numbers, and three copies of working drawings and engineering data sheets for approval.

Include in the submittal a certified statement from the manufacturer of the substitute equipment that it does, in fact, equal the electronic and physical features and functions of the specified equipment.

E. A continuing service contract shall be offered at time of bid to commence at the expiration of warranty included with the system.

2.2 FIRE ALARM CONTROL PANEL

A. Modular design with all modules and spacing panels to be the same size. All solid-state circuitry and components. Battery backup.

B. Dead front panel construction. Panels to be mounted in heavy gauge steel cabinets finished in read with module front plates finished in black. Hinged cabinet doors with locks to provide access to field wiring terminals. Internal audible signal.

C. Fire alarm control panel to Incorporate the Following Basic Components for Fire Alarm System Functions:

1. Operators control module.

2. Remote annunciator (approved by Fire Department).

3. Signal generator module.

4. Amplifier module or modules.

D. Operators Control Module to Incorporate:

1. Eighty character alpha-numeric display for continuous indication of time-of-day, day-of-week, month, date-of-month and year or for indication of manual function entries.

2. LED indicators for operating and supervising power, common alarm, alarm silenced, manual mode, system trouble, audible silenced, common trouble, loop fault, alarm circuit trouble and disconnect and auxiliary circuit trouble.

3. Keypad for the following entries and call ups displayed on the alpha-numeric display:

a. Alarm silence.

b. Audible silence.

c. System reset.

d. Auxiliary disconnect for central station circuit.

e. Call up of all system troubles not annunciated.

f. Call up of the status of any system point.

g. Set time, day-of-week, month, date-of-month and year.

h. Annunciator LED test.

E. Annunciator Module to Incorporate:

1. LED indicators for zone alarm and trouble.

2. Provision for indicating zone designations.

F. Signal Generator Module to Incorporate:

1. Two separate electrically supervised fire tone circuits.

2. Failure of one circuit to sound a trouble signal and the second circuit to take over automatically.

G. Battery Backup: Sealed lead acid type, with automatic battery charger. Four hour standby, five minute alarm.

H. Model EST-3 or equal.

2.3 REMOTE ANNUNCIATOR

A. The remote annunciator to be a Graphic type. The Graphic Annunciator to have a display of LED's for displaying individual initiating devices and be approved by

B. Model ”ENVOY” Series or equal.

2.4 ALARM/TROUBLE POINT TRANSMITTERS

A. Single, four or eight input point Class "B" units as required by the system design and layout.

B. Number of units in any one zone as required by the system design and layout.

C. For mounting in standard module cabinets.

D. Power supplied from the main fire alarm control panel.

E. Model SIGA-CT1, or equal.

2.5 MANUAL ALARM REPORTING STATIONS

A. Non-coded, semi-flush, double action with "Lift to Break - Pull Lever Down" lettering on clear plastic shield.

B. Mechanically locked until manually reset, rigid metal construction with raised lettering "Pull Down".

C. Model SIGA-270 single action or equal.

D. Manual Stations shall have a protective clear plastic cover model “Stopper II”.

2.6 AUTOMATIC SMOKE DETECTORS

A. Solid-state dual chamber type ionization detector, allowing for compensation for pressure and humidity changes.

B. Equipped with solid state voltage regulator to maintain detection sensitivity over varying voltages, and current regulator to insulate from power surges.

C. Detector mounted LED visual alarm indicator.

D. Model SIGA-IS with base model SIGA-SB or equal.

2.7 HEAT DETECTORS

A. Combination fixed temperature and rate-of-rise type, 135 degrees Fahrenheit fixed temperature rating, 15 degrees F per minute rate-of-rise rating, normally open contacts.

B. Flush mounted in finished areas, surface mounted in unfinished areas, off-white finish.

C. Model SIGA-HFS with base model SIGA-SB or equal.

2.8 AUDIBLE/VISUAL SIGNAL DEVICES

A. Combination speaker/lamp units, steel back box, recessed or surface mounted as indicated, on

supervised circuits. Visual portion to flash on alarm condition.

B. Model 757-8A-T, Model 757-7A-T, Model 757-5A-T or equal.

2.9 VISUAL SIGNAL DEVICES

A. Solid-state lamp flasher, built-in lamp unit, red thermoplastic lens, steel back box, red molded phenolic front panel, recessed or surface mounted as indicated, on supervised circuits. Unit to flash on alarm condition.

B. Model 202-5A-Tor equal.

2.10 DUCT DETECTORS

A. Furnished under H.V.A.C., Section, connected under this section.

B. Coordinate with H.V.A.C., Section.

2.11 WATERFLOW AND/OR PRESSURE SWITCHES

A. Furnished under Fire Protection section connected under this section.

B. Coordinate with Fire Protection section.

2.12 SPRINKLER VALVE TAMPER SWITCH

A. Furnished under Fire Protection Section, connected under this section .

Coordinate with Fire Protection section.

2.13 CONDUCTORS

No. 14 AWG, 600 volt, minimum shielded as required. Twisted pairs for audio. Conductor layout and quantities to be delineated on the shop drawing submittals as described in Paragraph 1.B. of the specifications. Calculate voltage drop and increase conductor size as required.

2.14 SUPPLEMENTARY RELAYS

A. Designed to activate or deactivate external circuit controls such as fans, smoke dampers, door releases.

B. Contacts rated two amperes minimum, but adequate for circuit controlled.

C. Relay coil supplied from system power supply.

D. Where remote from command center, enclose in NEMA 12 dust tight enclosure.

E. State Fire Marshal approved for use in fire alarm system.

2.15 DIGITAL COMMUNICATOR

A. Furnish and install a digital communicator by “Silent Night” Model 5104 or equal with all required accessories to send alarm and trouble signals

B. The Contractor shall arrange for the activation of the Building fire alarm system

C. The Contractor shall pay for all accessories, including communicator and one year of fire alarm monitoring and maintenance service by an approved monitoring company

2.16 Door Hold Open Devices

Electromagnetic type at doors where required, 24 VDC. Door release on activation of fire alarm system by floor.

PART 3 -- EXECUTION

3.1 GENERAL

A. Comply with all applicable paragraphs in Section 16020 – Municipal Facilities General Electrical Requirements, apply as though repeated herein.

B. Install system(s) in accordance with manufacturer's instructions.

C. Include services of certified technicians to supervise installation, adjustments, final connections and system testing.

3.2 OPERATION

Systems outlined herein to be complete and operable including all labor and material necessary for the required performance. Exact wiring and connections per suppliers' wiring diagrams.

3.3 GROUNDING

All equipment to be grounded by means of green ground wire to "U" contact of duplex receptacles and bonded to ground provided under Electrical Section.

3.4 INSPECTION

Systems to meet all the requirements of the code enforcing agency and shall be approved thereby before installation.

3.5 LOCATION

Before installation, verify exact location of control equipment and outlets. The City reserves the right to relocate outlets within a radius of 10' at no increase in cost before rough-in work is started for the respective outlet.

3.6 WIRING

A. Furnish all conductors, equipment, plugs, terminal strips, etc., and labor to install a complete and operable system. All cable conductors to be color coded and numbered for identification at all terminals. Green for grounding conductor. White for grounded conductor.

B. All cables and wiring shall be installed in conduits

3.7 TESTING

After all equipment specified herein for each system has been installed and is in operating condition, conduct performance tests to determine if the installation and components comply with these specifications. Perform smoke removal test. Furnish competent personnel, all test material and approved test instruments and conduct the tests under supervision of factory personnel, in the presence of the Project Manager, and the City building and fire inspecting agencies. Test atrium smoke control system before sunrise or after sunset.

3.8 COMMISSIONING

A. Spot check location of sensors and switches to ensure conformance with requirements.

B. Verify sampling of all types of devices. Cause activation of the device, assure alarms are initiated and resulting response is per the requirements.

C. Verify interfaces with all other inter-related systems or equipment including FMS, sound systems, security systems, HVAC systems, vertical delivery systems, etc.

D. Validate output devices (speakers and strobes) meet the code criteria (96 dBa at 10' and 117 candela at peak)

E. Test all functions and sequences associated with the elevator recall system.

F. Activate high temperature detectors in the elevator machine room. Verify all sequences including elevator shunt off, elevator recall including alternate floors when main floor is in alarm.

G. Activate smoke detector and verify all smoke control sequences and ensure fire/smoke dampers actuate as required.

H. Activate a sample of sprinkler flow switches. Validate that appropriate zone enunciates and alarms sound.

I. Verify audio aspects of the system function as required. Verify paging messages can be heard throughout the building.

J. Testing of the HVAC response is included with the associated equipment. Coordinate testing of the fire alarm system with the testing of the individual HVAC systems including shaft pressurization systems.

K. Ensure that the system functions while using all sources of power including normal, emergency, and battery. Check battery life by simulating an extended outage.

3.8 REPORT

Prepare written report of final test results, signed by witnessing parties. Submit to the Project Manager in triplicate.

END OF SECTION

SECTION 31 00 00

GENERAL EARTHWORK

PART ONE - GENERAL

1.1 SUMMARY

A. Provide and execute grading work as indicated on the Contract Drawings or in the Project Manual including but not limited to the following:

1. General excavating and trenching for various trades.

2. General exterior grading and cutting.

3. General excavating for site improvements.

4. Filling, Backfilling and Compaction.

B. RELATED WORK SPECIFIED ELSEWHERE

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS, DIVISION 1 - GENERAL REQUIREMENTS and other applicable Sections of the Project Manual.

2. CAST IN PLACE CONCRETE in Section 03 30 00.

3. SITE CLEARING in Section 31 10 00.

4. IRRIGATION in Section 32 80 00

5. LANDSCAPE PLANTING in Section 32 90 00.

1.2 QUALITY ASSURANCE

A. Labor: Use adequate numbers of skilled laborers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with specified requirements and the methods needed for proper performance of the Work of this Section.

B. Equipment: Use equipment adequate in size, capacity, and numbers to accomplish the work of this Section in a timely manner.

C. Codes and Standards: Perform excavation work in compliance with applicable ordinance of governing authorities having jurisdiction including, but not limited to, the L. A. City Building Code and applicable Amendments; Division 1-DEPARTMENT OF INDUSTRIAL RELATIONS of Title 8 of the California Code of Regulations; Section 300 - EARTHWORK of SSPWC, as amended by Brownbook.

1. In addition to complying with Codes and Standards having jurisdiction, comply with directions of the GEOTECHNICAL ENGINEER.

D. Stormwater Pollution Control: The CONTRACTOR shall provide and employ the required measures for stormwater pollution control and water quality protection. The CONTRACTOR shall meet the standards of these requirements and reporting at all times.

E. Testing and Inspection Services: The CITY will provide qualified soil testing and inspection for quality control during earthwork operations. Testing shall be performed in accordance with the APPROVED SOIL REPORT and testing standards, the instructions of the GEOTECHNICAL ENGINEER and the applicable Sections of GENERAL CONDITIONS.

F. Geotechnical Engineer: The CITY will retain the services of a GEOTECHNICAL ENGINEER for the purpose of soil investigations and compaction testing, all the necessary inspections and observations, and certifications.

G. Survey: The CONTRACTOR shall employ the services of a California licensed surveyor for the purposes of survey control, layout, grade and cross-sections required to control work. Survey work shall conform to Survey Section of the General Requirements.

1.3 SUBMITTALS

Conform to provisions of DIVISION 1 - GENERAL REQUIREMENTS.

A. Sources of imported fill materials, if required.

B. Dewatering Plans, if required.

C. As required: California General Construction Activity Stormwater Permit, Waste Discharge Identification Number, Wet Weather Erosion Control Plan or Stormwater Pollution Prevention Plan.

D. Test Reports-Excavating: Contractor shall submit the following reports directly to the Los Angeles City Department of Building & Safety, prepared by the Soil Engineer and the testing service, with a copy to the CONSTRUCTION MANAGER.

1. Test reports on imported fill material.

2. Verification of each footing subgrade.

3. Field density test reports.

4. One optimum moisture-maximum density curve for each type of soil encountered.

5. Other test reports as required by the GEOTECHNICAL ENGINEER and the Los Angeles City Department of Building & Safety.

1.4 PERMITS

A. Required: In addition to the requirements specified herein, and in applicable Sections of the GENERAL REQUIREMENTS of the Project Manual.

B. The Contractor shall perform all work in accordance with the permit requirements of the Los Angeles

City Department of Building and Safety, including obtaining the grading permit; a grading bond, and making the required notification to the adjacent property owners; at no additional expense to the City.

C. Contractor shall furnish the BCA Inspector with a duplicate copy of OSHA excavation permit when required, and all other required permits prior to the start of the excavation work.

D. The Contractor shall obtain and pay for the California State Regional Water Quality Control Board (LARWQCB) Construction Water Discharge Permit if required.

E. The Contractor shall obtain and pay for California General Construction Activity Stormwater Permit if required. The Contractor shall obtain Waste Discharge Identification Number after submitting the Wet Weather Erosion Control Plan (WWECP) pursuant to Section 61.02 and 64.72 of L.A.M.C.

F. The Contractor shall make all necessary notifications, obtain and pay for required permits and file manifests with the South Coast Air Quality Management District (S.C.A.Q.M.D.) when required.

1.5 JOB CONDITIONS

A. Required Work Coordination: The Contractor shall fully coordinate the work operations of this Section with that of other trades involved and with the ENGINEER to assure proper sequence of work, limitations, methods and time of work to minimize or avoid interference with the existing utilities as well as performance of work by the other Contractors. Contractor shall include minimum two weeks in the Construction Schedule to allow the Soil Engineer to prepare final Soil Report to be submitted to the Los Angeles City Department of Building and Safety Grading Division for final approval. The Contractor shall coordinate and arrange for all the inspections with the local authorized agencies and the Bureau of Contract Administration.

B. Trench Safety: Attention is directed to the provisions of Section 6705 of the Labor Code concerning trench excavation safety plans when specified.

C. Air Pollution Control: The Contractor shall comply with all air pollution control rules, regulations, ordinances and statutes which apply to work performed pursuant to the Contract, including any air pollution control rules, regulations, ordinances and statutes, specified in Section 1107 of the Government Code.

1. The Contractor shall conform to Section 7-8.1 of the SSPWC latest edition with the current yearly supplements for clean-up and dust control.

D. Sound Control Requirements: The Contractor shall comply with all local sound control and noise level rules, regulations and ordinances which apply to any work performed pursuant to the Contract.

1. Each combustion engine, used for any purpose on the job or related to the job, shall be equipped with a muffler of a type recommended by the manufacturer. No internal combustion engine shall be operated on the project without said muffler.

E. Use of Explosives: The use of explosives is not permitted.

1.6 PROTECTIONS

A. General: Comply with provisions of Section 30 - PROTECTION OF PERSONS AND PROPERTY AND RESTORATION OF EXISTING IMPROVEMENTS in GENERAL CONDITIONS. Protect and guard all

excavations against damage to life, limb and property as prescribed by Los Angeles City Department of Building and Safety.

B. Protections of Persons and Property: Provide and install signs, lights and barricades at danger points on and off the job site to guard against accidents, etc.

1. Barricade open excavations occurring as part of this work and post with warning lights.

2. Protect all existing structures, utilities, sidewalks, pavements and other facilities to remain from damage caused by settlement, lateral movement, undermining, washout and other hazards created by earthwork operations.

3. See: Tree Protection, sheet G104 for addition requirements.

C. Existing Improvements: Protect against damage resulting from CONTRACTOR'S operations. Repair or replace damaged items to the full satisfaction of the CITY at no additional cost to the City.

D. Shoring, Cribbing and Lagging: Shall be installed where required by Code for safety of excavations and earth banks as necessary to prevent caving in, erosion or gullying of sides.

1. CONTRACTOR shall be responsible for obtaining and paying for all shoring permits, shoring design and calculations of shoring, etc.

2. Shoring shall be in accordance with requirements of with the latest Los Angeles City Building Code, Section 2811 and Safety Orders of State of California, Division of Industrial Safety, Title 8, Subchapter 4, Article 6, Sections 1540 and 1541.

3. Upon completion of project or when no longer needed or otherwise directed by the authority having jurisdiction, CONTRACTOR shall remove all such shoring from the job site.

E. Water: Divert or pump out of all excavations until concrete and other items are placed therein, forms removed, and backfilling is completed. The CONTRACTOR shall provide a means for solids removal before discharging the water. Comply with all applicable Codes and Regulations.

F. Existing Utilities: Utilities shown on the drawings are shown pursuant to a search of available records and are shown as a matter of information and not as a matter of fact. Conforming with GENERAL REQUIREMENTS and other Sections of the Project Manual, the CONTRACTOR shall locate existing underground utilities in areas of work. If utilities are to remain in place, provide adequate means of support and protection during earthwork operations.

1. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, CONTRACTOR shall notify the CONSTRUCTION MANAGER immediately for direction. CONTRACTOR shall cooperate with CITY and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility Company.

2. Do not interrupt existing utilities serving facilities occupied and used by CITY and others, during occupied hours, except when permitted in writing by the PROJECT MANAGER and then only after acceptable temporary utility services have been provided.

3. Provide a minimum of 48-hour notice to the PROJECT MANAGER and receive written notice to proceed before interrupting any utility. Obtain clearance and notify all utility companies in the area and call Underground Service Alert by calling (800) 422-4133. Deliver utility clearance ticket number to the BCA INSPECTOR prior to the start of any work.

4. Demolish and completely remove from site existing underground utilities ***indicated to be removed***. Coordinate with utility companies for shut-off of service if lines are active.

G. Dust Control: Use means necessary to prevent dust becoming a nuisance to the public, to neighbors, and to other work being performed on or near the job site. Comply with all applicable Codes and Ordinances.

1.7 INSPECTION

A. Required: All work and materials are subject to inspection and approval by the PROJECT MANAGER or ENGINEER. Any work done without proper inspection will be subject to rejection per Section 2-11 of the Standard Specifications for Public Works Construction. The Contractor shall notify the Bureau of Contract Administration (BCA) INSPECTOR and PROJECT MANAGER three (3) days prior to requested date of inspection of the following for approval:

1. All excavations and trenches shall be inspected by the BCA INSPECTOR, Los Angeles City Building and Safety Inspector, and the GEOTECHNICAL ENGINEER before filling, backfilling and/or other subsequent work is placed therein. Earthwork backfill for structures shall comply with requirements of Section 300-3.5 - STRUCTURAL BACKFILL of SSPWC and/or requirements in the Project Manual.

2. ROUGH GRADING: When forms have been set, they shall be reviewed by ENGINEER to verify alignment and grade. Offsets or vertical controls shall be verifiable in the field, or be provided in grade sheet form, and submitted to the CONSTRUCTION MANAGER for approval prior to the inspection.

3. FINISH GRADE REVIEW: For all finish grades in planting areas following rolling in turf areas and prior to landscape container planting.

1.8 GEOTECHNICAL INFORMATION

The GEOTECHNICAL REPORT dated April 18, 2022, the Supplemental Geotechnical Report dated July 24, 2023, and LADBS Approval letters dated June 23, 2022 and August 26, 2023 are part of the Project Manual. CONTRACTOR shall comply with all Soils Report recommendations specified and other instruction directed by the GEOTECHNICAL ENGINEER. In case of conflicts between other part of the Project Manual and Soils Report the most restrictive condition shall govern unless otherwise approved by the Soil Engineer.

1.9 MATERIAL HANDLING

A. Delivery: All materials, tools, equipment, etc. to be delivered to the job site, in such a manner coordinated with progress of work of this Section.

B. Material Storage: Stockpile satisfactory excavated materials where directed, until required for backfill or dispose of in accordance with Section 300-2.6 - SURPLUS MATERIALS of SSPWC. Place, grade and shape stockpiles for proper drainage.

1. Locate and retain soil materials away from edge of excavations. Do not store within drip line of trees indicated to remain.
2. Dispose of excess soil material and waste materials as herein specified.

PART TWO – PRODUCTS

2.1 SOIL MATERIALS

A. Suitable Excavated Material: Suitable materials from excavations for use in fill shall be free from shale, sod, large clods or hard lumps of earth, roots, trash or other debris; that has a liquid limit of less than 30, and a plasticity index of less than 9; and is readily compatible to specified density. No rock, cobbles or broken concrete exceeding 2-inches in maximum dimension shall be placed in compacted fill without the specified approval of the GEOTECHNICAL Engineer. No rock, cobles or broken concrete exceeding 1-inch in maximum dimension shall be placed in compacted fill of the utility trench.

B. Fill Material: Furnish imported earth material as necessary if specified in the contract requirements or if the amount of suitable earth materials obtained from the job site excavations is not sufficient to properly construct the required fill, subject to the approval of the GEOTECHNICAL ENGINEER prior to use.

1. Fill material shall meet the requirements noted in the Geotechnical Report.

2. Submit imported fill material samples and testing results for the ENGINEER'S approval prior to importing to the job site in accordance with Section 300-5 BORROW EXCAVATION of SSPWC and the Geotechnical Report..

3. Imported fill material shall be free of foreign materials, vegetable growths, sod, rocks, expansive soils and debris.

4. Where fill material exhibits a wide variation in consistency, the ENGINEER may require blending to stabilize and upgrade the material as directed by the GEOTECHNICAL ENGINEER.

5. In landscape planting areas, the top 24" of fill shall be "Class A" topsoil, and not contain anything that would prevent normal plant growth (800-1.1.2). See LANDSCAPE PLANTING, Section 32 90 00 for additional information. Refer to Section 33 16 66 – Capture and Reuse LID System for soil requirements of LID planters.

C. Base Material: Shall be "Crushed Miscellaneous Base," as specified in Section 200-2 - UNTREATED BASE MATERIALS of SSPWC.

D. Pipe Bedding and Trench Backfill Material:

1. Trench excavations may be backfilled with onsite soils under the observation of the Geotechnical Engineer. Refer to the Geotechnical Report.

2. Use clean earth materials previously removed from job site excavations, or use approved imported fill materials as above specified, free from clay, rock or gravel larger than 1-inches for utility trenches, subject to the Soil Engineer's approval prior to use.

3. For storm drain piping, use approved washed sand to 4-inches above top of pipe, with the balance of backfill to be approved clean earth materials. For storm drain piping sections located beneath the sidewalk and connected to a concrete curb outlet, sand bedding and backfill are not required.

4. For domestic water pipe, use approved washed sand to 4-inches above top of pipe, with the balance of backfill to be approved clean earth materials.

5. For electrical conduits, see Electrical Plans.

6. For the landscape irrigation piping, use clean earth materials previously removed from job site excavations, or use approved imported fill materials as specified above, free from clay, rock or gravel larger than 1-inches diameter.

7. Conforming to applicable Sections of the Project Manual for the pipe bedding widths and depths.

2.3 TOPSOIL

A. The top 24" of any placed fill in proposed landscape planting areas shall be approved topsoil. Where possible, obtain or re-use stockpiled "CLASS C" topsoil from sources within the project limits.

B. If required by or indicated on the Landscape Drawings or specifications, CONTRACTOR shall provide imported "CLASS A" topsoil (800-1.1.2). Imported "Class A" topsoil shall meet the following additional requirements.

1. Gradation Limits: Sand - 50-80 percent, clay - 20 percent maximum, and silt - 30 percent maximum. The sand, clay and silt gradation limits shall be as defined in ASTM D-422 – TEST METHOD FOR PARTICLE – SIZE ANALYSIS OF SOILS.

2. Permeability Rate: Hydraulic conductivity rate shall be not less than one inch per hour nor more than 20 inches per hour when tested in accordance with the USDA Handbook Number 60, method 34b or other approved methods.

3. Agricultural Suitability and Fertility Analysis Tests: The top-soil shall be fertile and friable garden soil suitable for sustaining and promoting the growth of the specified plants. The topsoil shall comply with maximum permissible element concentration.

C. All imported "Class A" Topsoil shall be from a source outside the limits of the project selected by the Contractor and in compliance with Inspection requirements specified in General Conditions. Within 90 days after Notice-To-Proceed, CONTRACTOR shall submit the proposed source of topsoil to the ENGINEER for approval. After the ENGINEER or authorized representative makes an initial inspection at the site of the proposed imported material, the Contractor shall perform the required tests as deemed necessary to determine that the material meets the requirements. The Contractor shall submit to the ENGINEER a written report of a soil testing laboratory registered by the State of California for agricultural soil evaluation which states that the proposed source complies with this Section, and or proposed soil amendments as needed to meet compliance. After the testing report and proposed soil amendments are reviewed by the ENGINEER, the CONTRACTOR shall comply with all the recommendations of the soil testing laboratory and add any additional soil amendments necessary to achieve proper nutrient levels to support a healthy plant growth to the imported topsoil at the time of placement, at no additional cost to the City.

2.4 OTHER MATERIALS

Provide other materials, not specifically described but required for a complete and proper installation, as selected by the Contractor subject to the approval of the ENGINEER.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until detrimental conditions are corrected.

3.2 WATER QUALITY PROTECTION

A. Comply with requirements shown in the approved Wet Weather Erosion Control Plan (WWECP).

3.4 SUBGRADE PREPARATION

A. Excavation of Subgrade. For permitted structures, structural paving, roads, and vehicular pathways, over-excavate the existing soil including fill material, debris, roots and foreign materials to natural subgrade at the proposed location. Over-excavation shall be to the depth and extended to each side beyond edge of construction as indicated in the APPROVED SOILS REPORT. Completed over-excavation shall be approved by the GEOTECHNICAL ENGINEER and LADBS GRADING INSPECTOR prior to placing fill.

1. For non-structural paving, footings, or other work as indicated in the APPROVED SOILS REPORT, excavate surface material to the required depth of the subgrade per plans or details.

2. If fill material is encountered below the required depth of excavation, CONTRACTOR shall notify the GEOTHECHNICAL ENGINEER immediately.

B. Subgrade Preparation: Unless indicated otherwise in the APPROVED SOILS REPORT, scarify for top of subgrade to a depth of 6-inches and bring to optimum moisture content and then recompact to at least 95% maximum density for subgrade as per ASTM D1557 - TESTED METHOD FOR LABORATORY COMPACTION CHARACTERISTICS OF SOIL USING MODIFIED EFFORT (56,000 FT - LBF/FT^3.). Prepare subgrade in accordance with Section 301-1 - SUBGRADE PREPARATION of SSPWC.

C. Backfill and Recompaction: Unless indicated otherwise in the APPROVED SOILS REPORT, place backfill in accordance with Section 300-4.5 - PLACING MATERIALS FOR FILLS of SSPWC in 8-inch layers and each layer compacted to 95% relative compaction and finished to elevations necessary to require cutting by fine grading. Inspection by Los Angeles City Building and Safety Inspector and the GEOTECHNICAL ENGINEER are required prior to placing fill. Obtain minimum one compaction test for each layer or volume as specified by Code or indicated in the APPROVED SOILS REPORT.

D. Dewatering:

1. Remove all water, including rainwater, encountered during trench and sub-grade work to an approved location by pumps, drains, and other approved methods.

2. Keep excavations and site construction area free from water.

E. Moisture Control: Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water to surface of subgrade, or layer of soil material. Apply water in manner to prevent free water appearing on surface during or subsequent to compaction operations.

1. Remove and replace, or scarify and air dry, soil material that is too wet to permit compaction to specified density.

2. Soil material that has been removed because it is too wet to permit compaction may be stockpiled or spread and allowed to dry. Assist drying by disking, harrowing, or pulverizing until moisture content is reduced to a satisfactory value.

F. Rework: Any previously compacted or tested subgrade and fill material, which are affected or disturbed, in the opinion of the GEOTECHNICAL ENGINEER, by the inclemency of the weather such as rains, floods, earthquake or others shall be reworked, retested and re-inspected at no additional cost to the City.

3.5 GRADING

A. Rough: Leave cut and fill sufficiently high to require cutting by fine grading.

B. Fine: To elevations required to ensure proper drainage or finished elevations indicated on drawings; finish elevations for planting areas in Section 02900 – LANDSCAPING.

C. Subgrade Preparation: Unless indicated otherwise in the APPROVED SOILS REPORT, required for all areas, other than filled or backfill areas, over which moisture barrier material, slabs, walks or pavement will be placed; in accordance with provision specified herein and Section 301-1 - SUBGRADE PREPARATION of SSPWC.

D. Inspection Required: Prior to placing base material, concrete or other materials.

3.5 EXCAVATING

A. General: Unless indicated otherwise in the APPROVED SOILS REPORT:

1. Excavation consists of the removal and disposal of materials necessary to establish required grade elevations and certified compacted fill for new construction pursuant to Section 300-2 UNCLASSIFIED EXCAVATION of SSPWC.

2. Excavated materials suitable for use as fill and/or backfill to be stockpiled where directed by the PROJECT MANAGER.

3. Non-approved and excess excavated materials to be legally removed and disposed of from the job site at the CONTRACTOR'S expense.

4. Shoring, Bracing and Bulkheading of Trenches: All to be provided, installed and maintained where required to support trenches, See Subsection 1.6 of this Section. Conform to the requirements prescribed by the Los Angeles City Department of Building and Safety, CAL/OSHA, and other Sections of the Project Manual.

5. Access to Trenches: Conform to Section 306-1.1.4 - ACCESS TO TRENCHES of SSPWC. Provide safe and suitable ladders, which project 2 feet above the top of the trench. It shall be provided for all trenches over 4 feet in depth. Minimum one ladder shall be provided for each 50 feet of open trench or fraction thereof and be so located that the workers in the trench need not move more than 25 feet to a ladder.

6. Encountered Existing Underground Piping or Conduits: Immediately stop the trench operations at the point of encounter, notify the PROJECT MANAGER of such condition and submit support drawings to the ENGINEER for approval. The support drawings shall be in conformance with the

Los Angeles City Bureau of Engineering Standard Plans S-253, SUPPORTS FOR STORM DRAIN AND SEWER PIPES ACROSS TRENCHES, latest edition; CAL/OSHA and the utility company's requirements.

B. For Site Improvements:

1. For Planter Curbs: To exact curb limit, without excessive removal of adjacent paving or subgrade for new paving.

2. For Concrete and Asphaltic Site Improvements such as concrete and/or asphalt pavements, concrete walkways, driveways aprons, concrete curb and gutter: Excavate to exact limits of such work without excessive removal of existing subgrade. Scarify and compact top 6 inches of subgrade and compact at 95% relative density, unless otherwise indicated in the APPROVED SOILS REPORT.

C. For Walls (including wall footings): refer to recommendation of the APPROVED SOILS REPORT.

D. Conduit and Piping: Conforming to the requirements as specified on the drawings, Los Angeles City Plumbing Code, SSPWC and other sections of the Project Manual. Any piping with 8 feet or less cover or backfill, Case 1 Bedding Installations of Los Angeles City Bureau of Engineering Standard Plan S-251, latest edition, shall be used for all piping laying unless otherwise specified on the drawings or noted.

E. Depth and Width of Trench for Storm Drainage Piping: To depth necessary for installation of piping and construction of catch basin in accordance with requirements of Section 02545 - STORM DRAIN SYSTEM, PLUMBING Section in Division 15 of the Project Manual and as noted on the Contract Drawings. Provide minimum [7 ½ inches] [12 inches] side clearance from side of the piping. Make the sides vertical and the bottoms smooth, firm, level or uniformly sloped as required, slope to not exceed a downward slope of two horizontal to one vertical in a manner to prevent formation of water pockets in the pipe. For backfill or earth cover exceeded 8 feet, refer to Los Angeles City Bureau of Engineering Standard Plan S-251, latest edition, for maximum allowable trench width and bedding material. Unless specified otherwise, provide minimum 2 inches washed sand bedding below the pipe barrel.

F. Depth and Width of Trench for Plumbing Piping: As necessary for complete installations of the piping, fixtures and controls; provide minimum [7 1/2 inches] [12 inches] side clearance from side of the piping; make the sides vertical and bottoms smooth, firm, level or slopes, as required by the code for proper drainage. [Final elevations shown on Contract Drawings] shall mean the invented pipe elevations. Pipe thickness and bedding thickness shall be used in determining trench depths. Conform to the requirements as specified in the Los Angeles City Plumbing Code and in Division 15 of the Project Manual. For backfill or earth cover exceeded 8 feet, refer to Los Angeles City Bureau of Engineering Standard Plan S-251, latest edition, for maximum allowable trench width and bedding material. Unless specified otherwise, provide minimum 4 inches washed sand bedding below the pipe barrel. If final elevation is not shown on contract drawings, place all piping to a depth no less than 24 inches.

G. Corrections: Required of all unauthorized excavations made below indicated depths, as recommended by the Soil Engineer at no added cost to the City.

3.7 FILLING

A. General: Construct in accordance with the APPROVED SOILS REPORT and Section 300-4- UNCLASSIFIED FILL of SSPWC. Place soil in layers not exceeding 8-inches thickness, compacted to a relative compaction of not less than 95% when tested in accordance with Section 211-2 - COMPACTION TESTS of SSPWC.

B. Fill in planting areas shall be compacted to no more than 90% relative compaction. For Topsoil fill in the upper 24" of the profile, see Section 32 90 00 LANDSCAPE PLANTING for more information.

C. Fill all holes on the existing jobsite or resulting from site-clearing or demolition operations.

3.8 BACKFILLING

A. Prior to Backfilling: Remove any debris, trash or foreign material from excavation.

B. Inspection Required: Prior to backfilling operations, for compaction of subgrade or trench bottom.

C. Placement of Backfill: in accordance with the APPROVED SOILS REPORT in layers not exceeding 8-inches thickness, moisten to optimum moisture content and tamp until 95% relative compaction is achieved and finish to designated elevations providing for any anticipated settlement and shrinkage.

D. Pipe Bedding and Backfill Over Underground Piping and Conduit: Place bedding and backfill material in conformance with provisions specified [Subsection 2.1 (D) herein] and in Section 02545 - STORM DRAIN SYSTEM, Division 15 - PLUMBING and Division 16 – ELECTRICAL of the Project Manual. Do not place backfill materials until the Inspector has inspected and approved the pipe installation. The bedding shall be compacted and shaped to form a firm base for the pipe and conduit. The initial backfill shall be placed in two lifts. The first lift shall be to the spring line of the pipe or conduit. The initial backfill shall be lightly compacted by light tamping. The balance of backfill shall be placed in accordance with [Subsection 3.8 (C)] herein.

E. For Backfill Against Retaining Walls: Do not place until such walls have gained sufficient strength to resist backfill loads and backside of such walls have been properly waterproofed to details and specifications without prior approval of the BCA INSPECTOR. Bring backfill up to finish grade or to subgrade for paving as indicated on the drawings.

F. Slurry Backfill: In areas where specified and/or around the utilities, vaults or other structures where the Soil Engineer determines that it is not practical to attain the required compaction by the mechanical methods or water densification, provide a trench slurry backfill 60-E0.7 (Class 100-E-100).

3.9 DISPOSAL OF EXCESS AND WASTE MATERIALS

A. Removal from City's Property: Remove waste materials, including unacceptable excavated material, trash and debris, and dispose of it off City's property in a legal manner and to conform with the requirements shown in Section 01572 – CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT of Division 1 - General Requirement

B. Provide written consent of the owner of the property upon which the surplus material is to be deposited, pursuant to Section 01572 – CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT specified above and Section 300-26 - SURPLUS MATERIAL of SSPWC.

END OF SECTION 31 00 00

31 10 00

SITE CLEARING AND DEMOLITION

PART 1 - GENERAL

1.1 DESCRIPTION

Perform all site clearing and demolition on the job site as indicated on the Contract Drawings.

A. Demolition shall include the removal and disposal of all constructed site features designated on the Contract Drawings for removal, including all below-ground components such as footings, etc.

B. Site clearing shall consist of removing all vegetation such as trees, roots, stumps, shrubs, brush, limbs; and stone, boulders, wood and other vegetative growth from the ground surface. Clearing shall also include the removal and disposal of trash piles, rubbish, debris, etc.

C. CONTRACTOR shall furnish all tools, equipment materials and supplies and shall perform all labor to complete the work associated with removal of all designated natural and artificial material from the areas of work as indicated in the contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide materials not specifically described but required for completion of the work of this section as selected by the CONTRACTOR subject to the approval of the ENGINEER.

PART 3 - EXECUTION

3.1 SITE CONDITIONS

A. Examine the job site and conditions under which work of this section will be performed. Correct conditions detrimental to timely and proper site-clearing operations, as directed by the ENGINEER. Do not proceed until such detrimental conditions have been corrected.

3.2 PROTECTION

A. Protect existing trees and shrubs indicated to remain in the Contract Drawings per tree protection requirements in sheets G104.

1. Prior to commencement of site clearing work, all Tree Protection fencing shall be installed and approved by the ENGINEER.

3.3 SITE CLEARING AND GRUBBING

A. General:

1. For drawing clarity, not all trees, shrubs, brush, grass, weeds, or exact amount of trash or debris are shown on the drawings. CONTRACTOR shall carefully study the Contract Drawings and visit the job site and verify the extent of the work to be done prior to bidding.

2. 48 hours prior to commencement of clearing, grubbing and stripping operations, the CONTRACTOR shall request a site meeting to include the BCA inspector, PROJECT MANAGER, project ENGINEER and other CITY staff as designated by the PROJECT MANAGER to review and clearly mark all existing vegetation to remain, and to mark the extents of any required tree protection fencing.

B. Site clearing operations

1. Remove all surface vegetation indicated on the Contract Drawings for removal. Remove all roots, and stumps and other undesirable materials to a depth of at least (2) feet below existing ground surface.

2. Remove all concrete and masonry debris, including footings.

3. Remove all existing rubbish and debris or material resulting from work operations of this section as soon as possible and dispose of properly per general requirements.

4. Where active utility lines need to be capped or plugged, perform such work in accordance with requirements of the utility company or government agency having jurisdiction and conform to relevant provisions of the general requirements.

5. Existing utility services to remaining structures are to be maintained at all times.

3.4 STRIPPING

A. Stripping shall include the removal and disposal of all surface organic sod, grass and grass roots, topsoil and other objectionable material remaining after clearing and grubbing from the areas designated in the Contract Drawings. The depth of stripping shall be as shown on the drawings and/or specified herein.

B. Prior to beginning any excavation or fill, strip the existing topsoil to a depth of 12” or as sufficient to remove all organic material, and stockpile for future use. In general, topsoil shall be removed where structures are to be built, trenches dug, and roads, parking lots, walks, and similar improvements constructed within the areas presently covered with topsoil.

3.5 TOPSOIL

A. If on site topsoil is specified for reuse, stockpile topsoil in an area clear of new construction or where directed by the ENGINEER or the CONSTRUCTION MANAGER.

B. Maintain topsoil stockpiles in a manner which will not obstruct the natural flow of drainage.

1. Maintain the stockpiled topsoil free from debris and trash.

2. Keep the stockpiled topsoil moist to prevent drying out and creating a dusts source.

3. Place and compact topsoil backfill in the planting areas where designated on Contract Drawings. See section landscape planting for amendment requirements.

3.6 REMOVAL AND DISPOSAL OF CLEARING AND GRUBBING DEBRIS

A. General: all undesirable materials removed during site clearing and demolition shall be disposed of per general requirements. No accumulation of flammable material shall remain inside the limit of work.

3.7 STORAGE OF MATERIALS AT THE JOB-SITE

A. Storage of removed materials is not permitted beyond brief accumulation awaiting pick up by removal trucks. Delays in the removal of site-clearing materials from the job site shall be subject to the approval of the CONSTRUCTION MANAGER or the BCA inspector.

END OF SECTION 31 10 00

SECTION 32 00 00

GENERAL LANDSCAPE

PART 1 - GENERAL

A. The GENERAL CONDITIONS and GENERAL REQUIREMENTS, the latest edition and supplements of the Standard Specifications For Public Works Construction, hereinafter referred to as (SSPWC) adopted by the Board Of Public Works and the City of Los Angeles including the City of Los Angeles Department Of Public Works SSPWC additions and amendments (Brown Book) shall be made a part of these plans.

1. Website: http://eng2.laCITY.org/brownbook/frame.cfm

B. Where conflicts occur between the GENERAL CONDITIONS and GENERAL REQUIREMENTS and the SSPWC, the GENERAL CONDITIONS and GENERAL REQUIREMENTS shall take precedence. Where conflicts occur between these LANDSCAPE SPECIFICATIONS and the SSPWC, these LANDSCAPE SPECIFICATIONS shall take precedence.

1. Subsections included within these LANDSCAPE SPECIFICATIONS modify or add to the corresponding subsection (by number) of the SSPWC, latest edition with current yearly supplements; where options for materials and/or methods appear in the SSPWC, the option listed herein shall be used.

C. Precedence of contract documents shall be in accordance with the GENERAL CONDITIONS.

D. Contract work area shall be as defined on the title sheet, or as indicated on the plans by means of a contract limit of work line.

E. Permits and licenses: CONTRACTOR shall procure all required CITY, county and state permits and licenses, including municipal business license and pay all charges and fees for the same.

F. These LANDSCAPE SPECIFICATIONS apply only to work described on sheets L201-L803.

G. The project site shall be maintained in conformance with Section 7-8: Project Site Maintenance of the SSPWC and the requirements of the Project Manual.

1.1 PLANS AND SPECIFICATIONS

A. The CONTRACTOR shall be responsible for issuing a complete set of plans and specifications to all Sub-Contractors.

B. CONTRACTOR shall maintain a current set of plans reflecting all issued plan clarifications, RFI's and change orders at all times.

C. GEOTECHNICAL INFORMATION: The Geotechnical Report dated April 18, 2022, the Supplemental Geotechnical Report dated July 24, 2023, and LADBS Approval letters dated June 23, 2022 and August

26, 2023 are part of the Project Manual. CONTRACTOR shall comply with all soils report recommendations specified and other instruction directed by the GEOTECHNICAL ENGINEER. In case of conflicts between another part of the Project Manual and Geotechnical Report the most restrictive condition shall govern unless otherwise approved by the GEOTECHNICAL ENGINEER.

1.2 SCHEDULE OF WORK

A. The CONTRACTOR shall schedule all work in accordance with the GENERAL REQUIREMENTS.

B. The PROJECT MANAGER, CONSTRUCTION MANAGER, ENGINEER, CONTRACTOR and Department Of Recreation & Parks (RAP) maintenance personnel shall coordinate the CONTRACTOR's schedule of work with ongoing RAP maintenance of the facility outside the work area and the CONTRACTOR's maintenance of the area within the work area, as defined in the maintenance portion of the LANDSCAPE PLANTING section.

1.3 JOB START MEETING

A. The CONTRACTOR shall schedule a job start meeting with the PROJECT MANAGER after receipt of the notice to proceed. This meeting shall include the following participants: CONTRACTOR, PROJECT MANAGER, CONSTRUCTION MANAGER, BCA Inspector, ENGINEER, and RAP site maintenance personnel prior to the commencement of meeting to review the content of the plans and discuss the coordination of the project with RAP operations at the project site. The pre-construction meeting can be held at the same time as the job start meeting at the CONTRACTOR’s discretion.

1.4 QUALITY ASSURANCE

A. Labor: use adequate number of skilled laborers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this section.

B. Codes and regulations: conform to the applicable Los Angeles City Building Code and Amendments, the SSPWC latest edition, Los Angeles City Bureau of Engineering Brown Book, latest edition and provisions hereinafter specified in the Project Manual, and all other applicable codes and regulations.

C. Permits: CONTRACTOR shall submit inspection/acceptance certificates required by the governing authorities and pay for all the required permits, plan check, inspections, and fees unless otherwise noted. CONTRACTOR shall arrange for and make required inspections and tests.

D. Inspections: all work and materials are subject to inspection and approval by the BCA inspector, PROJECT MANAGER or project ENGINEER. Any work done without required inspection will be subject to rejection per Section 2-11 of the SSPWC.

1. The CONTRACTOR shall notify the BCA Inspector and PROJECT MANAGER three (3) days prior to requested date of inspection. See each section herein for required inspections for each type of work.

2. Pre-final inspection. Pre-final inspection shall be in accordance with Article 46 of the GENERAL CONDITIONS.

3. Contract final inspection: contract final inspection shall be in accordance with the GENERAL CONDITIONS

4. In-plant inspection: CONTRACTOR shall be responsible for scheduling all required in-plant inspections with the bureau of contract administration. In-plant inspection requirements shall be determined by BCA materials control unit, and shall include, but not limited to, the following items:

1. Galvanizing of fabricated steel items	6. Shop welding of fabricated steel items
2. Galvanizing of chain link fabric and hardware	7. Shop painting of fabricated steel items
3. Steel grates and frames	
4. Portland cement concrete & base	
5. Asphalt concrete and base	

1.5 MATERIALS SUBMITTAL

The CONTRACTOR shall make required submittals in accordance with the GENERAL REQUIREMENTS.

1.6 SUBSTITUTIONS AND "OR EQUAL" SUBMITTAL

The CONTRACTOR shall make substitution submittals in accordance with the GENERAL REQUIREMENTS.

1.7 RECORD DRAWINGS (AS-BUILTS) SUBMITTALS

Record drawings shall be in accordance with the GENERAL REQUIREMENTS. See Section 11 - IRRIGATION SYSTEMS for additional requirements.

1.8 DEPARTMENT OF PUBLIC WORKS STANDARD PLANS

The following department of public works standard plans are to be included as a part of these plans:

Number	title
S-442-6	Curb Ramps
S-601-3	Detectable Warning Surfaces
S-463-3	Pedestrian Pipe Guardrails and Handrails

SSPWC

2017 edition of the Greenbook
Website: http://eng.laCITY.org/techdocs

1.9 LAYOUT OF WORK & GRADE SHEET APPROVAL

All spot elevations, grading contour lines, and grades shown on the plans for grading, pavement and drainage improvements shall be staked by a California licensed land surveyor provided by the CONTRACTOR at no additional cost to the CITY per the GENERAL REQUIREMENTS. Grade stakes shall be a minimum size of 1" x 2" and shall be driven a minimum of 12" into ground; each grade stake shall be protected by a flagged lath projecting 24" above ground; grade stakes disturbed by on-site activities shall be reset by the surveyor. If specified on the plan the CONTRACTOR shall have his surveyor provide grade sheets. The grade sheets shall be submitted to the CONSTRUCTION MANAGER for approval one week in advance of any grading operations.

1.6 PROTECTION OF PERSONS AND PROPERTY

A. General: comply with provisions of Article 30 - Protection of Persons And Property And Restoration Of Existing Improvements in the GENERAL CONDITIONS.

B. Protections of persons and property: provide and install signs, barricades and other required devices or techniques at danger points in the job site to guard against accidents, etc.

C. Existing improvements: protect against damage resulting from CONTRACTOR'S operations. Repair or replace damaged items to the full satisfaction of the CITY at no additional cost to the CITY.

1. See: Tree Protection Requirements, sheet G104 for addition requirements.

D. Existing utilities: utilities shown on the drawings are shown pursuant to a search of available records and are shown as a matter of information and not as a matter of fact. Conforming with GENERAL REQUIREMENTS and other sections of the Project Manual, the CONTRACTOR shall locate existing underground utilities in areas of work. If utilities are to remain in place, provide adequate means of support and protection during earthwork operations.

1. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, CONTRACTOR shall notify the CONSTRUCTION MANAGER immediately for direction. CONTRACTOR shall cooperate with CITY and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility company.

2. Do not interrupt existing utilities serving facilities occupied and used by CITY and others, during occupied hours, except when permitted in writing by the PROJECT MANAGER and then only after acceptable temporary utility services have been provided.

3. Provide a minimum of 48-hour notice to the PROJECT MANAGER and receive written notice to proceed before interrupting any utility. Obtain clearance and notify all utility companies in the area and call underground service alert by calling (800) 422-4133. Deliver utility clearance ticket number to the BCA inspector prior to the start of any work.

4. Demolish and completely remove from site existing underground utilities ***indicated to be removed***. Coordinate with utility companies for shut-off of service if lines are active.

2.0 ENVIRONMENTAL CONTROL

CONTRACTOR shall comply with provisions of Article 5 in GENERAL REQUIREMENTS – Environmental Control and Mitigation, to include:

A. Site sanitation and odor control: use means necessary to provide sanitary conditions at job site and prevent a nuisance to the public, to neighbors, and to other work being performed on or near the job site. Comply with all applicable codes and ordinances.

B. Dust control: use means necessary to prevent dust becoming a nuisance to the public, to neighbors, and to other work being performed on or near the job site. Comply with all applicable codes and ordinances.

C. Noise and vibration: comply with requirements of CITY noise ordinances and mitigation specified in general requirements.

D. Storm water pollution control: the CONTRACTOR is responsible for obtaining all required permits and deploying all required storm water pollution control measures for construction activities, including when required:

1. Comply with the state general construction activity storm water permit.

2. Wet weather erosion control plan (WWECP)

3. The CONTRACTOR Stormwater Pollution Prevention Plan (SWPPP): CONTRACTOR is responsible for the payment of the notice of intent (NOI) to the State of California Water Resources Control Board to comply with the California General Construction Activity Stormwater Permit (NPDES NO. CAS000002), and the prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) document, which is to be prepared by a qualified SWPPP developer (QSD). This document is to be submitted to the PROJECT MANAGER for approval and submission to the State Water Resources Control Board. The SWPPP must describe the erosion control practices being implemented during construction and the selection and implementation of appropriate BMP's to account for site-specific and seasonal conditions. CONTRACTOR shall draft the SWPPP before start of construction and submit it to the ENGINEER for approval; no construction work shall commence without an approved SWPPP. The document is to remain on the construction site and all of the measures stated in the document are to be implemented during the duration of construction. The QSD shall be responsible for creating, revising, overseeing and implementing the SWPPP and the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities.

E. Migratory Bird Protection: In compliance with the Migratory Bird Treaty Act and California Fish and Game Code Sections 3503 and 3503.5, all designated tree removal shall take place outside of the nesting bird season (February 1 to September 1), unless specifically authorized by the PROJECT MANAGER in writing. In accordance with these regulatory requirements, removal of trees may be performed between September 2 and January 31 to avoid the nesting bird season. If tree removal or adjacent construction activities are to occur during the nesting bird season, all suitable habitats inside the limit of work and extending 500' beyond, shall be thoroughly surveyed for the presence of nesting birds by a qualified biologist (or a qualified arborist) at the CONTRACTOR's expense, a minimum of (3) days prior any tree removal. If any active nests are detected, tree removal will be suspended, and the area will be flagged. A minimum 250 foot (500 foot for raptors) non-disturbance buffer shall be established (a modification of this buffer may be determined by the monitoring biologist and in consultation with US Fish and Wildlife Service and California Department of Fish and Wildlife), and construction activity inside the established buffer shall be suspended until the nesting cycle has been completed, and the monitoring biologist determines that the nest has fledged.

END OF SECTION 32 00 00

SECTION 32 12 16

ASPHALT PAVING AND RESURFACING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Provide all work indicated on the drawings and in other sections of the project manual; including but not limited to:

1. Asphalt concrete paving.
2. Asphalt concrete paving repairs.
3. Seal coating.
4. Concrete wheel bumpers.
5. Parking lot striping and disabled symbol marking.
6. Disabled parking accessible signage.

1.2 SUBMITTALS

A. Asphaltic concrete:

1. Submit a mix design for asphaltic concrete prepared by a material laboratory under the direction of a California Registered Engineer.

2. Certificates: submit certificates signed by the materials producer and the asphalt paving Sub-CONTRACTOR, stating that materials meet or exceed the specified requirements prior to any fabrication. Submit the certified delivery tickets for each truckload of asphaltic material delivered to the job site.

B. Product data: submit to the ENGINEER the data on all proprietary items, materials, etc. To be used in the work of this section, as conforming to the specified requirements of this section.

PART 2 - PRODUCTS

2.1 ASPHALT CONCRETE MATERIALS

A. Asphalt: Asphalt to be used shall be as follows:

1. Asphalt for parking lots and roadway construction shall be type C2-PG 64-10-50, (203-6.3) or as otherwise indicated in Contract Drawings. See applicable details in Contract Drawings.

2.2 MISCELLANEOUS MATERIALS

A. Aggregate base: as specified in Section 31 00 00 – GENERAL EARTHWORK.

B. Asphalt sealcoat: The asphalt-based sealcoat shall be as specified on Contract Drawings:

1. Where indicated, the sealcoat shall be Guardtop asphalt-based sealcoat or approved equal. Apply per Manufacturer's instructions. Refer to manufacturer's website for technical bulletin and SDS sheet.

C. Prime coat: consisting of Grade SC-250 liquid asphalt, applied at a rate between 0.10 and 0.25 gallon per square yard, conforming to section 302-5.3 - Prime Coat of the SSPWC.

D. Tack coat/binder: Grade SS-1H emulsified asphalt at an approximate rate of 0.05 to 0.10-gallon per square yard), conforming to section 302-5.4 - Tack Coat of the SSPWC.

E. Adhesive for securing of concrete wheel bumpers to concrete paving: a long curing, two-component type epoxy adhesive, manufactured by Edeco, Furance, Andrew Brown or approved equal.

F. Paint for parking stalls and game court striping shall be regular dry type non-reflective, applied at a wet film thickness of 15 mil min. traffic paint, as manufactured by Vista Paint, or an approved equal in the specified color, per SSPWC (310-5), (210-1).

PART THREE - EXECUTION

3.1 JOB-SITE CONDITIONS

A. Examine the areas and conditions under which work of this section will be performed. Correct conditions detrimental to timely and proper completion of the work, as directed by the ENGINEER.

3.2 ASPHALT CONCRETE PAVING

A. Asphalt paving thickness and courses shall be as indicated on the contract drawings and details.

B. Installation of underground piping crossing asphalt paving: where pipe or conduit is to be installed under existing A.C. paving, the paving shall be removed in clean straight parallel lines by saw-cutting. The resulting trench shall be backfilled to within 1" of the undersides of the existing A.C. paving with a two-sack concrete slurry mix. The existing A.C. paving shall have a tack coat applied before the new A.C. is placed.

C. Construction:

1. Prime coat: apply to the subgrade or aggregate base prior to placing the asphalt concrete and subbase; and to other surfaces designated by the BCA Inspector.

2. Tack coat: apply to concrete surfaces abutting new A.C. paving at least 24 hours prior to laying new work; apply to the surface of any course before the succeeding course or all cold pavement joints, curbs, gutters, manholes and the like. All the surfaces shall be free of water, foreign material or debris when the tack coat is applied.

3. Laying and compaction: in accordance with section 302-5.5 Distribution and Spreading and Section 302.5.6 - Rolling of the SSPWC.

4. Finish asphalt concrete surfaces smooth and even, to indicated elevations without low spots, hollow or irregularities and properly sloped for drainage.

D. Testing: Upon completion, the pavement shall be true to grade and cross section. When a straight edge is laid on the finished surface, the surface shall not vary from the edge of the straightedge no more than ⅛" inches, except at the intersection or at the change of grade.

1. Any area that is not within this tolerance shall be brought to grade by removing the paving material in the area to be repaired by an approved method. Provide a minimum laying depth of 1" inches of the new pavement material at the joint line. Repairs shall not be made to the pavement surface by feather edging at the joints.

E. Sealcoat: 30 days after the asphalt concrete surfacing was installed, apply one coat of approved sealcoat to the surface, in accordance with manufacturer's instructions. Before application of the seal coat, the surface of the newly constructed asphalt concrete shall be thoroughly cleaned.

3.3 ASPHALT SEAL COATING

A. Required: over new asphalt concrete paving, or as otherwise directed in Contract Drawings.

B. Surface preparation: Clean all existing asphalt concrete surfaces of oil, grease, and foreign materials.

C. The CONTRACTOR shall not apply any seal coat if the weather is not suitable for the application. The CONTRACTOR shall notify the CONSTRUCTION MANAGER and the BCA Inspector minimum 24 hours in advance of the date the CONTRACTOR intends to begin work.

D. Protection: provide as required to avoid getting seal coat materials on exposed concrete, masonry and/or miscellaneous adjacent surfaces.

E. Application: apply 2 coats per manufacturer's instructions.

F. Curing: allow for curing and drying per manufacturer's instructions.

3.4 INSTALLATION OF CONCRETE WHEEL BUMPERS

A. Locations: in parking stalls where indicated on the Contract Drawings and details.

1. On asphalt concrete: secure in place with steel drift pins or pipe driven to at least 1/4" below top of a surface of the bumper unit. Fill holes with non-shrink grout to top surface of unit.

3.5 PARKING LOT STRIPING, LETTERS AND ARROWS.

A. Materials: as specified above.

B. Lines: 4" wide, or as indicated on the drawings.

C. Letters: sizes and strokes as indicated on the drawings. Minimum dry paint thickness shall be 9 mils.

D. Arrows: 10" stroke with proportionate head.

E. Handicapped parking striping: sizes and colors are in conformance with the State Of California, Code Of Regulations, Title 24. An international symbol of accessibility symbol shall be stenciled at the rear of the parking space. Each accessible parking unloading zone shall be marked.

F. Preparation: all surfaces to be free of dirt, grease or other foreign materials. Remove existing markings by sandblasting or other approved methods.

G. Application: apply one heavy undiluted coat with traffic line painting equipment in locations indicated on the drawings in uniform coverage, free from light spots and with all edges clean-cut and true. Paint by spray can shall not be allowed. Wet paint thickness shall be 15 mils.

3.6 DISABLED ACCESSIBILITY PARKING SIGN

A. Required: where indicated on the contract drawings Disabled Accessibility Parking Signage Complying with State of California, Code of Regulation, Title 24.

B. Materials and fabrications: constructed of 3m Scotchlite brand reflective sheeting laminated to 18-gage heavy duty sheet steel and silkscreened in transparent blue with "disabled symbol" and/or the appropriate message in white. Sign to have a weather-resistant finish.

END OF SECTION 32 12 16

SECTION 32 14 33
PERMEABLE PAVERS

PART ONE: GENERAL

1.1 REFERENCES

A. American Society of Testing Materials (ASTM)

1. C936, Standard Specification for Solid Concrete Interlock Paving Units
   Clarification, Section 1.2 – Hydro-Flo pavers have the desired special feature of being permeable. Therefore, regarding Section 5.4, by design, the absorption rate is greater for Hydro-Flo pavers than the 5% desired for non-pervious pavers. Similarly, for Section 5.3 the compressive strength for Hydro-Flo pavers is less than the 8,000 psi required for non-pervious pavers as the main property of pervious concrete, permeability, is inversely proportional to strength.
2. C140, Standard Test Methods of Sampling and Testing Concrete Masonry Units
3. C136, Method for Sieve Analysis for Fine and Coarse Aggregate
4. C33, Specification for Concrete Aggregates
5. D2940, Standard Specification for Graded Aggregate Material for Bases

1.2 QUALITY ASSURANCE

A. Utilize an installer who has successfully completed installations similar in type and size to this

B. project. Installer shall provide certification of experience.

C. As applicable by state/provincial and local laws, contractor shall hold a current contractor's and business license in the state/ province and locality where work is performed.

1.3 SUBMITTALS

A. In accordance with Conditions of the Contract and Division 1 Submittal Procedures Section.

B. Manufacturer's drawings and details: Indicate perimeter conditions, relationship to adjoining materials and assemblies, [expansion and control joints,] concrete paver [layout,] [patterns,] [color arrangement,] installation [and setting] details.

C. Sieve analysis per ASTM C 136 for grading of bedding and joint sand.

D. Samples :

1. Four representative full-size samples of each paver type, thickness, color, finish that indicate the range of color variation and texture expected in the finished installation. Color(s) selected by Landscape Architect as specified on contract drawings.
2. Accepted samples become the standard of acceptance for the work.
3. Manufacturer's catalog product data, installation instructions, and material safety data sheets for the safe handling of the specified materials and products.
4. Paver Installation Subcontractor:
5. A copy of Subcontractor's current certificate from the Interlocking Concrete Pavement Institute Concrete Paver Installer Certification program.

E. Mock-Ups:

1. Install a 5 ft x 5 ft paver area.
2. Use this area to determine surcharge of the bedding sand layer, joint sizes, lines, laying pattern(s), color(s) and texture of the job.

3. This area will be used as the standard by which the work will be judged.
4. Subject to acceptance by owner, mock-up may be retained as part of finished work.
5. If mock-up is not retained, remove and properly dispose of mock.

1.4 DELIVERY, STORAGE AND HANDLING

A. General: Comply with Division 1 Product Requirement Section.

B. Refer to manufacturer's ordering instructions and lead-time requirements to avoid construction delays.

C. Deliver interlocking pavers to the site in plastic wrapped cubes capable of transfer by fork lift. Unload pavers at job site in such a manner that no damage occurs to the product.

D. Cover sand and topsoil with waterproof covering to prevent exposure to rainfall or removal by wind. Secure the covering in place.

E. Store materials protected such that they are kept free from mud, dirt, and other foreign materials.

1.5 ENVIRONMENTAL CONDITIONS

A. Do not install sand or pavers during heavy rain or snowfall.

B. Do not install frozen sand or topsoil.

.

PART 2: PRODUCTS

2.1 PAVERS

A. Dimensions, Quantities and Weight A 8” x 4” x 2 3/8”

B. Stones per SF: 4.6

C. Stones per pallet: 450

D. Coverage: 98 sf per pallet

E. Weight: 26 lb/sf, 2548 lb/pallet

2.2 CRUSHED STONE FILLER, BEDDING, BASE AND SUBBASE

A. Crushed stone with 90% fractured faces, LA Abrasion < 40 per ASTM C131, minimum CBR of 80% per ASTM D1883.

B. Do not use rounded river gravel.

C. All stone materials shall be washed with less than 1% passing the No. 200 sieve.

D. Joint/opening filler, bedding, base and sub-base: conforming to ASTM D448 gradation as shown in Tables 1, 2, 3 and 4 below:

E. Depths of each layer per detail.

Table 1: ASTM C33 Fine Aggregate Joint Filler – Grading Requirements:

Sieve Size	Percent Passing
3/8 inch (9.5 mm)	100
No. 4 (4.75 mm)	95-100
No. 8 (2.36 mm)	80-100
No. 16 (1.18 mm)	50-85
No. 30 (600 µm)	25-60
No. 50 (300 µm)	5-30
No. 100 (150 µm)	0-10

Table 2: No. 8 Bedding Aggregate – Grading Requirements:

Sieve Size	Percent Passing
1/2 inch (12.5 mm)	100
3/8 inch (9.5 mm)	85 to 100
No. 4 (4.75 mm)	10 to 30
No. 8 (2.36 mm)	0 to 10
No. 16 (1.18 mm)	0 to 5

Table 3: No. 57 Base Aggregate – Grading Requirements:

Sieve Size	Percent Passing
1 1/2 inch (37.5 mm)	100
1 inch (25 mm)	95 to 100
1/2 inch (12.5 mm)	25 to 60
No. 4 (4.75 mm)	0 to 10
No. 8 (2.36 mm)	0 to 5

Table 4: No. 2 Subbase Aggregate – Grading Requirements:

Sieve Size	Percent Passing
3 inch (75 mm)	100
2 1/2 inch (63 mm)	90 to 100
2 inch (50 mm)	35 to 70
1 1/2 inch (37.5 mm)	0 to 15
3/4 inch (19 mm)	0 to 5

2.3 NON-WOVEN PERMEABLE GEOTEXTILE

A. As indicated in the Contract Drawings.

2.4 PERFORATED PIPE

A. Refer to Section 33 40 00 Storm Drain System.

PART 3: EXECUTION

3.1 EXAMINATION

A. Subgrade shall be compacted in accordance with the geotechnical engineer.

B. Verify that base is dry, uniform, even, free of any sediment (if open-graded), and ready to support sand, pavers and imposed loads.

C. Verify gradients and elevations of base are correct.

D. Verify location, type, installation and elevations of edge restraints around the perimeter area to be paved.

E. Beginning of installation means acceptance of base and edge restraints.

3.2 INSTALLATION

A. Note: The specifier should be aware that the top surface of the pavers after compaction may be 1/8 to 1/4 in. (3 to 7 mm) above the final elevations after compaction. This difference in initial and final elevations is to compensate for possible minor settling.

B. Spread the leveling course aggregate evenly over the compacted, open-graded base course and screed uniformly to 1 – 1 ½ in. (25 - 40 mm) thickness. The screeded aggregate should not be disturbed. Place sufficient aggregate to stay ahead of the laid pavers.

C. Ensure that pavers are free from foreign materials before installation.

D. Lay the pavers in the pattern(s) as shown on the drawings. Maintain straight pattern lines.

E. Joints between the pavers shall be between 1/16 in. and 1/8 in. (2 to 4 mm) wide.

F. Fill gaps at the edges of the paved area with cut pavers or edge units.

G. Cut pavers to be placed along the edge with a double-bladed splitter or masonry saw.

H. Compact and seat the pavers into the screeded aggregate using a low amplitude, 75-90 Hz plate compactor capable of at least 5,000 lbs. (22 kN) centrifugal compaction force. Note: A rubber or neoprene pad between the compactor and grids is necessary to prevent cracking or chipping on textured surfaces.

I. Vibrate and compact the pavers again, sweeping a small fraction of ASTM C33 fine aggregate or equivalent into the joints and openings until it is within ½ in. (13 mm) from the top surface. This will require at least two or three passes with the compactor. Do not compact within 3-ft (1 m) of the unrestrained edges of the paving units.

3.3 EXTRA MATERIALS:

A. Contractor shall provide owner with (2) 50lb sacks of additional joint sand for maintenance and repair. Contractor shall provide owner (10) pavers of each color used for maintenance and repair. Pavers shall be from the same production run as installed materials.

END OF SECTION 32 14 33

SECTION 32 31 13

CHAIN LINK FENCING AND GATES

PART ONE - GENERAL

1.1 SUMMARY

A. All permanent chain link fencing, gates and appurtenances as indicated on the Contract Drawings and as specified herein, and as needed for complete and proper installation.

B. Related Work Sections:

1. Concrete Work in Section 03 30 00.

1.2 QUALITY ASSURANCE

A. Labor: Use adequate number laborer's who are thoroughly trained and skilled in the fencing trade and who are completely familiar with the specified requirements and methods needed for the proper executions of the work of this Section.

B. Codes and Regulations: Perform all work in strict accordance with applicable Government Codes and Regulations, meeting all "Safety Standards" of CAL/OSHA, County and the current Los Angeles City-Building Code and applicable Amendments.

C. Qualification of Fabricators: Provide adequate number of fabricators who are thoroughly familiar with the specified requirements regarding fabrication of fencing fabrics, posts and gates.

D. Quality of All Materials and Accessories: All materials and accessories shall conform with the requirements of the Standard Specifications for Public Works Construction (SSPWC) and specified herein.

1.3 SUBMITTALS

A. General: Comply with applicable provisions the GENERAL REQUIREMENTS and other Sections of the Project Manual.

B. Product Data:

1. CONTRACTOR shall provide Shop drawings in sufficient detail to show layout of fence and gate, elevation details, fabrication, assembly, hardware, installation, anchorages and interface of work of this Section with work of adjacent trades.

2. Manufacturer's Specifications and other data needed to prove compliance with the specified requirements for chain link fabric, posts and rails.

3. Manufacturer's recommended installation procedures which when reviewed and approved by the ENGINEER, will become the basis for accepting or rejecting actual installation procedures used on the Work.

4. Vinyl coating and color for chain link fabric. Note: For special post coating, use section 206-6.1 of SSPWC.

1.4 PRODUCT HANDLING

A. Protection: Protect fencing fabric, posts and gate assemblies before, during and after installation. Properly package and identify and note location of unassembled items (hardware, etc.) for protection against damage.

B. Delivery: Deliver all items to be built into concrete or masonry work in time, so as not to delay construction and installation operations.

PART TWO - PRODUCTS AND FABRICATION

2.1 MATERIALS

A. General: All materials for fencing, posts and gates and fasteners to be new and hot-dipped galvanized.

B. Galvanizing: Where noted on drawings or Specified herein, metal products shall be hot-dipped galvanized, and comply with requirements of Section 210-3 - GALVANIZING of SSPWC, except as modified herein.

C. Fabric:

1. Galvanized steel chain link fabric shall conform to ASTM A392 - SPECIFICATION FOR ZINC COATED STEEL CHAIN LINK FENCE FABRIC and A817 - SPECIFICATION FOR METALLIC - COAT STEEL WIRE FOR CHAIN LINK FENCE FABRIC. Fabric shall be 2-inch mesh of 9-gage steel wire (minimum 75,000 psi tensile strength) galvanized with 1.2 oz/ft^2 zinc, in single fabric width for the entire height. Top and bottom selvedges shall be knuckled.

   Vinyl coated galvanized steel fabric, when specified, shall conform to ASTM F 668, Class 2b, "fused and adhered", and meet the galvanizing requirements contained in this section, (206-6.3).

2. Fabric Tie: 11 gage galvanized steel used to fasten the fabric to posts, rails and gate frame.

D. Posts:

1. Schedule 40 Standard weight pipe conforming to ASTM F-1083 - SPECIFICATION FOR PIPE, STEEL, HOT-DIPPED ZINC - COATED (GALVANIZED) WELDED, FOR FENCE STRUCTURES.

2. Line Posts: 2 3/8-inch O.D. complete with malleable iron eye-top of suitable design to provide moisture-proof cap.

3. Terminal (End) and/or Corner Posts: 2 7/8-inch O.D. with malleable iron moisture-proof cap.

4. Gate Posts: 4-inch O.D. complete with malleable iron moisture-proof cap.

E. Top and Bottom Rails: 1-5/8 inch O.D. standard weight steel pipe complete with end caps and end clamps for attachment to posts.

F. Horizontal and Diagonal Bracing:

1. Horizontal Rails with Diagonal Bracing to all end sections: Intermediate horizontal rail, 1-5/8-inch O.D. standard weight steel pipe complete with end caps and clamps for attachment to posts.

2. Diagonal: 3/8-inch diameter steel truss rods complete with turn buckles and attachments to post.

G. Tension Wire: For fabric of 9-gage and heavier use 6-gage galvanized coiled spring steel wire.

H. Galvanizing Repair Material: Galvanized surfaces which have been damaged in transport or during installation shall be re-coated using the metalizing process or zinc oxide, zinc dust paint per Section 210-3.5 of the SSPWC.

I. Galvanized Steel Brace Bands, Tension Bands or Bars and Tension Rods: Brace bands shall be galvanized**,** minimum of 3/16 inch x 3/4-inch wide; tension bands or bars shall be 3/16 inch x 3/4-inch wide and tension rods shall be 3/8 inch diameter galvanized steel rod with galvanized turnbuckles or other suitable tightener or tightening devices.

2.2 GATE HARDWARE

A. Swinging Gate:

1. Hinges: Heavy-duty ball and socket, industrial service**,** offset type**,** minimum 3 inch in width.

2. Latch for Single Swing Gate: Heavy malleable iron, fork type with provisions for padlocking.

3. Latch for Double Swing Gate: Heavy center drop rod latch assembly with provisions for padlocking. For hold-back sleeves provide steel pipe of diameter greater than of drop rod diameter and of length **[**indicated on the Drawing**].]**

2.3 GATE CONSTRUCTION

A. Swinging Gate Frame Construction:

1. All welded, fabricated of 1-7/8 inch O.D., galvanized steel pipe; all welded joints ground smooth and coated with a galvanizing repair material; all in accordance with reviewed Shop Drawings.

2. Frame Bracing: Use galvanized steel truss rods with galvanized turn buckles as hereinbefore specified.

3. Fabric: Same as hereinbefore specified for fencing, placed on exterior side of gate frame, as indicated, in same manner as specified for fencing.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the work. Do not proceed until detrimental conditions are corrected.

3.2 CHAIN LINK FENCE INSTALLATION

A. Post Setting: In concrete foundations per applicable detail/s; set plumb, at specified height and spacing, in straight alignment for uniform installation as indicated on the Drawings.

1. Excavating and Backfilling: Neatly and accurately excavate foundation holes for posts as indicated. Compact subgrade or any loose material. Solidly and firmly backfill around completed concrete foundations with excavated earth materials to finish grade or to proper elevation, as necessary for required paving as applicable.

2. Concrete Footings: Minimum 2500 psi concrete or as otherwise specified on drawings and conforming to the most recent edition of Los Angeles City Building Code and applicable Amendments. Finish top of footing smooth and even, sloped to shed water and with edges at finish grade of adjoining ground or adjusted for paved surfaces. Allow concrete to attain at least 75% of its 28-day strength before installation of fencing components.

C. Top Rail: Extend through post eye-top caps and attach ends to corner, gate, and/or terminal (end) posts.

D. Horizontal and Diagonal Bracing:

1. Horizontal Rail: Locate mid-height in fencing panels adjacent to gates, corner, and terminal (end) posts.

2. Diagonal Bracing: Extend from the joint of horizontal brace (with adjacent post) diagonally to the base of gate, corner, or terminal post.

E. Chain Link Fabric:

1. The fabric shall be installed so that the edge extends beyond the top rail and the bottom rail by 1 inch. The bottom of the fabric shall extend to within 1 inch maximum of the natural ground or final grade. High points of ground shall be excavated to clear the bottom of the fabric and depression shall be filled and compacted to within 2 inches of the bottom of fabric. Secure fabric to tension wire with galvanized clip rings or wire ties spaced not more than 18 inches apart.

2. Tightly stretch and secure to line posts, with adequate tie wires, space maximum 18-inches apart or as recommended by manufacturer.

3. Secure fabric to top rail, terminal (end) and gate posts by means of heavy, galvanized steel bands bolted to 1/4-inch x 3/4-inch tension bars passing vertically through full

height of fabric 16 inches interval.

3.3 SWINGING GATE INSTALLATION

Properly hang or set gate(s) in plumb and level position for full opening without interference and adjust the hardware for smooth and trouble-free operation and inspect latching and locking hardware for proper alignment and function.

3.4 MISCELLANEOUS

A. Use U-shaped tie wires, conforming to diameter of pipe to which attached, clasping pipe and fabric firmly with ends twisted at least two full turns.

B. Bend ends of wire to minimize hazards to persons and clothing.

C. Fasteners:

1. Install galvanized nuts for tension band and hardware bolts on side of fence opposite fabric side.

2. Peen the ends of bolts to prevent removal of the nuts.

D. Repairs: Repair fencing coatings damaged in the shop or during field erection using a hot-applied repair compound applied in accordance with repair compound manufacturer's recommendations as approved by the City Engineer; at no added cost to the City.

E. Cleanup: Comply with provisions of the GENERAL REQUIREMENTS regarding removal from the jobsite; rubbish, all equipment, unused materials, temporary structures and/or facilities no longer required.

END OF SECTION 32 31 13

SECTION 32 80 00

IRRIGATION

PART ONE – GENERAL

Website: http://eng2.lacity.org/brownbook/frame.cfm

1.1 DESCRIPTION

A. Work Included:

1. All labor, materials, equipment, appliances, fixtures and tests necessary for complete demolition of existing irrigation system and a new operating irrigation system as indicated on the Contract Drawings.

B. Related Work:

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS in DIVISION 1 - GENERAL REQUIREMENTS and other Sections of the Project Manual.

2. Site Clearing and Grubbing in Section 31 11 00.

1.2 SUBMITTALS

A. The Contractor shall make all required materials submittals in accordance with Article 10 of the General Requirements. Far all materials not approved upon the first submittal, Contractor is responsible to promptly resubmit for approval, necessary data concerning a substitution for a disapproved item or piece of equipment.

B. The Contractor shall make substitution submittals in accordance with Article 11 of the General Requirements.

C. Submit copies of the following:

1. Complete list of irrigation materials and miscellaneous hardware complete with descriptions and/or photographs and manufacturer's literature. Clearly mark or underline proposed items.

1.3 QUALITY ASSURANCE

A. Codes and Regulations: Contractor shall obtain and pay for all required permits. Deliver all permits and submit certifications of compliance to the BCA Inspector and the Project Manager.

1.4 GENERAL REQUIREMENTS

A. **Approvals by the Engineer**: Before commencement of irrigation installation, Contractor shall obtain:

1. All approvals on required submittals hereinafter specified.

2. Approval of all re-submittals requested by the City Engineer.

3. Contractor shall make a detailed staked layout on the work site of the proposed trenching locations for all mainline, control wire conduit, and valve manifolds for approval by City Engineer prior to trenching.

4. Contractor shall make a detailed staked layout on the work site of the proposed head locations for approval by City Engineer prior to lateral line trenching.

B. **Required Inspections**: Notify the City Inspector at least 72 hours prior to time of required inspection.

1. **IRRIGATION MAINLINE PRESSURE TEST:** The pressure test shall take place under the direction of the BCA Inspector.

2. I**RRIGATION COVERAGE TEST:** After installation of heads and lateral lines etc., entire irrigation system shall be tested for coverage. Contractor shall notify the BCA Inspector, Project Manager, Landscape Architect and designated Recreation and Parks Regional maintenance staff three (3) days before the scheduled test.

C. **Existing Utilities and Plant Materials**: Protect utilities and/or plant materials not designated for removal or modification in place against damage resulting from work of this Contract. Perform any removal and/or modifications only on approval or instruction from the City Engineer or in accordance with applicable provisions noted or specified.

D. **Verification of Dimensions and Quantities**: Verify site conditions, contract drawings, all dimensions and quantities prior to the bid. Furnish the quantities as necessary to do the specified work. Notify the Project Manager of any discrepancies between the Contract Drawings and the site conditions prior to beginning work. Do not work in areas where such discrepancies occur until further instruction by the City Engineer.

E. **Record Drawings**: Comply with provisions of the General Requirements. Contractor shall accurately dimension the location and depths of all piping, valves, and control equipment as installed. Indicate with suitable colored ink on one set of prints of the Contract Drawings to produce a record of complete installations to be kept on the job and up-to-date at all times during construction. At the completion of the work and prior to Final Inspection, the Contractor shall copy his record "as installed" data, using red ink, onto a set of clean prints. The Contractor shall certify to the completeness and accuracy of the "as installed" information indicated on the prints with his signature, and deliver the signed prints to the Project Manager for review prior to the completion of the Plant Establishment Period.

Dimension from two permanent points of reference, building corners, sidewalk, or road intersections, the location of the following items:

1. Connection to existing water lines.

2. Connection to existing electrical power.

3. Gate valves.
4. Routing of all pressure lines. Indicate dimensional location at 100' intervals.
5. Irrigation control valves.
6. Routing of control wiring.
7. Quick coupling valves.
8. Controller.
9. Other related equipment as directed by the Architect.
10. Sleeve locations.

F. **Water and Power Services:** Upon award of contract, the Contractor shall contact the Department of Water and Power to arrange and pay for the installation of all required water meters and services. Service connections shall be as shown on the Contract Drawings or as designated by the utility company. Upon final acceptance of the project, the Contractor shall transfer billing to the City of Los Angeles, Department of Recreation and Parks as directed by the Project Manager.

G. **Guarantee**: In accordance with provisions of the GENERAL CONDITIONS, contractor shall guarantee the entire irrigation system against defects in materials and workmanship for a period of one year from the date of final acceptance of the Project.

1. The entire irrigation system shall be warranted to be free from defects in materials and workmanship, and installed in accordance with the irrigation plans, specifications and the SSPWC. The Contractor shall be required to repair or replace any defects in material or workmanship which may develop within one (1) calendar year from the date of acceptance, excepting ordinary wear and tear and unusual abuse or neglect. Further, the Contractor shall be required to make any necessary repairs within 48 hours of notification at no cost to the City. If the Contractor or his agent fail to make such repairs within the stipulated time, the City shall make such repairs or have repairs made by a third party and bill the Contractor for all expenses that accrue from making such repairs.

2. The City reserves the right to make temporary repairs as necessary to keep the irrigation system equipment in operating condition. The exercise of this right by the City will not relieve the Contractor of his responsibilities under the terms of the guarantee.

3. Contractor shall repair any settlement of backfilled trenches which may occur during a one-year period after final acceptance by the City Engineer, to the City Engineer's satisfaction, without expense to the City, including the complete restoration of all damaged planting, paving, or other improvements of any kind.

1.5 DELIVERY, STORAGE AND HANDLING

A. **Delivery**: Deliver products to the job-site in their manufacturer's original containers, with labels intact and legible.

B. **Storage**: Store piping, materials, fitting, etc. at the job-site where directed by the City Engineer until such time for installation.

C. **Handling**: Promptly remove damaged materials and unsuitable items from the job-site and promptly replace with materials meeting the specified requirements, at no added cost to the City.

PART TWO - PRODUCTS

2.1 MATERIALS

A. **General**: Provide recently manufactured materials of the best grade of each respective kind.

B. **Pipe and Fittings**: The type of pipe material and fittings designated on the Contract Drawings, or as hereinafter specified shall be:

1. Steel Pipe: Galvanized standard weight Schedule 40 steel water pipe complying with ASTM A53 - SPECIFICATION FOR PIPE, STEEL, BLACK AND HOT-DIPPED, ZINC-COATED, WELDED AND SEAMLESS; jointed with galvanized, threaded, standard weight malleable iron fittings, and/or couplings.

2. Plastic Irrigation Pipe: High impact rigid polyvinyl chloride PVC 1220 (Type I, Grade 2), conforming to ASTM D1785 - SPECIFICATION FOR POLY (VINYL CHLORIDE) (PVC) PLASTIC PIPE, SCHEDULES 40 & 80 and CLASS 200. The minimum pressure rating to be not less than indicated therein for the schedule and size listed.

3. DOMESTIC WATER LINES FOR DRINKING FOUNTAINS: Install water piping in accordance with the latest edition of the Uniform Building Code and all local ordinances. Prior to allowing human consumption of water from newly installed drinking fountains the contractor shall perform domestic sterilization procedures as indicated in applicable details and provide testing results to document compliance with the standards indicated. New drinking fountains shall be turned off or otherwise made inoperable until this testing is successfully completed and approved.

    a. Domestic Cold Water Piping **ABOVE GRADE**: Piping shall be ASTM B88 Type "L" seamless hard drawn copper tubing with ANSI B 16.22 wrought copper fittings. Joints shall be made up with lead-free, nickel bearing alloy solder such as Harris Bridget.

    b. Domestic Cold Water Piping **BELOW GRADE**: Piping shall be ASTM B88 Type "K" seamless hard drawn copper tubing with ANSI B 16.22 wrought copper fittings. Joints shall be made up with lead-free, nickel bearing alloy solder such as Harris Bridget.

4. All Pipes: Shall be homogeneous throughout and free from cracks, holes, foreign materials, blisters, deleterious wrinkles, and dents.

5. Solvent-welded Schedule 40 PVC plastic pipe and fittings shall be used for pipe sizes up to and including 2½ inch for installation of irrigation pressure lines and lateral lines.

6. Schedule 80 PVC plastic pipe and threaded fittings shall be used only when threaded

joints are specified, or otherwise permitted by the City Engineer.

7. All piping shall be permanently marked with the following: Manufacturer's name or trademark, size, schedule, and type of pipe, working pressure at 73 degrees F. and National Sanitation Foundation (N.S.F.) approval.

8. Gasket lubricant for push on fittings shall be non-toxic, odorless, tasteless and shall not support bacteria. Use 'Seal Lube", SK#87710 by IPS Weldon Corp. or equal.

C. **Valves and Valve Boxes**:

1. General: Provide valves of the type and capacity designated on the Contract Drawings and with the requirements specified herein. All valves shall be capable of continuous performance at a working pressure of 200 psi or less.

2. Gate Valves and mainline isolation Valves: ***in sizes 2.5-inch and smaller*** shall be bronze type, non-rising stem, solid wedge gate valve; model as noted per plan or approved equal.

3. Automatic Control Valves: Electrically operated, cast brass or bronze normally closed globe valve, capable of with manual flow control adjustment and manual operation capability, readily disassembled for servicing, slow opening and closing, and self-flushing. Reclaimed water compatible. Model as noted per plan or approved equal.

5. Quick-Coupling Valves: shall be 1" type with two-piece red brass construction with a locking thermoplastic rubber cover. The Contractor shall provide one quick coupler key with hose swivel for each five quick couplers installed. Rainbird model #44LRC or approved equal.

6. Valve Boxes and 2-wire cable pull boxes and terminal boxes shall be constructed of polypropylene or equivalent material for maximum durability, UV protection and corrosion resistance. The plastic body, excluding extensions, shall have pipe slots on each end and the plastic body shall have two (2) resting points for the lid to sit securely and flush. The plastic lid shall have molded diamond tread-pattern for skid resistance. Valve boxes shall have a lockable lid using a hex-bolt to secure the cover.

   For Remote Control Valves and 2-wire pull/terminal boxes:
   The dimensions of the box shall be 14.5" L x 9.4" W, Model VB-STD-H by Rainbird, or approved equal. The lid shall be permanently heat-embossed with station number for each valve, or CW for control wire.

   For Quick Couplers and Gate Valves:
   The dimensions of the box shall be 13.75 inches bottom diameter and 10" top diameter. Model VB-10RND-H by Rainbird, or approved equal.

   Boxes are to be installed per the applicable details. The lid shall be permanently heat-embossed as follows (paint is not acceptable):

Gate Valve	GV
Remote Control Valve	RCV
Quick Coupler Valve	QC
Master Valve	MV

Flow Meter FM
2-wire cable Pull Boxes CW

D. **<u>Backflow Prevention - Reduced Pressure Zone Assembly and Wye Strainer</u>**:

1. The Reduced Pressure Zone Assembly shall consist of two independently operating, spring loaded, "Y" pattern check valves and one hydraulically dependent differential relief valve. Mainline valve body and caps including relief valve body and cover shall be lead-free cast copper silicon alloy. Check valve and relief valve components shall be constructed so they may be serviced without removing the valve body from the line. Shutoff valves and test cocks shall be full ported ball valves.

   The assembly shall be rated to 175psi working pressure and water temperature range from 32°F to 140°F. The lead-free* Reduced Pressure Zone Assemblies shall comply with state codes and standards, where applicable, requiring reduced lead content. The assembly shall meet the requirements of AWWA Standard Code C511; and approved by the Foundation for Cross-Connection Control and Hydraulic Hydraulic Research at the University of Southern California. The Reduced Pressure Zone Assembly shall be Febco LF825Y, or approved equal.

2. Wye-Strainer: The main body shall be low lead bronze (ASTM B 584), the access cover shall be low lead yellow brass (ASTM B 16) or cast bronze (ASTM B 584), the strainer screen shall be 300 series stainless steel #100 mesh. Screens shall be accessible for cleaning without removing the device from the line. Model as noted per plan or approved equal.

3. Backflow enclosure: shall be of a vandal resistant nature manufactured of formed cold rolled steel tubing and rod, coated with a performance polymer alloy. All locking and mounting hardware shall be manufactured entirely of stainless steel. Each enclosure shall have amounting pad which shall be used as installation frame. Enclosure hardware on the mounting frame shall be stainless steel. The backflow cage enclosure shall remain bolted to frame in open and closed positions. Enclosure and door shall close with concealed locking tab with hole to accept padlock. Enclosure shall be powder-coated dark green. By Strongbox, SBBC-CR series or approved equal. https://strongbox.com

E. **<u>Irrigation Heads</u>**:

1. <u>Pop-up spray head</u>: bodies shall have a 4", 6" or 12" pop-up stroke. The body of the spray head shall be constructed of corrosion and UV-resistant, heavy-duty A.B.S. The spray head body shall have a factory-installed drain check valve capable of checking up to 10 feet in elevation change. The spray head body shall have a standard pressure-regulating device as an integral part of the pop-up riser maintaining a constant nozzle outlet pressure of 30 or 45 PSI with inlet pressures of up to 100 PSI. Nozzles shall be matched precipitation rate, fixed spray or multiple-stream, rotating type or other as noted on Contract Drawings.

2. <u>Pop-up Gear Driven Rotor Head</u>: The body of the rotor head shall be constructed of corrosion and UV-resistant, heavy-duty A.B.S. The rotor head body shall have a factory-installed drain check valve capable of checking up to 10 feet in elevation change. The full or part-circle rotor head shall be a single stream, water lubricated, gear drive type

capable of both full circle and/or part circle operation in the same unit as noted on Contract Drawings. The rotor head shall have a screen attached to the drive housing to filter inlet water, protect the drive from clogging and simplify its removal for cleaning and flushing of the system. The rotor head body shall have a 1" (26/34) female (NPT or BSP) bottom inlet. The rotor head shall have a standard rubber cover which designates each adjustment opening from the top. Pop-up height as measured from the top of the cover to the centerline of the nozzle orifice shall be at least 5 inches. The rotor shall have a stainless steel covered nozzle turret and riser stem. Manufactured by Rainbird Corporation, or approved equal.

3. Root Watering System: The RWS assembly shall consist of a perforated polyethylene rigid mesh cylinder 18" long x 4" diameter or 10" long x 2" diameter with an integrated pressure compensating bubbler and optional check valve. The assembly shall be preconfigured with swing joint assembly or spiral barbed fittings to enable the RWS to be directly connected to PVC or polyethylene lateral drip lines, and shall have a plastic locking grate cover. Manufactured by Rainbird Corporation, or approved equal.

4. SA Swing Joint Assemblies: The Swing Assemblies shall be used as a flexible swing joint assembly for 1/2" inlet sprinklers. The pipe shall be flexible black tubing constructed of linear low density polyethylene material with a wall thickness of 0.090"and an inside diameter of 0.490". The fittings shall be constructed of UV-resistant, thermoplastic material. The Swing Assembly shall have an operating pressure rating of 80 psi at 110° F. As manufactured by Rain Bird Corporation, Glendora, California or approved equal.

F. **Automatic Irrigation Controller**: The Controller shall be of a type that combines fully automatic or manual operation with an interface to a two-wire path for decoder-based irrigation control. The controller shall provide flow sensing capability and management and a 50 station capacity expandable to 200 stations. The controller shall allow up to 8 valves to operate simultaneously per program and total for the controller including the master valves. The controller shall incorporate a FloManager feature providing real-time flow, power, and station management. FloManager shall manage the number of stations operating at any point in time based on water source capacity, station flow rate, number of valves per station, and shall incorporate the ability to provide station priorities to determine the order in which stations shall operate. The Flow Smart Module shall accept sensor decoder input from 1 - 5 flow sensors with no flow scaling device required. Controller shall include a FloWatch Learn Flow Utility which learns the normal flow rate of each station and compares the current real-time flow rate to the learned rate and takes user-defined actions if high flow, low flow, or no flow is detected. FloWatch shall automatically determine the location of the flow problem and isolate the problem turning off the affected station(s) or master valve(s). FloWatch shall be compatible with both normally closed and open master valves. A Manual Master Valve Water Window shall be provided to coordinate daytime manual watering with the flow sensing. This Water Window shall offer programmable days of the week and manual watering additional flow rate. The controller shall have features and modular options that include: ET Manager Smart Cartridge, NCC Network Communication Cartridges. ESP-LXIVM, manufactured by Rain Bird Corporation or approved equal.

1. Two-wire Controller Field Devices: Shall be Rainbird IVM-SOL to control station valves, Rainbird IVM-OUT interfaces with non-Rainbird valves, IVM-SEN interfaces with weather sensors and flow sensors, and IVM-SD, which provides surge protection on the two-wire path.

H. **Control Wire**:

1. Connection between the automatic controller and the valve decoders shall be made with polyethylene double-jacketed or UF-B UL PVC double-jacketed two-conductor solid core wire designed for direct burial with insulation 3/16 inch (.060") thick, high density, sunlight resistant incased in an outer jacket of Polyethylene or PVC conforming to ICEA S-GL-402 or NEMA WC5, having a minimum wall thickness of .045 inches. Two-wire Polyethylene 'twisted' cable and single strand 14 gauge PVC coated irrigation wire are not acceptable.

2. 2-WIRE Conductor SIZING**:** Standard wire lengths for straight line installation i.e. wire distance to the furthest device without any loop:

Wire Size(gauge)	#14	#12
Total loop Length	10,000'	14,800'
Distance to furthest valve	5,000'	7,400'

3. All 2-wire conductors shall be installed in a 1-1/4" diameter sch. 80 PVC conduit per details. Distance between pull boxes shall not exceed 200'. See materials specifications above for Valve Boxes for 2-wire cable pull boxes.

4. Low voltage control wire conductors between the 2-wire decoders and the valves shall be U.L. approved direct burial Type U.F., 600 volt, No. 14 AWG solid copper. Use a different color wire for each valve in the manifold grouping.

I. **Wire Connectors**: Control wire connections shall be made with 3-M brand of DBY or DBR Direct Burial Splice kits, or approved equal. The splice kit shall consist of a one-piece malleable plastic bulb body with internal locking fingers, filled with re-enterable gel sealant and a Scotchlok Electrical Spring Connector. Materials shall be as follows:

1. Connector shall be a flame retardant PVC insulator with a steel spring and shell within. Connector shall be a non-crimping system
2. Tube material shall be clear see-through polypropylene.
3. Gel material shall be hixotropic calcium organic complex.
4. Wire sizes and numbers of wires per connector shall be as follows:

Connector:	Color:	No. and Size of Wires:
3M Model DBY	Yellow	Max. 4-12 gage UF wires
3M Model DBR	Red	Max. 3-14 gage UF wires

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

Examine the area of work and conditions under which work of this Section will be performed. Correct any conditions detrimental to timely and proper completion of the work prior to commencing installation of irrigation equipment.

3.2 IRRIGATION SYSTEM INSTALLATION:

A. General:

1. The Irrigation system layout shown on the Contract Drawings shall be considered as diagrammatic. The Contractor shall make all necessary adjustments to conform to actual field conditions unless otherwise noted or as directed by the Engineer at no additional cost to the City.

2. The CONTRACTOR shall verify that approximate finish grade is in place prior to beginning irrigation trenching or installation. If finish grade is not already achieved, CONTRACTOR shall notify the PROJECT MANAGER immediately. Any irrigation work performed by the CONTRACTOR prior to the establishment of approximate finish grade may require repair or modification at the CONTRACTOR's expense.

3. All piping shown on the Contract Drawings in paved areas but running parallel and adjacent to planted areas, is done for clarity only and is to be installed inside the planting area whenever possible.

4. Specimen trees (24-inch or larger size box) may be planted before installing the irrigation system upon written approval from the Project Manager. Contractor shall re-route irrigation lines conflicting with specimen plant locations to clear the root ball by twenty-four (24) inches minimum at no additional cost to the City. Watering of all specimen trees planted before completion of the irrigation system shall be the Contractor's responsibility.

5. Contractor shall make all required water and utility connections as shown on the Contract Drawings or as required by the utility company. Replace all sidewalks, curbs or paving removed or damaged by the installation of required utilities to the satisfaction of the BCA Inspector.

B. Trench Excavating and Backfilling: Size trenches and other excavations to accommodate the irrigation system components, conduits, pipe bedding material and other required elements indicated on Contract Drawings. Provide a minimum of 4" of side clearance on outside of lateral piping, and 6" of side clearance on outside of mainline piping to assure proper installation and access for inspections.

1. See TREE PROTECTION REQUIREMENTS on Sheet G104 for trenching within the protected root zone of an existing tree.

2. Unless otherwise specified, the minimum depth of cover over pipelines and conduits shall be as follows:

   a. Control wire conduit - 30-inches (36-inches under roadways and parking lots).

   b. Other Control Wiring - Depth of mainline, or a minimum of 24-inches cover if without any mainline.

   c. Irrigation Mainline: 24-inches for piping 2" and smaller; 30-inches for piping 3" and larger.

   d. Lateral lines - 12-inches.

3. Make the bottom of trenches true to grade and free of protruding stones, roots or other matter which would prevent proper bedding of pipe or other facilities.

4. All trench backfill shall be performed in accordance with approved soils report. Pipe bedding shall be clean site soil, free of all rocks, debris, etc. over 1/2" diameter. Bed pipe in at least 4-inches of finely divided material to provide a firm, uniform bearing. Surround the pipe with additional finely divided material to at least 6-inches over the top of the pipe. Bedding shall be placed in 6-inch maximum lifts. Backfill shall be site soil placed above the bedding to finish grade. There shall be no rocks over 2" in greatest dimension or organic matter in the backfill. All bedding and backfill shall be properly moisture conditioned and compacted at each lift. All trenches shall have a minimum relative compaction of 90%. Compaction shall be tested by the City at locations to be determined by the Geotechnical Engineer.

5. Finished trenches shall be flush with adjacent finish grades. The Contractor shall be responsible for maintaining the trenches flush and smooth with adjacent surface grade until final acceptance of the project. After compaction has been approved, trenches in existing turf areas shall be re-planted per "Method A" lawn repair of the Landscape Planting Specifications, unless otherwise noted.

C. **Irrigation Pipeline Installation - General**: Execute trench excavating and backfilling, including the depth of cover over the pipeline, in accordance with requirements above.

1. Pipe layout as shown on irrigation plan is diagrammatic. Contractor shall route piping in planted areas in the most expedient manner consistent with the requirements set forth herein, including avoidance of tree roots.

2. When two or more pipelines are installed in the same trench, separate the pipelines by a minimum horizontal clear distance of 12-inches. Install piping such that each pipe, valve, or other component may be serviced or replaced without disturbing the others.

2. During installation of pipe, fittings, valves, and other components, prevent soil or foreign matter from entering the system. Temporarily cap or plug all open ends at completion of installation operations.

3. All changes in pipe size shall be made with reducer fittings. No close nipples or bushings shall be used.

4. a. Where irrigation piping crosses a vehicular roadway or other paving having a width of less than 25 feet, a Schedule 40 PVC sleeve which is a minimum of two pipe sizes larger than the piping to pass through it, shall be placed under the paving at a depth of 36 inches minimum cover. Where remote control wiring crosses under paving having a width of less than 25 feet, a 3-inch Schedule 40 PVC sleeve shall be placed under the paving at a depth of 30 inches minimum. All sleeves shall extend 3 feet minimum beyond the edges of paving.

b. Where irrigation piping crosses a vehicular roadway or other paving having a width greater than 25 feet, a trench shall be excavated across the roadway or paving to accommodate a Schedule 40 PVC sleeve a minimum of two pipe sizes larger than the piping to pass through it, at a depth of 36 inches minimum cover. Where remote control wiring crosses under paving having a width greater than 25 feet, a 3-inch Schedule 40

PVC sleeve shall be installed at a depth of 30 inches minimum cover. The backfill of the trench shall be a 2-sack cement slurry. The slurry shall extend from the bottom of the trench to within one inch of the bottom of the existing paving. The trench in the existing paving shall be repaired with a like paving material and join the existing paving both horizontally and vertically.

c. All piping and control wire sleeves shall be placed perpendicular to the edge of paving.

5. Pipe or irrigation components of dissimilar metals shall be separated by an approved "Dielectric" coupling.

D. **Steel Pipe**:

1. Square cut and ream pipe ends to full size with a long taper reamer.

2. Cut threads with clean sharp dies.

3. Make joints with a non-toxic, non-hardening joint compound applied to the male threads only.

4. Wrap steel pipe embedded in the ground with seamless 10 mil F.D.S. Safe-T-clad tape. Spiral wrap pipe with uniform laps. Apply the second layer of wrap in the reverse direction of the first layer of wrap.

5. Joints and any remaining unwrapped portion of the pipeline shall be similarly wrapped after pressure testing.

E. **Solvent Welded Plastic Pipeline**:

1. Join plastic pipe with slip type solvent welded fittings, threaded fittings as specified. Install steel pipe first when plastic pipe is joined to steel pipe.

2. Cut pipe square, externally chamfer approximately 10-15 degrees, and remove all burrs and fins.

3. Prior to the application of the P.V.C. solvent cement, prepare all surfaces to be solvent welded with tetrahydrofuran primer tinted purple. Make solvent welded joints in accordance with ASTM D2855 - PRACTICE FOR MAKING - SOLVENT - CEMENTED JOINTS WITH POLY (VINYL CHLORIDE) (PVC) PIPE AND FITTINGS. Use a solvent approved by the pipe manufacturer.

4. Install plastic pipe in accordance with ASTM D2774 - PRACTICE FOR UNDERGROUND INSTALLATION OF THERMOPLASTIC PRESSURE PIPING and the requirements herein. Exercise care in assembling a pipeline with solvent welded joints so that stress on previously made joints is avoided. Handling of the pipe following jointing, such as lowering the assembled pipeline into the trench, shall not occur prior to the set times specified by the manufacturer.

5. Apply solvent to pipe ends in such a manner that no material is deposited on the interior surface of the pipe or extruded into the interior of the pipe during jointing. Wipe off excess cement on the exterior of the joint immediately after assembly.

6. Make threaded pipe joints using Teflon tape or other approved jointing material. Do not use solvent with threaded joints. Protect pipe from tool damage during assembly. Use vises with padded jaws and strap wrenches for installation of fittings and nipples. Remove and replace any plastic pipe which has been nicked, scarred, or otherwise damaged.

7. Snake plastic pipe from side to side in the trench to allow 1-foot of expansion and contraction per 100 feet of straight run.

8. Do not expose the pipeline to water for 24 hours after the last solvent welded joint is made.

F. Bell and Spigot Gasketed Pipeline:

1. Join plastic pipe with "push-on" type gasketed fittings with mechanical restraints as detailed and specified.

2. Cut pipe square, externally chamfer approximately 10-15 degrees, and remove all burrs and fins. Remove and replace any plastic pipe which has been nicked, scarred, or otherwise damaged.

3. Align pipe sections straight. Clean all debris from the bell areas of the fitting and install gasket so that it is completely seated in the groove with no raised areas.

4. Apply lubricant to the installed gasket and to beveled end of the cut pipe or to the spigot end of the pipe or fitting. Align the pipe with fitting and push together by hand or with pry bars on the end of the fitting or with two pry bars using the lugs on the fitting. Insert until the reference line mark is even with edge of the fitting bell.

5. Install mechanical restraints per details and manufacturer's instructions.

6. Snake plastic pipe from side to side in the trench to allow 1-foot of expansion and contraction per 1000 feet of straight run.

G. Installation of Valves, Valve Boxes, and Special Equipment:

1. General: Install all valves and other equipment in strict accordance with the details, and make readily accessible for manual operation, maintenance or replacement.

2. Install isolation or gate valves of the same size as the pipeline in which they are installed, unless otherwise indicated.

3. Install all valves below ground housed in a covered valve box with a securable lid that will permit access for field servicing. Boxes shall be set flush with existing grade, including sloped areas, and all soil within 12 inches of the perimeter of the box shall be compacted per the trench repair section of this specification. Boxes are to be positioned per details.

4. Set valve boxes per applicable details and set valves at sufficient depth to provide clearance between the cover and valve handle or key when the valve is in the fully open position. Do not cover valve with pea gravel.

5. Install backflow preventers per applicable details with pipe supports and the accessories necessary to properly secure the assembly where required. Install backflow preventers per prevailing codes. All Backflow devices shall be certified by a licensed inspector as required by the County Health Department Test Instructions, Water Pollution Control Section after installation at the Contractor's expense.

6. No equipment shall be installed closer than 12 inches to any paved surface, unless separated from the paved surface by a wall, fence, curb, or similar barrier, or installed underground.

H. <u>Irrigation Head Installation and Adjustment</u>:

1. General: In accordance with the requirements of Subsection 3.2 of this Section, flush and pressure test all mains and flush lateral lines before installing irrigation heads.

2. Irrigation Head Placement and Spacing:

   a. Irrigation plans are designed, as a minimum standard, for head-to-head coverage on all spray heads. Head locations shall be determined by referencing the irrigation plan and using the head spacing listed in the irrigation head legend. Accuracy of final installation shall be within plus or minus 12 inches for all rotary heads having a throw of 30 feet or greater; within plus or minus 4 inches for all head types with a throw of under 30 feet. Do not exceed the maximum irrigation head spacing shown on the Contract Drawings.

   b. Prior to head installation, Contractor shall mark the proposed locations of all irrigation heads in the field for review and approval by the Engineer. Contractor shall make any adjustments to head locations requested by the Engineer at that time at no additional expense to the City. Contractor shall provide minimum 48 hours notice prior to the requested time of inspection.

3. Head Installation:

   a. Do not exceed the maximum irrigation head spacing shown on the Contract Drawings.

   b. Install all irrigation heads <u>3-inches</u> clear of adjacent walks, curbs, paving, headers, and similar improvements. Adjust all heads to flush with the final finish grade - adjusting for depth of sod in turf areas if needed.

   c. All soil within 12 inches of the perimeter of the head shall be compacted as indicated in applicable details.

   d. All irrigation heads shall be installed on swing joint assemblies as shown on details.

4. Irrigation Head Adjustment:

   a. When all irrigation heads are installed and the irrigation system is operating, adjust and balance each section or unit with all section control valves fully open to obtain uniform 100% head to head coverage.

b. Adjust irrigation heads having adjustable pin nozzles, screws or orifices to provide optimum distribution of water over the coverage pattern. Without additional cost to the City, Contractor shall substitute larger or smaller nozzles in irrigation heads and/or add or omit sprinkler heads as necessary to obtain uniform coverage to meet MWELO requirements. Any requested modification shall not alter the total GPM to a degree to require a major revision of pipe sizing.

c. At no time is the irrigation system to cause excessive overspray on adjacent paved areas, or cause any erosion to the site.

d. Low Head Drainage: The Contractor shall install in-line drainage swing check valves where necessary to prevent low head drainage or as indicated on contract drawings.

I. <u>Automatic Control System Installation</u>:

1. General: Install a complete automatic irrigation 2-wire control system, including the automatic controller, automatic control valves, decoders and wiring, and all necessary accessories and utility service connections.

2. Install the automatic controller outside of the coverage pattern of the irrigation system at the location designated on the Contract Drawings. Verify location with City Engineer prior to installation.

3. Install a separate disconnect switch between the source of power and the controller inside the controller enclosure per details. Provide grounding per details and manufacturer's instructions.

4. Install all electrical service wiring per Electrical Code in galvanized steel electrical conduit from the service point to the controller. The minimum service wire shall be No. 12 AWG copper 600 volt, Type THW or THWN or larger, as required by the controller manufacturer. Locate splices only in specified pull boxes and make splices with a water-proof packaged kit approved for underground use. Set pull boxes to finish grade on a 12-inch deep layer of one (1) inch crushed rock.

5. All 2-wire control wire shall be installed in 1-1/4" SCH 80 PVC conduit per details, with a maximum run of 200' between pull boxes. Install conduit in the same trench as irrigation mainline per trenching detail where possible. Low voltage control wire conductors between the 2-wire decoders and the valves shall be installed in 1/2" SCH 80 PVC conduit per details.

6. Wire connectors shall be DBY or DBR as manufactured by 3M Corp. Control wires shall be stripped of 1/2 inch of insulation USING A WIRE-STRIPPING TOOL SPECIFICALLY MADE FOR THAT PURPOSE, inserted into the electrical spring connector, and the connector twisted in a clockwise direction until the wires are tight. Insert the completed splice into the gel-filled tube, and check visually to confirm that the wire nut has been pushed past the fingers and is seated in the bottom of the tube. Position wires in wire channels and close insulator cover. Make splices in control wire in accordance with the requirements for service wire. Leave at least 2-feet of coiled slack at each splice and point of connection inside of valve boxes.

7. Testing Electrical Components: Field tests shall be performed by the Contractor on all irrigation system conductors in accordance with the requirements specified herein prior to performing the functional tests. Where conductors are installed by trenching and backfilling, such tests shall be performed after at least six (6) inches of backfill material has been placed over the conductors and backfill material has been compacted.

   a. Prior to the start of the functional testing, the Contractor shall perform the following tests on all irrigation system electrical conductors in the presence of the BCA Inspector:

      1. Each circuit shall be tested for continuity and open circuits.

      2. Each circuit shall be tested for grounds.

      3. An insulation resistance test at 500-volts DC shall be made on each circuit between the circuit and the ground. The insulation resistance shall not be less than 10-megohms on all circuits.

   b. The functional test for all the electric automatic irrigation system(s) shall consists of a minimum of fifteen (15) working days of operation during which time the controller shall complete at least three (3) complete cycles automatically for each station. The lengths and frequencies of the cycles will be determined by the City's representative. If unsatisfactory performance of the system develops, the condition shall be corrected and the test repeated until fifteen (15) working days of continuous, satisfactory operation is obtained.

   c. The functional test shall be satisfactorily completed prior to the start of the plant establishment period.

   d. Repair to the irrigation system wiring shall be made within five (5) working days of a malfunction or damage to any portion of the system.

8. Contractor shall leave the control system in operating condition with an operational chart mounted within the controller cabinet upon completion of the work.

3.3 FLUSHING AND TESTING

A. After completion, and prior to the installation of any terminal fittings, thoroughly flush the entire pipeline system to remove dirt, scale, or other material. After flushing, conduct the following tests in the sequence listed below. Provide all equipment, materials, and labor necessary to perform the tests. Conduct all tests in the presence of the City Inspector.

1. The irrigation system mainlines shall be pressure tested for 24 hours at 125 p.s.i. with all control valves in place and closed. During the test, the Contractor shall provide pressure gauges downstream from the backflow device and upstream from the farthest remote control valve in the system. Air pressure testing of the irrigation system is acceptable if approved by the BCA inspector. Placement of control wires shall be verified before mainline trenches are backfilled after pressure test.

2. After installation, the irrigation lateral lines shall be thoroughly flushed in the presence

of the BCA inspector. Each valve and lateral system shall be flushed commencing with the head closest to the valve and proceeding to the farthest head.

3. Irrigation Coverage Test: After installation of heads and lateral lines etc., entire irrigation system shall be tested for coverage. The BCA Inspector, Project Manager, Contractor and Recreation and Parks Regional maintenance staff shall be notified three (3) days before the scheduled test. Perform the coverage test for each zone after irrigation heads have been installed and demonstrated that each section or unit in the irrigation system is balanced to provide uniform and adequate coverage of the areas serviced. Correct deficiencies in the system in accordance with the requirements of Subsection 3.2(G)4.

3. Operational Test: Evaluate the performance of all components of the automatic control system for manual and automatic operation. During the maintenance period, and at least 15 days prior to final inspection, set the controller on automatic operation so that the system will operate satisfactorily during such period. Make all necessary repairs, replacements, and adjustments until all equipment, electrical work, controls, and instrumentation are functioning in accordance with the Contract Documents.

3.4 OPERATING MANUALS AND EQUIPMENT

A. Furnish the City with 2 bound copies of operating and maintenance manuals for all irrigation system equipment such as automatic controller, valves, heads, etc.

B. Explain in detail all irrigation equipment operations, watering schedule and maintenance procedures to the City personnel as directed by the Project Manager before completion of the project.

C. Provide the City with a reduced legible copy of the "As-Installed" Irrigation Plan hermetically sealed in a plastic cover to be affixed inside the controller cover.

3.5 RECORD DRAWINGS

Irrigation record drawings shall include the following: Dimension the following locations from two permanent points of reference (building corners, sidewalks, road intersections, etc.):

a. Connection to existing water lines
b. Connection to existing electrical power
c. Gate valves
d. Mainline routing and/or directional turns (dimension maximum 100 feet along routing).
e. Remote control valves
f. Air and pressure relief valves
g. Master valves/flow sensors
h. Control wire routing
i. Quick coupling valves

END OF SECTION 32 80 00

SECTION 32 90 00

LANDSCAPE PLANTING

PART ONE - GENERAL

1.1 DESCRIPTION

A. Work Included:

1. All labor, materials, equipment, and tools necessary to provide and execute: soil preparation and amendments; planting of new trees, plants, shrubs, vines, and ground cover and sod; all required testing and inspections; maintenance and establishment of new landscape plantings as indicated on the Contract Drawings, specified herein and as needed for complete and proper installation and maintenance.

1.2 SUBMITTALS

A. The CONTRACTOR shall make all required materials submittals in accordance with the General Requirements.

B. The CONTRACTOR shall make substitution submittals in accordance with the General Requirements.

Submit copies of the following:

1. Complete list of landscape plant materials soil amendments, fertilizers and miscellaneous hardware complete with descriptions and/or photographs and manufacturer's literature. Clearly mark or underline proposed items.

1.3 QUALITY ASSURANCE

A. Codes and Regulations: CONTRACTOR to obtain and pay for all required permits. Deliver all permits and submit certifications of compliance to the CITY ENGINEER.

1.4 GENERAL REQUIREMENTS

A. Required Approvals by the ENGINEER: No work included in this Section shall be commenced until the following are completed and approved:

1. Any required agricultural suitability and fertility analysis or testing and weed/pest control prior to placing topsoil or soil amendments.

2. All work on irrigation system prior to start of landscape planting work.

3. All reviews on required submittals and re-submittals requested by the ENGINEER for materials included in this section.

B. Inspection: All work and materials are subject to inspection and approval by the Bureau of Contract

Administration (BCA) Inspector and the PROJECT MANAGER. Any work done without proper inspection will be subject to rejection per Section 2-11 of the Standard Specifications for Public Works Construction. The CONTRACTOR shall notify the Bureau of Contract Administration (BCA) Inspector and PROJECT MANAGER three (3) days prior to requested inspection of the following for approvals:

1. For all finish grades in planting areas following all weed/pest control, soil fertilizing and conditioning, prior to landscape container planting, and after rolling in turf areas.

2. Inspection of all plant materials under 24" box size shall be at the time of delivery to the job site. This inspection will be for compliance with the caliper, height and spread requirements if given on the plant legend and for the general health, structure and appearance of plants. The CONTRACTOR shall also stake all tree planting locations at this time for review and approval by the ENGINEER.

3. Tagging of 24" box or larger trees at the grower with City approved tags. This inspection will be for compliance with the caliper, height and spread requirements if given on the plant legend and general health, structure and appearance of plants. All trees shall be tagged by the ENGINEER or authorized representative.

4. All completed landscape planting and irrigation work for approval to begin the plant maintenance and plant establishment period.

C. Existing Plant Materials: Protect all existing plant materials, not designated for removal or modification, in place against damage resulting from work of this Contract. Perform any removal and/or trimming only on approval or instructions from the CITY ENGINEER or in accordance with applicable provisions noted or specified on the Contract Drawings. CONTRACTOR shall replace all damaged existing plant material with like type and size material. If an acceptable replacement is not available, CONTRACTOR shall pay damages to the CITY for the value of the damaged tree as assessed by the tree value formula in the ISA Guide for Establishing Value of Trees and Other Plants.

D. Tree Protection Requirements: See sheet L-020.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery:

1. Delivery of plant material shall begin only when it is ready for plant installation and after the inspections are made and any required soil samples and tests have been reviewed by the PROJECT MANAGER. All materials furnished for the work shall be not less than the approved submittal. Upon delivery, CONTRACTOR shall tag one plant of each variety for identifying purposes.

2. Notify the ENGINEER of a scheduled delivery a minimum of 48 hours in advance so the plant materials may be inspected upon arrival at the jobsite. All plant material judged by the ENGINEER at the time of delivery as unacceptable shall be removed immediately from the jobsite by the CONTRACTOR. All trees not accompanied with the tags signed placed the ENGINEER or the authorized representative**,** or plants not correspondent with contract requirements shall be rejected and immediately removed from the job site.

3. Protect plants during delivery against damage to root balls or desiccation of leaves. Protect trees during transport by tying in the branches and covering all exposed branches.

4. Deliver fertilizer to the jobsite in the original and unopened containers bearing manufacturer's guarantee chemical analysis, name, trademark or trade name in conformance with Federal and Local law. In lieu of containers, fertilizer may be furnished in bulk and a certificate indicating the above information shall accompany each delivery.

B. Storage:

1. Store plants, trees, etc. at the jobsite where directed by the PROJECT MANAGER.

2. Keep fertilizer in dry storage away from contaminants. Loose fertilizers and soil amendments shall be kept covered with a tarp.

3. Store plants not installed on the day of arrival at the jobsite as follows:

a. Outside storage to be protected from wind.

b. Keep plants in containers in a moist condition until planted by watering with fine mist spray.

C. Handling: Transport and handle plants with care to ensure protection against injury.

PART TWO - PRODUCTS

2.1 MATERIALS

A. Topsoil: The type and thickness of topsoil shall be as shown on the plans. If not shown, the topsoil shall be the existing class "C" on-site topsoil and amended as indicated.

B. Fertilizers and Conditioning Materials: Comply with the applicable requirements of the State Agricultural Code. All fertilizing materials shall be packaged, first grade, commercial quality products identified by source, type of material, weight and manufacturer's guaranteed analysis. Fertilizing material shall not contain toxic ingredients or fillers in quantities harmful to human, animal, or plant life.

1. Agricultural Gypsum: Hydrated calcium sulfate product containing 23 percent calcium and 18 percent sulfur with a guaranteed analysis of 84 percent calcium sulfate.

2. General Purpose Fertilizer: Shall be Gro-Power Plus fertilizer, having a minimum analysis of 5-3-1 (N-P-K) derived from ammonium phosphate, urea, sulfate of potash, compost and sulfides and oxides of iron, manganese and zinc, with 1.00% Alkyl Naphthalene Sodium Sulfonate soil penetrant as manufactured by Gro-Power Inc., 5065 Telephone Avenue, Chino, CA 91710 (909) 393-3744, or an approved equal. https://www.gropower.com

3. Fertilizer Tablets**:** Fertilizer tablets shall be Tri-C Myco Tabs planting tablets, 1.7 gram 17-9-5 (N-P-K) as manufactured by TRi-C Organics Inc., (800) 590-3301, or an approved equal. https://www.tricorganics.com

4. Granular Humic Acid Soil Conditioner: Shall be LIVE EARTH HUMATE SOIL CONDITIONER [PLUS GYPSUM] or Tri-C Humate [Tri-C Humate Plus with Gypsum] or approved equal. Contact Todd Burns, Live Earth Products, Inc. (661) 978-7307 for availability, or TRi-C Organics Inc., (800) 590-3301 https://www.tricorganics.com, or an approved equal. Apply per manufacturer's instructions.

5. Soil Penetrant**:** Shall be "Ground Breaker" by Green As it Gets, Inc. or approved equal. Soil penetrant shall contain organic yucca and kelp extracts. Soil penetrant MAY NOT contain alcohol. Apply soil penetrant per manufacturer's instructions. Contact: Green As It Gets Inc., 300 Morning Drive, Bakersfield, CA 93306 Phone: 1-800-476-0034. https://www.greenasitgets.com

6. Organic Soil Amendment**:** "Type 1" organic soil amendment shall be a relatively dry and friable fine-textured organic composite that is well-composted and nitrogen stabilized, derived from composted greenwaste or processed wood products, and free of foreign matter including animal waste and any viable plant, tree or weed seed. 99% of material shall pass through a 1/2" screen. CONTRACTOR shall submit a sample of the organic soil amendment to the PROJECT MANAGER for approval prior to installation.

   All Organic Soil Amendment shall conform with the following criteria:

   a. The pH of the material shall be between 6 to 7.5.

   b. Salinity: material shall have a maximum saturation extract conductivity of 2.50 millisiemens per centimeter.

   c. Boron content of the saturated extract shall be less than 1.0 parts per million.

   d. Sludge-based or animal waste materials are not allowed.

   e. Carbon:Nitrogen ratio is less than 25:1.

   f. All compost shall be aerobic without malodorous presence of decomposition products.

   g. Maximum total permissible pollutant concentrations in amendment in parts per million on a dry weight basis:

Arsenic	20	Copper	150	Selenium	50
Cadmium	15	Lead	200	Silver	10
Chromium	300	Mercury	10	Vanadium	50
Cobalt	50	Molybdenum	60	Zinc	300
Nickel	100				

7. Top Dress Mulch**:** Shall be well-seasoned composted tree chip mulch, free all foreign matter including weed and tree seeds. Mulch chip size shall be minimum one (1) inch in diameter and not more than four (4) inches in diameter. Submit a sample of mulch and source to the PROJECT MANAGER for approval prior to application.

C. Plant Materials:

1. Availability & substitutions: No substitutions of plant species, type, cultivar, size etc. will be accepted without prior approval of PROJECT MANAGER. CONTRACTOR is expected to utilize all reasonable nursery resources in the Southern California region before determining if a specified material is unavailable. When plants of a specified kind or size are determined by PROJECT MANAGER to be not available, substitution may be made upon approval by the ENGINEER, in accordance with the General Conditions. CONTRACTOR shall provide information regarding his attempts to locate such material.

2. All Plants: The plant names shown or listed on the Contract Drawings shall conform to the "Sunset Western Garden Book," latest edition unless otherwise specified. In all cases, botanical names take precedence over common names. One plant of each variety shall be tagged for identifying purposes.

3. Quality: All plants shall have a growth habit normal to the species in accordance with U.S.A. Standards for Nursery Stocks, latest editions; shall be sound, healthy, vigorous and free from insect pests, plant disease, sun scalds, weeds, fresh bark abrasions, excessive abrasions or other objectionable disfigurements. Tree trunks shall have normal well-developed branch systems. All plant materials shall have vigorous and fibrous root system, not root bound and shall be free of kinked or girdling roots. The CONTRACTOR shall be responsible for the condition of all plants, planted or otherwise, until final acceptance by the CITY and termination of maintenance period

4. Sod: Shall be of the type designated on the planting plan, or an approved equal. Sod shall be delivered to the job site within 24 hours of being cut at the nursery, and COMPLETELY installed within 12 hours of delivery to the job site. The sod shall be machine cut to between 3/8" and 5/8" thick, not including top growth or thatch.

5. All plants shall be inspected and approved prior to planting as per provisions of Subsection 1.4(B) specified above

D. Tree Stakes:

1. Wood tree stakes 2-inches in diameter by 10 feet long, lodgepole grade, pressure-treated, capable of standing in the ground at least two years.

   a. All trees in non-turf areas as indicated on the Contract Drawings shall be ***double staked*** per detail.

   b. All trees in turf areas as indicated on the Contract Drawings shall be ***triple staked*** per detail.

E. Slope Stabilization and Erosion Control Material: Jute Mesh material shall be light weight, brown color, fire retardant, open weave construction and shall have a minimum 4-year longevity. Material shall handle maximum water flow of 8 feet per second.

PART THREE - EXECUTION

3.1 GENERAL

A. The Landscape work shall not be performed at any time when it may be subject to damage by climatic conditions.

B. Planting and soil preparation work shall not begin in until irrigation installation is complete, and coverage and approximate finish grade has been approved by the ENGINEER in the area of work.

C. The CONTRACTOR shall verify all dimensions shown on the Contract Documents and at the site.

D. In case of conflict between the plant schedule totals and total plant count of the contract documents, the CONTRACTOR shall provide the higher number of plants.

E. Delivery of material shall begin only when it is ready for the work and after the inspections are made and the required samples and tests have been reviewed by the ENGINEER. All materials furnished for the work shall be not less than the reviewed sample.

F. The CONTRACTOR shall provide temporary fencing, barricades, covering, or other protection to preserve existing landscaping items indicated to remain and to protect the adjacent properties and other structures from damages by the landscape and other contract work.

G. The CONTRACTOR shall abide by the Tree Preservation Guidelines, Section 1.4.D herein for all trees indicated to remain.

H. The CONTRACTOR shall remove and/or relocate landscape items such as trees, shrubs, grass, other vegetation, improvements, and obstructions as shown on Drawings or specified otherwise. All plant material to be removed shall be disposed of off the site in a legal and proper manner.

3.2 SURFACE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the work. Do not proceed until detrimental conditions are corrected.

3.3 GRADING AND SITE PREPARATION:

A. Rough Grading:

1. Earthwork and Topsoil Placement: Shall include excavation and backfilling for the irrigation system and the preparation for the spreading, densification, cultivation and raking of topsoil, including fertilization and conditioning.

B. Topsoil Preparation and Amendment:

1. After completion of ***all necessary trenching and backfill*** for electrical, irrigation, or drainage piping and conduit, bring planting areas to approximate finish grade, including construction of landscape mounds, before performing soil amendment. CONTRACTOR shall account for the amount of fertilizer and soil amendments to determine the appropriate grade.

2. Turf Areas**:** For all TURF planting areas ***outside of tree protection zones,*** Class "C" on-site ("native") topsoil shall be scarified and cultivated to a uniform, finely divided condition to a depth of 12 inches. Soil shall not be worked when it is so wet as to cause excessive compaction to cause the formation of large clods; or so dry as to create excessive dust. All soil amendments

shall then be broadcast evenly at the rate as specified below (or per the recommendations of the approved agricultural suitability and fertility analysis if directed by the PROJECT MANAGER)**,** and then thoroughly and uniformly incorporated to the depth of 12 inches**.** Prior to planting, the top 3 inches of all planting areas (including slopes) shall be free of weeds, stones and other deleterious matter 1-inch diameter and larger.

a. All turf planting areas shall receive the following soil amendments per 1,000 square feet:

4 cubic yards, Type I organic soil amendment
15 lbs. Agricultural Gypsum
50 lbs. Gro-Power Plus fertilizer

b. Topsoil shall be restored to a smooth finish grade after amendment process is complete and irrigated thoroughly to activate amendments and fertilizers.

3. Non-Turf Area Bulk Amendment**:** For all continuous areas designated on plans for tree, shrub and groundcover planting areas ***outside of tree protection zones***, the Class "C" on-site ("native") topsoil shall be scarified to a depth of 1 inch, taking care not to damage surface roots.

a. After scarification, apply “GROUND BREAKER” soil penetrant to all planting areas at a rate of 1 gallon per 1,000 square feet per manufacturer’s instructions.

b. 12 hours minimum after applying soil penetrant, all planting areas shall receive the following soil amendment per 1,000 square feet:
   - 50 lb. GRANULAR HUMIC ACID SOIL CONDITIONER

c. Soil amendment shall be evenly broadcast on the surface and uniformly cultivated into the top 6” of the soil and ***thoroughly irrigated*****.** Soil shall not be worked when it is so wet as to cause excessive compaction or to cause the formation of large clods; or so dry as to create excessive dust. Prior to planting, the top 3 inches of soil (including slopes) shall be free of weeds, stones and other deleterious matter 1-inch diameter and larger.

4. For all planting areas ***inside of tree protection zones***, the Class "C" on-site ("native") topsoil shall be scarified to a depth of 1 inch, taking care not to damage surface roots.

a. After scarification, apply “GROUND BREAKER” soil penetrant to all planting areas at a rate of 1 gallon per 1,000 square feet per manufacturer’s instructions.

b. 12 hours minimum after applying soil penetrant, all planting areas shall receive the following soil amendment per 1,000 square feet:
   - 20 lb. GRANULAR HUMIC ACID SOIL CONDITIONER

c. Soil amendment shall be evenly broadcast on the surface and uniformly cultivated into the top 1” of the soil and ***thoroughly irrigated*****.** Soil shall not be worked when it is so wet as to cause excessive compaction or to cause the formation of large clods; or so dry as to create excessive dust. Prior to planting, the top 3 inches of soil (including slopes) shall be free of weeds, stones and other deleterious matter 1-inch diameter and larger.

5. For individual tree and shrub planting outside of designated bulk soil amendment areas, backfill shall be 100% Class "C" on-site ("native") topsoil uniformly amended with GRANULAR HUMIC ACID SOIL CONDITIONER at the rate specified below:

15 gallon: 1/2 cup (US) per plant
24" box: 2 cups (US) per plant
36" box: 6 cups (US) per plant
48" box: 10 cups (US) per plant

6. Incorporation of all soil amendments shall be performed in the presence of the BCA Inspector, and at that time CONTRACTOR shall furnish the BCA Inspector with delivery tickets to verify the source, kind and quantities delivered and applied. Furnish PROJECT MANAGER duplicate copies of the material invoices as required in Subsection 1.2 (C).

C. Finish Grading:

1. Make finish grade smooth, uniform and free of abrupt grade changes and depressions to insure proper surface drainage.

2. Finish grade below adjacent paving, curbs or headers shall be 1.5 inches in shrub or ground cover areas and 3/4 inch in sodded lawn areas.

3. Water soil after spreading of fertilizer and/or soil conditioning materials and allow it to settle to provide a stable surface. After the soil has dried out to a workable condition, regrade, rake and smooth to the required grades and contours, eliminating any erosion scars. Finished surfaces shall be clean and suitable for planting.

4. Finish grading shall insure proper drainage of site. Surface drainage shall be away from all building foundations at a minimum of 2% or in accordance grades shown on Contract Drawings.

5. Turf Areas**:** Finish grading of turf areas shall take place after the soil has dried out to a workable condition following the soil preparation operations. The soil shall be remodeled and smoothed to the required grades and contours, then rolled in two directions at right angles with a water ballast roller weighing 200 to 300 pounds maximum. Any resulting irregularities in the grade after the initial rolling shall be re-raked, cut or filled, then re-rolled until the grade is free from irregularities. No trucks, tractors or other heavy objects shall be taken over the areas at any time. The final finish grade shall be smooth, uniform, without abrupt changes in grade, within one-tenth of a foot of the grades shown on the plan. No turf areas shall exceed 5:1 slope. Final grade must be approved by the CITY ENGINEER or BCA Inspector prior to seeding or sodding. (801-2.3).

3.4 WEED ABATEMENT

A. Weed Suppression (Non-Herbicide Weed Removal): shall apply to all turf and planting areas. The suppression operation shall be commenced only after removals, grading, hardscape construction, installation of irrigation system, soil preparation, and fine grading of turf and planting areas have been completed. The CONTRACTOR shall thoroughly water all turf and planting areas for a minimum period of two weeks prior to commencing removal. CONTRACTOR shall completely remove from the site all unwanted vegetation and weeds including underground roots and stolons by hand or mechanical means. All removed vegetation shall be properly disposed of off-site. Watering and removal process shall be repeated again 2 weeks after completion of initial removal. CONTRACTOR shall maintain the entire work area weed-free on a weekly basis from completion of weed removal process until Final Acceptance.

3.5 PLANTING

B. **General:** All plant materials, including plants previously approved at the nursery, shall be inspected by the ENGINEER prior to planting. The CONTRACTOR shall be responsible for the condition of all plants, planted or otherwise, until final acceptance by the CITY and termination of maintenance and establishment period. CONTRACTOR shall be obligated to honor all requirements of warranty as indicated herein.

1. Perform planting with materials and equipment according to procedures favorable to the optimum growth of the plant. Do not plant during high wind conditions.

2. Except as noted for specimen planting, do not start planting operations until the completion of weed suppression and completion and acceptance of the irrigation system coverage and approximate finish grade is achieved.

3. In cases where dripline tubing irrigation is specified, planting may occur prior to placement of dripline with approval of the PROJECT MANAGER. In such cases, extensive hand watering of the planting area should occur prior to planting – do not plant in dry soil.

4. Large boxed trees may be planted prior to hardscape installation or irrigation completion to facilitate construction and avoid damage to completed work with written approval from the PROJECT MANAGER. CONTRACTOR shall re-route irrigation lines in conflict with boxed tree locations to clear the root ball by 24" minimum at no additional cost to CITY.

C. Protection and Storage:

1. Keep all plant materials delivered to the jobsite in a healthy condition for planting. Do not crowd containers together in a manner that adversely affects plant foliage or growing conditions.

2. Do not allow plants to dry out or suffer physical damage from other construction activities. Protect from heavy winds.

D. Layout and Plant Locations:

1. Plant locations indicated on the Contract Drawings are approximate.

2. CONTRACTOR shall lay out each plant in its intended planting location as shown on the plan while the plant is still in the container and obtain approval of the layout from the ENGINEER ***prior to installation***.

3. Prior to planting, the CONTRACTOR may be directed to alter the layout of plants by direction of the ENGINEER, without additional compensation to the CONTRACTOR.

4. For "on center" plant spacing, locate the first row of plants in areas designated at one-half the specified spacing from the edge. Do not stretch the maximum specified spacing for each species as shown on the plans.

E. Container Plants Backfill Mix:

1. Unless specified otherwise or recommended by the approved agricultural suitability and fertility analysis and approved by the PROJECT MANAGER, container plants shall be backfilled with 100% amended site soil.

    a. Each plant pit shall also receive Tri-C Myco Tabs 1.7 gram 17-9-5 (N-P-K) planting tablets as shown in the relevant planting details, and as follows:

Container Size	
1 gallon	= 2 tablet
5 gallon	= 8 tablets
15 gallon	= 10 tablets
Boxed Trees	= 10 tablets per inch of trunk diameter, with a minimum of 20 tablets per tree.

    b. Some plant species may be designated not to receive any planting tablets. Refer to legend on Planting Plan.

F. Tree and Shrub Planting:

1. Prior to planting, irrigation system installation and soil amendment shall be completed and approved. Soil shall be thoroughly irrigated beforehand, and suitably moist for planting. ***Do not plant in dry soil***.

2. Make planting holes approximately square with vertical sides ***no greater than the depth of the plant container*** (or such depth as needed so that the root crown has the correct relationship to adjacent finished grade per the planting details) and approximately twice the width of the plant container or rootball and larger if necessary to permit handling and planting without injury to the root system. Lightly scarify native soil at the bottom of planting holes.

3. Do not plant plants with a broken or cracked rootball. Such plants shall be considered defective and rejected. Rejected plants shall be removed promptly from the job site.

4. Open and remove plant containers in such a manner that the plant roots are not injured. Do not pull plants out of the pot by the stalk.

5. Scarify native soil at the bottom of planting holes.

6. If soil is not adequately moist, apply water to planting hole and allow to drain. Set the plant approximately in the center of the planting hole and add backfill under rootball if needed to adjust the root crown to correct grade.

7. Backfill the balance of the planting hole with moist, amended site soil; firming the backfill by hand or with tools to assure all air pockets have been removed, and settlement will be minimized. After planting, all plants shall be plumb with the root crown at its natural depth with respect to finish grade.

8. Prune or remove any broken or damaged minor limbs. Any major damage to plant material shall be brought to the attention the ENGINEER for evaluation. Trees or shrubs with major broken limbs shall be considered defective and rejected. Rejected plants shall be removed promptly from the job site.

9. For any trees installed prior to completion of irrigation system: form a circular watering basin 6-inches high and slightly larger than the planting hole to accommodate temporary hand watering. Make the bottom of the basin level with surrounding finish grade. Watering basin berms shall be removed during fine grading process and before application of top-dress mulch.

10. Tree Edging: Where trees are planted in lawn area, a minimum 4-foot diameter circle around each tree shall be maintained free of lawn area to avoid the growth-reducing effects of lawn area on trees. Mulch shall be placed in the circle. This circle shall be kept clear of lawn area by the CONTRACTOR for the duration of the maintenance period.

11. Install vines per planting detail. Remove nursery stakes and affix all branches to walls or fences per notes and details on Contract Drawings.

G. Turf Planting: Soil amendment, irrigation installation, weed abatement, and fine grading shall be completed and approved before seeding or sod installation.

1. **Sod Planting**: The type of sod and the area to be sodded shall be in accordance with the Contract Drawings. Sod shall be machine cut to between 3/8" and 5/8" thick, not including top growth or thatch.

a. Site shall be fine graded to the specified thickness of the sod below finish grades. Soil conditioning and fine grading shall be completed before sodding. No heavy equipment shall operate over the site after grading is completed.

b. The site shall be moist but not wet when sod is laid. Sod shall be laid with closely fitted joints, and the ends of the strips shall be staggered forming a running bond pattern. Openings shall be plugged with sod or topsoil. Within 2 hours after installing sod and before rolling, the sod shall be lightly irrigated. All seams and joints shall then be rolled with a 200-300 lb. water ballast roller until the sod is well bonded to the soil below.

c. The sodded areas shall then be watered thoroughly to penetrate the subsoil at least 8 inches. Watering shall be repeated as necessary to keep the sod moist until rooted into the subgrade. Sodded areas shall be protected against all traffic until the sod is well established.

2. Turf Repair: All trenches shall be fully compacted, and the grade brought flush with the adjacent undisturbed finish grade. This repair shall include areas of irrigation or other piping trenches, conduit trenches or where vehicles or equipment has damaged the existing turf. Turf repair shall be accomplished using sod shall be carefully cut, removed, and reused to re-sod trenches after backfilling and compaction. CONTRACTOR shall use seed/sod to match existing turf type in areas being repaired unless directed otherwise by the ENGINEER.

3.6 TREE STAKING AND GUYING

A. Tree Staking: See planting legend for what type of staking shall be used for each tree type, if any shall be used. Stake trees with 2" diameter x 10' long lodgepole pine stakes as indicated on the Drawings and details.

1. After planting, all trees shall be re-staked promptly per details.

2. Remove any existing nursery stakes first before installing new lodgepole stakes.

3. All trees in turf areas shall be triple staked unless noted otherwise. Stakes shall be placed in a circular pattern around tree, evenly spaced 1/3 circle apart.

4. All trees in non-turf areas shall be double staked, unless noted otherwise. Align stakes with the direction of strongest seasonal winds.

5. DO NOT drive stakes into the rootball of any newly planted trees.

B. Guying: Guy any boxed trees indicated on planting legend. Install guying immediately after planting per detail.

3.7 MAINTENANCE AND PLANT ESTABLISHMENT

A. General Maintenance: Maintain all areas Inside of work on a continuous basis as they are completed ***during the progress of the work and during the plant establishment period***.

1. CONTRACTOR shall maintain the entire area of work until final acceptance of the Contract by the CITY. Maintenance activities shall include continuous operations of picking up trash, watering, weeding (including all broadleaf weeds in lawn areas), mowing, rolling, edging, fertilization, spraying & pest control of insects and rodents, reseeding & plant replacement (irrespective of cause), or any other operations necessary to provide normal healthy plant growth.

2. Any malfunctions of, or damage to the irrigation system due to workmanship or materials or as caused by the CONTRACTOR in the execution of his work shall be repaired by the CONTRACTOR within 24 hours at his own expense. The CONTRACTOR is responsible for keeping all plant material sufficiently watered during any irrigation failures.

B. Plant Establishment Period:

1. The Plant Establishment Period shall be for a minimum period of **90** days unless extended as described in this section. The Plant Establishment Period shall be started when all planting and irrigation related work has been completed in accordance with the contract documents and approved by the PROJECT MANAGER. CONTRACTOR shall request a review of completed work by the PROJECT MANAGER at the appropriate time to determine if the Plant Establishment period may begin. A field notification will be issued to the CONTRACTOR to establish the effective beginning date of the plant establishment period.

2. The designated plant establishment period is part of the total contract time. The plant establishment period will be extended at fourteen (14) day intervals if, at the end of the plant establishment period, the planting, irrigation and other improvements do not reflect the intent of the plans and specifications. All extensions of the plant establishment period shall be subject to the assessment of liquidated damages, (801-6).

3. All lawns shall be of the grass seed or sod specified and shall be free from all broadleaf weeds. The lawn shall not be allowed to grow higher than three (3) inches and shall be mowed to a 1½" - 2" inch height. The lawn shall be mowed at least weekly during the Plant Establishment Period. All lawn areas shall have 95 percent coverage with bare areas not exceeding three square inches at the end of the Plant Establishment Period. **60 days** after commencement of Plant Establishment Period, CONTRACTOR shall apply a slow release 38-0-0 granular fertilizer at a rate of 15 pounds per 1000 sq. ft. to all lawn areas and irrigate immediately afterwards. The fertilizer shall be applied in the presence of the BCA Inspector.

4. All trees and shrubs shall be healthy and vigorous in appearance throughout the duration of the Plant Establishment Period. Upon notice from the PROJECT MANAGER, the CONTRACTOR shall replace within seven (7) days of such notice at his own expense, any and all plant materials and/or sod which, for any reason dies or is damaged while under the CONTRACTORS care, or does not meet or exceed the quality of appearance and growth condition at the time of planting. Replacement shall be made with the same plant species and varieties as indicated or specified for the original planting. All replacement plants are subject to the same inspection requirements set forth in these specification for the original plant installation.

5. During the plant establishment period, all damage caused by erosion shall be repaired by the CONTRACTOR at his own expense within three (3) working days.

6. Broken or vandalized tree stakes shall be repaired or replaced by the CONTRACTOR at his own expense within seven (7) days.

7. During the plant establishment period, the irrigation system shall be operated in the automatic mode, unless otherwise permitted by the ENGINEER. No hand watering or manual station operations should be performed without notifying the ENGINEER. CONTRACTOR shall be responsible for setting an appropriate watering schedule for all irrigation zones, such as to provide adequate watering for each plant type, but not so much as to create any wasteful or unhealthful growing conditions. CONTRACTOR shall be responsible for modifying the watering schedule as needed to accommodate changing weather conditions.

C. Final Inspection/Final Acceptance:

1. Upon completion of the plant establishment period, a final inspection for acceptance will be performed by the BCA Inspector and ENGINEER or authorized representative. The CONTRACTOR shall request for inspection at least three (3) working days prior to the anticipated date. For this inspection, the site must be thoroughly cleared of all debris and excess material removed. If work fails to pass final inspection, any subsequent inspection must be rescheduled as per above, and will be charged to the CONTRACTOR.

2. If the plant establishment period is satisfactorily completed ahead of other work included in the Contract, the plants establishment shall be extended and shall be the responsibility of the CONTRACTOR until all other work has been completed and accepted by the CITY.

3.8 GUARANTEE

A. General: All shrubs and ground covers shall be guaranteed for a period of ninety (90) days from the end of the Plant Establishment Period. All trees and shrubs 15-gallon size or larger shall be guaranteed for a period of one (1) year from the end of the Plant Establishment Period. CONTRACTOR shall provide a written guarantee for the above materials as a part of the final close out package.

B. Deficiencies: Should any deficiencies develop within the specified guarantee period, CONTRACTOR shall correct such deficiencies to the full satisfaction of the ENGINEER without added expense to the CITY. All replacement plants shall be subject to a new guarantee for a period as described herein above.

END OF SECTION 32 90 00

SECTION 33 16 66

STORMWATER CAPTURE AND REUSE SYSTEM

PART ONE - GENERAL

1.1 DESCRIPTION

A. Furnish all labor, materials and equipment necessary to provide Capture and Reuse System as shown on the Contract Drawings.

B. Related work sections:
   1. Section 33 40 00 – Storm Drain System
   2. Section 31 00 00 – Earthwork
   3. Section 32 05 23 – Cast-in-place Concrete
   4. Section 03 20 00 – Reinforcement Steel

1.2 QUALITY ASSURANCE

A. A Certificate of Compliance in conformance with the provisions of these Standard Specifications shall be furnished to the Engineer.
B. Photo-documentation of each stage of construction will be required by the Landscape Architect in accordance with Stormwater Observation Report noted on the plan documents.
C. Contractor shall coordinate an on-site meeting with the manufacturer, landscape architect, and BCA Inspector to review installation instructions.

1.3 SUBMITTALS

A. Product Data: Within 35 calendar days after the Contractor has received the City's "Notice to Proceed", submit:

   1. Materials list of items proposed to be provided under this Section and other related Sections;

   2. Manufacturer's Specifications and other data needed to prove compliance with the specified requirements;

   3. Manufacturer's recommended installation procedures which, when approved by the City Engineer, will become the basis for accepting or rejecting actual installation procedures used on the Work.

1.4 INSPECTION

A. Required:

   1. All work inside the property lines regarding storm drain lines shall be inspected by the Los

Angeles City Department of Building and Safety.

2. Photo-documentation of each stage of the planter construction will be required by the Landscape Architect in accordance with Stormwater Observation Report noted on the plan documents.

PART TWO-PRODUCTS

2.1 PERMAVOID PRE-FABRICATED GEOCELLULAR UNITS/FITTINGS

A. Permavoid (PV150) : Manufactured using 100% recycled pre-consumer polypropylene to the following requirements.

1. Dimensions (metric): 710mm x 355mm x 150mm, Footprint area: 0.252m^2
   Dimensions (imperial): 27.95in x 13.98in x 5.91in, Footprint area: 2.713ft^2

2. Material: Polypropylene

3. Storage: 95% void space, 35.92L (1.2696 ft^3)

4. Compressive Yield Strength, Vertical : 715kPa (103.6psi) [1162kPa (168 psi) ultimate strength], Lateral: 156kPa (22.6psi)

5. Deflection Strength, Vertical: 400kPa (58.0psi) Lateral: 47.6kPa (6.9psi)

B. Permaties: Full height interlocking monolithic key connectors. Tapered with dovetail interlock to pull units together. PV150 has six tapered slots and utilizes two permaties per slot installed from the top and bottom.

D. Shear Connectors: When stacking Permavoid, shear connectors must be used to prevent lateral shift. One shear connector per unit is required.

E. Wicking Cylinders: Mineral Fibre capillary cones designed to deliver water from storage tank to soil.

F. PermaTexHP: A Wicking geotextile designed to spread water laterally to maintain full contact with the soil from wicking cylinders.

G. Supplied by:

As supplied by: ABT, Inc.
259 Murdock Rd. Troutman, NC 28166
Phone: 800-438-6057
Fax: 704-528-5478
www.abtdrains.com

2.2 PERMAVOID PLANTER SOIL REQUIREMENTS

A. The landscape/planter area has been sized to capture and treat the stipulated design volume and allow for the growth of healthy vegetation. Minimum recommendation for achieving the aforementioned are as follows:

1. 75% (+/- 5%) by weight shall consist of sand meeting the following:
2. For soil depths of 6 to 12 inches, average particle size shall be 500mm (0.020 in.)
3. For soil depths of 12 to 24 inches, average particle size shall be 300mm (0.012 in.)
4. Soils shall have a uniformity coefficient of 4.0 or less
5. Soils shall have less than 10% fines (passing 200 sieve) by weight
6. Planting media should consist of 60 to 80% fine sand and 20 to 40% compost.

B. Sand should be free of wood, waste, coating such as clay, stone dust, carbonate, etc. or any other deleterious material. All aggregate passing the No. 200 sieve size should be non-plastic. Sand for biofiltration should be analyzed by an accredited lab using #200, #100, #40, #30, #16, #8, #4, and 3/8 sieves (ASTM D 422 or as approved by the local permitting authority) and meet the following gradation (Note: all sands complying with ASTM C33 for fine aggregate comply with the gradation requirements provided in the following table:

Sand Texture Specifications

	Percent Passing by Weight	
Sieve Size ASTM D422	**Minimum**	**Maximum**
3 /8 inch	100	100
No. 4	90	100
No. 8	70	100
No. 16	40	95
No. 30	15	70
No. 40	5	55
No. 110	0	15
No. 200	0	5

C. Compost shall be a well decomposed, stable, weed free organic matter source derived from waste materials including yard debris, wood wastes, or other organic materials not including manure or biosolids meeting standards developed by the US Composting Council (USCC). Compost quality should be verified via a lab analysis to be:

1. Feedstock materials shall be specified and include one or more of the following: landscape/yard trimmings, grass clippings, food scraps, and agricultural crop residues.
2. Organic matter: 35-75% dry weight basis.
3. Carbon and Nitrogen Ratio: 15:1 < C:N < 25:1
4. Maturity/Stability: shall have dark brown color and a soil-like odor. Compost exhibiting a sour or putrid smell, containing recognizable grass or leaves, or is hot (120 F) upon delivery or rewetting is not acceptable.
5. Toxicity: any one of the following measures is sufficient to indicate non-toxicity:
6. NH4:NH3 < 3
7. Ammonium < 500 ppm, dry weight basis
8. Nutrient content:
9. Total Nitrogen content 0.9% or above preferred

10. Total Boron should be <80 ppm, soluble boron < 2.5 ppm
11. Salinity: < 6.0 mmhos/cm
12. pH between 6.5 and 8
13. Compost for biofiltration should be analyzed by an accredited lab using #200, ¼ inch, ½ inch, and 1 inch sieves (ASTM D 422) and meet the gradation described in the following table:

    Compost Texture Specifications

	Percent Passing by Weight	
Sieve Size ASTM D422	**Minimum**	**Maximum**
1 inch	99	100
½ inch	90	100
¼ inch	40	90
#200	2	10

C. Product: Biofiltration Soil Mixture: A loamy sand blend (moderate percolation rate media of 5-10 in/hr) as supplied by Gail Materials, Corona, CA 92883; (951) 667-6106; www.gailmaterials.net or approved equal.

2.3 IMPERMEABLE LINER

A. Impermeable Liner: 30 mil PVC liner by AccuGeo or approved equal. Impermeable plastic liner shall conform to Section 210-2 – PLASTIC LINER (Subsections 210-2.1 to 210-2.3.6) of SSPWC.

2.4 SUBSTITUTIONS

A.. The Permavoid system is being utilized as a capture and reuse passive irrigation system that has been reviewed and approved by LA Sanitation and Environment (LASAN) to meet the Low Impact Development (LID) requirements for this project. Alternate capture and reuse passive irrigation systems can only considered if they meet the storage capacity requirements of the Permavoid system within the given planter footprint while irrigating the entirety of the planter area and have equal or better strength characteristics. Alternate systems will also need to be reviewed and approved by LA Sanitation and Environment (LASAN); all costs for additional plan check review (if any) will be borne by the Contractor. Substitutions will be also subject to additional requirements noted in the GENERAL REQUIREMENTS.

PART 3: EXECUTION

3.1 INSTALLATION, GENERAL

A. All work to be carried out by a suitably qualified installer, with a minimum of 5 years' experience. Ensure site support from membrane and Permavoid manufacturers' representatives.
B. Site storage of Permavoid units must ensure UV protection if duration exceeds 7 days.
C. Coordinate with applicable trades for water inlet and discharge locations.

3.1 EXCAVATION

A. Ensure planters are level for base units. Leveling sand can be used to ensure accuracy (installed under impermeable liner). Ensure site is free of sharp objects and projections.
B. Tolerance to achieve a maximum deviation of 5mm in 3.0m in any direction.
C. Locate inlet and discharge pipe locations.
D. Install impermeable membrane liner. Waterproof membrane manufacturer to ensure suitable membrane for water containment with high resistance to puncture and elongation. All joints and pipe penetrations to be water-tight and welded by a qualified contractor. Corners to be formed and folded welts and heat sealed if required.

3.2 PERMAVOID PASSIVE IRRIGATION TANK

A. Ensure membrane is dry, clean and free from debris before installing Permavoid.
B. Check installation plans to confirm Permavoid orientation.
C. Install Permavoid wicking geotextile. Allow enough material to fully cover the bottom, sides and top of the Permavoid tank. Overlaps should be a minimum of 450mm.
D. Install wicking cones into Permavoid panels. Refer to installation plans to confirm location, quantity and style of wicking cones.
E. Install Permavoid panels onto wicking geotextile using all necessary tie connectors.
F. Install aeration piping/cleanouts.
G. Wrap panels with wicking geotextile to ensure coverage on all sides, top and bottom. Can be held in place with tape.

END OF SECTION 33 16 66

SECTION 33 40 00

STORM DRAIN SYSTEM

PART ONE - GENERAL

1.1 DESCRIPTION

A. Furnish all labor, materials and equipment necessary to provide "on-site" Storm Drain System as shown on the Contract Drawing and specified herein, including:

1. Catch basin
2. Drainage Piping/Fittings
3. Clean outs

B. Related work sections:
1. Section 33 16 66 - Permavoid Capture and Reuse Planter
2. Section 32 14 33 - Permeable Pavers
3. Section 31 00 00 - Earthwork
4. Section 32 05 23 – Cast-in-place Concrete

1.2 QUALITY ASSURANCE

A. Codes and Regulations: Conform to the applicable Los Angeles City Building Code and Amendments, Los Angeles City Bureau of Engineering Standard Plans, and the Standard Specifications for Public Works Construction (SSPWC), latest edition.

1.3 SUBMITTALS

A. Product Data: Within 35 calendar days after the Contractor has received the City's "Notice to Proceed", submit:

1. Materials list of items proposed to be provided under this Section and other related Sections;

2. Manufacturer's Specifications and other data needed to prove compliance with the specified requirements;

3. Manufacturer's recommended installation procedures which, when approved by the City Engineer or the Consultant, will become the basis for accepting or rejecting actual installation procedures used on the Work.

1.4 INSPECTION

A. Required:

1. All work inside the property lines regarding storm drain lines shall be inspected by the Los Angeles City Department of Building and Safety.

1.5 COORDINATION

A. Required: All on-site storm drain work shall be fully coordinated with other Contracted Work operations as per approved work scheduled.

PART TWO-PRODUCTS

2.1 CATCH BASINS

A. PVC surface drainage inlets shall include the drain basin type and size as indicated on the plans. The ductile iron grates for each of these fittings are to be considered an integral part of the surface drainage inlet and shall be furnished by the same manufacturer. The surface drainage inlets shall be as manufactured by Nyloplast a division of Advanced Drainage Systems, Inc., or prior approved equal.

B. The drain basins required for this contract shall be manufactured from PVC pipe stock, utilizing a hermoforming process to reform the pipe stock to the specified configuration. The drainage pipe connection stubs shall be manufactured from PVC pipe stock and formed to provide a watertight connection with the specified pipe system. This joint tightness shall conform to ASTM D3212 for joints for drain and sewer plastic pipe using flexible elastomeric seals. The flexible elastomeric seals shall conform to ASTM F477. The pipe bell spigot shall be joined to the main body of the drain basin or catch basin. The raw material used to manufacture the pipe stock that is used to manufacture the main body and pipe stubs of the surface drainage inlets shall conform to ASTM D1784 cell class 12454.

C. The grates and frames furnished for all surface drainage inlets shall be ductile iron for sizes and shall be made specifically for each basin to provide a round bottom flange that closely matches the diameter of the surface drainage inlet. Grates for drain basins shall be capable of supporting various wheel loads as specified by Nyloplast.

D. Backfill and Bedding Material for Catch Basin: The backfill material shall be crushed stone or other granular material meeting the requirements of class 1, class 2, or class 3 material as defined in ASTM D2321. This requirement may be met with onsite soil subject to the approval of the geotechnical engineer. Bedding and backfill for surface drainage inlets shall be well placed and compacted uniformly in accordance with ASTM D2321.

E. Catch Basin Filters: As indicated in Contract Drawings.

2.2 PIPE MATERIALS/FITTINGS

A. PVC Pipe**:** size per Contract Drawings**.** As per Section 207 - Pipe and Section 208 - Pipe Joint Types and Materials of the Standard Specifications for Public Works Construction (SSPWC.

B. Perforated Subsurface Drain Pipe: Provide shop-perforated with perforations symmetrically located within a maximum arc of 160 degrees. Perforations shall provide a total open area of at least 0.3 square inches per linear foot of pipe, with a minimum of one perforation per linear foot, except for joint areas. Perforation shall be either holes or slots. Hole diameters of 1⁄4-inch minimum to 3/8-inch maximum. Width of slots of 3/16-inch minimum to 5/16-inch maximum with slot length not exceeding 4-inches.

C. Backfill and Bedding Material for Pipe: Conform to the requirements of Section 31 00 00 - EARTHWORK, and Approved Soils Report as required.

2.3 CLEANOUTS

A. Cleanout: detail and location per contract drawings.

1. Concrete Paved area - Smith Fig. 4020, secure round top, spigot connection, set in concrete flush with paved surface.

2. Paver area – Smith Fig. 4040 with secure square top, spigot connection, set flush with top of paver surface.

3. Unpaved area - Smith Fig. 4240 with extensions to finish grade.

B. Concrete, Mortar and Related Materials: Conform to Section 32 05 23 – CAST IN PLACE CONCRETE.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completions of the Work. Do not proceed until detrimental conditions are corrected as directed by the ENGINEER or BCA Inspector.

3.2 EXCAVATING AND TRENCHING

A. General: Conform to the requirements as specified on the drawings, Los Angeles City Plumbing Code, SSPWC, Geotechnical Reports, and Section 31 00 00 - EARTHWORK.

B. Provide excavation and trenches for storm drain piping systems, concrete catch basins indicated on the Contract Drawings in accordance with applicable requirements specified in Section 31 00 00 - EARTHWORK.

3.3 STORM DRAIN SYSTEM CONSTRUCTION

A. General: In strict accordance with pipe manufacturers recommendations and the Los Angeles City Plumbing Code and the SSPWC.

B. Installation of Catch Basins: The specified PVC catch basins shall be installed using conventional flexible pipe backfill materials and procedures. The backfill material shall be crushed stone or other granular material meeting the requirements of class 1, class 2, or class 3 material as defined in ASTM D2321. Bedding and backfill for surface drainage inlets shall be well placed and compacted uniformly

in accordance with ASTM D2321. The drain basin body will be cut at the time of the final grade. No brick, stone or concrete block will be required to set the grate to the final grade height. For other installation considerations such as migration of fines, ground water, and soft foundations refer to ASTM D2321 guidelines.

C. Installation of Pipe: In accordance with Sec. 306-1.2 INSTALLATION OF PIPE of the SSPWC on unyielding bedding foundations with uniform bearing under full length of pipe barrels; walking on or disturbing pipe in any manner after joints have been made, is not permitted. Whenever work is stopped for any reason, protect ends of pipe with temporary tight-fitting closures. Slope pipe per Contract Drawings.

D. Pipe Bedding:

1. Provide bedding per applicable requirements specified in Section 31 00 00 - EARTHWORK and Approved Soils Report. Bedding material to be tamped and compacted and accurately graded and shaped to support bottom quadrant of pipe, with coupling holes dug prior to placement of pipe.

2. Backfill: Provide backfill and compact per applicable requirements specified in Section 31 00 00 - EARTHWORK and Approved Soils Report.

Appendix B – Geotechnical Data Report for the Las Palmas Senior Citizen Renovation Project by Tetra Tech BAS, Inc. dated March 31, 2022

Appendix C – Results of LPILE Analyses

1.0 INTRODUCTION

This report presents the results of our geotechnical investigation for the Las Palmas Senior Center Improvements project. The project site, as shown on Figure 1 – Vicinity Map, is located on the southeast corner of Franklin Avenue and North (N) Las Palmas Avenue in the Hollywood area. The project site address is 1820 N Las Palmas Avenue.

The purposes of this investigation were to evaluate the nature and engineering properties of the subsurface materials and develop geotechnical recommendations for design and construction of the project. The City of Los Angeles, Department of Public Works, Bureau of Engineering, Geotechnical Engineering Division (GED) has prepared this report in response to the Architectural Division's request.

2.0 PROJECT DESCRIPTION

The project site location is presented on Figure 2 – Site Location Map, and the concept plan is provided in Appendix A of this report. As shown on the concept plan (Appendix A), the project includes construction of a concrete pedestrian ramp. The maximum retained height of the ramp walls is not expected to exceed 4 feet. Other site improvements include a shade structure, outdoor seats, lighting, new pavement, and a trash enclosure. Structural load information for the proposed shade canopy and/or ramp retaining wall footings was not provided at the time this report was prepared. The maximum applied static bearing pressure is not expected to exceed 1,500 pounds per square foot (psf).

We understand the existing Senior Center building will undergo interior renovations; however, the project does not include structural retrofitting of and/or any addition(s) to the existing Senior Center building. New foundations and/or foundation upgrades within the existing building are not proposed at this time. Furthermore, the total value of the interior renovations is expected to be significantly less than 50 percent of the theoretical replacement value. We expect the interior renovation of the existing building will meet the exemption requirements from liquefaction and fault-rupture hazard zone investigations, as outlined in the Los Angeles Department of Building and Safety's (LADBS') Information Bulletin P/BC 2020-044.

We understand the site will be re-graded. We expect the proposed finished grades will be approximately within one to two feet of the existing ones, except in the area of the proposed pedestrian ramp. The finished grades could be up to 4 feet lower than the existing ones in some areas of the pedestrian ramp. If significant changes to the project are proposed, the findings and recommendations in this report may not be applicable, and a supplemental report may be required. The GED shall be provided an opportunity to review any proposed changes and determine if a supplemental report is required.

3.0 GEOTECHNICAL INVESTIGATION

This geotechnical investigation included reviewing relevant information, field exploration, and laboratory testing. The field exploration and laboratory testing was completed by Tetra Tech BAS, Inc. (Tetra Tech), and a copy of their data report is included in Appendix B of this report. The GED has reviewed their data report, concurs with the information contained in it, and accepts responsibility for the use of its contents.

3.1 REVIEW OF RELEVANT INFORMATION

As part of this investigation, the GED reviewed previous geologic and geotechnical investigation reports that were prepared for developments at private properties in close proximity to the project site. Many of these reports evaluated potential faulting associated with the Hollywood Fault and provided design recommendations to mitigate hazards associated with active faulting where appropriate. The list of reports reviewed are included in the references section at the end of this report. Key findings and conclusions of these investigations are summarized in Section 4.2 of this report.

3.2 FIELD EXPLORATION

Tetra Tech drilled four hollow-stem auger exploratory borings, and an additional boring that was used for infiltration testing. The boring locations are presented on the Field Exploration Location Map in Figure 2 in Tetra Tech's report (Appendix B). The boring depths ranged from approximately 16½ to 26½ feet below ground surface (bgs). The infiltration test boring, I-1, was drilled to a depth of approximately 8½ feet bgs. The subsurface conditions and infiltration test results are discussed in Sections 4.4 and 4.6 of this report, respectively.

3.3 LABORATORY TESTING

Laboratory tests were performed on selected samples to characterize the engineering properties of the on-site soils. The laboratory testing program included in-situ moisture content and dry density, particle size distribution (i.e. gradation) and hydrometer, percent passing the No. 200 sieve (i.e. fines content), Atterberg Limits, Expansion Index (EI), maximum dry density and optimum moisture content (i.e. compaction), consolidation, and direct shear. The individual laboratory test results are included in Tetra Tech's report (Appendix A). The test results are discussed in Section 4.7 of this report.

4.0 DISCUSSION OF FINDINGS

The following discussion of findings is based on the results of the data review, field exploration, and laboratory testing programs.

4.1 GEOLOGIC SETTING

The geology of the site and surrounding areas is presented on Figure 3 – Geologic Map. Regionally, the site is located near the boundary of the Peninsular Ranges physiographic province and Transverse Ranges physiographic province. Northwest trending mountains and faults characterize the Peninsular Ranges, whereas east-west trending mountain and faults characterize the Transverse Ranges. The predominate structural feature near the project site is the east-west trending Hollywood Fault Zone. As shown on Figure 4 – Earthquake Zones of Required Investigation, the main trace of the Hollywood Fault is mapped a few hundred feet north of the project site.

Locally, the site is situated near the southern flank of the Santa Monica Mountains at the northern edge of the Los Angeles Basin. The Santa Monica Mountains immediately north of the site are composed of Miocene-age shale or claystone of the Upper Topanga Formation. Based on geological mapping by Dibblee Jr. (1991), the site is underlain by late Pleistocene-age older alluvial deposits (Qae) consisting of clay, sand, and gravel.

4.2 PREVIOUS HOLLYWOOD FAULT EVALUATIONS BY OTHERS

As shown on Figure 4 – Earthquake Zones of Required Investigation, the project site and surrounding areas are located within an "Earthquake Fault Zone" associated with the Hollywood Fault. An Earthquake Fault Zone is a state-designated zone that was established to restrict development of new human-occupied structures across traces of active faults and mitigate the hazards associated with surface fault rupture. To construct new human-occupied structures in this zone, developers are required to prove absence of active faulting in order to get their projects permitted. As such, numerous investigations have been performed at properties near the site to evaluate faulting and the potential impacts on development of new human-occupied structures. A fault investigation is not required for the subject project because the planned improvements do not include human-occupied structures. Therefore, the following is presented for informational purposes only.

As shown on Figure 5 – Previous Hollywood Fault Investigation Map, previous surface fault rupture investigations have been performed for the adjacent properties located directly west (1840 N. Highland Ave.) and east (6650 and 6668 W. Franklin Ave., and 1855 N. Cherokee Ave.) of the existing Las Palmas Senior Center property. At the 1840 N. Highland Ave. property, GeoPentech performed an extensive fault investigation to support design of a six-story multi-family residential building. The investigation included advancement of 35 Cone Penetrometer Soundings (CPT's), drilling of 23 continuous core borings, and observation and logging of excavations created during construction. GeoPentech determined that four active fault splays (referred to as Fault F-1, F-2, F-3, and F-4 on Figure 5, attached) projected across the northern portion of the site, and no active faulting existed in the southern portion of the site. Based on these findings, GeoPentech concluded that a building exclusion zone should be established for the northern portion of the site within which human-occupied structures could not be constructed (Figure 5). The six-story residential building was recommended and permitted for construction on the southern portions of the site. The surface fault rupture investigation report was approved by the LADBS, Grading Division on September 5, 2017 under Log No. 99716.

To evaluate faulting on the property located directly east of the site (6650 and 6668 W. Franklin Ave., and 1855 N. Cherokee Ave.), Feffer Geological Consulting (Feffer) performed an investigation to support design of a six-story residential apartment building. Feffer's investigation included the advancement of four CPT's, drilling of two continuous core borings and six bucket-auger borings, and excavation of three fault trenches. Feffer identified two faults that projected across the property however, the faults were interpreted to have occurred before the Holocene Epoch, and therefore, these faults are considered to be "inactive." Feffer concluded that the property is not exposed to the hazard of surface fault rupture and human-occupied structures are acceptable within the entire site limits. The surface fault rupture investigation report was approved by the LADBS, Grading Division on October 3, 2016 under Log No. 92628-01.

4.3 SITE CONDITIONS

The property at 1820 N Las Palmas is bounded by Franklin Avenue to the north, N Las Palmas Avenue to the west, and private properties to both the south and east. The northeastern portion of the property is occupied by an existing single-story building that currently serves as a Senior Center and a preschool. The building is accessed via a pedestrian walkway from N Las Palmas Avenue.

The project site is located in the southeast area of the property and on the south side of the existing building. There is an existing concrete staircase that is located within approximately 3 feet away from the south side of the building. The stairs extend from the paved exterior concrete paths on the south side of the building to a paved concrete "court" area, which is mostly used for outdoor leisure activities. There is also an existing concrete retaining wall that is connected to the stairs and extends along the north and west sides of the "court" area. The maximum retained height of the concrete wall and stairs is approximately 3 feet. We expect portions of the concrete retaining wall will be demolished to facilitate construction of the pedestrian ramp near the southeast corner of the building. The project site also includes an existing paved parking area on the south side of the "court" area, which is accessed from N Las Palmas Avenue. There is a chain-link fence surrounding the south, west, and east sides of the court area. The adjacent area to the west is landscaped with grass, plants and several trees.

The elevation difference across the property in a north-south direction is approximately 8 feet. The ground surface descends to the south at an average inclination of approximately 2.7 percent. The approximate 3-foot grade difference between the "upper" building area and "lower" court area is not clearly depicted on Figure 2.

4.4 SUBSURFACE CONDITIONS

Uncertified fill was encountered in all four exploratory borings. The fill thickness in all borings, except Boring B-4, is approximately 20 feet. The fill thickness in B-4, which was advanced in the parking area, is approximately 15 feet. The fill is mostly comprised of clayey sand with varying amounts of gravel. Fill indicators, including glass, brick, and concrete fragments, were observed in several of the samples collected. Based on the field Standard Penetration Test (SPT) blow counts, the relative density of the fill is generally loose to medium dense. The underlying native soil mostly consists of silty sand with gravel. A layer of lean clay with sand / sandy lean clay was encountered at a depth of approximately 25 feet bgs in Borings B-2 and B-3. Based on the field SPT blow counts, the native "sandy" is generally medium dense. Refer to the boring log information in Appendix B for more details.

4.5 GROUNDWATER

Groundwater was not encountered in any of the four borings, which were advanced to a maximum explored depth of approximately 26½ feet bgs. Groundwater information from the California Department of Conservation, Division of Mines and Geology (DMG, 1998) indicates the shallowest reported historic groundwater depth is between approximately 80 to 100 feet.

It is important to note that the Hollywood Fault is considered to act as a groundwater barrier in this area. The groundwater levels on the north side of the fault are expected to be much higher than those on the south side. Also, groundwater levels can also fluctuate with seasonal rainfalls, dry weather (i.e. drought conditions), and pumping activities in the vicinity of the site. Groundwater is not expected to affect the proposed construction.

4.6 BOREHOLE INFILTRATION TEST RESULTS

A borehole infiltration test was performed to evaluate the feasibility of onsite stormwater infiltration. The soils within the infiltration zone consist of existing uncertified fill. The infiltration rate was estimated using the guidelines presented in the County of Los Angeles, Department of Public Works, Geotechnical and Materials Engineering Division's (2021) Administrative Manual. The infiltration rate was averaged over a period where a steady-state flow condition could be achieved. The *unadjusted* infiltration rate was found to be approximately 0.9-inch per hour. The feasibility of stormwater infiltration is discussed further in Section 6.9 of this report.

4.7 LABORATORY TEST RESULTS

Moisture and dry density determinations were performed to evaluate the in-situ unit weight of the soil. Test results indicate the moisture content and dry density of the existing fill ranges from about 8.1 to 23.2 percent and 87.9 to 111.1 pounds per cubic foot (pcf), respectively. The total unit weight of the existing fill ranges from approximately 95 to 126 pcf with an average value of 116 pcf. Based on a limited number of (i.e. three) test results, the total unit weight of the native soil ranges from approximately 107 to 117 pcf.

Four gradation tests and four fine content tests were performed on selected samples of the fill and native soil. The test results confirm the soil descriptions shown on the boring logs. Hydrometer test results material indicate the clay content (percent finer than 0.005 mm) of the existing fill is approximately 15 percent.

An EI test was performed on a bulk sample of the near surface fill material from B-1. The test results indicate the EI value is 6, which indicates a very low potential expansion potential.

Atterberg Limits tests were performed on three samples of the existing fill material and on two samples of the native soil to evaluate the shrink-swell behavior of these materials. The test results indicate the plasticity index (PI) of the fill is between 9 and 20. The test results indicate the PI of the native "clayey" soil is 31. Based on these test results, the existing fill and native soil are expected to exhibit moderate and high shrink-swell behavior, respectively.

Direct shear tests were performed on a remolded sample of the near surface fill material and on a relatively undisturbed sample of the native "clayey" soil. The near surface fill material was remolded to approximately 90 percent relative compaction (RC) at 2 percent above the optimum moisture content. The direct shear test results indicate the ultimate friction angle and cohesion value of the remolded fill material is 34 degrees and 100 psf, respectively. The direct shear test results indicate the ultimate friction angle and cohesion value of the "clayey" native soil is 27 degrees and 250 psf, respectively.

A consolidation test was performed on a remolded sample of the near surface fill material from Boring B-3. The soil was remolded to approximately 90 percent RC at 2 percent above the optimum moisture content. The results indicate there is no significant potential for collapse upon wetting. The remolded sample did exhibit swell upon wetting; however, it was relatively minor (~0.1%).

Finally, a compaction test was performed on a bulk sample of the near surface fill material to determine its maximum dry density and optimum moisture content. The compaction test results indicate the optimum moisture content and maximum dry density of this material is 11.5 percent, and 124.2 pcf, respectively.

5.0 SEISMIC CONSIDERATIONS

The following sections present seismic design parameters and discuss seismic hazards for the site.

5.1 2020 LABC SEISMIC DESIGN PARAMETERS

Seismic design parameters for the project were developed in accordance with the 2020 Los Angeles Building Code (2020 LABC), which are based on the procedures outlined in ASCE 7-16. The seismic design parameters for the site are summarized in Table 1.

TABLE 1 – SEISMIC DESIGN PARAMETERS

Parameter	Value
Site Class	D
S_s	2.116
S_1	0.76
S_{MS}	2.539
S_{M1}	Null – see Section 11.4.8
S_{DS}	1.692
S_{D1}	Null – see Section 11.4.8

The site modified peak ground acceleration (PGA_M) at the site is 1.09g.

5.2 SEISMIC HAZARDS

This section provides the results of our evaluation of earthquake-related geologic/geotechnical hazards for the site, including surface fault rupture, and liquefaction.

5.2.1 Surface Fault Rupture

As discussed in Section 4.2 of this report, the site is located in close proximity to adjacent sites where active faulting has been identified by others. Based on our review of existing fault investigation reports by others, portions of the Las Palmas Senior Center property may be underlain by active fault traces. The GED's scope of work for this project did not include an evaluation of surface fault rupture; therefore, we are not in a position to render an opinion regarding the surface fault rupture hazard. Based on the LADBS' Information Bulletin P/BC 2020-044, we consider the proposed improvements to be exempt from a surface fault rupture evaluation. If the proposed project changes, a surface fault rupture evaluation may be required.

5.2.2 Liquefaction Evaluation

As shown on Figure 4, the project site is located within a liquefaction zone. As discussed, groundwater was not encountered in the borings to the maximum explored depth of approximately 26½ feet. Although the historical high groundwater depth is between approximately 80 and 100 feet, the GED acknowledges the groundwater depth may be much shallower in the northern portion of the property due to the groundwater barrier associated with the Hollywood Fault.

Based on the LADBS' Information Bulletin P/BC 2020-044, we consider the proposed improvements to be exempt from a liquefaction evaluation. The GED's scope of work for this project did not include an evaluation of liquefaction; therefore, we are not in a position to render an opinion regarding the liquefaction hazard potential.

6.0 RECOMMENDATIONS

Based on the results of our investigation, the proposed project is considered geotechnically feasible provided the recommendations presented in this report are incorporated into the design and construction. If changes in the design are made, or variations or changed conditions are encountered during construction, the GED shall be notified to determine if supplemental recommendations are required.

6.1 KEY DESIGN ISSUE

The primary geotechnical design issue is the long-term effect of settlement associated with loose and debris-laden fill. This settlement is expected to be episodic and differential in nature. Static settlement (i.e. soil collapse) is expected to occur if the uncertified fill is inundated with water. Dynamic settlement may occur during an earthquake. As discussed, the fill thickness is approximately 20 feet in the proposed pedestrian ramp and shade structure areas (see B-1 through B-3). The fill thickness is approximately 15 feet in the proposed trash enclosure area (see B-4). The LADBS, Grading Division typically doesn't allow structures to be supported on uncertified fill. To mitigate the effects of potential settlement associated with loose and debris-laden uncertified fill, we recommend supporting the shade structure and pedestrian ramp on cast-in-drilled-hole (CIDH) piles. As an alternative to deep foundations, the pedestrian ramp and retaining walls may be supported on a rigid shallow foundation that is designed to resist differential settlement. The earthwork recommendations provided in Section 6.2 of this report will also help mitigate the effects of potential settlement on the proposed improvements.

Differential settlement may impact existing and proposed utility pipes. To minimize the potential for settlement to impact underground utility pipes, we recommend discussing mitigation alternatives with someone who specializes in the design of them. They should be involved in the design process, and their recommendations should be implemented during construction. Flexible pipe connections shall be used wherever feasible, and connections should be designed to withstand the differential settlement between inlet and outlet facilities. The GED recognizes the potential for utility pipes to become damaged in the future and we consider this is a matter of maintenance. Repairs to damaged utility pipes should be made in a timely manner. If possible, the civil engineer should locate utilities in areas that can be easily assessed.

6.2 EARTHWORK

All earthwork shall be performed in accordance with the geotechnical recommendations presented in this report and the LADBS, Grading Division requirements. Furthermore, all earthwork should be performed under the observation and testing of the GED.

6.2.1 Site Preparation

Site preparation will initially involve the demolition of the existing pavement, structures, and other obstructions within the construction area. Following demolition, the construction area should be cleared of any vegetation and stripped of miscellaneous debris and other deleterious material. Organic matter and other material that may interfere with the completion of the work should be removed from the limits of the construction area. Vegetation and organic matter should not be incorporated into the compacted fill. Organic rich soil, if present, may be stockpiled for future landscaping. Voids resulting from the demolition shall be backfilled with properly compacted fill. These materials shall be removed from the construction area and hauled to a proper disposal area.

Any utilities, whether active or inactive, shall be identified and properly abandoned or relocated per project plans and specifications. Any depressions resulting from removal of any existing foundations or utility lines shall be properly backfilled and compacted in accordance with the recommendations in the following sections.

6.2.2 Over-Excavation

Over-excavation and recompaction is not required for structures that are entirely supported on CIDH piles.

If shallow foundations are the preferred alternative for the pedestrian ramp and retaining walls (see Section 6.3), the existing soil shall be removed to a depth of at least 48 inches below the bottom of the proposed foundation. The excavation shall extend laterally at least 48 inches beyond each edge of the structure, except in areas on the north side adjacent to the existing building. Lateral over-excavation on the north side of the proposed ramp, and particularly in the west portion, shall only be performed if it can be done without undermining the existing building foundation.

The existing soil beneath proposed pavement areas and the trash enclosure shall be removed to a depth of at least 24 inches below existing subgrade. The excavation shall extend laterally at least 24 inches beyond each edge of the pavement/slab or to the property boundary, whichever is less. The over-excavation and recompaction, including subgrade preparation shall result in at least 24 inches of compacted fill beneath the exterior slab for the trash enclosure and 18 inches of compacted fill beneath the aggregate base for new pavements.

The soil beneath non-structural footings (planters, fences, and non-retaining site walls) shall be removed to a depth of 24 inches below the bottom of footing. The excavation shall extend laterally at least 2 feet beyond the edge of the footing or to the property boundary, whichever is less.

6.2.3 Temporary Excavations

Based on our observations during subsurface investigation and results of laboratory tests, the materials at the site should be readily excavated by conventional earthmoving equipment in good operating condition. All temporary excavations shall conform to the State of California Construction Safety Orders (CAL/OSHA).

Unsurcharged, temporary vertical excavations shall generally not exceed 5 feet, except near the existing building; however, unsurcharged temporary excavations shall not extend within a 1:1 (horizontal:vertical) theoretical projection of the existing building footing(s). It is the contractor's responsibility to make sure temporary vertical excavations do not adversely impact the existing building's foundation elements. If deeper excavations are proposed, they shall be reviewed by the GED, and supplemental recommendations may be required.

6.2.4 Temporary Shoring

Cantilever or braced shoring may be considered at this site as an alternative to temporary excavations. Shoring deflections shall not exceed ½-inch unless it can be clearly demonstrated with calculations that adjacent structures, utilities, and/or streets will not be impacted. Sheet piles, box shoring, and/or trench shields (i.e. speed shores) are generally not acceptable. The GED may approve them; however, approval depends on several factors. If they are proposed, the GED will review each situation on a case-by-case basis.

Settlement of structures will occur in proportion to both the distance between the shoring and the structure, and the amount of horizontal deflection of the shoring system. Vertical settlement will be a maximum at the shoring face and decrease as the horizontal distance from the shoring increases. Beyond a distance from the shoring equal to the height of the shoring, the settlement is expected to be negligible. The maximum vertical settlement is expected to be about 75 percent of the horizontal deflection of the shoring system.

Prior to excavation, it is recommended that walls, structures, or portions of structures within a horizontal distance of 1½ times the depth of the excavation be inspected to determine their present condition. For documentation purposes, photographs should be taken of preconstruction conditions and level surveys should be performed.

6.2.4.1 Lateral Earth Pressures

Cantilever or braced shoring shall be designed for the lateral earth pressures shown on Figure 6 – Lateral Earth Pressures for Temporary Shoring Systems. These values are based on the assumption that (1) the shored soil material is level at ground surface, (2) the exposed height of the shoring is no greater than 15 feet, and (3) the shoring is temporary, and will not be required to support the soil longer than about six months. Surcharge coefficients of 0.32 and 0.48 may be used with uniform vertical surcharges for cantilever and braced shoring lateral earth pressures, respectively. These surcharge pressures should be added to the lateral earth pressures.

6.2.4.2 Soldier Piles and Lagging Design

Drilled holes for soldier piles shall be backfilled with sand-cement slurry per Greenbook Section 201, from the bottom of lagging (i.e. proposed excavation depth) to the ground surface. The sand-cement slurry shall contain a minimum of one sack of Portland cement per cubic yard of slurry and a maximum of two sacks of Portland cement per cubic yard of slurry. Drilled holes below the excavation bottom shall be backfilled with structural concrete. To reduce the potential for sloughing and caving of the soils, continuous lagging shall be installed between the soldier piles. All lumber shall be pressure-treated in accordance with Specification C-2 of the American Wood Preservers Association.

6.2.4.3 Construction Considerations for Soldier Piles

We expect the soldier piles can be drilled using conventional equipment. Significant caving conditions are not anticipated; however, if caving conditions are encountered, temporary steel casing shall be used to support the sides of the pile excavations. Sonotubes are not acceptable as a substitute for steel casing. For temporary steel casing, the inside diameter shall be at least as large as the diameter of the piles. Drilling shall be completed within the temporary steel casing.

The contractor shall remove loose soil (i.e. slough) from the bottom of the pile excavation. The drilled holes shall be plumb to within a tolerance of 2 percent. Upon completion of drilling, secure covers shall be placed over the excavations. Concrete placement shall be completed within 12 hours of drilling and drilled holes shall not be left open overnight. Excavations shall be observed and approved by the GED during drilling and prior to installation of steel reinforcement.

Depending on the final depths and construction methods, concrete placement by the pump and tremie method may be required. Concrete shall not be allowed to free fall more than 6 feet. Concrete placement shall be performed in a manner such that it does not hit the side of the drilled hole and so that the alignment of the steel reinforcement is not affected. The web of the steel reinforcement may be used as a vertical chute for placement of concrete provided the concrete does not impact its alignment.

If temporary steel casing is utilized, it shall be raised slowly during concrete placement as the drilled hole is filled with concrete. The bottom of the casing shall remain a minimum of 3 feet below the level of concrete during the pour.

6.2.5 Subgrade Preparation

Excavation bottoms shall be scarified to a depth of at least 6 inches, moisture conditioned to within 3 percent above the optimum moisture content, and compacted to at least 90 percent RC, as determined by ASTM Test Method D1557. Excavation bottoms shall be approved by a GED representative and the LADBS, Grading inspector prior to backfill.

6.2.6 Geotextile Placement

If shallow foundations are the preferred alternative for the pedestrian ramp and retaining walls, a layer of Tensar InterAx NX850 or equal shall be placed along the base of the excavation. An additional layer of Tensar InterAx NX850 or equal shall be placed at 18 inches above the initial layer following the placement of compacted fill (see Section 6.2.7).

For the proposed trash enclosure and new pavements, a layer of Tensar InterAx NX850 or equal shall be placed along the base of the excavation. An additional layer of Tensar InterAx NX850 or equal shall be placed at 12 inches above the initial layer following the placement of compacted fill (see Section 6.2.7). We anticipate the top layer will be near the bottom of the aggregate base within the pavement section.

6.2.7 Fill Materials and Backfill Placement

Fill materials may consist of the existing fill onsite or approved import soil. Import soil shall be predominantly granular (minimum 80% passing the No. 4 sieve and between 10% and 35% passing the No. 200 sieve), non-expansive (EI less than 20). All fill shall be free of organic or inorganic debris, contamination and materials with any dimension larger than 3 inches. Proposed import soil shall be reviewed by the GED for approval prior to delivery to the job site. The GED shall be notified a minimum of three working days prior to scheduled delivery to the site.

Fill material shall be placed in loose lifts not exceeding 8 inches in thickness, moisture-conditioned to between 0 and 3 percent above the optimum moisture content and mechanically compacted. The hydrometer test results indicate the onsite soils are “clayey.” “Clayey” primary structural fill and all secondary structural fill shall be compacted to at least 90 percent RC. Import “sandy” soil used as primary structural fill shall be compacted to at least 95 percent RC. Crushed aggregate base (CAB) and/or crushed miscellaneous base (CMB) in pavement areas, including the trash enclosure, shall be compacted to at least 95 percent RC.

Fill placement and compaction shall be observed and tested by a certified compaction testing agency working under the direct supervision of the GED. Compacted fill soils shall be kept moist, (at or slightly above the specified moisture content at the time of compaction) but not flooded, until covered with subsequent construction. If compacted fill soils become softened or disturbed, they shall be replaced or recompacted at the discretion of the GED before additional fill or construction is placed. Certification and inspection approvals for compromised soils are void and invalid.

6.2.8 Utility Trench Backfill

Trench excavations for utility pipes may be backfilled with onsite soils under the observation of a representative of the GED. After utility pipes have been laid, properly bedded, and covered per the project specifications, they shall be backfilled to the ground surface or design subgrade with controlled backfill. Controlled backfill shall be moisture conditioned, placed and compacted in accordance with the recommendations presented above (Section 6.2.7). Densification by flooding or jetting is not allowed.

6.2.9 Fill Certification

Upon successful completion of fill placement and compaction, the GED will issue a Compaction Certification for the fill. Unless approved by the Building Inspector during construction, the Contractor shall not pour footings until an approval letter is issued by the LADBS, Grading Division for the Compaction Certification. The contractor may excavate in compacted fill for foundation elements before the fill certification approval letter is issued, but does so at his/her own risk.

6.3 PEDESTRIAN RAMP SHALLOW FOUNDATION ALTERNATIVE – STRUCTURAL MAT

Following the site preparation and recommended earthwork, the proposed pedestrian ramp and retaining walls may be supported on a structural mat foundation. Design recommendations are provided in the following sections.

6.3.1 Bearing Capacity and Settlement

The structural mat shall be underlain by at least 48 inches of compacted fill that is reinforced with two layers of Tensar InterAx NX850 or equal. The structural engineer shall determine if thickened edges along the perimeter are required to resist the lateral loads. If thickened edges are required, they shall be embedded at least 12 inches below lowest adjacent grade. The mat may be designed based on an allowable static bearing capacity of 1,500 psf. This value may be increased by 1/3rd for temporary loading conditions such as wind or seismic forces.

Based on the allowable bearing value recommended above, the total static settlement of the mat foundation should not exceed 1 inch. The maximum differential settlement across the footprint of the structure is not expected to exceed ½-inch.

6.3.2 Lateral Load Resistance

Lateral load resistance will be developed by passive soil pressure against the thickened edges and by friction acting along the base of the mat. An allowable passive pressure of 250 psf per foot of depth may be used for design purposes. Passive pressure shall begin at a depth of 12 inches below the ground surface; however, if the ramp structure is located adjacent to an exterior slab or pavement, passive pressure may begin at the ground surface. The allowable passive pressure is only applicable for level (ground slope equal to or flatter than 5:1) conditions. An allowable coefficient of friction of 0.35 may be used for dead and sustained live loads for frictional resistance. A FS of 1.5 has been incorporated into both the allowable passive and frictional resistance values.

For temporary loading conditions such as wind or seismic forces, the lateral load resistance may combine the passive pressure and frictional resistance; however, the passive pressure shall not exceed ½ the combined total lateral resistance.

6.3.3 Modulus of Subgrade Reaction

We recommend the structural mat be designed based on elastic theory principles with an estimated modulus of subgrade reaction "k" based on the following equation:

$$k = k_1\left(\frac{1}{B}\right)\left(\frac{1+0.5\frac{B}{L}}{1.5}\right)$$

where k_1 is the coefficient of subgrade reaction in pounds per cubic inch (pci) of a square foundation measuring one foot by one foot, and B and L are the width and length of the structural mat, respectively. A value of 150 pci may be assumed for k_1 in the above equation.

6.4 CAST-IN-DRILLED-HOLE PILE FOUNDATIONS

The shade structure and pedestrian ramp may be supported on CIDH piles that are embedded at least 3 feet into the native soil. The actual embedment may be deeper and will depend on the results of the axial capacity and lateral load analysis, which shall be completed by the structural engineer. The minimum pile diameter shall be 24 inches, and the minimum pile spacing shall be 3 pile diameters on the center. Based on discussions with the Structural Engineer, the loads have not yet been determined at this time.

6.4.1 Axial Capacity in Compression

The axial compression capacity assumes the CIDH piles develop their capacity solely from skin friction or side resistance. Also, all skin friction shall be neglected in the upper 20 feet bgs. An allowable adhesion value of 500 psf may be used below 20 feet. The minimum pile embedment depth shall be 23 feet; however, the actual depth(s) may be deeper depending on the required lateral loads. We anticipate the piles will be isolated (i.e. spaced at least 3 pile diameters on center), and therefore, group effects are not anticipated. The total settlement for each pile is not expected to exceed 1-inch provided the piles are properly constructed.

The allowable adhesion value of 500 psf assumes the CIDH piles develop their capacity solely from side resistance of the native soil (i.e. skin friction). Also, we assumed no downdrag forces were contributed to the pile from the existing uncertified fill.

6.4.2 Axial Capacity in Tension

The allowable axial tensile capacity may be assumed to be ½ the axial capacity in compression (see Section 6.4.1 above). The weight of the embedded portion of the concrete shaft may be added to the tensile capacity.

6.4.3 Lateral Load Behavior

The lateral load behavior of a 24-inch diameter CIDH pile was evaluated using the LPILE (Ensoft, 2016) software program. LPILE (2016) uses load deflection (p-y) curves to approximate the relationship between soil resistance and pile deflection. The lateral load behavior was evaluated based on an allowable deflection of ½-inch at the pile head. We assumed a concrete compressive strength of 3,000 psi for our analyses and a steel reinforcement equal to approximately 1.1 percent of the total pile cross-sectional area.

The main inputs in the LPILE software for each soil layer are the unit weight and soil shear strength. The uncertified fill in our profile was assumed to behave as "sand" with a total unit weight of 98 pcf, effective friction angle of 20 degrees, and no cohesion. A request for modification of building ordinances for deriving lateral support from the existing undocumented fill will be submitted concurrently with this report. The existing native soil below 20 feet was assumed to have a total unit weight of 117 pcf, an effective friction angle of 27 degrees and a cohesion value of 250 psf. The results of the LPILE analyses are included in Appendix C of this report.

The structural engineer shall review the results of our analyses once the actual loads have been determined. We anticipate supplemental analyses will likely be required if the proposed pedestrian ramp and retaining walls are supported on CIDH piles.

6.4.4 CIDH Pile Construction

The recommendations provided in Section 6.2.4.3 of this report are applicable to CIDH pile construction for the shade structure and pedestrian ramp.

6.5 LATERAL EARTH PRESSURES FOR RETAINING WALLS

The pedestrian ramp retaining walls shall be designed to retain the surrounding soil using either an equivalent "active" or "at-rest" fluid pressure. Walls that are free to rotate away from the base (i.e. not restrained) shall be designed to withstand an "active" pressure based on an equivalent fluid pressure of 45 pcf. Restrained walls shall be designed to withstand an equivalent "at-rest" fluid pressure of 60 pcf. The recommended lateral earth pressure value assumes that the surface of the backfill behind the retaining walls is close to horizontal (inclination of 5:1 or flatter). The foregoing lateral earth pressure assumes non-expansive and free-draining backfill behind the ramp walls. If surcharge loads (live or dead) are applied, they should be added to the earth pressure by applying a uniform (rectangular) pressure. The lateral earth pressure coefficients for a uniform vertical surcharge load applied behind the ramp walls are 0.33 and 0.50 for an active and at-rest condition, respectively.

Although we expect the retained heights of the proposed ramp walls to be less than 6 feet, the exact retained heights are not known at this time. Per the requirements of the LADBS' Bulletin P/BC 2020-083, retaining walls supporting more than 6 feet of backfill shall be designed for seismic lateral earth pressures. The seismically induced increment, which is separate and in addition to the static earth pressure(s), was estimated based on the procedures outlined in Bulletin P/BC 2020-083. A seismic earth pressure increment of 25 pcf shall be used, and this should be applied as an inverted triangle pressure distribution.

6.6 RETAINING WALL DRAINAGE

The lateral earth pressures provided in Section 6.5 assume non-expansive backfill and no buildup of hydrostatic pressure behind the ramp retaining walls. The bottom front portion of the ramp walls shall include 2-inch diameter weep holes. Also, the backfill shall consist of granular filter material. A minimum 12-inch thick layer of filter material shall be placed against the back of the ramp walls and extend up to 18 inches below the adjacent grade behind the wall(s). The filter material should be clean, well-graded and consist of sand and gravel meeting the following gradation requirements:

Sieve Size	Percentage Passing Sieve
1"	100
¾"	90-100
⅜"	40-100
No. 4	25-40
No. 8	18-33
No. 30	5-15
No. 50	0-7
No. 200	0-3

An alternative to graded filter material is to use clean gravel (3/8-inch or ¾-inch size) with a nonwoven geosynthetic (i.e. filter fabric) placed between the gravel and backfill soil. The filter fabric shall also be placed between the clean gravel and the overlying soil cap. The filter fabric shall meet the requirements outlined in Table 213-2.2 of the "Greenbook". Fill materials overlying the filter material shall consist of the onsite fill material or import material.

6.7 PLANTER AND FENCE WALL AND NON-STRUCTURAL FOUNDATIONS

Continuous and/or isolated footings may be used to support planter, fence, and other non-structural (i.e. non-retaining) site walls less than 8 feet tall. Non-structural footings shall be structurally isolated from adjacent structural foundations. Also, the footings shall bear on at least 24 inches of compacted fill. The structural engineer is responsible for designing the steel reinforcement.

Footings with a minimum width of 12 inches and embedded a minimum of 18 inches below the lowest adjacent grade, bearing on properly compacted fill, may be designed for an allowable bearing capacity of 1,200 psf. The allowable bearing capacity includes dead-load and sustained live-loads. The value may be increased by one-third for short durations of loading which will include the effect of wind or seismic forces.

Lateral load resistance will be developed by passive soil pressure against the footings and by friction acting along the base of the footings. An allowable passive pressure of 150 psf per foot of depth may be used for design purposes. Passive pressure shall begin at a depth of 12 inches below the ground surface; however, if the structure is located adjacent to an exterior slab or pavement, passive pressure may begin at the ground surface. The allowable passive pressure is only applicable for level (ground slope equal to or flatter than 5:1) conditions. An allowable coefficient of friction of 0.35 may be used for dead and sustained live loads for frictional resistance.

6.8 DRAINAGE

Final grades should be sloped to direct surface water away from foundations and slabs and towards discharge facilities. Surface water should not be allowed to pond anywhere onsite. Water from downspouts, if any, should be collected in closed pipes and conveyed to storm drains or other appropriate discharge locations.

6.9 FEASIBILITY OF STORMWATER INFILTRATION

The requirements outlined in LADBS' Information Bulletin P/BC 2020-118 typically don't allow for storm water infiltration into existing uncertified fill material. Due to the potential for significant settlement to occur in the existing fill materials, the GED does not consider this site to be feasible for shallow stormwater infiltration. Deeper stormwater infiltration via a dry well may be feasible; however, it would require an additional investigation. The dry well is expected to increase saturation of the native soils below a depth of 20 feet making them prone to post-liquefaction settlement, and therefore, a liquefaction evaluation would be required. To meet the City's LID BMP requirements, the civil designer should consider other alternatives such as biofiltration and/or a capture-and-use system. A supplemental report, which includes the results of a liquefaction evaluation, will be prepared if a dry well system becomes incorporated into the project scope.

6.10 PAVEMENT DESIGN

The following pavement designs have been prepared for parking areas and driveways based on an assumed R-value of 50. In all pavement areas, the uppermost 18 inches of subgrade soil shall should be compacted to at least 90 percent RC.

6.10.1 Asphalt Pavement Sections

Traffic indexes (TIs) were not provided to us at the time of this report. Pavement sections were calculated for the range of TIs shown in the table below.

TABLE 2 – ASPHALT PAVEMENT SECTION LAYER THICKNESSES (INCHES)

Layer	Traffic Index = 5.0	Traffic Index = 6.0	Traffic Index = 7.0	Traffic Index = 8.0	Traffic Index = 9.0
AC surface	2.5	3.0	3.5	4.0	4.0
CAB/CMB (95 percent RC)	4.0	6.0	6.0	7.0	9.0
Compacted Subgrade (90 percent RC)	18	18	18	18	18

6.10.2 Portland Cement Concrete Pavement

Portland cement concrete (PCC) pavement may be used instead of asphalt concrete. For TIs between 6 and 7, a section of 6 inches of PCC over 8 inches of crushed aggregate base or crushed miscellaneous base is recommended. For TIs of 8 and 9, the PCC section should be increased to 7 and 8 inches, respectively. The Portland Cement Concrete should have a minimum modulus of rupture of 650 psi at 28 days.

7.0 SUPPLEMENTAL GEOTECHNICAL SERVICES

7.1 REVIEW OF PLANS AND SPECIFICATIONS

The grading and foundation plans and specifications should implement the recommendations presented in this report and should be reviewed by the GED to ensure proper interpretation and application of our recommendations.

7.2 GEOTECHNICAL OBSERVATION AND TESTING DURING CONSTRUCTION

All grading, excavation, and construction of foundations should be performed under the observation and testing of the Geotechnical Engineer at the following stages:

- During demolition and site clearing;
- During site excavation;

ALQUIST-PRIOLO EARTHQUAKE FAULT ZONES

Earthquake Fault Zones
Zone boundaries are delineated by straight-line segments that connect encircled turning points; the boundaries define the zone encompassing active faults that constitute a potential hazard to structures from surface faulting or fault creep such that avoidance as described in Public Resources Code Section 2621.5(a) would be required.

Active Fault Traces
Faults considered to have been active during Holocene time and to have potential for surface rupture; solid line where accurately located, long dash where approximately located, short dash where inferred, dotted where concealed; query (?) indicates additional uncertainty. Evidence of historic offset indicated by year of earthquake-associated event or C for displacement caused by fault creep.

1906 C

Overlap of Earthquake Fault Zone and Liquefaction Zone
Areas that are covered by both Earthquake Fault Zone and Liquefaction Zone.

SEISMIC HAZARD ZONES

Liquefaction Zones
Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslide Zones
Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Overlap of Earthquake Fault Zone and Earthquake-Induced Landslide Zone
Areas that are covered by both Earthquake Fault Zone and Earthquake-Induced Landslide Zone.

Subject: **GEOTECHNICAL DATA REPORT**
LAS PALMAS SENIOR CITIZEN CENTER RENOVATION PROJECT
1820 N Las Palmas Avenue
City of Los Angeles, California

Dear Mr. Schmidt:

Tetra Tech is pleased to submit this Geotechnical Data Report for the Las Palmas Senior Citizen Center renovation project located at 1820 N Las Palmas Avenue, Hollywood, in the City of Los Angeles. Our work was performed in general accordance with the scope of services as outlined in the City of Los Angeles' TOS 21-159, Work Order #E1908358, Contract No. C-130600 dated January 26, 2022. This report includes a brief description of site conditions, the proposed development, discussion regarding our field investigation, and description of subsurface soil conditions. The appendices to the report include logs of borings, laboratory testing data, and logs of infiltration testing.

We appreciate the opportunity to provide our professional services on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact the undersigned.

Respectfully submitted,
Tetra Tech BAS, Inc.

1. INTRODUCTION

Presented herein is Tetra Tech's Geotechnical Data Report for the Las Palmas Senior Center Citizen renovation project located at 1820 N Las Palmas Avenue, Hollywood, in the City of Los Angeles. Our work was performed in general accordance with the scope of services as outlined in the City of Los Angeles' TOS 21-159, Work Order #E1908358, Contract No. C-130600 dated January 26, 2022. It is our understanding that the project entails the complete renovation of the existing Las Palmas Senior Center and the construction of new exterior structures and site improvements. The new structures include two shade canopies and a concrete pedestrian ramp with retaining walls. The canopies will be built over an area that it is currently occupied by a concrete slab. Other site improvements include permeable pavements, outdoor seats, and lighting. The approximate location of the project site is shown in Figure 1 – Site Location Map.

A geotechnical investigation is required to provide information regarding the subsurface materials at the site and to provide information to the Geotechnical Engineering Division (GED), the Engineer of Record, so that foundation design and grading recommendations can be developed for the proposed new structures. Additionally, infiltration rates are herein for the design of infiltration Best Management Practices (BMPs). This report presents the geotechnical data collected from our field exploration program in support of the design and construction of the subject project.

2. SCOPE OF SERVICES

Tetra Tech's scope of services for this project is in general accordance with the requirements outlined in Task Order Solicitation (TOS) of City of Los Angeles TOS 21-159, Work Order #E1908358, Contract No. C-130600 dated January 26, 2022. The scope of services for this project consisted of the following tasks:

- Review of available background data, including in-house and Client provided geotechnical data, geotechnical literature, and geologic maps relevant to the subject site.
- Perform a reconnaissance site visit to observe ground conditions and mark boring locations in coordination with GED staff.
- Coordinate with GED staff and Underground Service Alert (USA) to locate underground utilities at the site.
- Perform concrete coring through existing concrete slab before drilling.
- Conduct a subsurface investigation including the excavating, logging, and sampling of 4 exploratory borings to a maximum depth of 26.5 feet.
- Advance one boring for infiltration testing to a depth of approximately 8.5 feet and conduct infiltration testing using a falling head test method.
- Transport selected soil samples obtained from the borings to the laboratory.
- Perform laboratory testing on select samples as requested by GED staff.
- Prepare this Geotechnical Data Report in conformance with the scope specified in Section 2.4 of TOS.

3. FIELD EXPLORATION PROGRAM

Prior to starting the field exploration program, a field reconnaissance was conducted to observe surface conditions and to mark the locations of the planned exploratory and infiltration boreholes under the direction of the GED staff.

Underground Service Alert and GED staff were notified of the subsurface exploration schedule at least 48 hours prior to drilling.

The subsurface soil and groundwater conditions beneath the site were explored on February 9, 2022. The field program included the drilling, logging, and sampling of 4 exploratory geotechnical borings denoted B-1 through B-4 and one additional boring for infiltration testing denoted I-1. Prior to drilling concrete coring was performed through the concrete slab at those marked boring locations within the slab footprint (B-1 through B-3 and I-1). All the borings were advanced using a track-mounted limited access rig equipped with 6-inch diameter hollow stem augers. The limited access rig had the following dimensions: 5.5 feet wide, 11 feet long, and 7.5 feet high when towered down. The borings were drilled at the approximate locations shown on Figure 2 – Boring Location Map. At least one GED representative was present at the site during all field activities.

The longitude and latitude of the as-drilled boring locations was obtained with a handheld NAD 83 Coordinate System Global Positioning System (GPS) unit and are summarized in Table 1 provided below. The highlighted exploration corresponds to an infiltration test location.

Table 1
Boring Information

Exploration Number	General Location	Approximate Latitude	Approximate Longitude	Approximate Ground Surface Elevation (feet)*	Approximate Depth (feet)
B-1	Southern end of the slab	34.104519° N	-118.335751° W	412	26.5
B-2	Central west end of the slab	34.104547° N	-118.335839° W	412	26.5
B-3	Northeastern end of the slab	34.104603 ° N	-118.335712° W	411	26.5
B-4	Near trash enclosure	34.104340° N	-118.335654° W	409	16.5
I-1	Northcentral end of the slab	34.104595° N	-118.3335779° W	411	8.5

One bulk sample was collected within the upper 5 feet at each boring location. Disturbed and relatively undisturbed soil samples were collected every 2.5 feet to a depth of 15 feet. Below 15 feet, soil samples were collected every 5 feet. The relatively undisturbed samples were collected utilizing a Modified California-type driven ring sampler. Disturbed soil samples were collected using a standard split-poon sampler (inner diameter = 1 3/8 inches) without liners. Standard Penetration Tests (SPT) and driven ring samplers were advanced with a 140-pound

hammer with a drop of 30 inches in general accordance with ASTM D1586. Field blowcounts were recorded for every 6 inches of penetration. The calibration of the hammer energy efficiency was reported to be about 87.7 percent.

Recovered cuttings from the soil borings and in-situ samples were logged by a Tetra Tech Professional Engineer in general accordance with the visual-manual procedure for description and identification of soils, ASTM D2488. The soil samples were also prepared for subsequent examination and laboratory testing. Following drilling, all boreholes were backfilled with soil cuttings, and the borings through the concrete slab, B-1 through B-3, and I-1, were repaired with a concrete patch at the surface. The remaining borehole on the asphalt pavement near the trash enclosure B-4 was capped with an asphalt cold patch.

Additional details pertinent to material types encountered in the borings, groundwater conditions, and sampling depths and types are presented in the boring logs included in Appendix A.

4. FIELD INFILTRATION TESTING

The infiltration testing was performed by Tetra Tech on February 9, 2022. The infiltration testing borehole I-1 was advanced to a depth of approximately 8.5 feet. The installation and testing of the infiltration test boring was performed in general accordance with the small diameter boring infiltration test procedure described in the Los Angeles County Department of Public Works (LACDPW) GS200.1 Guidelines (2021). The infiltration test boring was constructed by placing 2 inches of ¾-inch gravel at the bottom of the boring and then installing a 3-inch-diameter perforated pipe (casing) with 5/8-inch-diameter holes. The casing extended from the top of the gravel placed at the bottom of the boring to the ground surface and was wrapped in a protective cloth filter sock to limit the migration of soil particles into the pipe. The annular space of each boring was filled with ¾-inch gravel (filter pack) up to a few feet above the zone of infiltration testing. The ¾-inch gravel was selected as the filter pack material since it has a hydraulic conductivity significantly larger than that of the surrounding soil.

Prior to starting the infiltration testing, the borehole was presoaked for at least 4 hours. Based on the infiltration rate observed during the presoaking it was determined that a falling head test would be utilized for assessing the infiltration rate.

For the falling head test, an initial water level of approximately 1 foot was established above the bottom of the borehole and then the subsequent fall in water level was recorded over a 30-minute time interval. The water level after 30 minutes was refilled to the initial water level of about 1 foot for each successive test. Testing was performed at the I-1 location until a stabilized drop rate was obtained (per GS 200.1 a stabilized rate is obtained when the highest and lowest readings are within 10 percent from each other for 3 consecutive readings), with no less than 6 readings taken. The water levels were measured using a water sounder.

Logs of the infiltration test are included in Appendix B. Upon completion of infiltration testing, the casings was removed, and the boring was backfilled with soil cuttings generated during drilling. I-1 was capped with a concrete patch.

The results of the infiltration testing are provided in Table 2 below. The field percolation rate was converted, as indicated in the infiltration test logs in Appendix B, to a raw field infiltration rate using the Porchet method considering the effect of the porosity of the gravel pack i.e., approximately 0.35. According to City of los Angeles LID Manual (2016) a design Factor of Safety is required to be applied to the raw field infiltration rate to obtain a design infiltration rate. A minimum design Factor of Safety of 3 is required for the design of stormwater facilities. The design infiltration rate for stormwater facilities is provided in Table 2.

Table 2
Results of Infiltration Test

Exploration Number	Soil Type at Bottom of Hole	Approx. Ground Elevation (ft)	Depth to Bottom of Borehole (ft)	Infiltration Rate (in/hr)	
				Field	Design FS=3.0
I-1	Clayey Sand (SC)	411	8.5	0.9	0.3

5. LABORATORY TESTING

Laboratory tests were performed on selected samples recovered from the borings to aid in the classification of soils and to evaluate pertinent engineering properties of the foundation soils. The following tests were performed as requested by GED:

- In-situ Moisture Content and Dry Density, ASTM D2937;
- Grain Size Distribution, ASTM D6913 and D7928;
- Percent Passing #200 Sieve, ASTM D1140;
- Atterberg Limits, ASTM D4318;
- Expansion Index, ASTM D4829;
- Direct Shear ASTM D3080;
- Compaction Testing, ASTM D1557;
- Consolidation ASTM D2435.

Testing was performed in general accordance with applicable indicated ASTM Standards and California Test Methods. Results of all laboratory tests are presented in Appendix C. A summary of the direct shear test results is presented in Table C-1. For ease of referral to the soil profile, selected laboratory results have also been included in the boring logs in Appendix A.

6. SUBSURFACE SOIL CONDITIONS

Based on geological mapping (Dibblee and Ehrenspeck, 1991), the site is underlain by Quaternary age older alluvial deposits (Qae), underlain by Tertiary-age sedimentary bedrock of the Topanga Formation (Tt). As encountered in the borings, fill soils about 15 to 20 feet thick mantle the alluvium. Generalized descriptions of the encountered units are provided below. More detailed descriptions of the soil conditions encountered at the boring locations are presented on the boring logs in Appendix A.

6.1. Fill (Af)

Undocumented fill (Af) was encountered in all the borings to depths ranging from 15 feet near the trash enclosure to 20 feet in the concrete slab area. The fills consisted mostly of olive gray to yellowish brown loose to medium dense silty sands, and clayey sands. Trace amounts of red brick fragments and gravel were generally observed. It is noted that a soil investigation performed by Feffer Geological Consulting (2016) on a property adjacent to the site to the east at 6650 Franklin Avenue also encountered fills ranging in thickness between 3 and 22 feet.

6.2. Alluvium (Qae)

Alluvial soils (Qae) encountered in the 4 exploratory borings B-1 through B-4 consisted mostly of yellowish brown medium dense silty sands and clayey sands, and yellowish brown stiff to very stiff lean clays.

7. LIMITATIONS

The geotechnical data presented in this report are based on Tetra Tech's review of background documents and on information obtained from field explorations. Due to the limited nature of the field explorations, conditions not observed and described in this report may be present on the site. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation and laboratory testing can be performed upon request. It should be understood that conditions different from those anticipated in this report may be encountered during grading operations, for example, the extent of unsuitable soil and the associated additional effort required to mitigate them.

Site conditions, including groundwater level, can change with time as a result of natural processes or the activities of man at the subject site or at nearby sites. Changes to the applicable laws, regulations, codes, and standards of practice may occur as a result of government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Tetra Tech has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Tetra Tech should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document. Reliance by others on the data presented herein or for purposes other than those stated in the text is authorized only if so permitted in writing by Tetra Tech. It should be understood that such an authorization may incur additional expenses and charges.

Tetra Tech has endeavored to perform its evaluation using the degree of care and skill ordinarily exercised under similar circumstances by reputable geotechnical professionals with experience in this area and similar soil conditions. No other warranty, either expressed or implied, is made as to the conclusions and recommendations contained in this report.

Log of Exploratory Borings

Appendix A
Logs of Exploratory Borings

Bulk and relatively undisturbed driven samples were obtained in the field during our subsurface evaluation. The samples were tagged in the field and transported to our laboratory for observation and testing. The driven samples were obtained using the California Split Barrel Drive, Shelby Tube, or Standard Penetration Test (SPT) sampler as described below.

California Split Barrel Drive Sampler
The split barrel drive sampler was driven with a 140-pound hammer allowed to drop freely 30 inches. The number of blows per foot recorded during sampling is presented in the logs of exploratory borings. The sampler has external and internal diameters of approximately 3.0 and 2.4 inches, respectively, and the inside of the sampler is lined with 1-inch-long brass rings. The relatively undisturbed soil sample within the rings is removed, sealed, and transported to the laboratory for observation and testing.

Shelby Tube Sampler
This sampler consists of a thin-walled tube with a cutting edge at the toe. A sampler head attaches the tube to the drill rod. The sampler has external diameter and wall thickness of approximately 3 inches and 16 gauges, respectively, with a total length of 36 inches. The Shelby tube sampler was driven with a 140-pound hammer allowed to drop freely 30 inches. The number of blows per foot recorded during sampling is presented in the logs of exploratory borings. The relatively undisturbed soil sample within the Shelby tubes is removed, sealed, and transported to the laboratory for observation and testing.

Standard Penetration Test Sampler
The standard penetration test sampler is driven with a 140-pound hammer allowed to drop freely 30 inches in general accordance with ASTM D1586. The number of blows (N-value) required to drive the SPT sampler 12 inches is shown on the boring logs. The sampler has external and internal diameters of approximately 2.0 and 1.4 inches respectively. The sampling tube consists of an unlined split-tube barrel. The disturbed soil sample is removed, sealed, and transported to the laboratory for testing.

Problem Title

Project Name: LAS PALMAS

Job Number: 21-159

Client: ARCH

Engineer: JOSE BERISTAIN

Description: SHADE STRUCTURE PILES

Program Options and Settings

Computational Options:
- Use unfactored loads in computations (conventional analysis)

Engineering Units Used for Data Input and Computations:
- US Customary System Units (pounds, feet, inches)

Analysis Control Options:

- Maximum number of iterations allowed	=	500
- Deflection tolerance for convergence	=	1.0000E-05 in
- Maximum allowable deflection	=	100.0000 in
- Number of pile increments	=	100

Loading Type and Number of Cycles of Loading:
- Static loading specified

- Use of p-y modification factors for p-y curves not selected

- Analysis uses layering correction (Method of Georgiadis)
- No distributed lateral loads are entered
- Loading by lateral soil movements acting on pile not selected
- Input of shear resistance at the pile tip not selected
- Input of moment resistance at the pile tip not selected
- Computation of pile-head foundation stiffness matrix not selected
- Push-over analysis of pile not selected
- Buckling analysis of pile not selected

Output Options:
- Output files use decimal points to denote decimal symbols.
- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1
- No p-y curves to be computed and reported for user-specified depths
- Print using wide report formats

Pile Structural Properties and Geometry

Number of pile sections defined = 1
Total length of pile = 23.000 ft
Depth of ground surface below top of pile = 0.0000 ft

Pile diameters used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile. A summary of values of pile diameter vs. depth follows.

Point No.	Depth Below Pile Head feet	Pile Diameter inches
1	0.000	24.0000
2	23.000	24.0000

Input Structural Properties for Pile Sections:

Pile Section No. 1:

Section 1 is a round drilled shaft, bored pile, or CIDH pile
Length of section = 23.000000 ft
Shaft Diameter = 24.000000 in
Shear capacity of section = 0.0000 lbs

Ground Slope and Pile Batter Angles

Ground Slope Angle	=	0.000 degrees
	=	0.000 radians
Pile Batter Angle	=	0.000 degrees
	=	0.000 radians

Soil and Rock Layering Information

The soil profile is modelled using 2 layers

Layer 1 is sand, p-y criteria by API RP-2A, 1987

Distance from top of pile to top of layer	=	0.0000 ft
Distance from top of pile to bottom of layer	=	20.000000 ft
Effective unit weight at top of layer	=	98.000000 pcf
Effective unit weight at bottom of layer	=	98.000000 pcf
Friction angle at top of layer	=	20.000000 deg.
Friction angle at bottom of layer	=	20.000000 deg.
Subgrade k at top of layer	=	0.0000 pci
Subgrade k at bottom of layer	=	0.0000 pci

NOTE: Default values for subgrade k will be computed for this layer.

Layer 2 is cemented silt with cohesion and friction

Distance from top of pile to top of layer	=	20.000000 ft
Distance from top of pile to bottom of layer	=	40.000000 ft
Effective unit weight at top of layer	=	117.000000 pcf
Effective unit weight at bottom of layer	=	117.000000 pcf
Undrained cohesion at top of layer	=	250.000000 psf
Undrained cohesion at bottom of layer	=	250.000000 psf
Friction angle at top of layer	=	27.000000 deg.
Friction angle at bottom of layer	=	27.000000 deg.
Epsilon-50 at top of layer	=	0.0000
Epsilon-50 at bottom of layer	=	0.0000
Subgrade k at top of layer	=	0.0000 pci
Subgrade k at bottom of layer	=	0.0000 pci

NOTE: Default values for Epsilon-50 will be computed for this layer.

NOTE: Default values for subgrade k will be computed for this layer.

(Depth of the lowest soil layer extends 17.000 ft below the pile tip)

Summary of Input Soil Properties

Layer Num.	Soil Type Name (p-y Curve Type)	Layer Depth ft	Effective Unit Wt. pcf	Undrained Cohesion psf	Angle of Friction deg.	E50 or kpy krm pci
1	API default Sand (default)	0.00	98.0000	--	20.0000	--
		20.0000	98.0000	--	20.0000	--
2	Cemented (default)	20.0000	117.0000	250.0000	27.0000	default
	Silt (default)	40.0000	117.0000	250.0000	27.0000	default

Static Loading Type

Static loading criteria were used when computing p-y curves for all analyses.

Pile-head Loading and Pile-head Fixity Conditions

Number of loads specified = 1

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	4	y = 0.500000 in	M = 0.0000 in-lbs	0.0000000	N.A.

V = shear force applied normal to pile axis
M = bending moment applied to pile head
y = lateral deflection normal to pile axis
S = pile slope relative to original pile batter angle
R = rotational stiffness applied to pile head
Values of top y vs. pile lengths can be computed only for load types with
specified shear loading (Load Types 1, 2, and 3).
Thrust force is assumed to be acting axially for all pile batter angles.

Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness

---

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:

Dimensions and Properties of Drilled Shaft (Bored Pile):

Length of Section	=	23.000000 ft
Shaft Diameter	=	24.000000 in
Concrete Cover Thickness (to edge of long. rebar)	=	3.000000 in
Number of Reinforcing Bars	=	8 bars
Yield Stress of Reinforcing Bars	=	60000. psi
Modulus of Elasticity of Reinforcing Bars	=	29000000. psi
Gross Area of Shaft	=	452.389342 sq. in.
Total Area of Reinforcing Steel	=	4.800000 sq. in.
Area Ratio of Steel Reinforcement	=	1.06 percent
Edge-to-Edge Bar Spacing	=	5.678454 in
Maximum Concrete Aggregate Size	=	0.750000 in
Ratio of Bar Spacing to Aggregate Size	=	7.57
Offset of Center of Rebar Cage from Center of Pile	=	0.0000 in

Axial Structural Capacities:

Nom. Axial Structural Capacity = 0.85 Fc Ac + Fy As	=	1429.353 kips
Tensile Load for Cracking of Concrete	=	-178.179 kips
Nominal Axial Tensile Capacity	=	-288.000 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	0.875000	0.600000	8.562500	0.00000

NOTE: The positions of the above rebars were computed by LPile

Minimum spacing between any two bars not equal to zero = 5.678 inches
between bars 1 and 2.

Ratio of bar spacing to maximum aggregate size = 7.57

Concrete Properties:

Compressive Strength of Concrete	=	3000. psi
Modulus of Elasticity of Concrete	=	3122019. psi
Modulus of Rupture of Concrete	=	-410.791918 psi
Compression Strain at Peak Stress	=	0.001634
Tensile Strain at Fracture of Concrete	=	-0.0001160
Maximum Coarse Aggregate Size	=	0.750000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	0.000

Definitions of Run Messages and Notes:

C = concrete in section has cracked in tension.
Y = stress in reinforcing steel has reached yield stress.
T = ACI 318 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than 0.003. See ACI 318, Section 10.3.4.
Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.
Position of neutral axis is measured from edge of compression side of pile.
Compressive stresses and strains are positive in sign.
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 0.000 kips

-------------------------------------------------------------------------------
   Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1
-------------------------------------------------------------------------------

Moment values interpolated at maximum compressive strain = 0.003
or maximum developed moment if pile fails at smaller strains.

 Load           Axial Thrust        Nominal Mom. Cap.      Max. Comp.
  No.              kips                 in-kip               Strain
 ----         ----------------     ------------------     ------------
   1                0.000              2428.166           0.00300000

Note that the values of moment capacity in the table above are not
factored by a strength reduction factor (phi-factor).

In ACI 318, the value of the strength reduction factor depends on whether
the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction
factor to compute ultimate moment capacity according to ACI 318, Section
9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding
bending stiffnesses computed for common resistance factor values used for
reinforced concrete sections.

Axial     Resist.       Nominal     Ult. (Fac)    Ult. (Fac)   Bend. Stiff.
Load      Factor      Moment Cap    Ax. Thrust    Moment Cap    at Ult Mom
 No.    for Moment      in-kips        kips         in-kips      kip-in^2
-----  ------------  ------------  ------------  ------------  ------------

Layering Correction Equivalent Depths of Soil & Rock Layers

Layer No.	Top of Layer Below Pile Head ft	Equivalent Top Depth Below Grnd Surf ft	Same Layer Type As Layer Above	Layer is Rock or is Below Rock Layer	F0 Integral for Layer lbs	F1 Integral for Layer lbs
1	0.00	0.00	N.A.	No	0.00	237044.
2	20.0000	16.0449	No	No	237044.	N.A.

Notes: The F0 integral of Layer n+1 equals the sum of the F0 and F1 integrals for Layer n. Layering correction equivalent depths are computed only for soil types with both shallow-depth and deep-depth expressions for peak lateral load transfer. These soil types are soft and stiff clays, non-liquefied sands, and cemented c-phi soil.

Computed Values of Pile Loading and Deflection for Lateral Loading for Load Case Number 1

Pile-head conditions are Displacement and Moment (Loading Type 4)
Displacement of pile head = 0.500000 inches
Moment at pile head = 0.0 in-lbs
Axial load at pile head = 0.0 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness in-lb^2	Soil Res. Es*h lb/inch	Soil Spr. Lat. Load lb/inch	Distrib. p lb/inch

* This analysis computed pile response using nonlinear moment-curvature relationships. Values of total stress due to combined axial and bending stresses are computed only for elastic sections only and do not equal the actual stresses in concrete and steel. Stresses in concrete and steel may be interpolated from the output for nonlinear bending properties relative to the magnitude of bending moment developed in the pile.

Output Summary for Load Case No. 1:

```
Pile-head deflection             =     0.50000000 inches
Computed slope at pile head      =    -0.00400283 radians
Maximum bending moment           =        587851. inch-lbs
Maximum shear force              =          9394. lbs
Depth of maximum bending moment  =     9.20000000 feet below pile head
Depth of maximum shear force     =       0.000000 feet below pile head
Number of iterations             =             34
Number of zero deflection points =              1
```

Summary of Pile-head Responses for Conventional Analyses

Definitions of Pile-head Loading Conditions:

Load Type 1: Load 1 = Shear, V, lbs, and Load 2 = Moment, M, in-lbs
Load Type 2: Load 1 = Shear, V, lbs, and Load 2 = Slope, S, radians
Load Type 3: Load 1 = Shear, V, lbs, and Load 2 = Rot. Stiffness, R, in-lbs/rad.
Load Type 4: Load 1 = Top Deflection, y, inches, and Load 2 = Moment, M, in-lbs
Load Type 5: Load 1 = Top Deflection, y, inches, and Load 2 = Slope, S, radians

Load Case No.	Load Type	Load Pile-head	Load Type	Load Pile-head	Axial Loading	Pile-head Deflection	Pile-head Rotation	Max Shear in Pile	Max Moment in Pile
		Load 1		Load 2	lbs	inches	radians	lbs	in-lbs
1	y, in	0.5000	M, in-lb	0.00	0.00	0.5000	-0.00400	9394.	587851.

Maximum pile-head deflection = 0.5000000000 inches
Maximum pile-head rotation = -0.0040028305 radians = -0.229345 deg.

Summary of Warning Messages

The following warning was reported 2958 times

**** Warning ****

The input value for friction angle is either smaller than 29 degrees or
higher than 41 degrees and no value of k has been specified for a soil layer
defined using the API sand criteria. Program will assume an internal default value,
for k, but the friction angle is outside the range of data available.
Please check your input data for correctness.

The analysis ended normally.

LOCATION:	1820 N. Las Palmas Avenue

CURRENT REFERENCE REPORT/LETTER(S)	REPORT No.	DATE OF DOCUMENT	PREPARED BY
Soils Report	GED 21-159	07/24/2023	Geotechnical Engineering Div.

PREVIOUS REFERENCE REPORT/LETTER(S)	REPORT No.	DATE OF DOCUMENT	PREPARED BY
Grading Dept. Review Letter	121834	06/23/2022	LADBS
Soils Report	GED 21-159	04/18/2022	Geotechnical Engineering Div.
Geotechnical Data Report	ciLA 22-04G	03/31/2022	Tetra Tech

The Grading Division of the Department of Building and Safety has reviewed the referenced repors that provides recommendations for the proposed pedestrian ramp, retaining wall, shade structure, outdoor seating, lighting, hardscape and trash enclosure. The site is currently a senior center building. The project does not include any additions or new foundation with the exiting building. Subsurface exploration performed by Tetra Tech consisted of 4 hollow stem auger borings to a maximum depth of 26.5 feet. The earth materials at the subsurface exploration locations consist of up to 20 feet of uncertified fill underlain by native.

The consultants recommend to support the proposed structure(s) on mat-type or drilled-pile foundations bearing on native undisturbed soils.

A "Request for Modification of Building Ordinances" (RFM) had been reviewed by the Department and approved to allow the proposed trash enclosure to be supported compacted fill placed over uncertified fill.

Engineering analyses provided by Geotechnical Engineering Division is based on field and laboratory testing performed by Tetra Tech. Geotechnical Engineering Division is accepting responsibility for use of the data in accordance to Code section 91.7008.5 of LABC.

The project is located within a Fault Zone identified by the State of California Alquist-Priolo Act. However, the proposed construction is currently exempt (P/BC 2020-044).

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

The referenced reports are acceptable, provided the following conditions are complied with during site development:

(Note: Numbers in parenthesis ( ) refer to applicable sections of the 2020 City of LA Building Code. P/BC numbers refer the applicable Information Bulletin. Information Bulletins can be accessed on the internet at LADBS.ORG.)

1. The soils engineer shall review and approve the detailed plans prior to issuance of any permit. This approval shall be by signature on the plans that clearly indicates the soils engineer has reviewed the plans prepared by the design engineer; and, that the plans included the recommendations contained in their reports (7006.1).

2. An on-site storm water infiltration system at the subject site shall not be implemented, as recommended.

3. All recommendations of the report(s) that are in addition to or more restrictive than the conditions contained herein shall be incorporated into the plans.

4. A copy of the subject and appropriate referenced reports and this approval letter shall be attached to the District Office and field set of plans (7006.1). Submit one copy of the above reports to the Building Department Plan Checker prior to issuance of the permit.

5. A grading permit shall be obtained for all structural fill and retaining wall backfill (106.1.2).

6. All man-made fill shall be compacted to a minimum 90 percent of the maximum dry density of the fill material per the latest version of ASTM D 1557. Where cohesionless soil having less than 15 percent finer than 0.005 millimeters is used for fill, it shall be compacted to a minimum of 95 percent relative compaction based on maximum dry density. Placement of gravel in lieu of compacted fill is only allowed if complying with LAMC Section 91.7011.3.

7. Existing uncertified fill shall not be used for support of footings, concrete slabs or new fill (1809.2, 7011.3).

8. Drainage in conformance with the provisions of the Code shall be maintained during and subsequent to construction (7013.12).

9. Grading shall be scheduled for completion prior to the start of the rainy season, or detailed temporary erosion control plans shall be filed in a manner satisfactory to the Grading Division of the Department and the Department of Public Works, Bureau of Engineering, B-Permit Section, for any grading work in excess of 200 cubic yards (7007.1).

   201 N. Figueroa Street 3rd Floor, LA (213) 482-7045

10. All loose foundation excavation material shall be removed prior to commencement of framing. Slopes disturbed by construction activities shall be restored (7005.3).

11. The applicant is advised that the approval of this report does not waive the requirements for excavations contained in the General Safety Orders of the California Department of Industrial Relations (3301.1).

12. Temporary excavations that remove lateral support to the public way, adjacent property, or adjacent structures shall be supported by shoring or constructed using ABC slot cuts. Note: Lateral support shall be considered to be removed when the excavation extends below a plane projected downward at an angle of 45 degrees from the bottom of a footing of an existing structure, from the edge of the public way or an adjacent property. (3307.3.1)

13. Where any excavation, not addressed in the approved reports, would remove lateral support (as defined in 3307.3.1) from a public way, adjacent property or structures, a supplemental report shall be submitted to the Grading Division of the Department containing recommendations for shoring, underpinning, and sequence of construction. Report shall include a plot plan and cross-section(s) showing the construction type, number of stories, and location of adjacent structures, and analysis incorporating all surcharge loads that demonstrate an acceptable factor of safety against failure. (7006.2 & 3307.3.2)

14. The soils engineer shall review and approve the shoring and/or underpinning plans prior to issuance of the permit (3307.3.2).

15. Prior to the issuance of the permits, the soils engineer and/or the structural designer shall evaluate the surcharge loads used in the report calculations for the design of the retaining walls and shoring. If the surcharge loads used in the calculations do not conform to the actual surcharge loads, the soil engineer shall submit a supplementary report with revised recommendations to the Department for approval.

16. Unsurcharged temporary excavation may be cut vertical up to 5 feet, as recommended.

17. Surcharged ABC slot-cut method may be used for temporary excavations with each slot-cut not exceeding 5.5 feet in height and not exceeding 7 feet in width, as recommended. The surcharge load shall not exceed the value given in the report. The soils engineer shall determine the clearance between the excavation and the existing foundation. The soils engineer shall verify in the field if the existing earth materials are stable in the slot-cut excavation. Each slot shall be inspected by the soils engineer and approved in writing prior to any worker access.

18. Shoring shall be designed for the lateral earth pressures specified in the section titled "Temporary Shoring" starting on page 9 of the 04/18/2022 report; all surcharge loads shall be included into the design.

19. Shoring shall be designed for a maximum lateral deflection of 1 inch, provided there are no structures within a 1:1 plane projected up from the base of the excavation. Where a structure is within a 1:1 plane projected up from the base of the excavation, shoring shall be designed for a maximum lateral deflection of ½ inch, or to a lower deflection determined by the consultant that does not present any potential hazard to the adjacent structure.

20. A shoring monitoring program shall be implemented to the satisfaction of the soils engineer.

21. All foundations shall derive entire support from native undisturbed soils, as recommended (and approved by the geologist and soils engineer by inspection).

22. Pile caisson and/or isolated foundation ties are required by LAMC Sections 91.1809.13 and/or 91.1810.3.13. Exceptions and modification to this requirement are provided in Information Bulletin P/BC 2020-030.

23. When water is present in drilled pile holes, the concrete shall be tremied from the bottom up to ensure minimum segregation of the mix and negligible turbulence of the water (1808.8.3).

24. Existing uncertified fill shall not be used for lateral support of deep foundations (1810.2.1).

25. The seismic design shall be based on a Site Class D, as recommended. All other seismic design parameters shall be reviewed by LADBS building plan check. According to ASCE 7-16 Section 11.4.8, the long period coefficient (Fv) may be selected per Table 11.4-2 in ASCE 7-16, provided that the value of the Seismic Response Coefficient (Cs) is determined by Equation 12.8-2 for values of the fundamental period of the building (T) less than or equal to 1.5Ts, and taken as 1.5 times the

value computed in accordance with either Equation 12.8-3 for T greater than 1.5Ts and less than or equal to TL or Equation 12.8-4 for T greater than TL. Alternatively, a supplemental report containing a site-specific ground motion hazard analysis in accordance with ASCE 7-16 Section 21.2 shall be submitted for review and approval.

26. Retaining walls up to 4 feet shall be designed for the lateral earth pressures specified in the section titled "Lateral Earth Pressures For Retaining Walls" starting on page 14 of the 04/18/2022 report. Note: All surcharge loads shall be included into the design.

27. All retaining walls shall be provided with a standard surface backdrain system and all drainage shall be conducted in a non-erosive device to the street in an acceptable manner (7013.11).

28. With the exception of retaining walls designed for hydrostatic pressure, all retaining walls shall be provided with a subdrain system to prevent possible hydrostatic pressure behind the wall. Prior to issuance of any permit, the retaining wall subdrain system recommended in the soils report shall be incorporated into the foundation plan which shall be reviewed and approved by the soils engineer of record (1805.4).

29. Installation of the subdrain system shall be inspected and approved by the soils engineer of record and the City grading/building inspector (108.9).

30. Basement walls and floors shall be waterproofed/damp-proofed with an LA City approved "Below-grade" waterproofing/damp-proofing material with a research report number (104.2.6).

31. Prefabricated drainage composites (Miradrain, Geotextiles) may be only used in addition to traditionally accepted methods of draining retained earth.

32. All roof, pad and deck drainage shall be conducted to the street in an acceptable manner in non-erosive devices or other approved location in a manner that is acceptable to the LADBS and the Department of Public Works (7013.10).

33. All concentrated drainage shall be conducted in an approved device and disposed of in a manner approved by the LADBS (7013.10).

34. The soils engineer shall inspect all excavations to determine that conditions anticipated in the report have been encountered and to provide recommendations for the correction of hazards found during grading (7008, 1705.6 & 1705.8).

35. All friction pile or caisson drilling and excavations shall be performed under the inspection and approval of the geologist and soils engineer. The geologist shall indicate the distance that friction piles or caissons penetrate into competent material in a written field memorandum. (1803.5.5, 1705.1.2)

36. Prior to pouring concrete, a representative of the consulting soils engineer shall inspect and approve the footing excavations. The representative shall post a notice on the job site for the LADBS Inspector and the Contractor stating that the work inspected meets the conditions of the report. No concrete shall be poured until the LADBS Inspector has also inspected and approved the footing excavations. A written certification to this effect shall be filed with the Grading Division of the Department upon completion of the work. (108.9 & 7008.2)

37. Prior to excavation an initial inspection shall be called with the LADBS Inspector. During the initial inspection, the sequence of construction; shoring; pile installation; protection fences; and, dust and traffic control will be scheduled (108.9.1).

38. Installation of shoring, underpinning, slot cutting and/or pile excavations shall be performed under the inspection and approval of the soils engineer and deputy grading inspector (1705.6, 1705.8).

39. Prior to the placing of compacted fill, a representative of the soils engineer shall inspect and approve the bottom excavations. The representative shall post a notice on the job site for the LADBS Inspector and the Contractor stating that the soil inspected meets the conditions of the report. No fill shall be placed until the LADBS Inspector has also inspected and approved the bottom excavations. A written certification to this effect shall be included in the final compaction report filed with the Grading Division of the Department. All fill shall be placed under the inspection and approval of the soils engineer. A compaction report together with the approved soil report and Department approval letter shall be submitted to the Grading Division of the Department upon completion of the compaction. In addition, an Engineer's Certificate of Compliance with the legal description as indicated in the grading permit and the permit number shall be included (7011.3).

Historical Resource Evaluation Report

Prepared by:

CONSULTING GPA

January 2024

EXECUTIVE SUMMARY

This report presents the results of a historical resource evaluation in anticipation of a proposed project at 1820 N. Las Palmas Avenue in the Hollywood Community Plan Area (CPA) of the City of Los Angeles. The property is owned by the City of Los Angeles Department of Recreation and Parks (RAP) and consists of one parcel corresponding with Assessor Parcel Number (APN) 5547-003-900 on the southeast corner of N. Las Palmas Avenue and Franklin Avenue (Project site). The Project site is improved with a one-story municipal recreational building, the Las Palmas Senior Citizen Center, constructed in 1961.

The property is not currently listed in the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), or designated as a City of Los Angeles Historical-Cultural Monument (LA HCM), nor was it previously identified in any historical resource surveys.

After careful inspection, investigation, and evaluation, GPA Consulting (GPA) concludes that the property does not appear to be individually eligible for listing in the National Register, California Register, or for designation as an LA HCM, due to a lack of significance and integrity. GPA also concludes that the property does not appear to contribute to a potential historic district under the federal, state, or local designation programs. The recommended status code for the property is 6Z, ineligible for national, state, and local designation through survey evaluation. As such, the property is not a historical resource for the purposes of the California Environmental Quality Act (CEQA).

1. INTRODUCTION

1.1 Purpose

The purpose of this report is to analyze whether a proposed project (the Project) at 1820 N. Las Palmas Avenue in the City of Los Angeles (Project site) would impact historical resources as defined by the California Environmental Quality Act (CEQA). The Project site is comprised of one parcel, Assessor Parcel Number (APN) 5547-003-900, located in the Hollywood Redevelopment Area within the Hollywood Community Plan Area (CPA) of the City of Los Angeles (see **Figure 1**). The legal description is Lot 10, Block 2 of the Hollywood Oceanview Tract. The Project site is improved with the Las Palmas Senior Citizen Center, a one-story municipal recreational building constructed in 1961 for the City of Los Angeles Department of Recreation and Parks (RAP).

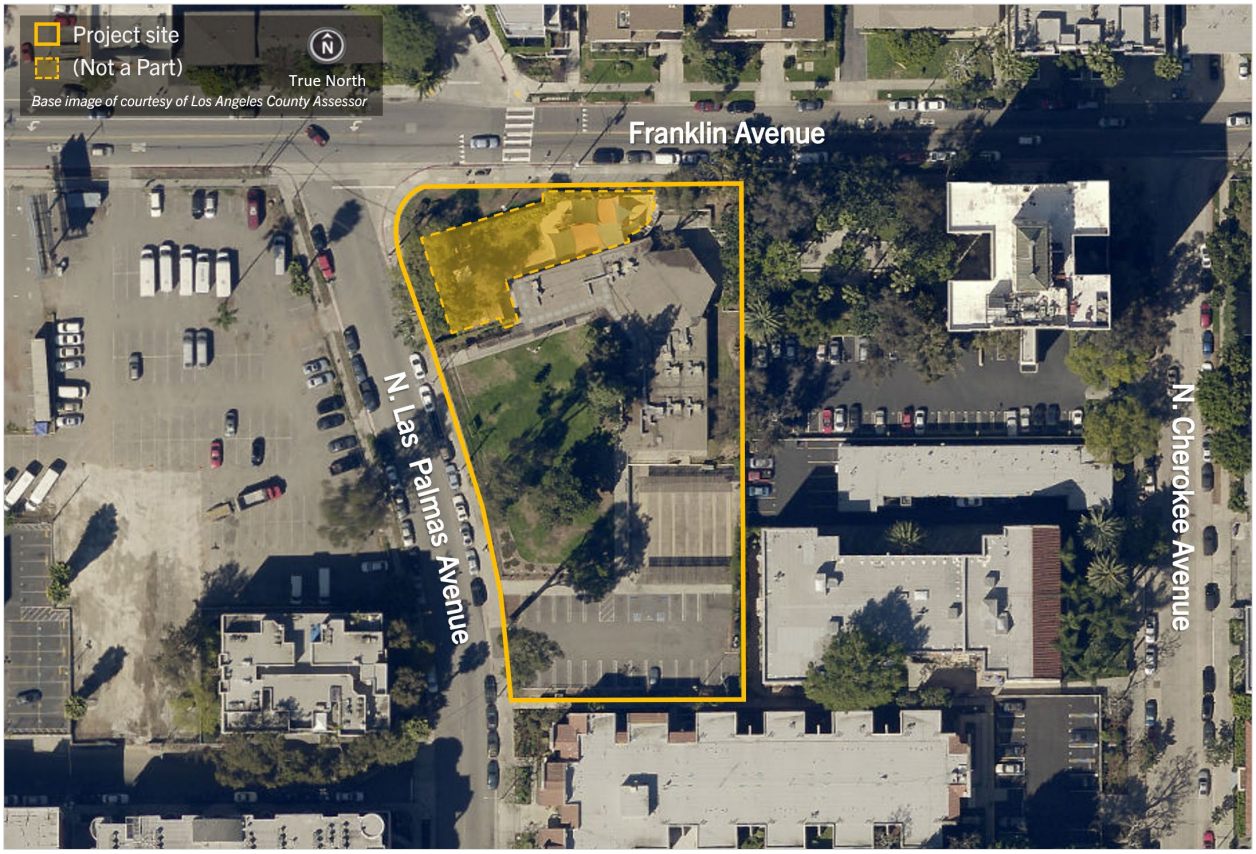

Figure 1: Location of the Project site.

1.2 Methodology

In preparing this report, GPA Consulting (GPA) performed the following tasks:

1. Reviewed existing information to determine if there are any listed or previously surveyed historical resources on the Project site. The following sources were consulted:
    a. The California Historic Resources Inventory System (CHRIS) via a records search request submitted to the South Central Coastal Information Center (SCCIC) by Bargas Environmental Consulting on May 8, 2023. The results of the records search were not received by the date of this report.

b. The Built Environment Resources Directory (BERD), maintained by the State Office of Historic Preservation (OHP), which includes information on cultural and historical resources reviewed for eligibility to the National Register of Historic Places (National Register) and the California Historical Landmarks (CHL) programs through federal and state environmental compliance laws, as well as resources nominated under federal and state registration programs.

c. Prior survey data, including the HistoricPlacesLA, maintained by the Los Angeles Office of Historic Resources (OHR), which includes information on designated and eligible historical resources identified during SurveyLA, as well as the *Historic Resources Survey Report: Hollywood Redevelopment Plan Area*, prepared by Architectural Resources Group (ARG), Historic Resources Group (HRG), and GPA Consulting in 2020. This survey was completed not as part of SurveyLA but utilized the methodology within SurveyLA to evaluate the properties within the Study Area. The above research confirmed that the building on the property comprising the Project site was not previously surveyed or designated.

Conducted a field inspection of the Project site. During the field inspection, GPA assessed the general condition and physical integrity of the building and features on the Project site. Digital photographs of the building and site were taken and are included throughout this report.

Concluded during the field inspection that the building on the does not contribute to a potential historic district.

Concluded during the field inspection that the subject building has undergone alterations since construction in 1961.

Therefore, the property comprising the Project site was evaluated individually as a potential historical resource according to the National Park Service, State Office of Historic Preservation, and City of Los Angeles Cultural Heritage Ordinance standards.

Conducted research into the history of the property. Sources referenced include building permit records, historic aerial photographs, Sanborn Fire Insurance maps, local historical society databases, and various newspaper archives.

Consulted the Historic Resources Survey Reports for the Hollywood CPA (2015) and the Hollywood Redevelopment Plan Area (2020) to gain an understanding of the history and development of the area in which the project site is located.

Consulted the Context/Theme/Property Type (CTP) eligibility standards formulated for the *Los Angeles Citywide Historic Context Statement* (*LACHCS*) to identify the appropriate CTPs under which to evaluate the property.

Reviewed and analyzed ordinances, statutes, regulations, bulletins, and technical materials relating to federal, state, and local historic preservation designations, and assessment processes and programs to analyze the integrity of the buildings on the Project site.

1.3 Qualifications of Preparers

Emma Haggerty, Associate Architectural Historian, and Amanda Duane, Senior Architectural Historian, were responsible for the preparation of this report. Jenna Kachour, Senior Associate Architectural Historian, was responsible for quality assurance and quality control. Audrey von Ahrens, Associate Architectural Historian was responsible for the digital photographs taken during the site visit. They fulfill the qualifications for a historic preservation professionals outlined in Title 36 of the Code of Federal Regulations, Part 61. Their résumés are included in Appendix A.

2. REGULATORY FRAMEWORK

Generally, a lead agency must consider a property a historical resource under CEQA if it is eligible for listing in the California Register. The California Register is modeled after the National Register. Furthermore, a property is presumed to be historically significant if it is listed in a local register of historical resources or has been identified as historically significant in a historic resources survey (provided certain statutory criteria and requirements are satisfied) unless a preponderance of evidence demonstrates that the property is not historically or culturally significant.[1] A lead agency may also treat a resource as historic if it meets statutory requirements and substantial evidence supports the conclusion. The National Register, California Register, and City designation programs are discussed below.

2.1 National Register of Historic Places

The National Register is "an authoritative guide to be used by federal, state, and local governments, private groups, and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[2]

Criteria

To be eligible for listing in the National Register, a property must be at least 50 years of age (unless the property is of "exceptional importance") and possess significance in American history and culture, architecture, or archaeology. A property of potential significance must meet one or more of the following four established criteria:[3]

A. Associated with events that have made a significant contribution to the broad patterns of our history; or

B. Associated with the lives of persons significant in our past; or

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Yield, or may be likely to yield, information important in prehistory or history.

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. "National Register Bulletin 15" states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific…property or site is understood and its meaning…is made clear."[4] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

Integrity

In addition to possessing significance within a historic context, to be eligible for listing in the National Register a property must have integrity. Integrity is defined in "National Register Bulletin 15" as "the ability of a property to

[1] Public Resources Code §5024.1 and 14 California Code of Regulations §4850 & §15064.5(a)(2).
[2] Title 36 Code of Federal Regulations Part 60.2.
[3] Title 36 Code of Federal Regulations Part 60.4.
[4] Patrick Andrus and Rebecca Shrimpton, eds., (National Register Bulletin 15) *How to Apply the National Register Criteria for Evaluation* (US Department of the Interior, National Park Service, Cultural Resources: 1997), 7-8, accessed May 2023, https://www.nps.gov/subjects/nationalregister/upload/NRB-15_web508.pdf.

convey its significance."[5] Within the concept of integrity, the National Register recognizes the following seven aspects or qualities that in various combinations define integrity: feeling, association, workmanship, location, design, setting, and materials. Integrity is based on significance: why, where, and when a property is important. Thus, the significance of the property must be fully established before the integrity is analyzed.

2.2 California Register of Historical Resources

In 1992, Governor Wilson signed Assembly Bill 2881 into law establishing the California Register. The California Register is an authoritative guide used by state and local agencies, private groups, and citizens to identify historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse impacts.[6]

The California Register consists of properties that are listed automatically as well as those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register and those formally Determined Eligible for the National Register;
- State Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.[7]

Criteria and Integrity

For those properties not automatically listed, the criteria for eligibility of listing in the California Register are based upon National Register criteria, but are identified as 1-4 instead of A-D. To be eligible for listing in the California Register, a property generally must be at least 50 years of age and must possess significance at the local, state, or national level, under one or more of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
2. It is associated with the lives of persons important to local, California, or national history; or
3. It embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important in the prehistory or history of the local area, California, or the nation.

Properties eligible for listing in the California Register may include buildings, sites, structures, objects, and historic districts. A property less than 50 years of age may be eligible if it can be demonstrated that sufficient time has passed to understand its historical importance. While the enabling legislation for the California Register is less rigorous regarding the issue of integrity, there is the expectation that properties reflect their appearance during their period of significance.[8]

[6] Public Resources Code §5024.1 (a).
[7] Public Resources Code §5024.1 (d).
[8] Public Resources Code §4852.

The California Register may also include properties identified during historic resource surveys. However, the survey must meet all the following criteria:[9]

1. The survey has been or will be included in the State Historic Resources Inventory;
2. The survey and the survey documentation were prepared in accordance with office [OHP] procedures and requirements;
3. The resource is evaluated and determined by the office [OHP] to have a significance rating of Category 1 to 5 on a DPR Form 523; and
4. If the survey is five or more years old at the time of its nomination for inclusion in the California Register, the survey is updated to identify historical resources that have become eligible or ineligible due to changed circumstances or further documentation and those that have been demolished or altered in a manner that substantially diminishes the significance of the resource.

Office of Historic Preservation (OHP) Survey Methodology

The evaluation instructions and classification system prescribed by the OHP in its *Instructions for Recording Historical Resources* provide a Status Code for use in classifying potential historical resources. In 2003, the Status Codes were revised to address the California Register. These Status Codes are used statewide in the preparation of historical resource surveys and evaluation reports. The first code is a number that indicates the general category of evaluation. The second code is a letter that indicates whether the property is separately eligible (S), eligible as part of a district (D), or both (B). There is sometimes a third code that describes some of the circumstances or conditions of the evaluation. The general evaluation categories are as follows:

1. Listed in the National Register or the California Register.
2. Determined eligible for listing in the National Register or the California Register.
3. Appears eligible for listing in the National Register or the California Register through survey evaluation.
4. Appears eligible for listing in the National Register or the California Register through other evaluation.
5. Recognized as historically significant by local government.
6. Not eligible for listing or designation as specified.
7. Not evaluated or needs re-evaluation.

The specific Status Codes referred to in this report are as follows:

6Z Found ineligible for NR, CR or Local designation through survey evaluation.

2.3 Los Angeles Cultural Heritage Ordinance

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and amended it in 2018 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission and criteria for designating Historic-Cultural Monuments (HCM). The Commission is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture and architecture. A monument is any site, building, or structure of particular historic or cultural significance to the City of Los Angeles and may be designated if it meets at least one of the following criteria:

[9] Public Resources Code §5024.1.

- The proposed HCM is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community; or
- The proposed HCM is associated with the lives of historic personages important to national, state, city, or local history;
- The proposed HCM embodies the distinctive characteristics of a style, type, period, or method of construction; or represents; or represents a notable work of a master, designer, builder, or architect whose individual genius influenced his or her age.[10]

Unlike the National and California Registers, the Ordinance makes no mention of concepts such as physical integrity or period of significance. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

2.4 Los Angeles Historic Preservation Overlay Zone Ordinance

The Los Angeles City Council adopted the ordinance enabling the creation of Historic Preservation Overlay Zones (HPOZs) in 1979; Angelino Heights became Los Angeles' first HPOZ in 1983. An HPOZ is a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development. According to Section 12.20.3 of the City of Los Angeles Municipal Code, the criteria for the designation of an HPOZ are:

1. Adds to the historic architectural qualities or historic associations for which a property is significant because it was present during the period of significance, and possesses historic integrity reflecting its character at that time; or
2. Owing to its unique location or singular physical characteristics, represents an established feature of the neighborhood, community or city; or
3. Retaining the building, structure, landscaping, or natural feature would contribute to the preservation and protection of a historic place or area of historic interest in the City.

[10] Los Angeles Administrative Code Section 22.171.7.

3. ENVIRONMENTAL SETTING

The Project site is in the Hollywood Redevelopment Area, within the Hollywood CPA of Los Angeles, at the southeast corner of N. Las Palmas Avenue and Franklin Avenue. Franklin Avenue is an east-west thoroughfare that runs parallel to Hollywood Boulevard to the south. North Las Palmas Avenue is a two-lane road that runs north to south. The built environment in the vicinity of the Project site consists primarily of multi-family residential buildings constructed as early as the 1900s and as recently as 2019.

3.1 Description and History of the Property

The Project site is currently improved with the Las Palmas Senior Citizen Center, a one-story municipal recreational building constructed for RAP in 1961. The building is situated in the northeast corner of the parcel with a deep setback from N. Las Palmas Avenue. The topography of the Project site matches the slope of N. Las Palmas Avenue and is higher at its north end. The building is surrounded by a flat area that is graded below Franklin Avenue. This topography, along with a retaining wall, vegetation, and fencing, partially obscures the north elevation from the public right-of-way. The northwest portion of the parcel is leased to an independent childcare facility and is not a part of the Project. The property is surrounded by a metal and chain-link fence and site features include concrete walkways, patios, and a lawn with mature trees. The southern portion of the parcel is occupied by a square, multi-lane shuffleboard court and an asphalt multi-stall parking lot that are both below grade of the main building due to the topography of the site.

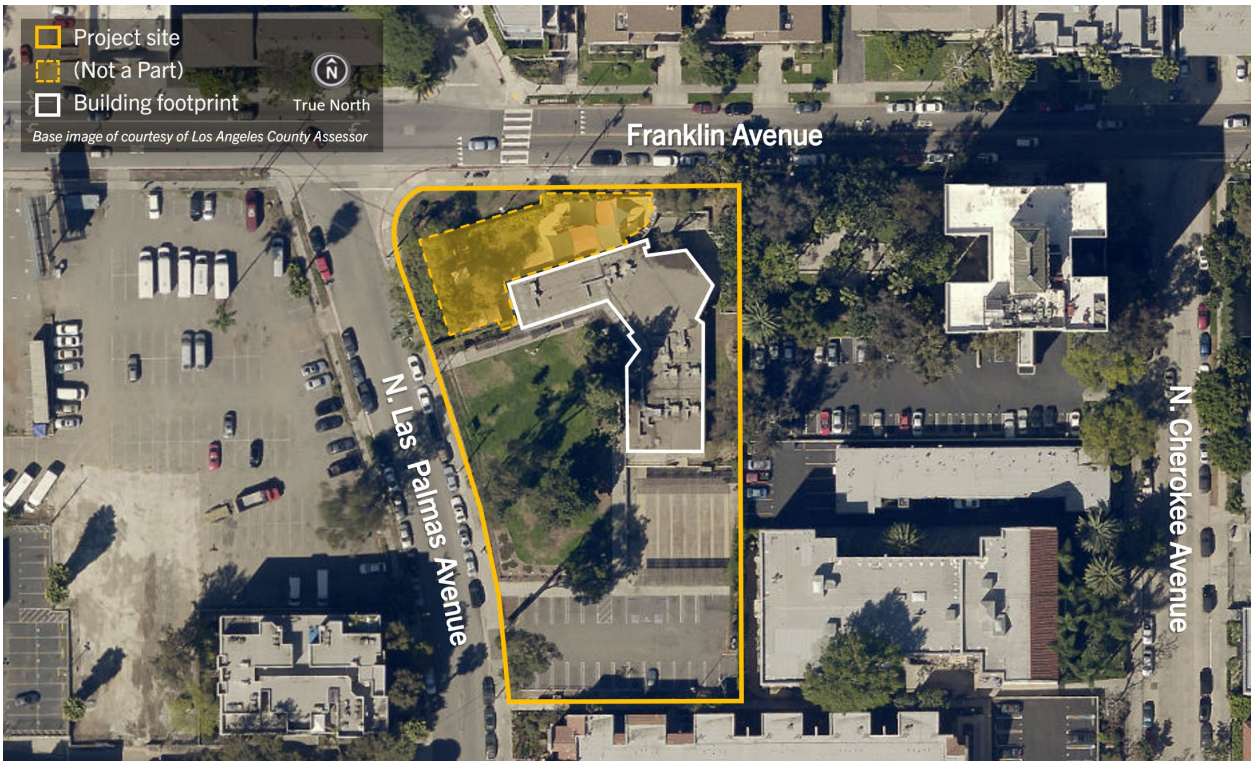

Figure 2: Location of the building on the Project site.

Architectural Description

The Senior Citizen Center is irregular in plan and generally comprises three volumes: a one story, rectangular volume with an east-west orientation (North Wing) that intersects a double-height hexagonal volume (noted as the Community Room on the original plans) that also intersected by another one-story, rectangular volume with

a north-south orientation (South Wing).[11] The building has a flat roof with overhanging, boxed eaves on the one-story wings and a low-sloped gabled roof with open eaves and bargeboards on the Community Room. The exterior of the building is clad in a combination of stucco with vertical scoring and vertical stack bond concrete masonry with raked joints that mimic the appearance of vertical panels. Some of the masonry units have decorative patterning. Fenestration consists of fixed metal single-light and multi-light windows, many of which extend from the floor to ceiling. Entryways consist of singular, hollow metal doors and fully glazed metal doors in singles and pairs. A wood trellis shelters the walkway that wraps around the west elevation of the building (see Figure 3).

North Wing

The North Wing is further divided into two, one-story volumes that are connected by a breezeway (see Figure 4). The south elevation of the western volume is clad in stucco with vertical scoring and has a rectangular clerestory window. The breezeway is enclosed by a non-original metal door and chain-link fencing. The south elevation of the eastern volume is also clad in stucco with vertical scoring, but there is no fenestration. The east elevation of the North Wing mostly intersects with the Community Room, but at its north end there is a shallow projection with two hollow metal doors that open onto a concrete patio area northeast of the building (see Figure 5). The north and west elevations of the North Wing were not accessible during the site visit, as they abut the leased portion of the site that is not a part of the Project.

Community Room

The Community Room is intersected by the North Wing to the west and the South Wing to the south. The main entrance is located roughly where the three volumes intersect and is oriented southwest towards N. Las Palmas Avenue. The entrance consists of a full-light, metal door with a single-light sidelight and transom. There are three multi-light, sliding metal doors to the left of the main entrance and two fixed single-light windows to the right (see Figure 6). The north elevation of the Community Room is clad in decorative concrete blocks and has a single hollow metal door that faces north towards Franklin Avenue (see Figure 7). The northeast elevation is clad in vertical stack bond concrete masonry and has an infilled clerestory window opening (see Figure 8). The southeast elevation of the Community Room is also clad in vertical stack bond concrete masonry and has a hollow metal door sheltered under a flat canopy (see Figure 9).

South Wing

The west elevation of the South Wing is clad in stucco and there is a secondary entry that consists of a pair of full-light, metal doors. There are five single-light, metal windows on either side of the entrance that are framed by four narrow rectangular columns (see Figure 10). The south elevation is clad in stucco with vertical scoring. There is a single and pair of hollow metal doors that open onto a landing for a staircase. The staircase has brick treads and a metal handrail and leads to the shuffleboard court (see Figure 11). The east elevation of the South Wing is clad in stucco with vertical scoring. There is a pair of hollow metal doors at the south end and another at the center of the elevation. The center doors are flanked by two fixed single-light metal windows (see Figure 12). The east elevation faces the neighboring property line with a narrow setback, forming a shallow grass lawn. The north end of the South Wing intersects with the remainder of the building.

Additional exterior photographs of the building's elevations and surrounding site can be found in Appendix E.

[11] The North Wing and South Wing terminology is used for the purposes of this report only.

Construction History

The Las Palmas Senior Citizen Center was constructed in 1961 for RAP and was designed by Carl B. Troedsson.[12] Troedsson was a Los Angeles-based architect who was born in Sweden in c. 1906. He relocated to the United States in 1923 when he was about 17 years old.[13] He graduated from Columbia University School of Architecture in New York and the Royal Institute of Technology in Stockholm, Sweden.[14] Prior to opening his own architecture firm, he was a professor as well as an author whose writing focused on urban planning issues related to the increased demand of the automobile.[15] One of the best-known examples of Troedsson's work includes the Tower Building in Long Beach, a 39-story circular apartment building with a revolving restaurant on the top floor.[16]

According to a *Los Angeles Evening Citizen News* newspaper article published in 1961, the Las Palmas Senior Citizen Center Building would be constructed of concrete block and stucco with a multi-sided "polyhedron" shaped community room between a north wing and a south wing.[17] The wings would include a foyer, club room, and a maintenance room connected by an open patio with a covered breezeway.[18] The original building permit could not be located, however, a copy of Troedsson's as-built plans from May 1961 were provided by the City and correspond to the description in the article (see Appendix C).

There are only three building permits on record for the building, listed in **Table 1,** below. While this is common for city-owned properties, only a few alterations are documented as a result. The oldest building permit on record for the property is from 2000 for interior and exterior construction including stairs, restroom, and parking lot remodel and the installation of an ADA-compliant wheelchair lift.[19] The wheelchair lift was removed to the scope in a subsequent 2001 permit.[20] The last available exterior building permit is from 2018 for the replacement of interior and exterior luminaries with LED.[21] Other permits are for mechanical, electrical, and/or plumbing work.

Table 1: Building Permit History

Date	Permit No.	Description	Builder	Owner
2000-12-14	00016-10000-01648	Stair, restroom, and parking remodel and ADA wheelchair lift installation.	Art Dungo	LA City
2001-02-01	00016-10001-01648	Scope change – omit ADA wheelchair lift	Art Dungo	LA City
2018-03-01	18041-10000-07572	Replacing indoor and outdoor luminaires with LED types.	N/A	LA City

Additional alterations were observed by GPA during their site visit in May 2023 based on a comparison of existing conditions and the original building construction plans from 1961. Observed alterations to the building not included in the building permit history are listed below.

North Wing:

- Added metal gate to breezeway at south elevation, unknown date (see **Figure 15**).

Ownership and Tenant History

The Las Palmas Senior Citizen Center was originally constructed for RAP.[22] The City has retained ownership and the building has been occupied by the senior citizen center since construction.

4. HISTORIC CONTEXTS

The significance of a property must be evaluated within its historic context(s). Historic contexts are those patterns or trends in history by which a specific property is understood. Because the property is located within the City of Los Angeles, the *LACHCS* was used as a framework for evaluating the buildings as potential historical resources. The *LACHCS* is organized into contexts, themes, and property types (CTP), and the most applicable CTPs were identified.

The relevant CTP for evaluating the significance of the property under Criteria A/1/1 and C/3/3 are the history of the Hollywood area and Public and Private Institutional Development and the theme of Municipal Parks, Recreation and Leisure, specifically the sub-theme of Municipal Recreational Facilities, 1932-1978. Properties significant within this sub-theme reflect trends in park and urban planning as municipalities worked to address a growing public need for people of all ages to have a place to exercise, socialize, and participate athletic events and recreational activities.

4.1 Development History of Hollywood

As previously mentioned, the Project site is located in Hollywood on the corner of Franklin Avenue and N. Las Palmas Avenue. The following information is excerpted from the *Historic Resources Survey Report: Hollywood Community Plan Area* prepared for the City of Los Angeles.

> The area that would become Hollywood was originally part of two former Spanish land grants – Rancho La Brea and Rancho Los Feliz. Hollywood began as a small agricultural community in the nineteenth century. Farmers, many of whom were European immigrants, experimented in cultivating a wide variety of exotic fruits, vegetables, and flowers. The agricultural character of the community changed in the early twentieth century as large real estate tracts were developed, transforming the community into a bustling suburb of Los Angeles.
>
> In 1900, the first electric streetcar track was completed along Hollywood Boulevard (then Prospect Avenue). Other streetcar lines soon followed, including along Melrose Avenue, La Brea Avenue, Santa Monica Boulevard, Highland Avenue, Vine Street, Western Avenue, Vermont Avenue, Virgil/Hillhurst Avenues, Kenmore Avenue, Fountain Avenue, Talmadge Street, Hyperion Avenue, Los Feliz Boulevard, and Beachwood Drive.
>
> In 1903 the City of Hollywood was officially incorporated, and in 1910 it was consolidated to the City of Los Angeles. The pre-consolidated area boundary is generally defined by the southernmost portion of Hollywood Hills to the north, Fountain Avenue to the south, Crescent Heights Boulevard to the west, and Mariposa Street to the east.
>
> The population of Hollywood during this early period was quite diverse, from cultural immigrants, such as French painter Paul de Longpre, to American transplants, such as Midwestern banker Gordon Wattles. Due to the large number of estates in the area, there was also a substantial local working class that was employed as caretakers and service workers; in Hollywood many of these were of Japanese and Scottish origin.
>
> The most significant factor in the development of Hollywood in the twentieth century was the entertainment industry. Film production began in Hollywood in 1911, and quickly grew into a significant economic force. As the popularity of motion pictures grew, more physical facilities related to motion picture production were constructed in Hollywood. In 1919 the City established a series of industrial zones specifically designated for motion picture use. The largest and most significant of these is located in the heart of the Hollywood Survey Area. Industrial resources include intact motion picture studio plants and a wide variety of support services dating to the 1920s. Due to its key role in the motion picture industry, Hollywood later became a center for radio, television, and record production. The burgeoning entertainment

industry brought about the development of thriving business districts along Hollywood Boulevard, Vine Street, and Sunset Boulevard.

From the 1910s through the boom of the 1920 s and into the 1930s, Hollywood experienced tremendous population growth. The rapidly expanding film business attracted migrants from around the United States and around the globe, resulting in a true "melting pot." For a period of time preceding World War II, the entertainment industry also became a refuge for émigrés from Eastern Europe. To accommodate the growing population of newcomers, there was a sharp increase in residential development. Concentrations of residential properties from this period are located adjacent to the major motion picture studios and include modest single-family residences along with a wide variety of multi-family housing types. The integrity of many of these properties is poor and intact neighborhoods of early twentieth-century studio-adjacent residences are now rare.

Density in Hollywood increased substantially following World War II. In the hillsides, residences were built on previously undeveloped lots. In the flatlands, inexpensive stucco-clad apartment buildings were erected as infill in previously established residential neighborhoods. Along the major commercial corridors, earlier buildings were updated or replaced with new construction. By the 1950s, entertainment industry-related properties began to spread out throughout the greater Los Angeles area, and the major industry in Hollywood shifted to tourism. During the late 1950s the infamous Capitol Records Building was constructed on Vine Street and the Hollywood Walk of Fame was created on Hollywood Boulevard as a tribute to actors, directors, and other contributors to the entertainment industry.

Also during this period, some of the nation's most important Modernist architects were working in Los Angeles, building sleek commercial buildings in the flatlands and highly innovative residential projects in the hillsides. The Hollywood Survey Area contains residential and commercial properties designed by a number of important Modernists, including Richard Neutra, Rudolph Schindler, Lloyd Wright, John Lautner, Craig Ellwood, Raphael Soriano, Gregory Ain, and Pierre Koenig.

In the 1960s-1970s Hollywood's population became more ethnically diverse, as new immigrant groups began settling in the area. In addition to a significant Latino population, Armenian and Thai immigrants began living and working in the East Hollywood area and opened shops and other businesses. Community and residential densities continued to increase, as original single-family houses, bungalow courts, and smaller apartment buildings were replaced with larger multi-family residential complexes.[23]

[23] Excerpted from HRG, *Historic Resources Survey Report: Hollywood Community Plan Area* (City of Los Angeles Office of Historic Resources, August 2011, Revised November 2015), 6-8.

4.2 Municipal Recreational Facilities, 1932-1978

As mentioned above, the Project site is a municipal recreational building used as a senior activity facility that has been owned by the City of Los Angeles Department of Recreation and Parks since its construction in 1961.

Origins of the Recreational Facility During the Great Depression, 1932-1945[24]

The concept of the recreational facility was a logical combination of what both the parks and the playgrounds had become by the early 1930s. The park had evolved from the bucolic landscape of the pleasure ground into what had become essentially an adult activity center, while the child-oriented playground had taken on elements, specifically enlarged club houses and swimming pools, which increasingly served an adult population.

The result was the idea of the recreational facility to serve all ages. It took the structures of the playground and combined them with the outdoor amenities of the park. Sacrificed was landscaping for its own sake. Site layout was shaped by the activities to be provided and, inevitably given the increasingly suburban location of the centers, by the need for parking.

One of the pioneers in this development was George Hjelte. Hjelte became the City's first general manager of the Playground and Recreation Department in 1926, a year after it was created out of the old City Playground Commission. He had previously been the superintendent for Berkeley's playgrounds and was chosen for Los Angeles after a nation-wide search. Hjelte remained general manager, first for the Playground and Recreation Department and then for the combined Recreation and Parks Department, until 1962.

During his tenure the City adopted the idea of the recreational facility. The larger parks, Hjelte believed, were fine for day-long excursions, generally taken on weekends or holidays and reached by automobile. But he believed that every neighborhood needed a recreational facility for convenient bouts of regular exercise. In terms of space, three acres of open space for every one thousand inhabitants was a good ratio, with one of those three dedicated to active recreation such as basketball and tennis.

The concept of the recreational facility was also becoming popular among city planners. It had been proposed for Los Angeles as early as 1930 by the landscape architects Olmsted Brothers and Harland Bartholomew Associates. The traditional playground, they believed, should be limited to schools and intended for student use alone. In its place, Olmsted and Bartholomew specified two types of recreational entities, the neighborhood center and the regional or district center. The neighborhood recreation center "should provide for people of all ages." It would include "sand piles and wading pools for the little tots" and playground equipment for older children, as well as tennis courts, ball fields and perhaps a swimming pool for everyone. A club house would provide space for community meetings.

It would also require parking. Olmsted and Bartholomew held that the traditional neighborhood playground, small and closely spaced in its distribution, might be appropriate for the older cities of the East and Midwest. But it made no sense in Los Angeles. "Nearly universal use of automobiles" meant that the centers, larger and containing parking, could be spread further apart.

[24] Excerpted from Daniel Prosser, "Public and Private Institutional Development, 1850-1980, Government Infrastructure and Services, 1850-1980: Municipal Parks, Recreation, and Leisure, 1886-1978," *Los Angeles Citywide Historic Context Statement* (City of Los Angeles Office of Historic Resources, December 2017), 25-27.

In addition to these neighborhood centers, there should be regional or district centers. These would focus on team athletic contests. In justifying the cost of these "sports parks," Olmsted and Bartholomew used the language of the earlier playground advocates. "The highly important social need for healthful outlets for the energies of youths of 'the dangerous age'" could be served by such a center "instead of forcing them in pernicious channels."

Here too Olmsted and Bartholomew were specific as to requirements. These regional centers needed large plots of nearly level land. Included were to be fields for baseball, football, and track events. Also to be included were tennis courts, a swimming pool, and a field house with locker and shower facilities.

Olmsted and Bartholomew were willing to impose their vision on existing parks. They ruled out Elysian and Griffith as too rugged and isolated. But Lincoln Park was fair game. They proposed incorporating a portion of the existing park together with adjacent land currently occupied by privately-owned uses considered undesirable, such as the Ascot Racetrack and an auto camp, in or Many of the proposals of Olmsted and Bartholomew were overlooked as the Depression took hold. But versions of their ideas were incorporated into the playground projects of the Works Progress Administration during the mid and late 1930s. Playground improvements, along with park landscaping, were ideal for the WPA and its program of government funded jobs for the unemployed. A great number could be put to work on construction, with club houses, bath houses, and swimming pools added to the more common landscape projects. der to create a larger parcel.

Early Postwar Recreational Facilities, 1945-1956[25]

In the orthodoxy of postwar urban planners, the recreational facility, particularly its neighborhood form, became a necessary requirement for a complete community. Such a facility was a public service, as important as fire and police protection and a local school. All citizens, regardless of class or age, were entitled to a publicly-funded place to play.

At the same time, during the early postwar years, recreation professionals continued to justify their projects with the older language of social work. Hjelte stressed the continued need for supervised play, particularly among young males. Once the war ended he extended this concern to young returning veterans.

In April of 1946, Hjelte presented a capital improvements program in excess of twelve million dollars. It included thirty new neighborhood recreation centers, thirteen district centers with swimming pools, a major sports center, and improvements to existing sites. This program became the basis of a bond issue that was placed on the ballot for May of 1947.

That May, Hjelte was more specific as to the different types of facilities. New neighborhood recreation centers were to be from three to seven acres in size. Each would have a community club house, consisting of a meeting hall, smaller club rooms, and a kitchen. The new district centers were to cover ten to twenty acres, and to have swimming pools, athletic fields, and recreational buildings large enough for indoor sports.

In campaigning for the measure, Hjelte continued to stress the importance of recreation as a means to "curb juvenile delinquency." At the same time, he promised new parks and playgrounds in all parts of the City, middle class as well as poor. With residential development

[25] Excerpted from Prosser, "Municipal Parks, Recreation, and Leisure," 29-31.

expanding into previously empty land, "now is the time for the City to acquire more playgrounds if it is ever to get them."

Comparatively good economic times and rapid population growth combined to encourage voters to approve the May 1947 bond issue. The issue was not limited to parks and recreation but addressed the needs of all the City's departments. Hjelte received the more than 12.5 million dollars he requested. At the same time, the fire department received 4.6 million dollars, while 6.5 million dollars went for health centers, 10 million dollars for sewers, and more than 18 million dollars for police buildings and jails.

Along with additional funds came reorganization. In 1947, the Parks Department merged with the Department of Recreation and Playgrounds to form a single Department of Recreation and Parks. Hjelte became the general manager of the new agency. He maintained, after the merger, that this move combined the expertise of the two agencies. "Employees formerly in the park service acquired added motivation from the consciousness that their work was oriented more toward people than before, while recreation personnel acquired ecological and horticultural sensitivity." He also maintained that all benefited. "In time, the playgrounds tended to become more park like, and the parks more functional for recreational activities."

By 1950, once the expansion program was well under way, Hjelte placed less emphasis on preventing juvenile delinquency and more on the benefits of City-supported recreation for all citizens. "Today recreation is recognized as a morale and efficiency measure." It is a "means of developing among Los Angeles' more than 2,000,000 citizens stronger community and family ties." In bringing the good life to all, "adequate recreation servicing is a prime factor socially, psychologically and culturally."

In August of 1952, Parks and Recreation provided a progress report. Twenty-six new recreational sites had been acquired, along with additional land for nine existing facilities. On these plots were constructed thirty-one new club houses, nine swimming pools, and seven field houses adjacent to athletic fields.

Late Postwar Recreational Facilities, 1957-1978[26]

By the mid-1950s, the Department of Recreation and Parks needed additional funds to maintain its construction program. In 1955 Hjelte placed a thirty-five million dollar bond issue on the June ballot. It managed to get a majority but failed to reach the necessary two-thirds. He returned again in 1957 with a request for 39.5 million dollars and this time won the needed super majority.

One of the significant aspects of the work done under the 1957 bond issue was an explicit parking requirement, which fit the suburban nature of most of the new sites. All new recreational facilities had to provide one space for every five patrons. The patron count was based on the fire marshal's ruling as to the occupancy allowed in club house meeting rooms, bath houses, bleachers, and other such entities.

By the end of 1959 Recreation and Parks had completed thirty-five projects and had an additional twenty-one underway. There were new swimming pools at the Northridge, Mar Vista, Sepulveda, Van Ness, and Orcutt Recreation Centers. Also constructed were parking lots at ten existing facilities.

[26] Excerpted from Prosser, "Municipal Parks, Recreation, and Leisure," 36-39.

Building projects at older sites ranged from a senior citizens center addition to the existing club house at the Yosemite Recreation Center in Eagle Rock to a new club house at the Sunland Recreation Center.

There were a few new projects that resembled the older compact playgrounds set in densely populated areas. One such was the Lemon Grove Recreation Center in Hollywood. Completed in 1959, it was a small site of 2.47 acres on a triangular piece of land bordered by Lemon Grove Avenue, Hobart Boulevard, and the 101 Freeway.

Lemon Grove consists of a standard club house – with multi-purpose meeting room, stage, kitchen, office, and restrooms – together with a play area for small children, a softball field, and the now required parking lot. The club house, is a single story concrete block structure topped by a slow-sloped gabled roof with extended beams, similar in style to the Sepulveda bath house discussed below. There is no architect of record on the building permit indicating that Recreation and Parks staff may have been responsible for the design.

But most new facilities were larger and located in suburban areas. Typical was the swimming pool and bath house at the Sepulveda Recreation Center in Panorama City. The Sepulveda center dates from the early postwar period and has one of the five 1948 club houses designed Gable and Wyant. It is similar to that at the Roberson Recreation Center discussed above and also appears to be generally intact.

Completed in 1959, the Sepulveda bath house is a good example of residential Mid-Century Modernism applied to an institutional building. The low-sloped gabled roofs of the concrete block building, complete with extended beams, are characteristic of the ranch houses of the era. It follows the standard bath house form of a central mass and side wings housing men's and women's facilities. But by breaking the building into three separate pavilions, the architects, H. L. Kahn and Edward Farrell, were able to maintain a domestic scale appropriate to the neighborhood.

In addition to recreational facilities, the City created some new parks that followed more traditional forms. Instead of focusing on serving a neighborhood with buildings such as club houses and swimming pools, they emphasized the older concept of the park as a place to experience nature. At the same time, they provide space for outdoor activities, thus resembling the Municipal Parks of the 1904 to 1931 period.

Representative is Chatsworth Park, now Chatsworth Park North, located at the western end of Chatsworth Street. It sits at the base of the Santa Susanna Mountains in the far northwest of the San Fernando Valley. Opened in 1963, it is divided into two sections, with athletic fields to the east and a natural area containing native trees and plants to the west. In the center is a Mid-Century Modern service building with a folded plate roof.

Recreation and Parks called upon the expertise of an outside landscape designer for Chatsworth Park. The firm responsible for the work was Cornell, Bridges and Troller. Ralph Cornell was one of the first professional landscape architects in the Los Angeles area. He worked on the development of the UCLA campus grounds, beginning in 1937. The firm of Cornell, Bridges and Troller was involved in designing the landscaping on such major works as Century City, the Los Angeles Civic Center, and the Music Center. Chatsworth Park was part of the City's effort to bring recreational facilities to the newer sections of the San Fernando Valley. In terms of size, the most significant park, or more accurately system of parks, in the western Valley was Porter Ranch. Developed in the late 1960s, its origins were much like those of the city's early parks. It was a case of a real estate developer, in the interest of promoting his investment, providing citizens with open space. The initial Porter Ranch development covered a 6.5 square mile area that extended from Reseda Boulevard on the east to Topanga Canyon

Boulevard on the west and from Devonshire Street on the south into the mountains. The Macco Realty Company bought the property in 1962 and laid out a series of subdivisions based on a master plan that called for a 423-acre complex of parks and golf courses. The proposed ten thousand single-family homes surrounding these open spaces were marketed to the managerial and professional upper-middle class. The original park within the larger setting was a sixty-three acre parcel donated by Macco Realty to the City and opened in 1966. A year later Macco approached the City with a proposition. The developer still owed 1.3 million dollars of the annexation fee, dating from the City's incorporation of the property. Macco offered to donate 403 acres of its green space in lieu of paying the balance. In March of 1967 the City Council approved the deal. The result is a chain of parks, including Aliso Creek (or Aliso Canyon), Eddleston, Limekiln Canyon, Porter Ridge, and Wilber-Tampa.

4.3 Eligibility Requirements

The eligibility requirements for Municipal Recreational Facilities are included in Table 2, below.

TABLE 2: MUNICIPAL RECREATIONAL FACILITIES, 1932-1978 [27]

Context: Public and Private Institutional Development, 1850-1980
Sub-Context: Government Infrastructure and Services, 1850-1980
Theme: Municipal Parks, Recreation, and Leisure, 1886-1978
Eligibility Standards
• Municipal Recreation Facility constructed between 1932 and 1978
• Includes active recreation areas such as athletic fields, tennis courts, golf courses, ball fields, horseshoe courts, activity lawns, game courts, outdoor pools, plunges, archery ranges, and facilities to support athletic events
• Is an excellent example of its type or style and/or represents the work of a significant landscape architect or designer
Character-Defining/Associative Features
• Present appearance resembles the original appearance and retains sufficient historic integrity to convey its historical association
• Retains a significant number of character-defining features, such that the visual, spatial, and contextual relationships of the property may be understood
• May include areas for social recreational functions (e.g., childcare facilities, children's play areas, senior activity centers, club houses, recreation centers, auditoriums, picnic tables, and grill areas)
• May include buildings and features that are significant examples of architectural styles of the period and/or the work of noted architects
• May provide indoor space to support a variety of activities including dancing, games, stage productions, food preparation, and dining
• May include support structures such as maintenance sheds and night lighting
• May represent more than one period of municipal park development
• May include improvements associated with WPA programs
• For the National Register, properties must possess exceptional importance if less than 50 years of age
Integrity Considerations:
• Should retain integrity of Design, Setting, Location, Feeling, and Association
• A sufficient number of original materials should be intact such that the historic fabric, character, and overall visual effect have been preserved
• Alterations, if reversible, may be acceptable
• Examples of original vegetation may have been replaced
• Individual design features may have been modified, altered, or replaced
• Original spaces for activities may have new uses

[27] Prosser, "Municipal Parks, Recreation, and Leisure," 53-55.

5. EVALUATION OF ELIGIBILITY

The property was evaluated under the applicable criteria for the National Register, California Register, and LA HCM designation using the eligibility requirements outlined in the CTP for Municipal Recreational Facilities, 1932-1978 within the *LACHCS*.

Criterion A/1/1

To be eligible under Criterion A/1/1, a property must have a direct association with events that have made a significant contribution to the broad patterns of history.

The Municipal Recreational Facilities sub-theme within the Public and Private Institutional Development context examines patterns of municipal recreational development from 1932-1978 and is the most applicable theme for evaluating the property under Criterion A/1/1.

The subject property was built during the late postwar continuation of a RAP construction program that was funded by two bond issues approved in 1947 and 1957. The program stemmed from a concept that emerged during the Great Depression and sought to provide recreational facilities for people of all ages. During the late postwar period, the most notable municipal recreational development was taking place in the suburbs, particularly in the San Fernando Valley, as RAP created large recreational facilities like Chatsworth Park. More densely populated communities, such as Hollywood, were already established by this time and had been largely built-out in the decades prior. New RAP improvements in these communities generally consisted of smaller facilities, like club houses, or updates to existing facilities to create parking lots. The subject property was one of at least five senior citizen centers developed and constructed in the early 1960s.[28]

While the subject property is associated with postwar municipal recreational development trends, as outlined in National Register Bulletin 15, "Mere association with historic events or trends is not enough, in and of itself, to qualify under Criterion A: the property's specific association must be considered important as well. For example, a building historically in commercial use must be shown to have been significant in commercial history."[29] Research did not reveal evidence to suggest that the subject property was especially unique or significant in the history of municipal recreational development. Rather, it appears to be one of several similar, standard facilities constructed as a continuation of trends established years earlier. As such, it has an association with the historic trend, but the association itself is not important.

Research did not reveal an association with any other historic events or trends. Therefore, for all the reasons outlined above, the Las Palmas Senior Citizen Center does not appear to be eligible under Criterion A/1/1.

Criterion B/2/2

Criterion B/2/2 states that to be eligible, a property must be associated with the lives of persons significant in our past.

As noted in Section 3.1, the building has been owned and operated by the City of Los Angeles since construction. However, research did not reveal the names of any specific individuals associated with the property that might rise to the level of significance necessary for eligibility under Criterion B/2/2. While numerous people have been

[28] Others include the Felicia Mahood Senior Citizen Center in West Los Angeles, North Hollywood Senior Citizen Center, the Anderson Memorial Senior Citizen Center in San Pedro, and the Sherman Oaks East Valley Adult Center, all of which were constructed c. 1960-1963. Newspapers.com, various articles, accessed May 2023.
[29] National Register Bulletin 15, 12.

employed with the Las Palmas Senior Center through the City of Los Angeles, collective efforts like these are better evaluated under Criterion A.[30]

Therefore, the property does not appear to be eligible under Criterion B/2/2.

Criterion C/3/3

A property is eligible under Criterion C/3/3 if it embodies the distinctive characteristics of a type, period, or method of construction, represents the work of a master, possesses high artistic values, or lastly, represents a significant and distinguishable entity whose components may lack individual distinction.

Although the building possesses features that reflect the era of its 1961 construction, like the decorative concrete block and full-height metal windows and doors, it does not embody any particular architectural style. However, the subject building was also evaluated as an example of its type under the Municipal Recreational Facilities, 1932-1978 sub-theme. The eligibility standards for this theme are included in Table 2.

To be eligible under this sub-theme, a property must be an excellent example of its type or style and/or represent the work of a significant landscape architect or designer with a date of construction between 1932-1978 and an active recreation area to support athletic events.[31] As mentioned, the subject building was constructed in 1961 and has a shuffleboard court to support athletic events. However, the property is not an excellent example of its type. It does not appear to be a rare, unique, or important example of the type, nor does it appear to reflect an important variation or evolution, and it does not appear to have had an impact on the design of later buildings.

Rather, the subject property is one of several such facilities constructed around the same time using common building materials and following design precedents and planning principles that were established several decades earlier. Additionally, it has been altered since its construction as noted in Section 3.1.

The original building plans identify Carl B. Troedsson as the architect of the building.[32] Research did not reveal evidence to suggest that Troedsson would be considered a master architect. Even if he were considered a master in his respective field, the subject property would be unlikely to be considered an important example of his work due to its simple design and common materials. Lastly, if it were an important example of his work, alterations after construction have diminished the integrity of Troedsson's original design.

The possession of high artistic values refers to a building's articulation of a particular concept of design so fully that it expresses an aesthetic ideal. A property eligible under this aspect of Criterion C would need to possess ornamentation and detail to lend it high artistic value, which is not the case for the subject building.

The last aspect of Criterion C/3/3 is generally applied to historic districts. As mentioned above, the property is not located within the boundaries of an HPOZ, nor within an area identified by SurveyLA or the Hollywood Redevelopment Project Survey as a potential historic district. These findings were confirmed during the field inspection conducted for this report, as there are not enough properties with shared physical characteristics or historical associations in the area to form a potential historic district. Therefore, the subject property does not appear to form or contribute to a distinguishable entity as a potential district does not appear to exist.

Therefore, for the reasons outlined above, the property does not appear to be eligible under any aspect of Criterion C/3/3.

[30] Beth Grosvenor Boland, (National Register Bulletin 32) *Guidelines for Evaluating and Documenting Properties Associated with Historic Persons* (US Department of the Interior, National Park Service, Cultural Resources: 1988), 5, accessed May 2023, https://www.nps.gov/subjects/nationalregister/upload/NRB32-Complete.pdf.
[31] Prosser, "Municipal Parks, Recreation, and Leisure," 53-55.
[32] Carl B. Troedsson, *Las Palmas Senior Citizen Center,* May 4, 1961, Sheet 1.

Criterion D/4

Criterion D/4 applies to the potential of the property to yield information important in prehistory or history. Criterion D generally applies to archaeological resources but may apply to a built resource in instances where a resource may contain important information about such topics as construction techniques or human activity. In any case, the resource must be the principal source of information. This is unlikely to be true for the subject property. Therefore, the property does not appear to be eligible under Criterion D/4.

Integrity

It is standard practice to assess a property's integrity as part of a historic evaluation. Integrity is a property's ability to convey its historic significance through its physical features. National Register Bulletin 15 defines seven aspects of integrity: Location, design, setting, materials, workmanship, feeling, and association. In order to convey significance, a property must retain some combination of these aspects of integrity from its period of significance. The aspects of integrity that are essential vary depending on the significance of the resource.

While the subject property does not appear to be eligible for listing in the National or California Registers, or as an LA HCM, it was examined against the seven aspects of integrity for further clarification.

Location: The place where the historic property was constructed or the place where the historic event occurred.

The subject property has not been moved since its construction and therefore retains integrity of location.

Design: The combination of elements that create the form, plan, space, structure, and style of a property.

While the property is still able to convey its original design intent, including its original function and use, the integrity of design has been diminished due to changes to the building over time, including the infilling and alteration of breezeways in multiple locations.

Setting: The physical environment of the historic property.

A review of historic aerials indicates that the immediate setting of the property on its site appears largely as it did at the time of construction. Although the surrounding setting has changed over time due to ongoing development, it does not detract from the subject property. Therefore, the property retains integrity of setting.

Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

While the original materials are apparent in the extant features and finishes from the time of construction, the integrity of materials has been diminished due to changes to the building over time, including installation of non-original doors and windows.

Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

While the original workmanship is still apparent in extant details such as the stacked bond concrete masonry, the integrity of workmanship has been diminished due to changes to the building over time.

Feeling: A property's expression of the aesthetic or historic sense of a particular period of time.

The property retains integrity of feeling as it is still able to convey the sense of a 1960s recreational facility.

Association: The direct link between an important event or person and a historic property.

The integrity of association does not apply to the property as there is no historic association for the physical integrity to convey.

Summary of Evaluation

For the reasons discussed above, the property does not appear to be eligible for listing in the National or California Registers, or for designation as an LA HCM due to diminished integrity and a lack of significance within the relevant context.

6. CONCLUSIONS

The Las Palmas Senior Citizen Center, located at 1820 N. Las Palmas Avenue, is not currently designated under any national, state, or local landmark program, nor was it previously identified in any historical resource surveys. After careful inspection, investigation, and evaluation, GPA concludes that the property does not appear to be eligible for listing in the National or California Registers, or for designation as an LA HCM due to diminished integrity and lack of significance within the relevant context. Additionally, it does not appear to contribute to a potential historic district. The recommended Status Code for the property is 6Z, ineligible for designation at the national, state, and local levels through survey evaluation. As such, the property is not a historical resource for the purposes of CEQA.

APPENDIX A – RÉSUMÉS

AMANDA DUANE

Amanda Duane is a Senior Architectural Historian at GPA. She has been involved in the field of historic preservation since 2011. Amanda graduated from Savannah College of Art and Design with a Bachelor of Fine Art degree in Historic Preservation. She has since worked in local government and private historic preservation consulting in California. Amanda joined GPA in 2012 and her experience has included the preparation of environmental compliance documents in accordance with the California Environmental Quality Act and Section 106 of the National Historic Preservation Act; Historic American Buildings Survey/Historic American Engineering Record recordation; large-scale historic resources surveys; Federal Rehabilitation Tax Credit and Mills Act applications; National Register Place nominations; local landmark applications; historic context statements; and evaluations of eligibility for a wide variety of projects and property types throughout California. She is experienced in expertly guiding property owners through the process of securing local and federal historic tax credits and working with local governments to develop design guidelines for administering local design reviews. Amanda is also highly skilled in graphic design as well as interpretation and exhibition design.

Educational Background:

- B.F.A, Historic Preservation, Savannah College of Art and Design, 2011

Professional Experience:

- GPA Consulting, Senior Architectural Historian, 2012-Present
- Architectural Resources Group, Intern, 2012
- City of Los Angeles, Office of Historic Resources, Intern, 2011-2012

Qualifications:

- Meets the Secretary of the Interior's Professional Qualification Standards for architectural history pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.
- National Preservation Institute, Section 106: An Introduction

Professional Activities:

- California Preservation Foundation Conference Programs Committee, 2017

Selected Projects:

- 1500 W. Adams Boulevard, Los Angeles, CEQA Historical Resources Technical Report, 2022
- 1527 17th Street, Secretary of the Interior's Standards Compliance Memo, City of Santa Monica, 2018-21
- 3014 4th Street, City of Santa Monica, Local Landmark Assessment, 2022
- 325 Georgina Avenue, City of Santa Monica, Local Landmark Assessment, 2022
- 3443 Sepulveda Boulevard, Los Angeles, CEQA Historical Resources Technical Report, 2018
- 400-432 S. San Vicente Boulevard, City of Los Angeles, CEQA Historical Resource Evaluation Report, 2022
- 631 Colorado Avenue, City of Santa Monica, Local Landmark Assessment, 2021 –2021
- 867 10th Street, Los Angeles, CEQA Historical Resources Technical Report, 2018
- Bank of Italy Building, Los Angeles, Federal Tax Credit Application and National Register Nomination, 2015-2019
- Bartlett Building, Los Angeles, Historic-Cultural Monument Application and Mills Act Application, 2015
- Bradbury Building, Los Angeles, Tenant Improvement Guidelines, 2016-2017
- Carnegie Library, City of Yreka, Historic Structures Report, 2022
- Commonwealth Nursery Griffith Park, Los Angeles, Character-Defining Features Analysis and CEQA Historical Resource Technical Report, 2014
- Municipal Ferry Building, San Pedro, Secretary of the Interior's Standards Compliance Memo, 2019
- Nikkei Hall, Santa Monica, CEQA Historical Resources Technical Report, 2020

EMMA HAGGERTY

Emma Haggerty is an Associate Architectural Historian at GPA and has been involved in the field of historic preservation since 2016. Emma graduated from the University of Vermont with a Master of Science in Historic Preservation. She has since worked in the public sector in both New Jersey and California on a variety of projects. Emma joined GPA in 2021 and her experience has included review of environmental compliance documents in accordance with the California Environmental Quality Act (CEQA) and Section 106 of the National Historic Preservation Act (NHPA); design review for consistency with the Secretary of the Interior's Standards (SOIS); and municipal code compliance. Additionally, Emma has experience reviewing Mills Act Applications, preparing Mills Act Contracts, and performing site inspections for properties under and interested in the Mills Act.

Educational Background:

- Master of Science, University of Vermont, 2018
- B.A., Planning and Public Policy, Rutgers University, 2016

Professional Experience:

- GPA Consulting, Associate Architectural Historian, 2021-Present
- City of San Diego, Historical Resources Senior Planner & Mills

  Act Coordinator, 2018-2021
- New Jersey Historic Preservation Office, Program Associate, 2018
- National Trust for Historic Preservation – Lyndhurst Mansion,

  Historic Preservation Intern, 2017

Qualifications:

- Meets the Secretary of the Interior's Professional Qualifications Standards for history and architectural history pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.
- National Preservation Institute, Section 106: An Introduction

Selected Projects:

- 1102 Pacific Coast Highway, City of Huntington Beach, CEQA Historical Resource Technical Report, 2021
- 2501 Curtis Avenue, Redondo Beach, CEQA Historical Resource Evaluation Report, 2021 –2022
- 3014 4th Street, City of Santa Monica, Local Landmark Assessment, 2022

14. APPLICATION COMMENTS

In the event that any box (i e. 1-16) is filled to capacity, it is possible that additional information that has been captured electronically is not printed. Nevertheless, the information printed herein exceeds that required by Section 19825 of the Health and Safety Code of the State of California.

15. Building Relocated From:

16. CONTRACTOR, ARCHITECT, & ENGINEER NAME	ADDRESS		CLASS	LICENSE#	PHONE #
(O) Owner-Builder	600 S. Spring St, 200	, 90012		0	2138475334

U 731 U 7 0 9 0 1 3 3

Unless a shorter period of time has been established by an official action, plan check approval expires one and a half years after the plan check fee has been paid. This permit expires two years after the building permit fee has been paid or 180 days after the fee has been paid and construction has not commenced or if work is suspended, discontinued or abandoned for a continuous period of 180 days (Sec 98 0602 LAMC). Claims for refund of fees paid must be filed within one year from the date of expiration for permits granted by the Dept. of Building & Safety (Sec. 22.12 & 22.13 LAMC).

17. LICENSED CONTRACTOR'S DECLARATION

I hereby affirm under penalty of perjury that I am licensed under the provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect. If doing work on a residential property, I certify that I hold a valid certification as a Home Improvement contractor per B&P Code, Section 7150.2e The following applies to B contractors only: I understand the limitations of Section 7057 related to my ability to take prime contracts or subcontracts involving specialty trades.

License Class: _____ Lic No: _____ Print: _____ Sign: _____

18. WORKERS' COMPENSATION DECLARATION

I hereby affirm, under penalty of perjury, one of the following declarations.

X I have and will maintain a certificate of consent to self insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.

☐ I have and will maintain workers's compensation insurance, as required by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued My workers' compensation insurance carrier and policy number are:

Carrier: _____ Policy Number: _____

☐ I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the workers' compensation laws of California, and agree that if I should become subject to the workers' compensation provisions of Section 3700 of the Labor Code, I shall forthwith comply with those provisions.

Sign: ARTEMIO S. DUNGO Date: 12/19/00 ☐ Contractor X Authorized Agent ☐ Owner

WARNING: FAILURE TO SECURE WORKERS' COMPENSATION COVERAGE IS UNLAWFUL, AND SHALL SUBJECT AN EMPLOYER TO CRIMINAL PENALTIES AND CIVIL FINES UP TO ONE HUNDRED THOUSAND DOLLARS ($100,000), IN ADDITION TO THE COST OF COMPENSATION, DAMAGES AS PROVIDED FOR IN SECTION 3706 OF THE LABOR CODE, INTEREST, AND ATTORNEY'S FEES

19. CONSTRUCTION LENDING AGENCY

I hereby affirm under penalty of perjury that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civil Code).

Lenders name: _____ Lenders address: _____

20. ASBESTOS REMOVAL

Notification of asbestos removal. X is not applicable ☐ Letter was sent to the AQMD or EPA Sign: ARTEMIO S. DUNGO Date: 12 19 00

21. OWNER-BUILDER DECLARATION

I hereby affirm under penalty of perjury that I am exempt from the Contractors License Law for the following reason (Section 7031.5, Business and Professions Code Any city or county which requires a permit to construct, alter, improve, demolish, or repair any structure, prior to its issuance, also requires the applicant for such permit to file a signed statement that he or she is licensed pursuant to the provisions of the Contractors License Law (Chapter 9 commencing with Sec. 7000 of Division 3 of the Business and Professions Code) or that he or she is exempt therefrom and the basis for the alleged exemption. Any violation of Section 7031.5 by any applicant for a permit subjects the applicant to a civil penalty of not more than five hundred dollars ($500))

X I, as the owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale (Sec 7044, Business & Professions Code The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who does such work himself or herself or through his or her own employees, provided that such improvements are not intended or offered for sale If, however, the building or improvement is sold within one year from completion, the owner-builder will have the burden of proving that he or she did not build or improve for the purpose of sale)

☐ I, as the owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec 7044, Business & Professions Code: The Contractors License Law does not apply to an owner of property who builds or improves thereon, and who contracts for such projects with a contractor(s) licensed pursuant to the Contractors License Law.)

☐ I am exempt under Sec. _____, Bus. & Prof. Code for the following reason: _____

Print: ARTEMIO S. DUNGO Sign: ARTEMIO S. DUNGO Date: 12/19/00 ☐ Owner X Authorized Agent

22. FINAL DECLARATION

I certify that I have read this application and state that the above information is correct. I agree to comply with all city and county ordinances and state laws relating to building construction, and hereby authorize representatives of this city to enter upon the above-mentioned property for inspection purposes. I realize that this permit is an application for inspection and that it does not approve or authorize the work specified herein Also that it does not authorize or permit any violation or failure to comply with any applicable law. Furthermore, that neither the City of Los Angeles nor any board, department officer, or employee thereof, make any warranty, nor shall be responsible for the performance or results of any work described herein, nor the condition of the property nor the soil upon which such work is performed. I further affirm under penalty of perjury, that the proposed work will not destroy or unreasonably interfere with any access or utility easement belonging to others and located on my property, but in the event such work does destroy or unreasonably interfere with such easement, a substitute easement(s) satisfactory to the holder(s) of the easement will be provided (Sec 91.0106.4.3.4 LAMC).

The Las Palmas Senior Center building is situated in the northeast corner of its parcel with a deep setback from N. Las Palmas Avenue. The topography of the Project site matches the slope of N. Las Palmas Avenue and is higher at its north end. The building is surrounded by a flat area that is graded below Franklin Avenue. This topography, along with a retaining wall, vegetation, and fencing, partially obscures the north elevation from the public right-of-way. The northwest portion of the parcel is leased to an independent childcare facility and is not a part of the Project. The property is surrounded by a metal and chain-link fence and site features include concrete walkways, patios, and a lawn with mature trees. The southern portion of the parcel is occupied by a square, multi-lane shuffleboard court and an asphalt multi-stall parking lot that are both below grade of the main building due to the topography of the site.

Period of Significance 1886-1978 **Property Type** Municipal Recreational Facility **Applicable Criteria** N/A
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The property was evaluated under the applicable criteria for the National Register, California Register, and Los Angeles Historic-Cultural Monument (HCM) designation using the eligibility requirements outlined in the Context, Theme, Property Type (CTP) for Municipal Recreational Facilities, 1932-1978 within the Los Angeles Citywide Historic Context Statement (LACHCS). For the reasons discussed below, the property does not appear to be eligible for listing in the National or California Registers, or for designation as an LA HCM due to diminished integrity and a lack of significance within the relevant context.

Criterion A/1/1

To be eligible under Criterion A/1/1, a property must have a direct association with events that have made a significant contribution to the broad patterns of history. The Municipal Recreational Facilities sub-theme within the Public and Private Institutional Development context examines patterns of municipal recreational development from 1932-1978 and is the most applicable theme for evaluating the property under Criterion A/1/1.

***P3a. Description (Continued from Page 1)**

The Senior Citizen Center is irregular in plan and generally comprises three volumes: a one story, rectangular volume with an east-west orientation (North Wing, for the purposes of this evaluation only) that intersects a double-height hexagonal volume (noted as the Community Room on the original plans) that also intersected by another one-story, rectangular volume with a north-south orientation (South Wing, for the purposes of this evaluation only). The building has a flat roof with overhanging, boxed eaves on the one-story wings and a low-sloped gabled roof with open eaves and bargeboards on the Community Room. The exterior of the building is clad in a combination of stucco with vertical scoring and vertical stack bond concrete masonry with raked joints that mimic the appearance of vertical panels. Some of the masonry units have decorative patterning. Fenestration consists of fixed metal single-light and multi-light windows, many of which extend from the floor to ceiling. Entryways consist of singular, hollow metal doors and fully glazed metal doors in singles and pairs. A wood trellis shelters the walkway that wraps around the west elevation of the building.

North Wing

The North Wing is further divided into two, one-story volumes that are connected by a breezeway. The south elevation of the western volume is clad in stucco with vertical scoring and has a rectangular clerestory window. The breezeway is enclosed by a non-original metal door and chain-link fencing. The south elevation of the eastern volume is also clad in stucco with vertical scoring, but there is no fenestration. The east elevation of the North Wing mostly intersects with the Community Room, but at its north end there is a shallow projection with two hollow metal doors that open onto a concrete patio area northeast of the building. The north and west elevations of the North Wing were not accessible during the site visit, as they abut the leased portion of the site that is not a part of the Project.

Community Room

The Community Room is intersected by the North Wing to the west and the South Wing to the south. The main entrance is located roughly where the three volumes intersect and is oriented southwest towards N. Las Palmas Avenue. The entrance consists of a full-light, metal door with a single-light sidelight and transom. There are three multi-light, sliding metal doors to the left of the main entrance and two fixed single-light windows to the right. The north elevation of the Community Room is clad in decorative concrete blocks and has a single hollow metal door that faces north towards Franklin Avenue. The northeast elevation is clad in vertical stack bond concrete masonry and has an infilled clerestory window opening. The southeast elevation of the Community Room is also clad in vertical stack bond concrete masonry and has a hollow metal door sheltered under a flat canopy.

South Wing

The west elevation of the South Wing is clad in stucco and there is a secondary entry that consists of a pair of full-light, metal doors. There are five single-light, metal windows on either side of the entrance that are framed by four narrow rectangular columns. The south elevation is clad in stucco with vertical scoring. There is a single and pair of hollow metal doors that open onto a landing for a staircase. The staircase has brick treads and a metal handrail and leads to the shuffleboard court. The east elevation of the South Wing is clad in stucco with vertical scoring. There is a pair of hollow metal doors at the south end and another at the center of the elevation. The center doors are flanked by two fixed single-light metal windows. The east elevation faces the neighboring property line with a narrow setback, forming a shallow grass lawn. The north end of the South Wing intersects with the remainder of the building.

***B10. Significance (Continued from Page 2)**

The subject property was built during the late postwar continuation of a City of Los Angeles Department of Recreation and Parks (RAP) construction program that was funded by two bond issues approved in 1947 and 1957. The program stemmed from a concept that emerged during the Great Depression and sought to provide recreational facilities for people of all ages. During the late postwar period, the most notable municipal recreational development was taking place in the suburbs, particularly in the San Fernando Valley, as RAP created large recreational facilities like Chatsworth Park. More densely populated communities, such as Hollywood, were already established by this time and had been largely built-out in the decades prior. New RAP improvements in these communities generally consisted of smaller facilities, like club houses, or updates to existing facilities to create parking lots. The subject property was one of at least five senior citizen centers developed and constructed in the early 1960s.[1]

While the subject property is associated with postwar municipal recreational development trends, as outlined in National Register Bulletin 15, "Mere association with historic events or trends is not enough, in and of itself, to qualify under Criterion A: the property's specific association must be considered important as well. For example, a building historically in commercial use must be shown to have been significant in commercial history."[2] Research did not reveal evidence to suggest that the subject property was especially unique or significant in the history of municipal recreational development. Rather, it appears to be one of several similar, standard facilities constructed as a continuation of trends established years earlier. As such, it has an association with the historic trend, but the association itself is not important.

Research did not reveal an association with any other historic events or trends. Therefore, for all the reasons outlined above, the Las Palmas Senior Citizen Center does not appear to be eligible under Criterion A/1/1.

Criterion B/2/2

Criterion B/2/2 states that to be eligible, a property must be associated with the lives of persons significant in our past.

The building has been owned and operated by the City of Los Angeles since construction. However, research did not reveal the names of any specific individuals associated with the property that might rise to the level of significance necessary for eligibility under Criterion B/2/2. While numerous people have been employed with the Las Palmas Senior Center through the City of Los Angeles, collective efforts like these are better evaluated under Criterion A.[3]

Therefore, the property does not appear to be eligible under Criterion B/2/2.

Criterion C/3/3

A property is eligible under Criterion C/3/3 if it embodies the distinctive characteristics of a type, period, or method of construction, represents the work of a master, possesses high artistic values, or lastly, represents a significant and distinguishable entity whose components may lack individual distinction.

---

[3] Beth Grosvenor Boland, (National Register Bulletin 32) *Guidelines for Evaluating and Documenting Properties Associated with Historic Persons* (US Department of the Interior, National Park Service, Cultural Resources: 1988), 5, accessed May 2023, https://www.nps.gov/subjects/nationalregister/upload/NRB32-Complete.pdf.

***B10. Significance (Continued from Page 2)**

Although the building possesses features that reflect the era of its 1961 construction, like the decorative concrete block and full-height metal windows and doors, it does not embody any particular architectural style. However, the subject building was also evaluated as an example of its type under the Municipal Recreational Facilities, 1932-1978 sub-theme.

To be eligible under this sub-theme, a property must be an excellent example of its type or style and/or represent the work of a significant landscape architect or designer with a date of construction between 1932-1978 and an active recreation area to support athletic events.[4] As mentioned, the subject building was constructed in 1961 and has a shuffleboard court to support athletic events. However, the property is not an excellent example of its type. It does not appear to be a rare, unique, or important example of the type, nor does it appear to reflect an important variation or evolution, and it does not appear to have had an impact on the design of later buildings.

Rather, the subject property is one of several such facilities constructed around the same time using common building materials and following design precedents and planning principles that were established several decades earlier. Additionally, it has been altered since its construction as noted in ***B6.**

The original building plans identify Carl B. Troedsson as the architect of the building.[5] Research did not reveal evidence to suggest that Troedsson would be considered a master architect. Even if he were considered a master in his respective field, the subject property would be unlikely to be considered an important example of his work due to its simple design and common materials. Lastly, if it were an important example of his work, alterations after construction have diminished the integrity of Troedsson's original design.

The possession of high artistic values refers to a building's articulation of a particular concept of design so fully that it expresses an aesthetic ideal. A property eligible under this aspect of Criterion C would need to possess ornamentation and detail to lend it high artistic value, which is not the case for the subject building.

The last aspect of Criterion C/3/3 is generally applied to historic districts. As mentioned above, the property is not located within the boundaries of an HPOZ, nor within an area identified by SurveyLA or the Hollywood Redevelopment Project Survey as a potential historic district. These findings were confirmed during the field inspection conducted for this report, as there are not enough properties with shared physical characteristics or historical associations in the area to form a potential historic district. Therefore, the subject property does not appear to form or contribute to a distinguishable entity as a potential district does not appear to exist.

Therefore, for the reasons outlined above, the property does not appear to be eligible under any aspect of Criterion C/3/3.

Criterion D/4

Criterion D/4 applies to the potential of the property to yield information important in prehistory or history. Criterion D generally applies to archaeological resources but may apply to a built resource in instances where a resource may contain important information about such topics as construction techniques or human activity. In any case, the resource must be the principal source of information. This is unlikely to be true for the subject property. Therefore, the property does not appear to be eligible under Criterion D/4.

***B10. Significance (Continued from Page 2)**

Integrity

It is standard practice to assess a property's integrity as part of a historic evaluation. Integrity is a property's ability to convey its historic significance through its physical features. National Register Bulletin 15 defines seven aspects of integrity: Location, design, setting, materials, workmanship, feeling, and association. In order to convey significance, a property must retain some combination of these aspects of integrity from its period of significance. The aspects of integrity that are essential vary depending on the significance of the resource.

While the subject property does not appear to be eligible for listing in the National or California Registers, or as an LA HCM, it was examined against the seven aspects of integrity for further clarification.

Location: The place where the historic property was constructed or the place where the historic event occurred.

The subject property has not been moved since its construction and therefore retains integrity of location.

Design: The combination of elements that create the form, plan, space, structure, and style of a property.

While the property is still able to convey its original design intent, including its original function and use, the integrity of design has been diminished due to changes to the building over time, including the infilling and alteration of breezeways in multiple locations.

Setting: The physical environment of the historic property.

A review of historic aerials indicates that the immediate setting of the property on its site appears largely as it did at the time of construction. Although the surrounding setting has changed over time due to ongoing development, it does not detract from the subject property. Therefore, the property retains integrity of setting.

Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

While the original materials are apparent in the extant features and finishes from the time of construction, the integrity of materials has been diminished due to changes to the building over time, including installation of non-original doors and windows.

Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

While the original workmanship is still apparent in extant details such as the stacked bond concrete masonry, the integrity of workmanship has been diminished due to changes to the building over time.

Feeling: A property's expression of the aesthetic or historic sense of a particular period of time.

The property retains integrity of feeling as it is still able to convey the sense of a 1960s recreational facility.

Association: The direct link between an important event or person and a historic property.

The integrity of association does not apply to the property as there is no historic association for the physical integrity to convey.

PROJECT TITLE: Las Palmas Senior Citizen Center - Renovation
(W.O. E1908358/ CIP No. G1163)

LOG REFERENCE

PROJECT LOCATION: The Project is located at 1820 N. Las Palmas Avenue on the southeast corner of Franklin Avenue and Las Palmas Avenue, in the Hollywood Community Plan Area of the City of Los Angeles, see also Parcel Profile Report from NavigateLA, Figure 1: Project Vicinity, and Figure 2: Project Location). Thomas Bros. Map Page 593, Grid E4

DESCRIPTION OF NATURE, PURPOSE, AND BENEFICIARIES OF PROJECT: The Las Palmas Senior Citizen Center - Renovation project (Project) consists of consists of renovating the interior of an approximately 5,504-square-foot senior community center, along with some exterior site improvements. Project beneficiaries include facility users, community members, and visitors who will have improved recreational facilities. Please see the Project Description Continuation in the narrative for more details. On December 1, 2025, the Bureau of Engineering (BOE) determined the Project is exempt under the California Environmental Quality Act (CEQA) and approved the Project design plans for indexing.

CONTACT PERSON	**CONTACT INFORMATION**

CATEGORICAL EXEMPTION NARRATIVE

I. DESCRIPTION OF NATURE, PURPOSE, AND BENEFICIARIES OF PROJECT, CONTINUED

The Las Palmas Senior Citizen Center is operated by the City of Los Angeles Department of Parks and Recreation. The Project consists of a renovation of the building interior space (approx. 5,500 square feet), exterior within the existing footprint, and a modernization of the exterior features, Figures 1 – 3). Minor excavation and modification of grades may be needed for the patio area, trash enclosure, and Low Impact Development (LID) capture and reuse planters. The plans call for a reduction in total landscaping (approx. 2,600 square feet less) and a loss of three parking spaces (21, down from 24). Fencing will be installed along the perimeter and internally (306 linear feet total).

The new parking lot shade structure will be built using cast-in-place concrete piles (not driven) set with boreholes excavated to a maximum depth of 25 feet. The Project site is considered to have a high paleontological sensitivity at depths of 15 feet and greater. There is a potential to encounter significant paleontological resources during drilling activities that extend to impact native Pleistocene-age deposits (i.e., drilling that exceeds a depth of 15 feet). Therefore, a Paleontological Resources Monitoring and Treatment Plan (PRMTP) must be prepared and implemented prior to any ground disturbance at a depth of greater than 15 feet. The plan should specify the levels and types of mitigation efforts during drilling activities and should also include a description of the professional qualifications required of key staff, communication protocols to be followed during construction, unanticipated discovery protocols, fossil recovery protocols, sampling protocols for microfossils (if required), laboratory procedures, reporting requirements, and curation provisions for any collected fossil specimens.

The scope of the contractor's work includes:

- Implementation of PRMTP
- redesign interior spaces to add additional restrooms
- renovate floor and ceilings throughout
- upgrade existing roof (approx. 7,900 SF), lighting, mechanical systems, and electrify building
- upgrade existing windows
- redesign existing trellis
- renovate turf areas and irrigation system
- renovate existing concrete walkways and patio spaces to meet ADA requirements
- renovate existing shuffleboard area to multi-use exercise area with photovoltaic shade structure and reconfigure landscaping
- restripe existing parking lot
- construct a new trash enclosure at parking area
- add one dual EV charger, and one single EV charger (3 spaces) at the parking lot
- replace old fencing and add 43 linear feet of new fencing

Unless otherwise stated, the proposed Project will be designed, constructed and operated following all applicable laws, regulations, ordinances and formally adopted City standards including but not limited to:

- City of Los Angeles Municipal Code
- Bureau of Engineering Standard Plans
- Standard Specifications for Public Works Construction (Greenbook), including Additions and Amendments (Brownbook)
- Work Area Traffic Control Handbook

The Project includes best management practices (BMPs) for compliance with applicable regulatory requirements that protect cultural resources and for implementation of applicable "Greenbook" Standard Specifications for Public Works Construction that protect cultural resources as follows:

BMP-CUL-1: In the event that unanticipated historical artifacts were encountered, Greenbook, Section 6-6.2, (Greenbook, 2021) states: "If discovery is made of items of archaeological or paleontological interest, the Contractor shall immediately cease excavation in the area of discovery and shall not continue until ordered by the Engineer." Therefore, during activities in which there will be ground disturbances (i.e., digging, drilling, etc.) if any evidence of archaeological, cultural, or paleontological resources are found, all work within the vicinity of the find shall stop until a qualified archaeologist can assess the finds and make recommendations. No excavation of any finds should be attempted by Project personnel unless directed by a qualified archaeologist. Construction activities may continue in other areas. If the discovery proves significant under CEQA (Section 15064.5f; Public Resources Code [PRC] 21082), additional work such as testing, or data recovery may be warranted.

BMP-CUL-2: The discovery of human remains is always a possibility during ground disturbances; State of California Health and Safety Code Section 7050.5 states that if human remains are encountered, no further disturbance shall occur until the Los Angeles County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. The Los Angeles County Coroner must be notified of the find immediately. If the human remains are determined to be prehistoric, the coroner will notify the Native American Heritage Commission, which will determine and notify a Most Likely Descendent (MLD). The MLD shall complete the inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

II. PROJECT HISTORY

The Project site is comprised of one parcel, Assessor Parcel Number (APN) 5547-003-900, located in the Hollywood Redevelopment Area within the Hollywood Community Plan Area (CPA) of the City of Los Angeles. The legal description is Lot 10, Block 2 of the Hollywood Oceanview Tract. The Project site is improved with the Las Palmas Senior Citizen Center, a one-story municipal recreational building constructed in 1961 for the City of Los Angeles Department of Recreation and Parks (RAP). The property is not currently listed in the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), or designated as a City of Los Angeles Historical-Cultural Monument (LA HCM), nor was it previously identified in any historical resource surveys.

The purpose of the renovation is to enhance the enjoyment of stakeholders. The current building is outdated and requires various repairs. The proposed work includes updates to existing building infrastructure including roofing, HVAC, and electrical systems. Unused outdoor space will be renovated to new multi-use exercise area. Uneven outdoor surfaces will be repaired. Limited landscape and

irrigation improvements will be provided. Interior space will be reconfigured for more efficient utilization of space and the addition of new restroom facilities. The interior and exterior finishes will be updated.

III. ENVIRONMENTAL REVIEW

A. Basis for Categorical Exemption

The Project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15301, Class 1 (a) and (d) *Existing Facilities* for operation, repair, maintenance, permitting, leasing, licensing, or minor alteration of existing public or private structures, facilities, mechanical equipment, or topographical features, involving negligible or no expansion of existing or former use because the Project consists of:

- Interior or exterior alterations involving such things as interior partitions, plumbing, and electrical conveyances
- Restoration or rehabilitation of deteriorated or damaged structures, facilities, or mechanical equipment to meet current standards of public health and safety, unless it is determined that the damage was substantial and resulted from an environmental hazard such as earthquake, landslide, or flood

The Project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15303, Class 3 (e) *New Construction or Conversion of Small Structures* which consists of construction and location of limited numbers of new, small facilities or structures; installation of small new equipment and facilities in small structures; and the conversion of existing small structures from one use to another where only minor modifications are made in the exterior of the structure. The numbers of structures described in this section are the maximum allowable on any legal parcel. Examples of this exemption include, but are not limited to:

- Accessory (appurtenant) structures including garages, carports, patios, swimming pools, and fences

The Project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15304, Class 4 (a) *Minor alterations to land* which consists of minor public or private alterations in the condition of land, water, and/or vegetation which do not involve removal of healthy, mature, scenic trees except for forestry or agricultural purposes. Examples include, but are not limited to:

- Accessory (appurtenant) structures including garages, carports, patios, swimming pools, and fences

Additionally, the Project is exempt from CEQA pursuant to the following City CEQA Guidelines from Article III, Section 1.

- Class 1-1: Interior or exterior alterations involving remodeling or minor construction where there be negligible or no expansion of use
- Class 1-4: Restoration or rehabilitation of deteriorated or damaged structures, facilities or mechanical equipment and systems to meet current standards of public health, safety and environmental protection
- Class 3-6: Accessory (appurtenant) structures including garages, carports, patios, swimming pools, fences, game courts (including tennis courts accessory to residential developments), play areas and retaining walls
- Class 4-1: Grading on land with a slope of less than ten percent (10%), except where it is to be located in a waterway, in any wetland, in an officially

designated (by federal, State, or local governmental action) scenic area or in an officially mapped areas of severe geologic hazard

B. Consideration of Potential Exceptions to use of a Categorical Exemption

The State CEQA Guidelines (CCR Sec 15300.2) limit the use of categorical exemptions in the following circumstances:

1. Location. Exemption Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may be significant in a particularly sensitive environment. Therefore, these classes are considered to apply in all instances, except where the project may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.

As of December 4, 2025, the site was listed within a special grading area (BOE basic grid Map A-13372) and a liquefaction zone on ZIMAS. As of February 12, 2024, the site is not a listed as part of a high fire severity zone or an oil zone on NavigateLA.

According to the Department of Conservation California Geological Survey, the Project site is located within the Alquist-Priolo Earthquake Fault Zone. Alquist-Priolo earthquake fault zones are regulatory zones surrounding the surface traces of active faults in California. These zones were conceived in the Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act), the intent of which is to reduce losses from surface fault rupture. Local agencies must regulate development projects within earthquake fault zones and demonstrate that proposed buildings will not be constructed on active faults. Projects include all land divisions and most structures for human occupancy.

The site lies within a designated liquefaction zone, an area mapped for “historic occurrence of liquefaction, or where local geological, geotechnical, and groundwater conditions indicate a potential for permanent ground displacements,” or where “previous occurrence of landslide movement, or local topographic, geological, geotechnical, and subsurface conditions indicate a potential for permanent ground displacements,” according to the Official Map of Seismic Hazards, released by the California Department of Conservation, California Geological Survey (CGS).

The proposed Project consists of renovation of an existing structure and addition of a small shade structure in a parking lot. No new structures for human habitation will be constructed. Repair and maintenance projects are common in the City and throughout areas deemed to be within the earthquake hazard zones, as such these repairs are not unusual circumstances. The Project would not potentially result in or increase vulnerability to damage caused by earthquakes and there is no reasonable possibility that the Project will have a significant effect due to unusual circumstances. All best management practices and building codes will be followed.

This Project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15301 *Existing Facilities* (a), (d); 15303 *New Construction or Conversion of Small Structures* (e); 15304 *Minor alterations to land* (a). However, it consists of renovation at an existing recreation facility in an area devoid of environmental resource of hazardous or critical concern. Therefore, the location exception does not apply.

2. Cumulative Impact. This exception applies when, although a project may not have a significant impact, the cumulative impact of successive projects of the same type in the same place, over time is significant.

As a preexisting structure, the Las Palmas Senior Citizens Center is not anticipated to need another renovation for another 30-40 years. Proceeding with this Project will not result in the renovation of many other related or similar or related projects within the state of California or City of Los Angeles. According

to NavigateLA, which includes information from the Public Way Reservation System, no other similar projects are proposed within the Project site or vicinity. Therefore, this exception has no application to this Project.

3. Significant Effect. This exception applies when, although the project may otherwise be exempt, there is a reasonable possibility that the project will have a significant effect due to unusual circumstances.

The community center has been in operation for at least 60 years. The facility will be closed during construction. This Project does not present any unusual circumstances. The borehole drilling for the parking lot shade structure will be actively monitored, and the spoils checked for paleolithic artefacts such as fossils, following the PRMTP.

The proposed Project consists of renovation to an existing building, landscaping, replacement of a fence, and addition of a shade structure in the parking lot. At the Project site, construction may require temporary traffic control. Motorists will be notified of traffic changes via temporary street signing and traffic control devices per the WATCH. It is anticipated that traffic in both directions will remain open.

The Project shall be performed in accordance with applicable WATCH as required by the California Manual on Uniform Traffic Control Devices (CA MUTCD) published by Caltrans, imposed on projects of this nature. City construction crews will coordinate with schools and the Department of Transportation according and provide flaggers when required. When the activity site encroaches upon a sidewalk, walkway or crosswalk area, pedestrians shall be provided advance warning if they are detoured away from the activity construction site.

The proposed Project shall be constructed following any or all the applicable measures below:

1. Construction could occur from 7 a.m. to 9 p.m. Monday through Friday and on Saturday from 8 a.m. to 6 p.m. as allowable by *LAMC § 41.10 - Construction Noise*.

2. Notify all adjacent property owners and land users of the construction length, duration, and hours of noise and vibration producing construction activities, in writing.

3. Provide and make available contact information for sidewalk and street repairs and replacement concerns, on construction activities, prior to and on-site during construction.

The equipment used on site will be tested to maintain noise levels at or below the City standard. Standard conditions and construction practices will be implemented for this Project. No unusual construction noise or traffic effects are anticipated. No reasonable possibility has been identified that the Project will have a significant effect due to unusual circumstances. As such, this exception does not apply.

Therefore, this exception has no application to this Project.

4. Scenic Highway. A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway. As of February 12, 2024, the proposed Project is not within a state designated scenic highway or within sight of any state designated scenic highway. Therefore, this exception has no application to this Project.

5. Hazardous Waste Site. This exception applies when a project is located on a site listed as a hazardous waste site under Government Code Section 65962.5. As of December 4, 2025, the Project site was not listed as a hazardous waste site on *Geotracker* or *Envirostor*. Therefore, this exception has no application to this Project.

6. Historical Resources. This exception applies when a project may cause a substantial adverse

change in the significance of a historical resource. This exception does not apply to the Project. GPA Consulting (GPA) submitted a technical cultural study which concludes that the Las Palmas Senior Citizens Center is not a historical resource for the purposes of CEQA. A paleontological memo authored by Bargas Environmental Consulting reports that no known paleontological resources were identified within a 1-mile buffer of the Project. The upper 15 to 20 feet of sediments consist of unmapped artificial fill, which have a low potential to contain significant paleontological resources due to their disturbed nature. However, the artificial fill is underlain by Pleistocene-age older alluvial sediments, which have a high paleontological potential since numerous vertebrate fossil-bearing localities have been recovered from Pleistocene-age sediments elsewhere in the vicinity of the Project. A Paleontological Resources Monitoring and Treatment Plan (PRMTP) must be prepared and implemented prior to ground disturbance.

The Project does not cause a substantial adverse change in the significance of a historical resource. This exception does not apply.

Subject: Paleontological Recommendations Memorandum for the Las Palmas Senior Citizen Center Renovation (G1163) Project located in the City and County of Los Angeles, California

Dear Jenna Kachour:

Bargas Environmental Consulting, LLC (Bargas) conducted a paleontological study and prepared this recommendations memorandum, on behalf of the City of Los Angeles Bureau of Engineering (BOE) and under contract with GPA Consulting, Inc. (GPA), for the Las Palmas Senior Citizen Center Renovation (G1163) (Project) in the City and County of Los Angeles, California. The purpose of the review was to determine if the Project has the potential to impact paleontological resources within the Project Site, and to provide recommendations to reduce impacts to less than significant levels. All work was completed in compliance with the California Environmental Quality Act (CEQA).

1 Project Location and Description

The Project includes renovations of the Las Palmas Senior Center located at 1820 North Las Palmas Avenue in the City and County of Los Angeles. The Project Site is bounded by Franklin Avenue to the north, North Las Palmas Avenue to the west, and private properties to the south and east. Specifically, the Project is in an unsectioned area of Township 1 South, Range 14 West of the U.S. Geological Survey's (USGS) 7.5-minute *Hollywood* quadrangle, San Bernardino Principal Meridian.

BOE proposes to renovate the outdated Las Palmas Senior Citizen Center focusing on updating the existing building and outdoor infrastructure. The existing structure consists of approximately 6,700 square feet on a lot comprised of approximately 49,836 square feet, or 1.144-acres. The Project components consist of the following:

- Renovating the existing shuffleboard area into usable space for outdoor exercise equipment and small group exercise classes, prefabricated storage, and exterior lighting (approximately 5,000 square feet)
- Restriping existing parking and constructing a trash enclosure
- Improving the street edge and corner with new fencing and landscaping
- Replacing existing roof on the entire structure (approximately 7,900 square feet)
- Renovating the interior space of the senior citizen center only (approximately 5,560 square feet)
- Completing electrification upgrades, which shall include these additional changes:
    - Upgrading windows
    - Upgrading gas appliances to electric
    - Installing PV panels on roof
    - Installing PV panels on a shade structure at the outdoor exercise area
    - Installing new electric vehicle (EV) charging at the parking lot
- Repairing uneven outdoor surfaces
- Completing limited landscape and irrigation improvements
- Reconfiguring interior spaces for more efficient space utilization
- Constructing new restroom facilities

The maximum depth of proposed excavation is 25 feet for installation of piles that will be bored and cast in place (not driven).

2 Methods

Bargas completed a desktop-level paleontological study that included reviews of geologic maps, the Project's geotechnical engineering report (City of Los Angeles 2022), and paleontological literature, and a records search at the Natural History Museum of Los Angeles County (NHMLA) to identify any known paleontological resources within the boundaries of the Project Site or from the same geologic unit within a 1-mile buffer. Paleontological sensitivity rankings were assigned to geologic units using the Society of Vertebrate Paleontology (SVP) criteria (SVP 2010; see Section 2.1). Paleontological recommendations were developed based on the results of the study and in accordance with SVP (2010) standards.

2.1 Paleontological Sensitivity Criteria

In general, paleontological resources are preserved in sedimentary rocks; however, they can occasionally be preserved in low-grade metamorphic rocks and can, on rare occasions, be preserved in volcanic rocks. Beyond acting as a vessel for the preservation of fossil remains, sedimentary strata record telltale information reflecting the environment in which they were deposited (e.g., sedimentary structures, maturity, and lithology). For example, fossil remains found within the fine-grained sediments of a floodplain deposit represent organisms that died and were later buried on an ancient floodplain. Because of the interwoven relationship between fossil remains and their geologic contexts, paleontological sensitivity is generally assigned to geologic units rather than to specific regions, areas, or localities. This assigned paleontological sensitivity classification or rank is based on the known or potential abundance of significant paleontological resources contained within that geologic unit. There are no superseding agency guidelines regarding paleontological sensitivity; therefore, many groups and agencies in California have developed their own sensitivity ranking systems. One of the most widely used was created by the SVP within the "Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources" (SVP 2010). Under the SVP (2010) guidelines, geologic units are classified in one of four categories of paleontological resource sensitivity: no, low, undetermined, and high. Table 1 provides a summary of the SVP (2010) sensitivity criteria and the typical paleontological resources management requirements.

Table 1. SVP Paleontological Sensitivity Criteria

SVP Ranking	Description	Typical Management Requirements
High Sensitivity	Geologic units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Geologic units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations and some volcaniclastic formations (e.g., ashes or tephras), and some low-grade metamorphic rocks which contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils (e.g., middle Holocene and older, fine-grained fluvial sandstones, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstones, fine-grained marine sandstones). Paleontological potential consists of both (a) the potential for yielding abundant or significant vertebrate fossils	A field survey as well as onsite construction monitoring is required. Any significant specimens discovered will require preparation, identification, and curation, as well as eventual accession into an appropriate museum collection. A final report documenting the significance of any finds is required.

SVP Ranking	Description	Typical Management Requirements
	or for yielding a few significant fossils, large or small, vertebrate, invertebrate, plant, or trace fossils and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, paleoecologic, taphonomic, biochronologic, or stratigraphic data. Geologic units which contain potentially datable organic remains older than late Holocene, including deposits associated with animal nests or middens, and rock units which may contain new vertebrate deposits, traces, or trackways are also classified as having high potential.	
Undetermined Sensitivity	Geologic units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential.	A field survey is required to further assess the geologic unit's paleontological potential. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy.
Low Sensitivity	Reports in the paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some geologic units have low potential for yielding significant fossils. Such geologic units will be poorly represented by fossil specimens in institutional collections, or based on general scientific consensus only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule (e.g., basalt flows or recent colluvium).	Mitigation is not typically required.
No Sensitivity	Some geologic units have no potential to contain significant paleontological resources, for instance high grade metamorphic rocks (such as gneisses and schists) and plutonic igneous rocks (such as granites and diorites).	No mitigation required.

3 Regulatory Framework

3.1 State Regulations

3.1.1 California Environmental Quality Act

The purpose of CEQA is to 1) inform governmental decision makers and the public about the potential, significant environmental effects of proposed projects; 2) identify ways to avoid or reduce environmental damage; 3) prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when feasible; and 4) disclose to the public the reason why a governmental agency approved the

project if significant environmental effects are involved (CEQA Guidelines, Article 1, Section 15002(a)). The CEQA Environmental Checklist Form includes one question regarding proposed project effects on paleontological resources:

> "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (CEQA Guidelines, Appendix G, Section VII, Part F)

The answer to this question must take account of the whole action involved, including on-site, off-site, direct, indirect, construction, operational, project-level, and cumulative impacts. If a project would result in significant adverse effects on paleontological resources, then alternative plans or mitigation measures must be considered. The level of consideration may vary with the importance of the paleontological resource.

3.1.2 California Public Resources Code

The California Public Resources Code (PRC) Section 5097.5 provides protection for paleontological resources located on public lands in California, which is defined as lands owned by, or under the jurisdiction of, the state, or any city, county district, authority, or public corporation, or any agency thereof. Under PRC Section 5097.5, it is a misdemeanor for a person to knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any vertebrate paleontological site, including fossilized footprints, or any other paleontological feature situated on public lands without the express permission of the public agency having jurisdiction of the lands.

3.2 Local Regulations

3.2.1 City of Los Angeles

The City of Los Angeles General Plan Conservation Element (2001) recognizes paleontological resources in Section 3: "Archeological and Paleontological" (II-3), specifically the La Brea Tar Pits, and identifies protection of paleontological resources as an objective (II-5). The General Plan identifies site protection as important, stating, "Pursuant to CEQA, if a land development project is within a potentially significant paleontological area, the developer is required to contact a bona fide paleontologist to arrange for assessment of the potential impact and mitigation of potential disruption of or damage to the site. Section 3 of the Conservation Element, adopted in September 2001, includes policies for the protection of paleontological resources. As stated therein, it is the City's policy that paleontological resources be protected for historical, cultural research, and/or educational purposes. Section 3 sets as an objective the identification and protection of significant paleontological sites and/or resources known to exist or that are identified during "land development, demolition, or property modification activities."

Additionally, Section 6-3.2 of the City of Los Angeles Standard Specifications for Public Works Construction requires that grading, excavation, or other ground disturbing activities for a public project be halted in the area of a paleontological find, until such time as a resource expert can review the find, determine its significance, and if required, determine appropriate mitigation measures.

4 Geological and Paleontological Setting

4.1 Regional Overview

At the regional scale, the Project is situated near the southern flank of the Santa Monica Mountains in the northern portion of the Los Angeles Basin, which is within the Peninsular Ranges Geomorphic Province at the junction with the Transverse Ranges. The Peninsular Ranges Geomorphic Province extends approximately 1,450 kilometers (km) (900 miles) from the Transverse Ranges to the tip of Baja Mexico and varies in width from 48 to 160 km (30 to 100 miles) (Norris and Webb 1990). The terrestrial (i.e., unsubmerged) portion of the Peninsular Ranges Province is characterized by a series of elongated northwest–southeast-trending mountains (Yerkes et al. 1965). These mountain ranges are composed dominantly of plutonic igneous rocks (often granites and granitoids) of Cretaceous age (approximately 120 to 90 million years ago [Ma])

and older metamorphic rocks of Jurassic to earliest Cretaceous age (approximately 200 to 140 Ma) (Gastil 1975; Krummenacher et al. 1975; Walawender 2000). In the basins and valleys beneath these mountain ranges, these igneous and metamorphic basement rocks are often overlain by sedimentary deposits of late Mesozoic to Cenozoic age (approximately 90 Ma to 10 thousand years ago [ka]) (Tweet et al. 2014). While the Los Angeles Basin is traditionally considered to be part of the Peninsular Ranges Geomorphic Province, its formation is also closely tied to the clockwise rotation and northward drift of the western Transverse Ranges, which opened the basin, and the subsequent uplift of the Transverse Ranges, which contributed to the rapid and thick accumulation of sediment in the basin (Harden 2004; Sylvester and O'Black Gans 2016).

Structurally, the Los Angeles Basin is divided into four major blocks that are bounded and divided by fault zones. The Project lies within the Central Block, which is wedge shaped and approximately 80 km (50 miles) in greatest length (northwest–southeast). The Central Block is generally bounded by the Whittier Fault Zone to the east and northeast, the Newport-Inglewood Fault Zone to the west and southwest, the Santa Monica Fault to the north, and the Santa Ana Mountains and San Joaquin Hills to the south and southeast (Yerkes et al. 1965). The sediments of the Central Block are relatively thick, especially at the western base of the Santa Ana Mountains, where sedimentary strata have been estimated at 9,754 meters (32,000 feet) in thickness. These sediments are late Cretaceous to Pleistocene in age (approximately 90 Ma to 10 ka) and are occasionally interbedded with Miocene volcanics (Yerkes et al. 1965). Strata within the Central Block were laid down in a variety of marine and terrestrial depositional contexts, which has given rise to a rich fossil record for the region.

4.2 Geologic Map and Paleontological Literature Review

Geologic mapping by Dibblee and Ehrenspeck (1991) indicates that the entirety of the Project Site is underlain by Pleistocene-age older alluvial sediments (Qae) (Figure 1), and the Project's geotechnical report (City of Los Angeles 2022) indicates that the native sediments within the Project Site are covered by an unmapped layer of modern artificial fill. Middle Miocene-age Upper Topanga Formation clay shale or claystone (Ttusi), middle Miocene-age Middle Topanga Formation basaltic volcanic rocks (Tvb), middle or early Miocene-age Lower Topanga Formation sandstone (Tts), Paleocene-age Santa Susana Formation sandstone (Tsu), late Cretaceous-age unnamed conglomerate (Kcg), late Cretaceous-age Trabuco Formation (Kcr), and Cretaceous-age quartz diorite (qd) are also mapped within a half-mile buffer of the Project Site (Dibblee and Ehrenspeck 1991; Figure 1). However, the additional geologic units in the half-mile buffer are not expected to be encountered during Project construction.

4.2.1 Artificial Fill (Not Mapped), Recent

Artificial fill deposits were placed as a result of human activities, such as construction activities. The composition of the deposits varies depending on the source of the material, but often contains construction debris in addition to sediments and clasts from the original source material. Based on the geotechnical report (City of Los Angeles 2022), the artificial fill within the Project Site generally consists of a 15- to 20-foot-thick layer of loose to medium dense, brown, yellowish brown, olive brown, and olive gray clayey sand with varying amounts of gravel and debris, such as glass, brick, and concrete fragments.

Artificial fill sediments could potentially contain fossil materials that were unintentionally introduced during earlier excavations; however, such fossil materials would be removed from their original geologic and stratigraphic contexts and thus would not be of paleontological interest or significance. Therefore, artificial fill deposits are considered to have low paleontological sensitivity.

4.2.2 Older Alluvial Sediments (Qae), Pleistocene

Older alluvial sediments in the region consist of slightly elevated and dissected clay, sand, and gravel and alluvial fans deposited during the late Pleistocene (approximately 11.7 ka to 126 ka) (Dibblee and Ehrenspeck 1991). Within the Project

Site, these sediments consist of medium dense, yellowish brown, fine- to coarse-grained silty sand with gravel and yellowish brown, fine- to coarse-grained sandy clay (Dibblee and Ehrenspeck 1991; City of Los Angeles 2022).

Pleistocene-age alluvial deposits have produced paleontological significant finds of well-preserved large-bodied land mammals throughout Los Angeles County, as well as in nearby Orange and Riverside Counties (Jefferson 1991). Such deposits have yielded remains of mammoths, mastodons, camels, bison, ground sloths, dire wolves, and American lions, among others. Plant remains, terrestrial invertebrates, and microfossils (especially micro-mammals) are also known from similar deposits throughout the Los Angeles Basin (Miller 1971).

Pleistocene-age old alluvial sediments (Qae) are considered to have high paleontological sensitivity due to the intermittent occurrence of significant paleontological resources.

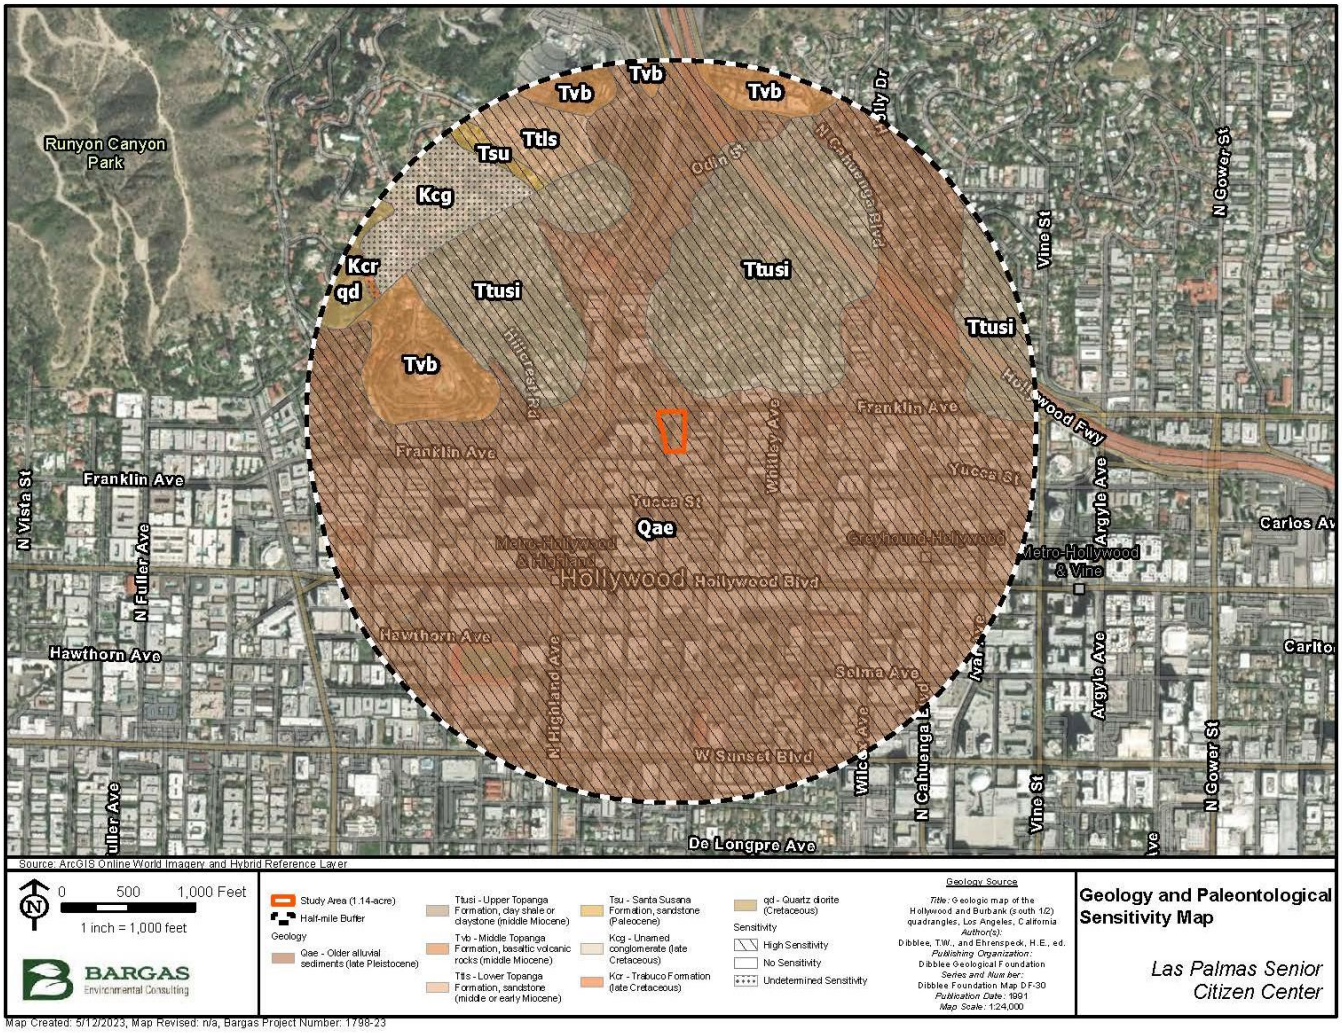

Figure 1. Project Geology and Paleontological Sensitivity Map

5 Records Search Results

A records search of the Project Site and a 1-mile buffer was completed by NHMLA staff member Dr. Alyssa Bell on May 21, 2023. Dr. Bell's report is summarized in Table 2 and provided in full in Appendix A. The search found no previously recorded

fossil localities directly underlying the Project Site. However, 10 paleontological localities were noted from the vicinity of the Project Site. Seven of these localities (LACM VP 6297-6300, 5845, 3371, 7673) occurred in Pleistocene-age deposits similar to those mapped within the Project Site and produced specimens of fossil horse (Equidae), mastodon (*Mammut americanum*, Mammutidae), bison (*Bison*), and camel (*Camelops*). The remaining reported localities were discovered in geologic units that are not anticipated to be encountered during Project construction. A single locality was identified from an unknown Eocene-age formation (LACM IP 3280), which produced a fossil snail (*Amaurellina clarki*). Finally, two localities (LACM IP 16840, 16841) were noted from the Miocene-age Puente Formation, which produced multiple unspecified invertebrates (Bell 2023; Appendix A; Table 2).

Table 1. Fossil Localities Reported within the Vicinity of the Project Site

Locality Number	Geologic Unit and Age	Common Name	Scientific Name	Location/Depth/ Proximity to Project
LACM IP 3280	Unknown formation (Eocene)	snail	*Amaurellina clarki*	North Gower Street, approximately 1 mile northeast of the Project Site. Unknown depth.
LACM VP 6297-6300	Older alluvium: pebble-gravel, sand, and clay (Pleistocene)	horse mastodon bison camel	*Equus* *Mammut americanum* *Bison* *Camelops*	Hollywood Boulevard between St. Andrews Place and Western Avenue, approximately 1.4 to 1.5 miles southeast of the Project Site. Discovered at a depth of 47 to 80 feet.
LACM IP 16840, 16841	Puente Formation (Miocene)	invertebrates	Invertebrata	MacArthur Park, approximately 4.5 miles southeast of the Project Site. Discovered at a depth of 60 feet.
LACM VP 5845	Unknown formation: unconsolidated yellow sediments (Pleistocene)	mastodon	Mammutidae	Intersection of Western Avenue and Council Street, approximately 2.5 miles southeast of the Project Site. Discovered at a depth of 5 to 6 feet.
LACM VP 3371	Unknown formation: green clay (Pleistocene)	bison	*Bison*	Intersection of Sierra Bonita Avenue and Oakwood Avenue, approximately 1.1 miles southwest of the Project Site. Discovered at a depth of 12 feet.
LACM VP 7673	Unknown formation: claystone (Pleistocene)	horse	*Equus*	Intersection of Rosewood Avenue and Westbourne Drive, approximately 3 miles southwest of the Project Site. Unknown depth.

6 Paleontological Impact Analysis

Impacts under CEQA are classified as direct, indirect, or cumulative. Direct impacts are the primary effects of a project. For paleontological resources, direct impacts are typically the result of ground-disturbing construction or maintenance activities that damage or destroy paleontological resources at the surface or in the subsurface. Indirect impacts are the secondary effects of a project, including project-induced changes such as increased public access to paleontologically sensitive areas and increased susceptibility of fossil-bearing geologic units to erosion due to activities like vegetation removal, which may result in adverse impacts to paleontological resources from illegal collection and damage from weathering, respectively. Cumulative impacts are the incremental effects of a project in combination with the effects of past, current, and probable future projects.

The City of Los Angeles CEQA Significance Thresholds Guide (2006) requires that the significance of impacts on paleontological resources be determined on a case-by-case basis, considering the following factors:

- Whether, or the degree to which, the project might result in the permanent loss of, or loss of access to, a paleontological resource; and
- Whether the paleontological resource is of regional or statewide significance.

The majority of proposed Project-related activities are shallow and anticipated to be entirely within unmapped artificial fill deposits in the upper 15 to 20 feet of the Project Site, which have a low potential to contain significant paleontological resources due to their disturbed nature. However, drilling for the installation of piles is expected to extend to depth of 25 feet into the underlying Pleistocene-age older alluvial sediments, which have a high paleontological potential since numerous vertebrate fossil-bearing localities have been recovered from Pleistocene-age sediments elsewhere in the vicinity of the Project Site and throughout Los Angeles County. Therefore, drilling activities have the potential to result in the permanent loss of scientifically important and regionally significant paleontological resources, including identifiable vertebrate fossils, uncommon invertebrate fossils, plant fossils, and trace fossils, which would represent a significant, adverse impact.

With implementation of regulatory compliance measures and standards, including City of Los Angeles Standard Specifications for Public Works Construction, Section 6-3.2, direct impacts on paleontological resources would be less than significant and the Project's potential to contribute to cumulative impacts would be negligible. Potential direct and cumulative impacts would be further reduced with implementation of the paleontological resource monitoring and treatment recommendations described in Section 7. Implementation of the Project would not increase public access or erosion; therefore, no indirect impacts to significant paleontological resources are anticipated.

7 Summary and Recommendations

Bargas completed a desktop-level paleontological study that included reviews of geologic maps and scientific literature, online locality database searches, and a records search at the NHMLA. No known paleontological resources were identified from within the Project Site or within a 1-mile buffer. However, seven paleontological localities were noted from Pleistocene-age deposits similar to those underlying the Project Site at a greater distance (Table 2). Paleontological potential rankings were assigned using the SVP classification for paleontological resource sensitivity (Table 1).

Based on the results of the geotechnical study (City of Los Angeles 2022), the upper 15 to 20 feet of sediments within the Project Site consist of unmapped artificial fill, which have a low potential to contain significant paleontological resources due to their disturbed nature. However, the artificial fill is underlain by Pleistocene-age older alluvial sediments, which have a high paleontological potential since numerous vertebrate fossil-bearing localities have been recovered from Pleistocene-age sediments elsewhere in the vicinity of the Project Site and throughout Los Angeles County. Therefore, the Project Site is

considered to have a low paleontological sensitivity from the surface to a depth of 15 feet and a high paleontological sensitivity at depths of 15 feet and greater.

The collected data indicate that there is a potential to encounter significant paleontological resources during drilling activities that extend to impact native Pleistocene-age deposits (i.e., drilling that exceeds a depth of 15 feet). Therefore, Bargas recommends that a Paleontological Resources Monitoring and Treatment Plan (PRMTP) be prepared and implemented prior to any Project ground disturbance. The plan should specify the levels and types of mitigation efforts during drilling activities, and should also include a description of the professional qualifications required of key staff, communication protocols to be followed during construction, unanticipated discovery protocols, fossil recovery protocols, sampling protocols for microfossils (if required), laboratory procedures, reporting requirements, and curation provisions for any collected fossil specimens.

Should you have any questions or comments regarding this study, please do not hesitate to contact me at (626) 899-3804 or crichards@bargasconsulting.com.

Sincerely,

Bargas Consulting

Attn: Courtney Richards

re: Paleontological resources for the Las Palmas Senior Citizen Center Project

Dear Courtney:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Las Palmas Senior Citizen Center project area as outlined on the portion of the Hollywood USGS topographic quadrangle map that you sent to me via e-mail on May 12, 2023. We do not have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that occur in the proposed project area, either at the surface or at depth.

The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).

Locality Number	Location	Formation	Taxa	Depth
LACM IP 3280	2443 N. Gower St	Unknown formation (Eocene)	*Amaurellina clarki* Stewart	unknown
LACM VP 6297-6300	Metro Rail Red Line Hollywood Blvd. subway tunnel, Hollywood Blvd from St. Andrews Place to Western Ave	Older alluvium (pebble-gravel; sand; sand & clay)	Horse (*Equus*), mastodon (*Mammut americanum*), bison (*Bison*), camel (*Camelops*)	47-80 feet bgs
LACM IP 16840, 16841	Wilshire Blvd in W MacArthur Park	Puente Formation	Invertebrates (unspecified)	60 feet bgs
LACM VP 5845	West side of Western Ave. just north of Council St	Unknown formation (Pleistocene, unconsolidated yellow sediments)	Mastodon (Mammutidae)	5-6 feet bgs
LACM VP 3371	Intersection of Sierra Bonita and Oakwood Ave	Unknown formation (Pleistocene; green clay)	Bison (*Bison*)	12 feet bgs (sewer replacement project)

LACM VP 7673	Intersection of Rosewood Ave. & Westbourne Dr	Undetermined (claystone; Pleistocene)	Horse (*Equus*)	Unrecorded (collected during Hollyhills Drain project)

VP, Vertebrate Paleontology; IP, Invertebrate Paleontology; bgs, below ground surface

This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As such, NHMLA recommends that a full paleontological assessment of the project area be conducted by a paleontologist meeting Bureau of Land Management or Society of Vertebrate Paleontology standards.

Sincerely,

Alyssa Bell, Ph.D.

1 INTRODUCTION

In accordance with the City of Los Angeles, Department of Recreation and Parks authorization, Ninyo & Moore has performed a hazardous building material survey in support of upcoming renovation activities of the Las Palmas Senior Center located at 1820 North Las Palmas Avenue in Los Angeles, California (the site; Figure 1). This report has been prepared in accordance with generally accepted environmental science and engineering practices. This report is based on conditions at the site at the time of the sampling activities and provides documentation of our findings and recommendations.

2 PURPOSE AND SCOPE OF SERVICES

The objective of the survey is to provide information about current conditions within the site structures regarding the potential presence of asbestos-containing materials (ACM) and lead containing surfaces (LCS) within the structures which will require removal prior to the planned demolition activities. For the purposes of this assessment, LCS refers to lead-based paint (LBP), as defined by the California Department of Public Health (CDPH) and United States Department of Housing and Urban Development (HUD).

The scope of services we performed is summarized below:

- Reviewed the previous asbestos survey report, 1999, Integrity, Comprehensive Asbestos Survey, Las Palmas Senior Citizen Center and Daycare, 1820 North Las Palmas Avenue, Hollywood, California, dated April.
- Reviewed the previous asbestos abatement monitoring and lead paint stabilization report, 2006, Integrity, Las Palmas Senior Citizens Center, 1820 North Las Palmas Avenue, Hollywood, California, dated October 16 (Integrity Abatement Report).
- Performed a visual reconnaissance of the structure to evaluate the possible presence of ACM and LCS.
- Collected 78 bulk samples and submitted these samples to an independent laboratory for analysis of asbestos content. Samples were analyzed in accordance with the United States Environmental Protection Agency (EPA) recommended method of Polarized Light Microscopy (PLM) in accordance with EPA Test Method 600/R-93/116 July 93.
- Collected 121 X-Ray fluorescence (XRF) readings (including calibrations) of potential LCS.
- Performed a visual assessment and quantification of miscellaneous hazardous materials which may be affected by the renovations limited to heating, ventilation, and air-conditioning (HVAC) and refrigeration systems (possible chlorofluorocarbon [CFC] gas).
- Prepared a field drawing showing suspect ACM and positive LCS sampling locations.
- Prepared this report, which presents our data and summarizes field activities, evaluated materials, and locations. This report includes a field drawn sample location map, a general area building description, laboratory testing information, laboratory test results, and conclusions and recommendations.

3 SITE BUILDING DESCRIPTION

The Senior Center and Day Care Center are single-story structures on a slab-on-grade concrete foundation with a breezeway between connecting the two buildings. Both structures encompass approximately 6,650-square feet (SF). The structures' footprints include offices, a community room, restrooms, clubrooms, storage rooms, a kitchenette, an electrical room, and a day care. The interior walls within each structure are finished with plaster. The ceilings are finished with nailed on ceiling tiles and some areas are finished with plaster. Flooring finishes include vinyl floor tile with some areas finished with ceramic tile. The exterior wall finishes include stucco and concrete masonry units. The roofing systems are finished with a built-up tar and gravel roofing and some areas are finished with rolled on asphalt roofing. The exterior shuffle board area consists of concrete and shade canopies.

4 FIELD LIMITATIONS

Survey activities were limited to the aboveground structures of the subject site within our scope. Underground utilities, such as suspect cementitious water lines or suspect insulated/coated gas or electrical lines, were not assessed during survey activities.

Physical limitations, such as inaccessible rooms or spaces, were generally not encountered during survey activities. Since non-destructive sampling techniques were used, there is a possibility that additional suspect materials and/or surfaces may be encountered in inaccessible areas (e.g., interstitial wall and ceiling spaces and canopy soffits) during building renovation and/or demolition activities. For instance, untested thermal system insulation may be present within wall and ceiling cavities and/or behind plumbing and heating fixtures (e.g., sinks, boilers, and radiators). Suspect materials and/or surfaces encountered during building renovation and/or demolition activities that have not been assessed either may be assumed to be asbestos- and/or lead-containing and handled accordingly, or may be sampled and analyzed to assess whether they are asbestos- and/or lead-containing.

5 ASBESTOS SURVEY

The asbestos survey was performed on March 1, 2023, by Mr. David Kelly, a California Department of Occupational Safety and Health (DOSH) Certified Site Surveillance Technician (No. 17-6144) and a DOSH Certified Asbestos Consultant (CAC) (No. 23-7217). The work was performed under the supervision of Mr. William P. Larkin, a DOSH CAC (No. 99-2688). Consultant certificates are presented in Appendix A.

5.1 Asbestos Inspection, Sampling, and Quantification

The survey inspection and sampling procedures were performed in accordance with the guidelines published by the EPA in 40 Code of Federal Regulations (CFR) Part 763 Subpart E, October 30, 1987 (Asbestos Hazard Emergency Response Act [AHERA]); the EPA guidance document "Asbestos in Buildings: Simplified Sampling Scheme for Friable Surfacing Materials (EPA 560/5-85-030a, October 1985); the National Emission Standards for Hazardous Air Pollutants (NESHAP; 40 CFR Part 61, subpart M); and the South Coast Air Quality Management District (SCAQMD) Rule 1403.

The survey consisted of three parts including: visual inspection, sampling, and quantification of the building materials.

5.1.1 Visual Inspection

Initial observations were made throughout the structures to evaluate the presence and condition of accessible suspect materials. Materials which were similar in general appearance were grouped into homogeneous sampling areas (areas in which the materials are uniform in color, texture, construction, or application date), as recommended by the EPA. Each homogeneous area was observed for material type, location, condition, and friability.

The definition of friability is any material containing more than one percent asbestos that, when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. The EPA's NESHAP regulation has different material categories for ACMs. These categories are used when demolition or renovation projects are being conducted. Each identified suspect homogeneous material was placed in one of the following EPA categories:

- **Category I Non-friable** - NESHAP defines a Category I non-friable ACM as packing, gaskets, resilient floor covering (except sheet flooring products which are considered friable), and asphalt roofing products which contain more than one percent asbestos.
- **Category II Non-friable** - NESHAP defines a Category II non-friable ACM as any material, except for Category I non-friable ACM, which contains more than one percent asbestos and cannot be reduced to a powder by hand pressure when dry.
- **Regulated Asbestos Containing Material (RACM)** - is (a) friable asbestos material, (b) Category I nonfriable ACM that has become friable, (c) Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting or abrading, or (d) Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations.

In accordance with the EPA and AHERA, suspect materials were placed in one of three classifications:

- **Surfacing Materials** - materials generally applied via sprayed or trowel methods,

- **Thermal Systems Insulation (TSI)** - materials generally applied to various mechanical systems, or
- **Miscellaneous Materials** - any materials which do not fit in the Surfacing or TSI classifications.

If asbestos is identified in a sample from a homogeneous area, the entire homogeneous area is considered to contain asbestos.

Representative samples were collected from each homogeneous area within the survey area, except areas that were inaccessible, or areas of assumed ACM, within the limitations of the survey.

5.1.2 Sampling Procedures

Following an initial walkthrough, the inspector collected selected samples of accessible materials identified as suspect ACM. EPA, AHERA, NESHAP, and SCAQMD guidelines were used to determine the sampling protocol. Sampling locations were chosen to be representative of the homogeneous material. Samples of surfacing material were collected in general accordance with the EPA sampling protocol outlined in EPA 560/5-85-030a, October 1985. Representative samples were collected from already damaged areas or areas which were the least visible. Samples of miscellaneous materials were collected as randomly as possible, while attempting to sample already damaged areas so as to minimize disturbance of the material. Generally, one to three samples of each homogeneous material were collected of miscellaneous materials and TSI, if present.

5.1.3 Quantification

Quantities of accessible and/or exposed building materials that were suspected of containing asbestos were estimated by taking approximate measurements in the field. Quantities are presented in SF or linear feet to be used as a guide for contractor estimates on bidding for abatement activities. It is the abatement contractor's responsibility to confirm quantities prior to bidding and removal.

5.2 Asbestos Laboratory Analysis Procedures

Analysis was performed by Eurofins Built Environment Testing (Eurofins), located at 2841 Dow Avenue, Suite 300 in Tustin, California (Phone Number 866-888-6653). Eurofins is a National Volunteer Laboratory Accreditation Program (NVLAP) accredited laboratory (NVLAP No. 200757-0). A chain-of-custody, documenting the possession of the samples from the time they were collected until analyzed and stored, was submitted with the bulk samples. The original chain-

of-custody accompanied the materials at all times. Custody documentation began at the time samples were collected and each transferor retained a copy of the chain-of-custody record.

Analysis was performed by using the bulk sample for visual observation and slide preparation(s) for microscopic examination and identification. The samples were mounted on slides and then analyzed for asbestos (chrysotile, amosite, crocidolite, anthophyllite, and actinolite/tremolite), fibrous non-asbestos constituents (mineral wool, paper, etc.), and non-fibrous constituents. Refractive indices, morphology, color, pleochroism, birefringence, extinction characteristics, and signs of elongation identified asbestos. The same characteristics were used to identify the non-asbestos constituents.

The microscopist visually estimated relative amounts of each constituent by determining the volume of each constituent in proportion to the total volume of the sample, using a stereoscope. The bulk samples were analyzed by PLM with dispersion staining as described by the method of the determination of asbestos in bulk insulation, EPA/600/R-93/116, July 1993. This is a standard method of analysis in optical mineralogy and the currently accepted method for the determination of asbestos in bulk samples. A suspect material is immersed in a solution of known refractive index and subjected to illumination by polarized light. The characteristic color displays which result enable mineral identification.

6 LCS SURVEY

The LCS survey was performed on March 1, 2023, by Mr. David Kelly, a CDPH Lead-Related Construction (LRC) Sampling Technician (No. 2285). Work was performed under the supervision of Mr. William P. Larkin, a CDPH LRC Inspector/Assessor (No. 1285). Consultant certificates are presented in Appendix A

The survey was conducted using a portable Sci-Aps X-550 Pb XRF analyzer in accordance with accepted environmental science and engineering practices. The protocol used for selecting components and sampling locations was that contained in the federal HUD “Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing” (Chapter 7 “Lead-Based Paint Inspection”), except the inspection was limited to accessible materials and, once a pattern was recognized for the component results, fewer readings for each component were collected.

The XRF analyzer used for the testing is a direct-reading instrument that determines the concentration of lead in painted surfaces by subjecting the surfaces to energy from a small radioactive source. When the instrument is placed against a surface, the energy from the XRF causes the surface to emit X-Rays that are indicative of the chemical make-up of the surface coating(s), which the XRF then analyzes. The instrument was calibrated to the manufacturer’s

specifications and the calibration was checked, at least every four hours and at the beginning and completion of each set of readings, against known lead sample standards produced by the National Institute of Standards and Testing. The XRF instrument measures lead in units of milligrams per square centimeter (mg/cm^2). A total of 121 XRF readings were collected (including calibration checks) over the course of the survey activities.

The CDPH requires that, after a lead evaluation is performed, a copy of CDPH form 8552 "Lead Hazard Evaluation Report" should be submitted. Ninyo & Moore has faxed this form to the CDPH and a copy is included in Appendix B.

7 INVENTORY OF UNIVERSAL WASTES

A visual evaluation of the structures was performed to quantify miscellaneous hazardous building materials. This included, but was not limited to, potential mercury-containing thermostats, switches, and fluorescent light tubes; items potentially containing polychlorinated biphenyls; potential tritium or battery-containing exit signs; and potential CFC-containing refrigeration systems within HVAC units.

8 SURVEY RESULTS

The following sections describe the survey and inventory results.

8.1 Asbestos Survey

A total of 78 samples of suspect ACM were collected and transferred under chain-of-custody procedures to Eurofins for analysis. The lower limit of reliable detection for asbestos using the PLM method is approximately 1 percent by volume. In the state of California, DOSH regulations define asbestos-containing construction materials (ACCM) if one sample from a homogeneous area contains asbestos content of greater than one tenth of 1 percent (>0.1 percent) which is confirmed by PLM point count analysis (PLM 400- or 1000-point count analysis). Materials in which no asbestos was detected are defined in the laboratory report as "None detected." Materials containing asbestos, but in amounts less than 1 percent, are defined as containing "trace" amounts and are considered to be ACM without PLM point count analysis. Inaccessible suspect ACM that are suspect of being ACM or ACCM, which were inaccessible are noted to be assumed asbestos-containing.

8.2 Asbestos Results Summary

Based on observations and the analytical results of bulk samples collected during the limited survey, ACM was detected at the subject property. The building materials which were sampled

and found to be ACM are summarized in Table 1. The building materials which were sampled and found to be non-asbestos-containing are summarized in Table 2. A copy of the laboratory analytical report and chain-of-custody records are presented in Appendix B. General photographic documentation of the structures and areas sampled are presented in Appendix C. The sample locations are shown on the field drawing presented in Appendix D.

Table 1 – Positive Asbestos Survey Results

Sample No. from COC	HA No.	Material	Location	ACM Category	Condition	Approximate Quantity/ Asbestos Content	Photograph No.
7 – 9	2	Roof Penetration Mastic	Roof	NESHAP Category II non-friable	G	600 SF Gray/black mastic: 5% CH Black mastic: ND	2-3
37 – 41	11 & 12	12" x 12" Beige VFT with yellow mastic over gray VFT with black mastic	Senior Center floors	NESHAP Category II non-friable	G	5,000 SF Beige VFT: ND Yellow mastic: ND Gray VFT: 3% CH Black mastic: 5% CH	4-5
NA	NA	Fire doors	Senior Center mechanical/ electrical room	NESHAP Category II non-friable	G	2 EA Assumed	6
NA	NA	Mirror mastic	Daycare restroom	NESHAP Category II non-friable	G	4 SF Assumed	7

Notes:
ACM – asbestos-containing material
CH - chrysotile
COC – chain of custody
G – good
HA – homogeneous
NA – not applicable
ND – none detected
No. – number
NESHAP – National Emission Standards for Hazardous Air Pollutants
SF – square feet
VFT – vinyl floor tile
& - and
" – inches

I, William Larkin, (CAC No. 99-2688) assume that the fire doors and the mirror mastic found at the site is ACM and is subject to SCAQMD Rule 1403.

Please note that quantities of ACMs are approximate. It is the abatement contractor's responsibility to confirm quantities prior to bidding and removal activities.

Table 2 – Non-Asbestos-Containing Materials Sampled

Sample No. from COC	HA No.	Sample Material Descriptions	Material Location
1 – 3	1	Tar and gravel roof core	Roof
4 – 6	2	Asphalt roof core	Roof
10 – 12	4	Gray sealant	HVAC ducting
13 – 19	5	12"x12" Ceiling tile (Nailed-on)	Senior Center ceilings
20 – 24	6	Plaster with skim coat	Senior Center and Daycare walls & ceilings
25 – 29	7	Plaster with texture	Senior Center electrical room, storage rooms 1 & 2, and Daycare office walls & ceilings

Table 2 – Non-Asbestos-Containing Materials Sampled			
Sample No. from COC	HA No.	Sample Material Descriptions	Material Location
30	8	Red fire stop	Senior Center electrical room conduit penetration
31 – 33	9	4" Black cove base with brown/beige mastic	Senior Center walls/floors
34 – 36	10	4" Brown cove base with black mastic	Senior Center kitchenette & entry walls/floors
42 – 45	13	12" x 12" Beige VFT with yellow mastic over blue 7 white VFT with yellow mastic	Senior Center kitchenette floor
46 – 48	14	4" white cove base with transparent mastic	Daycare walls/floors
49 – 51	15	12" x 12" green VFT with transparent mastic	Daycare restroom floor
52 – 54	16	12" x 12" blue/red VFT with yellow mastic	Daycare floor
55 – 57	17	White caulking	Throughout restrooms sinks, toilets, & urinals
58 – 60	18	Grout & thin set	Throughout restrooms walls & floors
61 – 63	19	CMU with mortar	Throughout perimeter walls
64 – 66	20	Stucco	Throughout exterior walls
67 – 69	21	Concrete	Shuffle board floor
70 – 72	22	Concrete	Exterior sidewalks & fence posts
73 – 75	23	Corrugated roof panels	Shuffle board canopy roof
76 – 78	24	Asphalt pavement	Parking lot

Notes:
COC – chain of custody
CMU – concrete masonry unit
HA – homogeneous
HVAC – heating, ventilation, and air conditioning
No. – number
VFT – vinyl floor tile
& – and
" – inches

8.3 Lead-Containing Surfaces Summary

Federal efforts to regulate LBP began with the LBP Poison Prevention Act in 1971. In 1973, the Consumer Product Safety Commission (CPSC) defined LBP as paint having lead content equal to or greater than 0.5 percent by weight (1.0 mg/cm^2 by XRF) in a dry film of newly applied paint. In 1978, the CPSC lowered the allowable lead levels in new paint to 0.06 percent which is considered lead containing paint. HUD developed guidelines relating to HUD facilities that specified lead content of 0.5 percent as an action level in determining the need for corrective action. However, a more stringent level is established by Los Angeles County Department of Health Services which defines "dangerous levels of lead-bearing substances" as paint or other surface coating with lead greater than 0.7 mg/cm^2 (Los Angeles County Code, Title 11, Chapter 11.28, Section 11.28.010 C). Federal and State DOSH do not define the amount of lead in paint to a regulatory requirement, rather the activities, or task, define when the regulation is in effect. Both Federal and State standards use the term "trigger task" activities. In the work place,

employers must make certain assumptions of the exposure levels and comply with regulations based on the level of disturbance rather than the lead level.

A total of 121 XRF readings were collected from the representative testing combinations (e.g., unique combination of room equivalent, building component, substrate, and color) within the planned renovations and demolition of the structures. LCS was detected within the planned renovation areas at the site. In addition, some building components were reported to have detectable amounts of lead and are subject to DOSH Lead in Construction Standard, Title 8 California Code of Regulations (CCR) 1532.1. The LCS building components are presented in Table 3. Photographic documentation is presented in Appendix C. A summary of all XRF readings is presented within Appendix E.

Table 3 – Lead Results Summary

Room/Area	Component	Substrate	Condition	Color	Result (mg/cm^2)	Approximate Quantity	Photograph No.
Exterior	Curb	Concrete	Intact	Yellow	3.1, 2.6	200 LF	8
Club room	Sink	Porcelain	Intact	White	7.5	1 EA	9
Women's restroom	Wall tile	Ceramic	Intact	Pink	6.8	300 SF	10
Men's and Child care center restrooms	Wall tile	Ceramic	Intact	White	6.5	340 SF	11-12

Notes
EA – each
LF – linear feet
mg/cm^2 – milligram per square centimeter
No.– number
SF – square feet

8.4 Universal Wastes Inventory

Universal wastes were found within the structures. The descriptions and locations of universal wastes found to be present are summarized in Table 4.

Table 4 – Universal Waste Inventory

Hazardous Material Location	Hazardous Material Description	Estimated Quantity
Senior Center auditorium	Fluorescent Light Ballasts	12 EA
Senior Center auditorium	Fluorescent Light Bulbs	24 EA
Senior Center auditorium	Halogen bulbs	4 EA
Throughout	Exit signs (metal halide & mercury vapor)	11 EA
Throughout	LED lighting with ballast	50 EA
Senior Center by storage room storage room 2	Mercury thermostat bulbs	2 EA
Throughout	Fire extinguishers	4 EA
Throughout	Refrigerators	2 EA
Exterior benches and shuffle board canopy	Pressure treated lumber	300 LF
Roof	HVAC units	10 EA

Notes:
EA – each
HVAC – heating, ventilation, and air-conditioning
LED – light emitting diode
LF – linear feet

9 RECOMMENDATIONS

The following recommendations are provided.

9.1 Asbestos

- The identified ACM in Table 1 should not be disturbed by unauthorized personnel. Prior to renovation activities which would disturb identified ACM, a licensed abatement removal contractor should remove the ACM. The licensed abatement contractor must maintain current licenses as required by applicable state or local jurisdictions for the removal, transporting, disposal, or other regulated activities.

- Based on the referenced Integrity Abatement report, asbestos abatement was previously performed within the Kitchenette area of the Senior Center. With the current sampling activities and findings, it is recommended that the vinyl flooring materials within the Kitchenette to be removed within a containment in order to determine the extent of where the ACM vinyl floor tile and black mastic ends.

- Applicable laws and regulations should be followed, including those provisions requiring notification to regulatory agencies, building occupants, demolition contractors, and workers of the presence of asbestos.

- Asbestos abatement monitoring consulting services should be performed by a third-party environmental consultant, to include oversight of abatement contractor activities to be performed in accordance with the abatement specifications, daily air monitoring, clearances, verification of complete removal of hazardous materials, and preparation of a closeout report summarizing the abatement activities.

9.2 Lead

- The identified LCS within Table 3 should not be disturbed by unauthorized personnel. All disturbances and removal activities should be performed by a licensed abatement contractor with certified lead personnel. All lead related removal activities should be performed in accordance with the DOSH Lead in Construction Standard, Title 8 CCR 1532.1.

- Proper LCS waste stream categorization is required for lead components which will be removed. Prior to disposal, a composite sample of the representative LCS material should be analyzed for total lead for comparison with the Total Threshold Limit Concentration in accordance with EPA reference method SW-846. If the concentration of total lead is greater than or equal to 1,000 milligrams per kilogram (mg/kg), the LCS waste material must be disposed at a landfill which can receive such wastes. If the concentration is less than 50 mg/kg the sample may be disposed as construction debris, if it is to remain in California. If the total lead result is greater than or equal to 50 mg/kg and less than 1,000 mg/kg, the sample must be further analyzed for soluble lead by the Waste Extraction Test for comparison with the Soluble Threshold Limit Concentration as described in Title 22 CCR 66261.24a. Additionally, if the result is greater than or equal to 100 mg/kg the sample must be further analyzed for leachable lead by the Toxicity Characteristic Leaching Procedure for comparison with the Resource Conservation and Recovery Act (RCRA) limits. Based on the results of the soluble and leachable analysis the waste material may require disposal as a RCRA-Hazardous waste or non-RCRA- (California-) Hazardous waste.

9.3 Universal Wastes

Universal wastes discussed in this report (Table 4), should be removed and properly recycled or disposed by the contractor during renovation activities. Contractor should provide proper manifesting for all hazardous materials removed and recycled to prove the disposal of all materials was completed in accordance with local, state, and federal requirements.

10 LIMITATIONS

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited sampling and chemical analysis. Further assessment of potential adverse environmental impacts may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated. However, if additional suspect ACMs or LCS are encountered during renovation activities, these materials should be sampled by qualified personnel, and analyzed for content prior to further disturbance. In addition, please note that quantities of ACMs are approximate. These numbers should be confirmed prior to removal or repair activities.

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. It should be understood that the conditions of a site can change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

Dear Certified Asbestos Consultant or Technician:

Enclosed is your certification card. **To maintain your certification, you must abide by the rules printed on the back of the certification card.**

Your certification is valid for a period of one year. If you wish to renew your certification, you must apply for renewal at least 60 days before the expiration date shown on your card. [8 CCR 341.15(h)(1)].

Please hold and do not send copies of your required AHERA refresher renewal certificates to our office until you apply for renewal of your certification.

Certificates must be kept current if you are actively working as a CAC or CSST. The grace period is only for those who are not actively working as an asbestos consultant or site surveillance technician.

Please contact our office at the above address or email w any changes in your contact/mailing information within 15 days of the change.

Sincerely,

Kevin Graulich
Principal Safety Engineer

Location: 4, Roof HVAC Island, Asphalt Roof Core

Lab ID-Version‡: 15414359-1

Sample Layers	Asbestos Content
Black Asphalt	ND
Composite Non-Asbestos Content:	40% Glass Fibers 35% Cellulose
Sample Composite Homogeneity:	Moderate

The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by any agency of the federal government. The Company reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed. Floor tile samples may contain large amounts of interference material and it is recommended that the sample be analyzed by gravimetric point count analysis to lower the detection limit and to aid in asbestos identification.
‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

Sample Layers	Asbestos Content
Green Floor Tile	ND
Transparent Mastic	ND
Sample Composite Homogeneity:	Good

Location: 50, Daycare Restroom Floor, Green VFT w/ Mastic Lab ID-Version‡: 15414405-1

Sample Layers	Asbestos Content
Green Floor Tile	ND
Transparent Mastic	ND
Sample Composite Homogeneity:	Good

Location: 51, Daycare Restroom Floor, Green VFT w/ Mastic Lab ID-Version‡: 15414406-1

Sample Layers	Asbestos Content
Beige Floor Tile	ND
Yellow Mastic	ND
Sample Composite Homogeneity:	Good

Location: 52, Daycare Floor, Blue VFT w/ Mastic (Mixed w/ Red VFT) Lab ID-Version‡: 15414407-1

Sample Layers	Asbestos Content
Blue Floor Tile	ND
Yellow Mastic	ND
Sample Composite Homogeneity:	Good

The test report shall not be reproduced except in full, without written approval of the laboratory. The report must not be used by the client to claim product certification, approval, or endorsement by any agency of the federal government. The Company reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified.

Inhomogeneous samples are separated into homogeneous subsamples and analyzed individually. ND means no fibers were detected. When detected, the minimum detection and reporting limit is less than 1% unless point counting is performed. Floor tile samples may contain large amounts of interference material and it is recommended that the sample be analyzed by gravimetric point count analysis to lower the detection limit and to aid in asbestos identification.
‡ A "Version" indicated by -"x" after the Lab ID# with a value greater than 1 indicates a sample with amended data. The revision number is reflected by the value of "x".

1. INTRODUCTION

Ninyo & Moore has prepared this Operations and Maintenance (O&M) Program for the existing lead-containing building components (LCBC) that are set to remain in place at the Las Palmas Senior Center located at 1820 North Las Palmas Avenue in Los Angeles, California (site; Figure 1).

The LCBC planned to remain in place on the structure and managed by this O&M Program are described in the Table 1 below. General photographic documentation of these components is provided in Appendix A.

Table 1 – Lead Containing Building Components Planned for Surveillance

Room Area	Component	Substrate	Color	Approximate Quantity	Photograph No.
Exterior	Curb	Concrete	Yellow	200 LF	2
Club room	Sink	Porcelain	White	1 EA	3
Women's restroom	Wall tile	Ceramic	Pink	300 SF	4
Men's and Child care center restrooms	Wall tile	Ceramic	White	340 SF	5-6

Notes:
EA – each
LF – linear feet
SF – square feet

This document has been prepared to assist in preventing potential exposures to lead. This plan is designed to be implemented and maintained by the Port of Long Beach with the assistance of a California Department of Public Health (CDPH) Lead Related Construction (LRC) Inspector/Assessor and Project Monitor (I/A & PM). It should be noted that this O&M Program is meant to be interactive in nature, and may be modified during implementation and operation.

2. THE PURPOSE AND ELEMENTS OF THE PROGRAM

The purpose of this Lead O&M Program is to minimize exposure of building occupants and employees to lead dust and debris which may occur from the LCBC within the structure. This program is designed to maintain LCBC in an intact condition, minimize future release of lead dust or debris by controlling access to LCBC, and utilize proper work practices around LCBC. The mere presence of LCBC in a building does not mean that the health of building occupants is endangered. Lead dust presents a potential lead hazard when lead paint gets old (deterioration) or damaged and releases small particles or dust. LCBC in an intact condition, which are not damaged or disturbed, are unlikely to release lead dust into the air. For this reason, this program has been designed to minimize the potential for future disturbance of LCBC.

As a rule, the degree of hazard that exists in a particular building depends on a number of factors, one of the most important being the nature of the lead products present. Lead paint in poor

condition, is typically the main source of lead debris or lead dust in the occupied spaces. LCBC in which the lead is firmly bonded or encased in another material generally pose very little hazard after installation; however, the sanding, grinding, or cutting of these materials, may release lead dust.

The specific elements of this Lead O&M Program include:

1. The Notification Practices and Procedures to inform workers and other building occupants where LCBC are present, and how and why to avoid disturbing the LCBC. Persons affected should be properly informed in writing.
2. Surveillance program
3. Work Controls and Permit System
4. Engineering and Work Practices Program
5. Recordkeeping System
6. Worker Protection Program
7. The Training Program for the assigned O&M Program Manager, maintenance personnel and building occupants.

3. LEAD CHARACTERISTICS AND HEALTH EFFECTS

Lead is a bluish-white lustrous metal. It is very soft, highly malleable, ductile, and is a relatively poor conductor of electricity. It is very resistant to corrosion but tarnishes upon exposure to air. Lead and lead compounds have been used in a wide variety of products used in building construction including paint, ceramics, pipes and plumbing materials, solders, gasoline, batteries, ammunition and cosmetics.

Lead can be aspirated (breathed in), swallowed or absorbed through the skin. Once in the body, lead is absorbed and stored in our bones, blood and tissues. It does not stay there permanently, rather it is stored there as a source of continual internal exposure. As we age, our bones demineralize and the internal exposures may increase as a result of larger releases of lead from the bone tissue.

When a person is exposed to very high levels of lead over a short period of time or relatively low levels over long periods of time, health effects can include:

- Abdominal pain;
- Constipation;
- Tiredness;
- Headache;

- Irritability or depression;
- Loss of appetite;
- Memory loss;
- Pain or tingling in the hands and/or feet;
- Weakness.

Because these symptoms may occur slowly or may be caused by other things, lead poisoning can be easily overlooked. Exposure to high levels of lead may cause anemia, weakness and kidney and brain damage. Very high lead exposure can cause death.

4. LEAD O&M PROGRAM RESPONSIBILITIES

4.1 Lead Program Manager Responsibilities

The responsibility of implementing and maintaining the O&M Program should be undertaken by an assigned Lead Program Manager. This position may be held by a building engineer, superintendent, or manager of the building. The Lead Program Manager is not required to have any special qualifications but should at least have lead awareness training, as the plan is written to require work on the LCBC be done only by lead-certified contractors, and there are assumed to be no LCBC which might be especially difficult to manage.

Responsibilities of the Lead Program Manager include, but are not limited to, the following:

- Notifying building occupants regarding the presence and location of LCBC at the site and the implementation of an O&M Program;
- Responding to inquiries from building occupants, and contractors regarding LCBC at the site;
- Ensuring that outside contractors who may come in contact with lead in the building is provided with information regarding the location of the LCBC;
- Ensuring that all custodial and maintenance personnel are properly trained;
- Ensuring warning labels are properly posted at appropriate locations;
- Coordinating periodic surveillance and re-inspection activities;
- Coordinating lead removal, repair, and maintenance operations as required;
- Ensuring that no additional lead-containing building materials are inadvertently installed in the buildings;
- Maintaining records relating to all lead activities including training, periodic surveillance, air monitoring, and response actions.

4.2 Lead Employee/Worker Responsibilities

If it is determined that lead worker training is needed for certain maintenance personnel, each employee must have basic knowledge of the hazards associated with lead. Each employee is responsible for wearing assigned personal protective equipment; following good personal hygiene practices; and adhering to all work practices established for each specific job. Lead awareness training should be provided to maintenance personnel and key building occupants.

4.3 Building Occupant/Responsibilities

Building occupants are also responsible for complying with the elements of the O&M Program. Building occupants should be aware of where the LCBC is located, and ensure that they do not disturb the LCBC. Prior to allowing potential contractors into the structure to perform work, the Lead Program Manager should review Table 1 to determine if LCBC are planned for potential disturbance as part of the contractors planned work. The Lead Program Manager should notify the contractors who work in the buildings that a lead O&M Program is in place. Questions from contractors regarding LCBC should be directed to the Lead Program Manager.

In the event building occupants, contractors, maintenance, or service personnel encounter any material they suspect may contain lead which will be disturbed (and are not sure if the material is lead), they should immediately stop their activity and notify the Lead Program Manager for further instructions and review of Table 1 of this O&M document. The Lead Program Manager will be responsible for the final determination of whether the suspect material contains lead (based on the Table 1 of this O&M document), and what further actions are required before work can be continued.

5. NOTIFICATION PRACTICES AND PROCEDURES

Notification is a key element of the O&M Program. Building occupants in areas where a renovation and/or repair project is planned that will involve the disturbance of LCBC will be notified in advance of work of the potential hazards and the precautions that will be taken.

There are several important California Division of Occupational Safety and Health Administration (CAL-OSHA) regulations that are designed to protect workers. They are summarized here, as guidance. CAL-OSHA has specific requirements concerning worker protection and procedures used to control LCBC specified in 8 CCR Title 1532.1 (California Lead in Construction Standard).

- For most O&M activities in the building, where the LCBC are in an intact condition, applicable CAL-OSHA permissible exposure limits are not likely to be exceeded. However, it is possible that some O&M activities will disturb some LCBC (which may be in a damaged condition) to such an extent that the OSHA limits are exceeded, unless good work practices are followed.

- The OSHA standards require employers to address a number of items which are triggered by exposure of employees to lead dust. Exposure is discussed in terms of micrograms per cubic meter (µg/m^3) of air. Two main provisions of the regulation are applicable to airborne lead dust. They are:

    - Permissible Exposure Limit (PEL) - Eight-hour Time-Weighted Average limit (TWA) – 50 µg/m^3 of air based on an eight-hour TWA sampling period. This is the maximum level of airborne lead, on average, that any employee may be exposed to over an eight-hour period (normal work shift).

    - Action Level – Eight-hour TWA – 30 µg/m^3 of air based on an eight-hour TWA sampling period. Exceeding this level requires the employer to begin specific compliance activities including blood lead testing for exposed workers.

California licensed lead abatement contractors are familiar with the applicable laws and regulations and should be utilized as required and as outlined in the following sections of this O&M Program.

Labeling of all LCBC within the building is typically not possible, nor is it typically required under an O&M Program. However, LCBC located in routine maintenance areas (i.e., mechanical rooms, etc.) should be labeled. The warning labels should be posted on or near LCBC and be readily visible.

All outside licensed abatement contractors and/or certified renovators involved with a renovation and/or repair project that involves the disturbance of LCBC within the facility, must post signs at the entrance and the perimeter of the regulated area of the project. All signs and postings of the project must be in accordance with the CAL-OSHA standards and all other applicable regulations. The following warning signs are required in each regulated area or work area where an employee's exposure to lead is above the PEL:

WARNING
LEAD WORK AREA
MAY DAMAGE FERTILITY OR THE UNBORN CHILD
CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM
DO NOT EAT, DRINK OR SMOKE IN THIS AREA

The following notification shall be given to all existing building occupants, new occupants, present maintenance and management personnel, newly hired or new to the building maintenance and management personnel, and contractors or utility company personnel who need to work on the building. The signed forms shall be maintained in the permanent lead program files by the Lead Program Manager.

LEAD NOTIFICATION

LCBC are present in the building due to the building construction date. LCBC only present a health hazard when lead dust (often not visible to the naked eye) is inhaled or swallowed. The mere presence of LCBC does not represent a health hazard.

DO NOT disturb LCBC! This includes cutting, sawing, sanding, or breaking painted surfaces within the building.

Please report any disturbance or damage of the LCBC which are present, any dust or debris that might have come from the LCBC, any change in the condition of the LCBC or any improper action with LCBC to the Lead Program Manager.

Maintenance and other personnel are taking special precautions during their work to properly clean up any lead debris (if present) and to guard against disturbing LCBC. All LCBC are inspected periodically and additional measures have been and will be taken if needed to protect the health of building occupants.

I have read and understand the above:

Date: _____

Name: _____ Signature: _____

Note: This notification is included within Appendix B.

6. THE SURVEILLANCE PROGRAM

Periodic surveillance is recommended from the date the O&M Program begins. Identified LCBS should be inspected annually or whenever personnel access an area for maintenance purposes in an area with LCS. This periodic inspection should be conducted by the Lead Program Manager or other individual with the proper training. The purpose of the periodic surveillance is to ensure that changes in material condition are documented. If maintenance personnel note a change, the change will be documented.

A LCBC log form or adequately backed-up computer file noting the LCBC, the location within the building of LCBC, and the date of the last inspection shall be maintained and updated accordingly or as changes are made or discovered by the Lead Program Manager. An example form is provided in Appendix C.

A CDPH LRC I/A & PM may initially be retained to assist with implementation of this O&M Program. A CDPH LRC I/A & PM may also subsequently be hired to reassess the condition of the LCBC and to make any recommendations for immediate actions or changes to the O&M Program.

The Lead Program Manager shall inform the maintenance personnel that they are to promptly report any damage, deterioration or disturbance of building materials and suspected LCBC which they see during the course of their normal duties. Newly hired personnel shall be asked to read and sign the above Lead notification form and shall be briefed by the Lead Program Manager on the program and their duties and responsibilities with regard to the LCBC.

7. THE WORK CONTROLS AND PERMIT SYSTEM

The work control and permit system are designed to avoid inadvertent and/or improper disturbance of LCBC during the course of any maintenance or repair work on the site. One goal of the system is to avoid introducing substantial delays or high added costs to the O&M of the site.

In most cases, a semi-formal permit system is appropriate. However, the Lead Program Manager, must first be contacted whenever any maintenance or repair work occurs. It is important that all persons on the management and maintenance staff understand that this is now required. It would be appropriate to write this requirement into the job descriptions and the performance reviews of the employees.

Whenever maintenance personnel plan a maintenance or repair project, they must first contact the Lead Program Manager to indicate the location and nature of the work to be performed. If any substantial change occurs in the work once it is underway, the Lead Program Manager should again be contacted. This also applies to work to be done by outside contractors or utility company personnel.

After the maintenance person(s) indicate to the Lead Program Manager the type and location of the work, the Lead Program Manager shall review this plan to determine if LCBC are present in the area where the work will occur. Example forms to utilize for this communication to the Lead Program Manager and the Lead Program Manager response are included in Appendix C:

- If there are no LCBC the Lead Program Manager shall convey that information to the maintenance or repair person(s) and the work may proceed. If it is unknown if lead is present, sampling of building materials to be disturbed and laboratory analysis for lead should occur prior to disturbance.

- If there are LCBC, but it is not anticipated that the LCBC will be disturbed, the Lead Program Manager shall inform the maintenance or repair person(s) of the presence of the LCBC and the importance of not disturbing it.

- If there are LCBC and it is anticipated that they will be disturbed, the Lead Program Manager shall contact one or more licensed lead contractors to obtain prices for their services to assist in the work, such as utilizing High Efficiency Particulate Air-vacuum equipped tools and/or other lead control measures including the construction of negative pressure enclosures. For substantial work, an environmental consulting company with CDPH LRC I/A & PMs should be hired to develop specifications/work plan documents, assist with the evaluation of bids, oversee (monitor) the work activities of a licensed lead contractor, perform air monitoring, and air clearances for re-occupancy. An abatement closeout report should be prepared summarizing the abatement activities. All records from any such work should be placed in the permanent lead record files.

The job descriptions of the maintenance persons and the Lead Program Manager shall be updated to reflect their responsibilities in dealing with lead issues.

8. THE ENGINEERING AND WORK PRACTICES PROGRAM

Based upon the types of LCBC and the cost of medical surveillance, respiratory protection programs, and insurance, it is recommended that most work with lead be performed by licensed lead contractors with trained personnel. It is important that the Lead Program Manager, maintenance personnel, and outside contractors who will work on the buildings understand that they are not to work with or disturb the LCBC. CAL-OSHA regulations require a respiratory protection program (and medical surveillance program) and protective clothing whenever workers are exposed or are likely to be exposed to lead above the current action level of 30 µg/m^3 on an 8-hour time-weighted average.

As long as LCBC remain in a building there is potential for a release of lead-contaminated dust. These release episodes can occur during maintenance and renovation projects, or from the disturbance of materials by untrained personnel. Tenants, custodians, outside contractors and/or maintenance workers should immediately report any evidence of possible lead dust release to the Lead Program Manager. Even minor release episodes must be treated seriously and proper procedures should be followed. Upon discovery of the release, access to the area should be restricted, and the Lead Program Manager should be contacted immediately. Under no circumstances should untrained building tenants, maintenance or custodial personnel, or outside contractors cleanup lead-containing debris. Conventional cleaning, such as sweeping with dry brooms, dusting with dry cloths, and vacuuming with standard vacuum cleaners may simply suspend lead fibers in the air. Cleaning of lead-containing debris should be conducted by properly trained and licensed personnel who are equipped with proper respiratory protection.

9. THE RECORD KEEPING SYSTEM

Accurate records will be established and maintained for the program including medical and exposure records, locations of identified LCBC and incident reports. Affected employees, former

employees, and their designated representatives can obtain access to exposure records by providing a written request to Port of Long Beach

All records of work done on the LCBC, updates to this O&M Program, lead survey reports, and periodic inspection reports, shall be kept permanently in files maintained at the office of the Lead Program Manager. All lead abatement activities (Abatement Closeout Reports) shall be kept permanently in files maintained in this office.

The maintenance of these records shall be added to the job descriptions of the Lead Program Manager, and new persons hired or promoted to fill this position shall be made aware in writing of their responsibility to perform these duties. Such updates of job descriptions and other duties shall be performed by the site manager and/or the Lead Program Manager.

10. THE WORKER PROTECTION PROGRAM

This O&M Program has been designed to avoid having most personnel on the operations or maintenance staff work with lead. For those individuals, the worker protection program shall consist solely of following the procedures outlined by this O&M Program. For those individuals identified as having potential exposure above the action level of 30 µg/m^3 however, personal protective equipment (PPE) will be required for some tasks. PPE should be worn at all times where there may be potential exposure to lead-containing materials including the initial exposure assessment phase. Where PPE is used, the following will apply:

- Wear respirators as an interim protection for tasks until exposure assessments can be completed.
- Wear respirators in work situations where engineering and work practice controls are not sufficient to reduce employee exposures below the PEL.
- Do not wear coveralls contaminated with lead outside of the regulated area.
- Wear gloves if they do not interfere with the work being performed.
- Wear eye protection meeting the ANSI Z87.1 standard while performing construction activities.

11. THE TRAINING PROGRAM

11.1 Employee General Awareness Training

For each employee in a work environment where LCBC are present, training will be conducted initially upon job assignment. Training will consist of, as a minimum, an overview of the hazards

of lead; warning signs/labels; relevant information from a Safety Data Sheet; and the contents of the Lead O&M Program.

11.2 Lead Worker Training

If applicable, and in addition to general awareness training, the Lead Program Manager, maintenance personnel (if assigned to work with or clean up lead hazards), and any other worker potentially exposed to an airborne concentration of lead above the action level of 30 µg/m^3 (micrograms per cubic meter) shall receive at least annually, information concerning:

- Specific jobs that could result in an exposure above the action level
- The use of personal protective equipment including the use of air purifying respirators
- Proper use of engineering controls and work practice controls
- Medical surveillance/removal program
- Use of chelating agents
- Access to medical/exposure records/training materials
- Content of Cal/OSHA's Lead in Construction Standard, Title 8, Section 1532.1.

12. LEAD CONSULTANT DOCUMENTATION

This O&M Program was prepared by Mr. Daivd Kelly, a CDPH LRC, Mr. William Larkin, a CDPH LRC I/A & PM and Mr. Stephen Waide an Certified Industrial Hygienist certified in Comprehensive Practice by the American Board of Industrial Hygiene. Certification documentation is provided in Appendix D.

1 INTRODUCTION

Ninyo & Moore has prepared this Operations and Maintenance (O&M) Program for the existing asbestos-containing materials (ACMs) that are planned to be left in place at the Las Palmas Senior Center located at 1820 North Las Palmas Avenue, Los Angeles, California (site; Figure 1).

The ACMs planned to remain in place on the structure and managed by this O&M Program are described in the Table 1 below. General photographic documentation of these materials and associated building components is provided in Appendix A.

Table 1 – Asbestos Containing Materials Planned for Surveillance

Material	Location	Quantity	Photograph No.
Roof Penetration Mastic	Roof	600 SF	2-3
12” x 12” Beige VFT with yellow mastic over gray VFT with black mastic	Senior Center floors	5,000 SF	4-5
Fire doors	Senior Center mechanical/ electrical room	2 EA	6
Mirror mastic	Daycare restroom	4 SF	7

Notes:
EA- each
NA – not applicable
No. - number
SF – square feet
VFT – vinyl floor tile
“ - inches

This document has been prepared to assist in preventing potential exposures to asbestos and is designed to be implemented and maintained with the assistance of a California Division of Occupational Safety and Health Certified Asbestos Consultant (CAC). It should be noted that this O&M Program is interactive in nature, and may be modified during implementation and operation.

2 THE PURPOSE AND ELEMENTS OF THE PROGRAM

The purpose of the Asbestos O&M Program is to minimize exposure of building occupants and employees to asbestos fibers from known and suspect ACMs within the structure. This program is designed to maintain ACMs in good condition, minimize future asbestos fiber release by controlling access to ACMs, and utilize proper work practices around ACMs. The mere presence of ACMs in a building does not mean that the health of building occupants is endangered. Asbestos fibers present a health hazard when they become airborne after being released from the material they are bound within. ACMs in good condition, which are not damaged or disturbed, are unlikely to release asbestos fibers into the air. For this reason, this program has been designed to minimize the potential for future disturbance of ACMs.

As a rule, the degree of hazard that exists in a particular building depends on a number of factors, one of the most important being the nature of the asbestos products present. ACMs such as asbestos-cement pipe and shingles, rolled roofing felts, asphalt roof shingles, and vinyl floor tiles in which the asbestos fibers are firmly bonded or encased in another material generally pose very little hazard after installation; however, the sanding, grinding, or cutting of these materials, may release asbestos fibers. Those types of materials are classified as Category I Non-Friable by the United States Environmental Protection Agency (EPA) National Emission Standards for Hazardous Air Pollutants (NESHAP; 40 CFR Part 61, subpart M). Category II Non-Friable materials are all other non-friable materials, different from Category I Non-Friable. Examples include plaster, and wall base-boards. Those materials pose the lowest hazard, as the release of the asbestos fibers would require destruction of the material by, for example, burning or dissolving of the material with a solvent.

Asbestos fibers are more readily released from friable materials like spray-applied fireproofing. Friable materials are considered regulated asbestos-containing materials (RACM) by the EPA, and can potentially become a hazard if they are not kept in an intact (good) condition. RACM is defined as (a) friable asbestos material, (b) Category I nonfriable ACM that has become friable, (c) Category I nonfriable ACM that will be or has been subjected to sanding, grinding, cutting or abrading, or (d) Category II nonfriable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations. A material is considered friable if, when dry, it can be easily crumbled, pulverized, or reduced to powder by hand. Friable materials can represent a serious potential health hazard in buildings. This does not mean, however, that friable materials containing asbestos pose a serious enough hazard to justify immediate corrective action.

The seven elements of the O&M Program are:

1. The Notification System to inform workers, tenants and building occupants where ACMs are present, and how and why to avoid disturbing the ACMs. Persons affected should be properly informed in writing.
2. The Surveillance Program to provide for regular ACM inspection to note, assess and document any changes in the condition of the ACMs.
3. The Work Control and Permit System to control activities which might disturb ACMs.
4. The Work Practices Program to avoid or minimize fiber release during activities affecting the ACMs.
5. The Record Keeping System to provide for documentation of O&M activities.
6. The Worker Protection Program to provide for medical and respiratory protection, as applicable.

7. The Training Program to provide for designation of an Asbestos Program Manager, as well as training for the manager and maintenance foreman.

3 ASBESTOS CHARACTERISTICS AND HEALTH EFFECTS

3.1 Characteristics of Asbestos

Asbestos is a naturally occurring mineral. It is distinguished from other minerals by the fact that its crystals form into long, thin fibrous bundles composed of minute hollow fibers. Deposits of asbestos are found throughout the world. Asbestos minerals are divided into two groups: 1) serpentine, which has a sheet or layered structure, and 2) amphibole, which has a chain-like crystal structure. Chrysotile, the only mineral in the serpentine group, is the most commonly used type of asbestos and accounts for approximately 95 percent of the asbestos found in buildings in the United States. Chrysotile is commonly known as “white asbestos,” so named for its natural color. Five types of asbestos are found in the amphibole group. Amosite, the second most likely type to be found in buildings, is often referred to as “brown asbestos” and its resistance to acid and heat is very high. Crocidolite, “blue asbestos,” is also an amphibole and is also very resistant to acid and to the effects of outdoor exposure. Crocidolite was utilized in high temperature insulation applications. The remaining three types of asbestos in the amphibole group are: anthophyllite, tremolite, and actinolite. These are extremely rare, and of little commercial value.

3.2 Use of Asbestos

Asbestos has been used in literally hundreds of products. EPA and others distinguish between friable and non-friable forms of ACMs. Friable ACMs can be “crumbled or reduced to powder by hand pressure.” Other things being equal, friable ACMs are thought to release fibers into the air more readily. However, many types of non-friable ACMs can also release fibers if disturbed. Asbestos gained wide spread use because it is plentiful, readily available, low in cost and because of its unique properties – it does not burn, it is strong, it conducts heat and electricity poorly, and it is impervious to chemical corrosion.

One of the most common uses for asbestos was as a fireproofing material. Chrysotile was the commonly used asbestos constituent, comprising up to 95 percent of the fireproofing mixture, and was used in conjunction with materials such as vermiculite, sand, cellulose fibers, gypsum and a binder such as calcium carbonate. These materials are soft and may be fluffy in appearance and to the touch. They vary in color from white to dark gray; occasionally they have been painted or encapsulated with a clear or color sealant.

Asbestos is added to a variety of building materials to enhance strength. It is found in concrete and concrete-like products. Asbestos cement products generally contain Portland cement,

aggregate, and chrysotile fibers. Asbestos cement products are used as siding and roofing shingles; as wallboard; as corrugated and flats sheets for roofing, cladding, and partitions or decorative panels; and as pipes for a variety of applications above and below ground. Asbestos has also been added to asphalt, vinyl and other materials to make products like roofing felts, exterior siding, floor tile, joint compounds and adhesives.

Fibers in asbestos cement, asphalt and vinyl are usually firmly bound in the cement and will be released if the material is mechanically damaged, for example by drilling, cutting, or sanding. Roofing shingles and siding may also show slow deterioration due to weathering. Studies have also shown that dry buffing of bare vinyl-asbestos floor tile during routine maintenance will release unacceptable quantities of airborne fibers.

As an insulator, asbestos received wide spread use for thermal insulation and condensation control. It was usually spray applied, trowel applied, or manually installed after prefabrication.

Asbestos can also be component of acoustical plaster. The material was applied by trowel or by spraying on ceilings and sometimes walls. Similarly, as a decorative product, asbestos was mixed with other materials and sprayed on ceilings and walls to produce a soft, textured appearance.

The following tables summarize typical ACM uses:

Table 2 – Ceiling, Walls, and Insulation

Product	How Fibers Are Released	Comments
Sprayed-on or troweled on insulation (on ceilings, walls, and steelwork) Acoustical Fireproofing Decoration Condensation prevention	Water damage, deterioration, contact damage	In use from 1935 to 1978. EPA banned nearly all uses in 1978.
Fire doors	Drilling, demolition	
Caulking putties	Sanding, scraping	
Vinyl wall covering	Sanding, scraping, tearing	
Insulation under/around heat sources such as stoves and fireplaces (asbestos-containing cement sheets or paper)	Sanding, scraping, cutting	
Patching or taping compound	Sanding, scraping	In use from 1945 to 1977. Banned use in 1977, but in 1980 many industrial joint-taping compounds still contained asbestos.
Some types of fireproof wallboard	Cutting, contact damage	Typically 1930-1950
Insulation “sandwiched” between plaster walls and behind ceilings and blown in or loose insulation	Disturbing during renovation or demolition. If located in air stream, may be disturbed by air-flow, releasing fibers throughout building.	Typically 1930-1950
Electrical insulation (around wiring)	Damage, fraying, or other deterioration	Usually in panel boards or heating appliances.
Some textured paints (small amounts)	Sanding	Typically on roofs
HVAC duct insulation and flexible/expansion joints	Cutting, fraying, or other deterioration	

Table 3 – Flooring		
Product	How Fibers Are Released	Comments
Vinyl tiles (binding agent)	Routine maintenance of large areas using power buffing machines	In use since 1950
Asphalt tiles (binding agent)	Removal, sanding	In use since 1920
Floor tile mastics	Dry-scraping, cutting	In use since 1920
Vinyl sheet flooring backing	Removal, sanding	In use since 1950

Table 4 – Roofing and Siding		
Product	How Fibers Are Released	Comments
Roofing and siding (binding agent is asphalt)	Replacing, repairing, demolishing	In use since early 1900s.
Shingles	Replacing, repairing, demolishing	In use since early 1900s.
Sheets	Replacing, repairing, demolishing	In use since early 1900s.
Roofing felt	Replacing, repairing, demolishing	In use since early 1900s.
Roofing mastics	Replacing, repairing, demolishing	In use since early 1900s.

3.3 Asbestos and Health

Several types of disease can result from exposure to asbestos. Some workers who had done shipyard work with asbestos for only a few weeks during World War II developed asbestos-related disease in the 1960s. Workers in the construction, renovation, and demolition trades who encounter asbestos on the job are among the higher risk groups. Family members of asbestos workers have contracted disease from exposure to asbestos fibers brought home on the worker's clothing. Authorities believe there is no safe level of exposure, although the higher the exposure to asbestos, the higher the risk of disease.

Material containing friable asbestos is especially hazardous because asbestos fibers are easily released into the air by impact and deterioration, or even by air flow across the material. Some asbestos is bound with other materials in products such as roofing shingles or vinyl-asbestos floor tiles. In these products, asbestos fiber is not released so easily. However, fibers in bound asbestos may be released when the material is cut, drilled, scraped, or sanded or when it is badly deteriorated.

Exposure to asbestos occurs when asbestos fibers of various sizes are released into the air and are inhaled. The smaller fibers can remain in the air for long periods of time. These fibers are so small that they are only visible with a microscope. In fact, it takes 600 asbestos fibers bundled together to equal the thickness of a human hair. Some of the large fiber bundles may lodge in the nose, but the smaller ones travel through the upper airways and become embedded in the lungs. The body has no effective mechanism for removing these fibers.

Exposure to asbestos may cause several types of diseases, including the following:

3.3.1 Asbestosis

Asbestosis occurs when asbestos fibers become lodged in the lungs, irritating the lung tissues and inflaming the small air tubes and sacs in the lungs. As the inflammation heals, permanent scar tissue (called fibrosis) remains. The scarring will cause shortness of breath, which grows worse over time, even after exposure ceases. Eventually, it may be impossible for the victim to inhale enough air, and heart failure may result. There is no cure for asbestosis.

What we know about the relationship between exposure to asbestos and asbestosis has been learned from studies of people who were heavily exposed. Usually, asbestosis is found in people who have been exposed to asbestos over a long period of time. The disease is much less likely to occur if proper precautions are taken.

3.3.2 Lung Cancer

Lung cancer is five times more common in people exposed to asbestos than in individuals who have not been exposed. Early symptoms are coughing, chest pains, and coughing up blood. Smoking greatly increases the risk of developing lung cancer from exposure to asbestos. A smoker who is heavily exposed to asbestos is 30 to 90 times more likely to develop lung cancer than a nonsmoker. However, as with asbestosis, proper precautions can help to reduce the risk of contracting asbestos-related lung cancer. There is usually no cure for this disease, but if the cancer is detected early, it may be surgically treated.

3.3.3 Mesothelioma

Mesothelioma is an extremely rare and deadly form of cancer that is almost always caused by exposure to asbestos. It is an “asbestos cancer,” and may result from relatively light exposure to asbestos.

This cancer occurs in the lining of the chest and abdomen. Early symptoms are shortness of breath or pain in the chest or abdomen. Mesothelioma would be expected to occur in only one out of 100,000 people not exposed to asbestos, but one study found that ten of 124 deaths of asbestos insulation workers were caused by mesothelioma. There is no cure for this disease, and most of the victims die within the first year of diagnosis.

3.3.4 Other Cancers

Exposure to asbestos is also thought to result in cancers of the gastrointestinal tract. These diseases may be caused by the victim swallowing some of the longer asbestos fibers that have been caught in the upper air passages or by fibers traveling through the body.

The likelihood of developing asbestos-related diseases depends on the amount to which one is exposed, the length of time, and the number of exposures. The greater the total exposure, the greater probability of illness.

Usually, asbestos-related disease will not show up for 15 to 40 years after exposure. The typically long period between exposure and noticeable disease is one of the greatest problems in convincing people of the danger of asbestos exposure.

4 ASBESTOS PROGRAM RESPONSIBILITIES

4.1 Asbestos Program Manager Responsibilities

The responsibility of implementing and maintaining the O&M Program should be undertaken by an Asbestos Program Manager. This position may be held by a building engineer, superintendent, or manager of the building. The Asbestos Program Manager is not required to have any special qualifications, as the plan is written to require work on the ACMs be done only by asbestos contractors, and there are assumed to be no ACMs which might be especially difficult to manage.

Responsibilities of the Asbestos Program Manager include, but are not limited to, the following:

- Notifying building occupants regarding the presence of ACMs within the building and the implementation of an O&M Program;
- Responding to inquiries from building occupants, and contractors regarding ACMs at the site;
- Ensuring that outside contractors who may come in contact with asbestos in the building are provided with information regarding the location of ACMs;
- Ensuring that all custodial and maintenance personnel are properly trained;
- Ensuring warning labels are properly posted;
- Coordinating periodic surveillance and re-inspection activities;
- Coordinating asbestos removal, repair, and maintenance operations as required;
- Maintaining records relating to all asbestos activities including training, periodic surveillance, air monitoring, and response actions.

4.2 Building Occupant/Responsibilities

Building occupants are also responsible for complying with the elements of the O&M Program. Building occupants should ensure that they do not disturb ACMs and should notify their contractors who work in the buildings that an asbestos O&M Program is in place. Questions from contractors regarding ACMs should be directed to the Asbestos Program Manager.

In the event building occupants, contractors, maintenance, or service personnel encounter any material they suspect may contain asbestos which will be disturbed, they should immediately stop their activity and notify the Asbestos Program Manager for further instructions. The Asbestos Program Manager will be responsible for determining whether the suspect material contains asbestos, and what further actions are required before work can be continued.

5 THE NOTIFICATION SYSTEM

The client may wish to consult with an attorney who has experience in dealing with asbestos issues in order to comply with all applicable laws and regulations regarding disclosures. This O&M Program document is not and cannot be legal advice. The applicable laws and regulations may have additional requirements beyond those addressed by this O&M Program, and there may be changes in applicable laws and/or regulations following implementation of this program. However, some of the laws and/or regulations applicable at the time of preparation of this O&M Program document are:

- EPA NESHAP, implemented locally by the local Air Quality Management District (e.g., South Coast Air Quality Management District [SCAQMD]). The EPA's rules concerning the application, removal, and disposal of ACMs, as well as manufacturing, spraying and fabricating of ACMs, were issued under the asbestos NESHAP. The asbestos NESHAP regulation governs asbestos demolition and renovation projects in all facilities. In order to comply, a building owner or operator must have the facility, or affected portion of the facility, inspected for asbestos prior to conducting a renovation or demolition. Further, the NESHAP rule requires owners or operators to have ACMs removed before a building is demolished, and may require its removal before a renovation. For renovation projects where friable ACMs will be disturbed, the NESHAP rule requires appropriate work practices or procedures for the control of emissions. EPA must be notified before a building is demolished or renovated.

- SCAQMD requirements (Rule 1403) for demolitions and renovations which follow EPA and NESHAP guidelines;

- The California Business and Professions Code regarding certification and training of asbestos professionals;

- The California Code of Regulations (CCR), Title 8, regarding asbestos practices;

- California Proposition 65 (CCR, Title 22, Chapter 3, Article 6, Section 12601), regarding notifications;

- California AB 3713 (CCR, Title 22, Chapter 10.4, Section 25915), regarding notifications; and (but not limited to);

- Occupational Safety and Health Administration (OSHA) Regulations: There are several important OSHA regulations that are designed to protect workers. They are summarized here, as guidance. OSHA has specific requirements concerning worker protection and procedures used to control ACMs specified in 29 Code of Federal Regulations 1926.1101.

    - For most operations and maintenance activities in building areas where only non-friable ACMs are present or where friable ACMs are in good condition, applicable OSHA

permissible exposure limits are not likely to be exceeded. However, it is possible that some O&M activities will disturb ACMs to such an extent that the OSHA limits are exceeded, unless good work practices are followed.

- The OSHA standards require employers to address a number of items which are triggered by exposure of employees to asbestos fibers. Exposure is discussed in terms of fibers per cubic centimeter (f/cc) of air. A cc is a volume approximately equivalent to that of a sugar cube. Two main provisions of the regulation fall into the general category of "Permissible Exposure Limits (PELs)" to airborne asbestos fibers. They are:

  - Eight-hour Time-Weighted Average limit (TWA) – 0.1 f/cc of air based on an eight-hour TWA sampling period. This is the maximum level of airborne asbestos, on average, that any employee may be exposed to over an eight-hour period (normal work shift).

  - Excursion limit – 1.0 f/cc as averaged over a sampling period of 30 minutes.

- These levels trigger mandatory requirements, which include the use of respirators and protective clothing, the establishment of "regulated areas," the posting of danger signs as well as the use of engineering controls and specific work practices.

California CACs and licensed asbestos abatement contractors are familiar with the applicable laws and regulations and should be utilized as required and as outlined in the following sections of this O&M Program.

Labeling of all ACMs within building is not possible, nor is it typically required under an O&M Program. However, if labeling should be desired at some future date, labels should be prepared as indicated below. Friable materials which are in a state where asbestos may be readily released, regardless of location, and most ACMs located in routine maintenance areas (i.e., mechanical rooms, etc.) should be labeled. The warning labels should be posted on or near ACMs. The warning labels should be readily visible and read as follows:

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD.
AUTHORIZED PERSONNEL ONLY.

The following notification shall be given to all existing building occupants, new occupants, present maintenance and management personnel, newly hired or new to the complex maintenance and management personnel, and contractors or utility company personnel who need to work on the buildings. The signed forms shall be maintained in the permanent asbestos program files by the Asbestos Program Manager.

ASBESTOS NOTIFICATION

Asbestos-containing materials (ACMs) may be present in the building due to the building construction date. ACMs only present a health hazard (cancer and lung disease) when asbestos fibers (not visible to the naked eye) are inhaled or swallowed. The mere presence of ACMs does not represent a health hazard.

DO NOT disturb the ACMs! This includes screwing fasteners or other objects into an ACM, rubbing or pushing objects against the ACM and cutting, sawing, sanding, or breaking the ACM.

Please report any disturbance or damage of the ACMs, any dust or debris that might have come from the ACMs, any change in the condition of the ACMs or any improper action with ACMs to the Asbestos Program Manager.

Maintenance and other personnel are taking special precautions during their work to properly clean up any asbestos debris (if present) and to guard against disturbing ACMs. All ACMs are inspected periodically and additional measures have been and will be taken if needed to protect the health of building occupants.

I have read and understand the above:

Date: _____

Name: _____ Signature: _____

Note: This notification is included within Appendix B.

6 THE SURVEILLANCE PROGRAM

There are two types of surveillance. The first is that which is done by the Asbestos Program Manager or assigned trained personnel (6-month assessment), the second is that which is done by maintenance personnel during the course of their other work at the building.

The Asbestos Program Manager or assigned trained personnel should inspect all ACMs every six months in accordance with the Asbestos Hazard Emergency Response Act (Code of Federal Regulations, 763 Subpart E). A log form or adequately backed-up computer file noting the ACMs, the location within the building of ACMs, and the date of the last inspection shall be maintained and updated accordingly or as changes are made or discovered by the Asbestos Program Manager.

A CAC may initially be retained to assist with implementation of this O&M Program. A CAC may also subsequently be hired to reassess the condition of the ACMs and to make any recommendations for immediate actions or changes to the O&M Program.

The Asbestos Program Manager shall inform the maintenance personnel that they are to promptly report any damage, deterioration or disturbance of building materials and suspected ACMs which they see during the course of their normal duties. Newly hired personnel shall be asked to read and sign the above notification form and shall be briefed by the Asbestos Program Manager on the program and their duties and responsibilities with regard to the ACMs.

7 THE WORK CONTROLS AND PERMIT SYSTEM

The work control and permit system is designed to avoid inadvertent and/or improper disturbance of ACMs during the course of any maintenance or repair work on the site. This may represent a fundamental change in the way that such work is done at the site. However, one goal of the system is to avoid introducing substantial delays or high added costs to the operation and maintenance of the site.

It should be noted that the SCAQMD rules regarding disturbance or removal of ACMs lists several requirements for work involving disturbance/removal of ACMs greater than specific threshold quantities, and provide for fines for violations.

In most cases, a semi-formal permit system is appropriate. However, the Asbestos Program Manager, must first be contacted whenever any maintenance or repair work occurs. This may be a significant change from present practice, but it is important that all persons on the management and maintenance staff understand that this is now required. It would be appropriate to write this requirement into the job descriptions and the performance reviews of the employees.

Whenever maintenance personnel plan a maintenance or repair project, they must first contact the Asbestos Program Manager to indicate the location and nature of the work to be performed. If any substantial change occurs in the work once it is underway, the Asbestos Program Manager should again be contacted. This also applies to work to be done by outside contractors or utility company personnel.

After the maintenance person(s) indicate to the Asbestos Program Manager the type and location of the work, the Asbestos Program Manager shall review this plan to determine if ACMs are present in the area where the work will occur. Example forms to utilize for this communication to the Asbestos Program Manager and the Asbestos Program Manager response are included in Appendix C:

- If there are no ACMs the Asbestos Program Manager shall convey that information to the maintenance or repair person(s) and the work may proceed. If it is unknown if asbestos is present, sampling of building materials to be disturbed and laboratory analysis for asbestos should occur prior to disturbance.

- If there are ACMs, but it is not anticipated that the ACMs will be disturbed, the Asbestos Program Manager shall inform the maintenance or repair person(s) of the presence of the ACMs and the importance of not disturbing it.

- If there are ACMs and it is anticipated that they will be disturbed, the Asbestos Program Manager shall contact one or more licensed asbestos contractors to obtain prices for their services to assist in the work, such as utilizing High Efficiency Particulate Air-vacuum equipped tools and/or other asbestos control measures including the construction of negative pressure enclosures. For substantial work, an environmental consulting company with CACs should be hired to develop specifications/work plan documents, assist with the evaluation of bids, oversee (monitor) the work activities of a licensed asbestos contractor, perform air monitoring, and air clearances for re-occupancy. An abatement closeout report should be prepared summarizing the abatement activities. All records from any such work should be placed in the permanent asbestos record files.

The job descriptions of the maintenance persons and the Asbestos Program Manager shall be updated to reflect their responsibilities in dealing with ACM issues.

8 THE WORK PRACTICES PROGRAM

Based upon the types of ACMs and the cost of medical surveillance, respiratory protection programs, and insurance, it is recommended that most work with ACMs be performed by licensed asbestos contractors. It is important that the Asbestos Program Manager, maintenance people, outside contractors or utility personnel who will work on the buildings understand that they are not to work with or disturb ACMs. OSHA regulations require a respiratory protection program (and therefore a medical surveillance program) and protective clothing whenever workers are exposed or are likely to be exposed to asbestos fibers above the current PEL on an 8-hour time-weighted average or the current 30-minute Excursion Limit. The training and record keeping necessary to allow for work with asbestos by maintenance personnel would be an ongoing and significant expense, which is not necessary due to the anticipated infrequent need to disturb the limited amount of ACMs present.

As long as ACMs remain in a building there is potential for a fiber release episode. Fiber release episodes can occur during maintenance and renovation projects, or from the disturbance of materials by untrained personnel. Tenants, custodians, outside contractors and/or maintenance workers should immediately report any evidence of possible fiber release to the Asbestos Program Manager. Even minor fiber release episodes of friable materials must be treated seriously and proper procedures should be followed. Upon discovery of the fiber release, access to the area should be restricted, and the Asbestos Program Manager should be contacted

immediately. Under no circumstances should building tenants, maintenance or custodial personnel, or outside contractors cleanup asbestos-containing debris. Conventional cleaning, such as sweeping with dry brooms, dusting with dry cloths, and vacuuming with standard vacuum cleaners may simply suspend asbestos fibers in the air. Cleaning of asbestos-containing debris should be conducted by properly trained and licensed personnel who are equipped with proper respiratory protection.

9 THE RECORD KEEPING SYSTEM

As this O&M Program has been designed to avoid having personnel on the operations or maintenance staff work with asbestos, no records of medical monitoring, personnel air monitoring, or training should be necessary.

All records of work done on the ACMs, updates to this O&M Program, asbestos survey reports, and periodic inspection reports, shall be kept permanently in files maintained at the office of the Asbestos Program Manager. All asbestos abatement activities (Abatement Closeout Reports) shall be kept permanently in files maintained at the office of the Asbestos Program Manager.

The maintenance of these records shall be added to the job descriptions of the Asbestos Program Manager, and new persons hired or promoted to fill this position shall be made aware in writing of their responsibility to perform these duties. Such updates of job descriptions and other duties shall be performed by the site manager and/or the Asbestos Program Manager.

Ninyo & Moore has included four forms adapted from an EPA publication. In order to provide examples of the types of forms (paper and/or electronic) the forms are presented in Appendix C.

10 THE WORKER PROTECTION PROGRAM

As this O&M Program has been designed to avoid having personnel on the operations or maintenance staff work with asbestos, the worker protection program shall consist of following the procedures outlined by this O&M Program. No respiratory protection component of the worker protection program is required beyond following the procedures outlined by this O&M Program, which avoids having personnel work with asbestos.

11 THE TRAINING PROGRAM

The Asbestos Program Manager and maintenance personnel shall be required to receive general awareness training on asbestos, during implementation of this O&M Program, and newly hired or assigned personnel shall be required to receive the same or similar training. This training involves a taking a two-hour training class. General awareness training includes the following:

- Information regarding asbestos and its various uses and forms
- Information on the health effects associated with asbestos exposure
- Location of asbestos-containing building materials within the structure in which the employee works
- Name and phone number of the Asbestos Program Manager and location of the Management Plan Documents
- Recognition of damage, deterioration, and delamination of ACMs
- Proper response to fiber release episodes
- Requirements of the OSHA standard in regards to housekeeping

New or promoted employees in these positions shall receive such training within two weeks in the positions, or, preferably, before they assume the position.

The Asbestos Program Manager is considered a competent person and under OSHA regulatory requirements, additional training is required in Asbestos Operations and Maintenance training. This training involves a full two-day course. This course includes the following:

- Descriptions of the proper methods of handling ACMs
- Information on the use of respiratory equipment and other personal protective measures
- Provisions of AHERA, NESHAP, EPA Worker Protection Rule, and the OSHA Asbestos in the Construction Industry Standard
- Hands-on training in the use of respiratory protection, other person protective measures, and good work practices

12 ASBESTOS CONSULTANT DOCUMENTATION

This O&M Program was prepared by Mr. David Kelly, a California Division of Occupational Safety and Health (DOSH) Certified Site Surveillance Technician and Mr. William Larkin, a DOSH Certified Asbestos Consultant. Consultant certificates are provided in Appendix D.

Dear Certified Asbestos Consultant or Technician:

Enclosed is your certification card. **To maintain your certification, you must abide by the rules printed on the back of the certification card.**

Your certification is valid for a period of one year. If you wish to renew your certification, you must apply for renewal at least 60 days before the expiration date shown on your card. [8 CCR 341.15(h)(1)].

Please hold and do not send copies of your required AHERA refresher renewal certificates to our office until you apply for renewal of your certification.

Certificates must be kept current if you are actively working as a CAC or CSST. The grace period is only for those who are not actively working as an asbestos consultant or site surveillance technician.

Please contact our office at the above address or email w any changes in your contact/mailing information within 15 days of the change.

Sincerely,

Kevin Graulich
Principal Safety Engineer

CONDITIONS OF APPROVAL (Continued from Page 1)

1. This extension approval is contingent upon the project being updated to comply with Correct Zoning, Building and Green Building Code requirements. The plans may be required to be re-submitted, as determined by the Department, to recheck and verify compliance with the Current Code requirements. Additional plan check fees, based on the plan review and verification time, will be assessed by the Department.
2. The date the plans are resubmitted for recheck shall be construed as the plan check submittal date for the purpose of determining the applicability of Current Code (laws, regulations, and ordinances).
3. The date the plans are resubmitted for recheck shall be construed as the plan check submittal date for the purpose of determining the applicability of Current Code (laws, regulations, and ordinances). If the plans are not required to be submitted, the vesting date shall be the previous expiration date.
4. This extension approval is contingent upon the owner re-obtaining required clearances for any expired agencies' approval plus any additional clearances due to new regulations.

GENERAL NOTES.

1. SOIL IS OF TYPE SILTY SAND-3,000#/□ - SEE SOIL REPORT.
2. ALL FOOTING SHALL BEAR ON FIRM UNDISTURBED SOIL.
3. CONCRETE ~~SEE BELOW.-16.~~ ~~#2 1/2 HAVING A MINIMUM CRUSHING STRENGTH OF 2000 #/□" AT THE AGE OF 28 DAYS. MAXIMUM WATER PER SACK OF CEMENT = 7 1/2 GALLONS.~~
4. CEMENT IS TESTED CEMENT.
5. CONCRETE BLOCKS SHALL COMPLY WITH THE REQUIREMENTS OF THE A.S.T.M. SPECIFICATIONS C 90-52. CONT. INSPECTION REQUIRED.
6. MORTAR SHALL BE TYPE A MIX 1:3 WITH NOT MORE THAN ½ PART LIME PUTTY ADDED-MEET L.A. BUILDING CODE ON MORTAR.
7. GROUT SHALL BE OF 1:3 MIX. WITH NOT MORE THAN 1/10 LIME ADDED.
8. PEA GRAVEL CONCRETE SHALL BE MIX 1:2:3 MIX.
9. REINFORCING STEEL SHALL BE DEFORMED BARS OF STRUCTURAL GRADE COMPLYING WITH A.S.T.M. SPECIFICATIONS A15-55-T A 305-55
10. ALL SPLICES SHALL BE 40 BAR DIAMETER.
11. STRUCTURAL STEEL SHALL COMPLY WITH A.S.T.M. SPECIFICATIONS A7-58.
12. ALL EXPOSED STAUCTURAL STEEL SHALL RECEIVE ONE SHOP COAT AND TWO FIELD COATS.
13. ALL HORIZONTAL LUMBER SHALL BE CONSTRUCTION GRADE 1350f GRADE MARKED
    ALL VERTICAL LUMBER SHALL BE STANDARD GRADE.
14. PLYWOOD SHALL BE "PLYSCORE" GRADEMARKED, EXTERIOR GRAIN FACES AT RT LS TO SUPPORT.
    PLYWOOD SHALL NOT BE COVERED UNTIL NAILING HAS BEEN INSPECTED.
15. WELDING SHALL BE DONE BY QUALIFIED WELDERS USING THE ELECTRIC ARC PROCESS, USING APPROVED ELECTRODES WELDING FULL STRESS - CONTINUOUS INSPECTION REQUIRED.

16. CONCRETE FOR BEAMS SHALL BE GRADE 'B' 3,000# CONT INSPECTION REQ.

Sheet Title:
TITTLE SHEET

Sheet Number:
FA-0.0

GENERAL NOTES:

1. THE SYSTEM SHOWN HERE IS INTENDED TO MEET THE FOLLOWING CODES AND STANDARDS:
   - HEALTH AND SAFETY CODE SECTION 13145.
   - CALIFORNIA CODE OF REGULATIONS (CCR), TITLE 19 CCR, TITLE 24, PART 2: 2017 EDITION.
   - CALIFORNIA BUILDING CODE (CBC) CCR, TITLE 24, PART 2: 2017 EDITION.
   - CALIFORNIA ELECTRICAL CODE CCR, TITLE 24, PART 3: 2017 EDITION.
   - CALIFORNIA MECHANICAL CODE (CMC) CCR, TITLE 24, PART 4: 2017 EDITION.
   - CALIFORNIA FIRE CODE (CFC) CCR, TITLE 24, PART 9: 2017 EDITION.
   - NFPA 72, THE NATIONAL FIRE ALARM CODE, 2016 EDITION, AS AMENDED IN CHAPTER 47 OF THE 2017 CFC.
2. CELLULAR ALARM COMMUNICATOR IS INHERENTLY POWER LIMITED, AND SIGNALING AND INITIATING CIRCUITS DO NOT REQUIRE OVERCURRENT PROTECTION.
3. CELLULAR ALARM COMMUNICATOR WILL CONNECT TO THE PRIMARY AND SECONDARY PORTS OF THE FIRE ALARM CONTROL UNIT'S DACT. THE CELLULAR ALARM COMMUNICATOR WILL TRANSMIT ANY OFF-NORMAL CONDITION TO THE CENTRAL STATION.
4. CELLULAR ALARM COMMUNICATOR MUST BE PROGRAMMED TO SEND TEST SIGNAL AT INTERVALS NOT EXCEEDING 60 MINUTES.
5. FAILURE OF THE PRIMARY TRANSMISSION PORT MUST BE ANNUNCIATED LOCALLY AND TRANSMTTED WITHIN 4 MINUTES OVER THE SECONDARY TRANSMISSION PORT.
6. THERE ARE NO ABOVE CEILING HEAT DETECTORS ON EXISTING SYSTEM.
7. ALL WIRING, INITIATING DEVICES, AND ANNUNCIATOR PANEL SHALL BE SUPERVISED TO THE PRINCIPAL POINT OF ANNUNCIATION (F/A PANEL TO SUPERVISE THE ANNUNCIATOR PANEL, ALL CIRCUITS AND INITIATING DEVICES).
8. WIRING SHALL NOT BE LOOPED THROUGH DEVICES; WIRE MUST BE CUT FOR IN AND OUT.
9. POINT AND COMMON ANNUCIATION PROHIBITED. NON-ADDRESSABLE CIRCUITS, T-TAPPING IS PROHIBITED.
10. ALL DEVICES IN THE ALARM SYSTEM SHALL BE COMPATIBLE AND INSTALLED TO MANUFACTURER'S SPECIFICATIONS.
11. AUDIBILITY OF ALARM AND VOICE COMMUNICATION SHALL BE NOT LESS THAN 15dBA ABOVE AMBIENT SOUND, BUT NOT LESS THAN 75dBA, THROUGHOUT AREA OF ALARM.
12. AREAS HAVING MORE THAN 2 STROBES IN THE FIELD OF VIEW SHALL BE SYNCHRONIZED (2016 NFPA 72, 18.5.5.4.2.(3)).
13. SMOKE DETECTORS AND HEAT DETECTOR LOCATIONS ARE BASED ON SMOOTH CEILING WITH MAXIMUM HEIGHT OF 10 FEET UNLESS OTHERWISE NOTED.
14. STROBE LOCATION IS BASED ON 10 FOOT CEILING HEIGHT AND ARE INSTALLED ACCORDING TO NFPA 72 REQUIREMENTS UNLESS OTHERWISE NOTED.
15. WALL-MOUNTED STROBES SHALL HAVE THEIR BOTTOMS NOT LESS THAN 80 INCHES ABOVE FINISHED FLOOR AND NO GREATER THAN 96 INCHES ABOVE FINISHED FLOOR.
16. STROBES IN SLEEPING AREAS SHALL BE LOCATED WITHIN 16 FEET OF PILLOW AND HAVE A MINIMUM INTENSITY OF 110cd. FOR STROBES LOCATED LESS THAN 24 INCHES FROM CEILING, MINIMUM INTENSITY SHALL BE 177cd.
17. MANUAL PULL STATIONS SHALL BE MOUNTED NO HIGHER THAN 48" TO TOP OF OUTLET BOX. (2016 CBC ADA C 1136A.2 AND 1142A.2)
18. FIRE ALARM SIGNAL SHALL MEET ANSI S3.41, AUDIBLE EMERGENCY EVACUATION SIGNAL (TEMPORAL PATTERN).

INSTALLATION NOTES:

1. ELECTRICAL CONTRACTOR TO PROVIDE 120VAC, 20AMP. DEDICATED CIRCUIT TO FIRE CONTROL PANEL COMMUNICATOR (NIC). FIRE CONTROL PANEL COMMUNICATOR CIRCUIT SHALL BE INSTALLED ACCORDING TO NFPA72 5.5.1(1)(2)(3).
2. POWER LIMITED WIRING SHALL BE SEPARATED FROM NON-POWER LIMITED, ELECTRIC LIGHT, POWER, AND CLASS I CIRCUITS A MINIMUM OF 2 INCHES. NFPA 70, 760-133.
3. ALL WIRING AND CABLING METHODS SHALL COMPLY WITH NFPA 70, 760-130., BY PROTECTING ALL WIRING WITHIN SEVEN (7) FEET ABOVE. FINISHED FLOOR IN CONDUIT STUB-UPS AND BY CONCEALING ALL WIRING IN WALLS, CEILINGS, AND PROTECTIVE BUILDING ELEMENTS.
4. ALARM CONTRACTOR SHALL PROVIDE THE OWNER WITH A COPY OF MAINTENANCE, OPERATION AND TEST INSTRUCTIONS, ALONG WITH A COPY OF THE "AS BUILT" DRAWINGS.
5. CONTRACTOR SHALL PROVIDE AND PERMANENTLY INSTALL A COPY OF THE OPERATING INSTRUCTIONS NEXT TO THE FIRE CONTROL PANEL AS WELL AS AN EMERGENCY SERVICE RESPONSE PHONE NUMBER.

CENTRAL STATION:
National Monitoring Center (NMC)
25341 Commercentre Dr.
Lake Forest, CA 92630
Ph. (800) 662-1711
U.L. CERTIFICATE #: S8126-1

INSTALLATION COMPANY:
FFSTECH Building Integrated Systems
6000 Venice Boulevard
Los Angeles, CA 80012
Ph. (323) 965-9300
U.L. CERTIFICATE #: S4755-1

SCOPE OF WORK:

1. REPLACE EXISTING FIRE ALARM PANEL WITH NEW IO1000GD ADDRESSABLE FIRE ALARM PANEL.
2. PROVIDE A NEW CELLULAR ALARM COMMUNICATOR FOR AN APPROVED SOLE PATH OF COMMUNICATION TO THE CENTRAL STATION.
3. INSTALL NEW FIELD DEVICES.
4. TOTAL DEVICES: 51.
5. NUMBER OF STORIES: 1.
6. TEST THE ENTIRE SYSTEM.

TELGUARD TG-7FS-LTE-V
CELLULAR COMMUNICATOR

iO1000 MOTHERBOARD (FACU)

FACU WIRING DIAGRAM

FIRE PREVENTION & PUBLIC SAFETY BUREAU

APPROVAL OF ALTERNATE TECHNOLOGY AS SINGLE COMMUNICATION PATH

The following technology, with the specific configuration, equipment, and requirements listed below, has been approved for use within the jurisdiction served by the LAFD. This approval letter shall be included on all plans submitted to the LAFD for alarm or monitoring systems utilizing this technology.

System Name: Telguard TG-7FS Cellular Alarm Communicator for AT&T LTE and Verizon LTE Networks

Transmission Technology: Cellular GSM/GPRS via either the AT&T LTE (TG-7FS LTE-A) or Verizon LTE (TG-7FS LTE-V) wireless network pursuant to manufacturer's certification; transmits cellular data to Telguard Communication Center, which then forwards TCP/IP data to designated central station.

Method of signal and data integrity: Method 2 – parity

Communicator Make/Model: AT&T LTE: Telular Corp. Model TG7LAF01; CSFM listing 7300-1402:0109. Verizon LTE: Telular Corp. Model TG7LVF01; CSFM listing 7300-1402:0110.

NOTE: At the request of Telular Corporation, Model TG7GFS04 for 3G/4G Networks and Model TG7VFS04 for Verizon CDMA networks are no longer CSFM listed and are excluded from this approval. This letter of approval supercedes the previous letters dated 1/11/17 and 3/15/17, which are now revoked.

Receiver Make/Model: UL listed compatible POTS/IP receivers that work with Contact ID, Modem IIe, IIIa[2], SIA2, Sonitrol, DMP, or Pulse (3/1 or 4/2 formats).

Data Throttling capable?: None indicated in manufacturer's installation instructions.

Central Station: Any LAFD-approved[†] central station supervising station equipped with a compatible receiver.

Special Requirements:

- [†] The central station supervising station must possess and maintain a current "F425" Fire Permit through the City of Los Angeles Office of Finance. Expiration or other loss of permit voids this approval.
- Any failure of the communication path shall be annunciated at the central station within 60 minutes.[1]
- Incomplete, corrupted, or other signal errors will be recorded and displayed at the central station. *Communicator will resend message if receipt is not acknowledged by receiver at central station.*
- The record and display rate of subsequent alarms will not be less than one every 10 seconds.[2]
- Approved for use with any local or remote antenna certified by the manufacturer for use with this product.

Inspection procedure:

[1] *Verify maximum 60-minute check-in and fail timing. Timing is programmed by installer into the communicator.*
[2] *Record and display rate can be tested by initiating two alarm devices simultaneously and then comparing time they were received/recorded by central station.*
Annunciator can display/verify: cellular signal strength (bar graph); modem operation, SIM card detectoin, cell tower detection, verification of SIM activation; if internet access and communication path is good.

ATTACHMENT G

LADWP CHANGE OF LOAD SERVICE COMMITTMENT, DATED 9/8/2025

Los Angeles Department of Water & Power
BUILDING A STRONGER L.A.

Karen Bass, Mayor

Board of Commissioners
Richard Katz, President
George S. McGraw, Vice President
Nurit D. Katz
Mia Lehrer
Wilma J. Pinder
Chante L. Mitchell, Secretary

Janisse Quiñones, Chief Executive Officer and Chief Engineer

September 8, 2025

Mr. Morgan Lytle
LABOE
1149 S Broadway STE 830
Los Angeles, CA 90015

Dear Mr. Lytle:

Subject: Change in Load Service Commitment
1820 N Las Palmas Ave - Las Palmas Senior Citizen Center
Project No. P333052 / Work Request No. 2962877

Thank you for providing us with plans for the project at the above address. The Department of Water and Power electrical facilities are adequate for the change in electrical load on the existing switchboard. This letter also confirms that you are not proposing any changes to your service equipment.

The maximum available fault current at the existing service(s) is estimated to be:

Service	Amps	Voltage	∅-Wire	Fault Current
MS	400A	120/240V	1Ø-3W	32,000A
MS	400A	120/240V	3Ø-4W	32,000A

This fault current information has been reported to the Department of Building and Safety. Please be advised that it is your responsibility to provide a copy of this Service Agreement to the contractor responsible for performing the work. You may track the status of your job on our website at https://wmis.powersystem.ladwp.com.

This commitment is valid for six months. Any change in load or design will require revised plans to be submitted to the Department for re-evaluation. If you have any questions regarding these requirements or if you wish to discuss any design changes, please contact our design engineer Mr. Jeremy Phan, at (213) 887-6753.

Sincerely,

Rodolfo Monroy

Rodolfo J. Monroy
District Engineer, Metro West Service Planning

c: Jeremy Phan

Attachment No. 3

COUNTY CLERK'S USE

CITY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
BUREAU OF ENGINEERING
1149 S. BROADWAY, 7th FLOOR
LOS ANGELES, CALIFORNIA 90015
CALIFORNIA ENVIRONMENTAL QUALITY ACT

NOTICE OF EXEMPTION

(Articles II and III – City CEQA Guidelines)

Submission of this form is optional. The form shall be filed with the County Clerk, 12400 E. Imperial Highway, Norwalk, California, 90650 and with the State Clearinghouse in the Office of Planning and Research, if filed with the County Clerk, pursuant to Public Resources Code Section 21152(b). Pursuant to Public Resources Code Section 21167(d), the filing of this notice starts a 35-day statute of limitations on court challenges to the approval of the project.

LEAD CITY AGENCY AND ADDRESS: City of Los Angeles c/o Bureau of Engineering 1149 S. Broadway, 6th Floor, MS 939 Los Angeles, CA 90015	**COUNCIL DISTRICT** 13
PROJECT TITLE: Las Palmas Senior Citizen Center - Renovation (W.O. E1908358/ CIP No. G1163)	**LOG REFERENCE**

PROJECT LOCATION: The Project is located at 1820 N. Las Palmas Avenue on the southeast corner of Franklin Avenue and Las Palmas Avenue, in the Hollywood Community Plan Area of the City of Los Angeles, see also Parcel Profile Report from NavigateLA, Figure 1: Project Vicinity, and Figure 2: Project Location). T.G. Page 593, Grid E4

DESCRIPTION OF NATURE, PURPOSE, AND BENEFICIARIES OF PROJECT: The project consists of consists of renovating the interior of an approximately 5,504 square-foot senior community center, along with the exterior site improvements. Project beneficiaries include facility users, community members, and visitors who will have improved recreational facilities. Please see the project description continuation in the narrative for more details. On [Insert date (Month Day, Year)], the [Insert decision making body (e.g., City Council, etc.)] determined the project was exempt under the California Environmental Quality Act (CEQA) and approved the project.

CONTACT PERSON	**CONTACT INFORMATION**
Robert Savinelli	robert.savinellli@lacity.org

EXEMPT STATUS:

CITY CEQA GUIDELINES	CATEGORICAL EXEMPTION*	Art. III, Sec. 1 Class 1 Cat. 1, 4 Art. III, Sec. 1 Class 3 Cat. 6 Art. III, Sec. 1 Class 4 Cat. 1
STATE CEQA GUIDELINES	CATEGORICAL EXEMPTION*	Sec. 15301 (a)(d) Sec. 15303 (e) Sec. 15304 (a)

* See Public Resources Code Sec. 21080 and set forth state and city guidelines provisions.

JUSTIFICATION FOR PROJECT EXEMPTION: This project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Sections 15301 Existing Facilities (a: interior/exterior alterations), (d: restoration or rehabilitation of deteriorated or damaged structures); 15303 New Construction or Conversion of Small Structures (e: accessory structures such as carports and fences) and 15304 Minor Alterations to Land (a: grading). Additionally, the project is exempt pursuant to the corresponding *City CEQA Guidelines (*Article III, Section 1, Classes 1-1, 1-4, 3-6, and 4-1). *None of the limitations set forth in State CEQA Guidelines 15300.2 apply (see attached narrative).*

CATEGORICAL EXEMPTION NARRATIVE

I. DESCRIPTION OF NATURE, PURPOSE, AND BENEFICIARIES OF PROJECT, CONTINUED

The Las Palmas Senior Citizen Center is operated by the City of Los Angeles Department of Parks and Recreation. The Las Palmas Senior Citizen Center - Renovation Project (Project) consists of a renovation of the building interior space (approx. 5500 SF), exterior within the existing footprint, and a modernization of the exterior features, Figures 1 – 3). Minor excavation and modification of grades may be needed for the patio area, trash enclosure, and LID capture and reuse planters. The plans call for a reduction in total landscaping (approx. 2600 square feet less) and a loss of three parking spaces (21, down from 24). Fencing will be installed along the perimeter and internally (306 linear feet total).

The new parking lot shade structure will be built using cast-in-place concrete piles (not driven) set with boreholes excavated to a maximum depth of 25 feet. The Project site is considered to have a high paleontological sensitivity at depths of 15 feet and greater. There is a potential to encounter significant paleontological resources during drilling activities that extend to impact native Pleistocene-age deposits (i.e., drilling that exceeds a depth of 15 feet). Therefore, a Paleontological Resources Monitoring and Treatment Plan (PRMTP) must be prepared and implemented prior to any ground disturbance at a depth of greater than 15 feet. The plan should specify the levels and types of mitigation efforts during drilling activities and should also include a description of the professional qualifications required of key staff, communication protocols to be followed during construction, unanticipated discovery protocols, fossil recovery protocols, sampling protocols for microfossils (if required), laboratory procedures, reporting requirements, and curation provisions for any collected fossil specimens.

The scope of the contractor's work includes:

- Implementation of PRMTP
- redesign interior spaces to add additional restrooms
- renovate floor and ceilings throughout
- upgrade existing roof (approx. 7900 SF), lighting, mechanical systems, and electrify building
- upgrade existing windows
- add photovoltaic panels to the roof
- redesign existing trellis
- renovate turf areas and irrigation system
- renovate existing concrete walkways and patio spaces to meet ADA requirements
- renovate existing shuffleboard area to multi-use exercise area with photovoltaic shade structure and reconfigure landscaping
- restripe existing parking lot
- construct a new trash enclosure at parking area
- add photovoltaic panels on a new shade structure in the parking lot or carport

- add one dual EV charger, and one single EV charger (3 spaces) at the parking lot
- replace old fencing and add 43 linear feet of new fencing

Unless otherwise stated, the proposed project will be designed, constructed and operated following all applicable laws, regulations, ordinances and formally adopted City standards including but not limited to:

- City of Los Angeles Municipal Code
- Bureau of Engineering Standard Plans
- Standard Specifications for Public Works Construction, including Additions and Amendments
- Work Area Traffic Control Handbook

In compliance with the Los Angeles Fire Code, Chapter 33, Fire Safety During Construction and Demolition, the proposed project shall, at a minimum, include the following precautionary measures:

- ensure there is a clear access path from the adjoining street or hard surface to the work site, prior to using fuel or heat generating equipment
- heat generating equipment shall only be operated in areas clear of combustible materials (i.e., grasses, weeds, shrubs, trash, etc.)
- no smoking is allowed within the work area
- fire extinguishers or water supply (if available) must be available at the work site for emergency situations, such as a fire occurs near the work site
- equipment shall be cooled down before refueling at the work site or be moved to an area not containing combustible materials
- ensure Fire Department contact information (i.e., 911 or local fire station phone number) at the site always
- have an egress plan available in case of a fire
- if water is available, spray the work area with water to reduce the risk of vegetation catching fire prior to work activities starting

The Project includes best management practices (BMPs) for compliance with applicable regulatory requirements that protect cultural resources and for implementation of applicable “Greenbook” Standard Specifications for Public Works Construction that protect cultural resources as follows:

BMP-CUL-1: In the event that unanticipated historical artifacts were encountered, City Engineer Standard Specifications, Section 6-6.2, (Greenbook, 2021) states: “If discovery is made of items of archaeological or paleontological interest, the Contractor shall immediately cease excavation in the area of discovery and shall not continue until ordered by the Engineer.” Therefore, during activities in which there will be ground disturbances (i.e., digging, drilling, etc.) if any evidence of archaeological, cultural, or paleontological resources are found, all work within the vicinity of the find shall stop until a

qualified archaeologist can assess the finds and make recommendations. No excavation of any finds should be attempted by project personnel unless directed by a qualified archaeologist. Construction activities may continue in other areas. If the discovery proves significant under CEQA (Section 15064.5f; Public Resources Code or PRC 21082), additional work such as testing, or data recovery may be warranted.

BMP-CUL-2: The discovery of human remains is always a possibility during ground disturbances; State of California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Los Angeles County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. The Los Angeles County Coroner must be notified of the find immediately. If the human remains are determined to be prehistoric, the coroner will notify the Native American Heritage Commission, which will determine and notify a Most Likely Descendent (MLD). The MLD shall complete the inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

II. PROJECT HISTORY

The Project site is comprised of one parcel, Assessor Parcel Number (APN) 5547-003-900, located in the Hollywood Redevelopment Area within the Hollywood Community Plan Area (CPA) of the City of Los Angeles. The legal description is Lot 10, Block 2 of the Hollywood Oceanview Tract. The Project site is improved with the Las Palmas Senior Citizen Center, a one-story municipal recreational building constructed in 1961 for the City of Los Angeles Department of Recreation and Parks (RAP). The property is not currently listed in the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), or designated as a City of Los Angeles Historical-Cultural Monument (LA HCM), nor was it previously identified in any historical resource surveys.

The purpose of the renovation is to enhance the enjoyment of stakeholders. The current building is outdated and requires various repairs. The proposed work includes updates to existing building infrastructure including roofing, HVAC, and electrical systems. Unused outdoor space will be renovated to new multi-use exercise area. Uneven outdoor surfaces will be repaired. Limited landscape and irrigation improvements will be provided. Interior space will be reconfigured for more efficient utilization of space and the addition of new restroom facilities. The interior and exterior finishes will be updated.

III. ENVIRONMENTAL REVIEW

A. Basis for Categorical Exemption

The project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15301, Class 1 (a) and (d) *Existing Facilities* for operation, repair, maintenance, permitting, leasing, licensing, or minor alteration of existing public or private structures, facilities, mechanical equipment, or topographical features, involving negligible or no expansion of existing or former use because the project consists of:

- Interior or exterior alterations involving such things as interior partitions, plumbing, and electrical conveyances
- Restoration or rehabilitation of deteriorated or damaged structures, facilities, or mechanical equipment to meet current standards of public health and safety, unless it is determined that the damage was substantial and resulted from an environmental hazard such as earthquake, landslide, or flood

The project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15303, Class 3 (e) *New Construction or Conversion of Small Structures* which consists of construction and location of limited numbers of new, small facilities or structures; installation of small new equipment and facilities in small structures; and the conversion of existing small structures from one use to another where only minor modifications are made in the exterior of the structure. The numbers of structures described in this section are the maximum allowable on any legal parcel. Examples of this exemption include, but are not limited to:

- Accessory (appurtenant) structures including garages, carports, patios, swimming pools, and fences

The project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15304, Class 4 (a) *Minor alterations to land* which consists of minor public or private alterations in the condition of land, water, and/or vegetation which do not involve removal of healthy, mature, scenic trees except for forestry or agricultural purposes. Examples include, but are not limited to:

- Accessory (appurtenant) structures including garages, carports, patios, swimming pools, and fences

Additionally, the Project is exempt from CEQA pursuant to the following City CEQA Guidelines from Article III, Section 1.

- Class 1-1: Interior or exterior alterations involving remodeling or minor construction where there be negligible or no expansion of use
- Class 1-4: Restoration or rehabilitation of deteriorated or damaged structures, facilities or mechanical equipment and systems to meet current standards of public health, safety and environmental protection
- Class 3-6: Accessory (appurtenant) structures including garages, carports, patios, swimming pools, fences, game courts (including tennis courts accessory to residential developments), play areas and retaining walls
- Class 4-1: Grading on land with a slope of less than ten percent (10%), except where it is to be located in a waterway, in any wetland, in an officially designated (by federal, State, or local governmental action) scenic area or in an officially mapped areas of severe geologic hazard

B. Consideration of Potential Exceptions to use of a Categorical Exemption

The State CEQA Guidelines (CCR Sec 15300.2) limit the use of categorical exemptions in the following circumstances:

1. Location. Exemption Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may be significant in a particularly sensitive environment. Therefore, these classes are considered to apply in all instances, except where the project may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies. As of February 12, 2024 the site was listed within a special grading area (BOE basic grid Map A-13372) and a liquefaction zone on ZIMAS. As of February 12, 2024 the site is not a listed as part of a high fire severity zone or an oil zone on NavigateLA.

According to the Department of Conservation California Geological Survey, the project site is located within the Alquist-Priolo Earthquake Fault Zone. Alquist-Priolo earthquake fault zones are regulatory zones surrounding the surface traces of active faults in California. These zones were conceived in the Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act), the intent of which is to reduce losses

from surface fault rupture. Local agencies must regulate development projects within earthquake fault zones and demonstrate that proposed buildings will not be constructed on active faults. Projects include all land divisions and most structures for human occupancy.

The site lies within a designated liquefaction zone, an area mapped for “historic occurrence of liquefaction, or where local geological, geotechnical, and groundwater conditions indicate a potential for permanent ground displacements,” or where “previous occurrence of landslide movement, or local topographic, geological, geotechnical, and subsurface conditions indicate a potential for permanent ground displacements,” according to the Official Map of Seismic Hazards, released by the California Department of Conservation, California Geological Survey (CGS).

The proposed project consists of renovation of an existing structure and addition of a small shade structure in a parking lot. No new structures for human habitation will be constructed. Repair and maintenance projects are common in the City and throughout areas deemed to be within the earthquake hazard zones, as such these repairs are not unusual circumstances. The project would not potentially result in or increase vulnerability to damage caused by earthquakes and there is no reasonable possibility that the project will have a significant effect due to unusual circumstances. All best management practices and building codes will be followed.

This project is exempt from CEQA pursuant to State CEQA Guidelines Article 19, Section 15301 *Existing Facilities* (a), (d); 15303 *New Construction or Conversion of Small Structures* (e); 15304 *Minor alterations to land* (a). Therefore, the location exception does not apply.

2. Cumulative Impact. This exception applies when, although a project may not have a significant impact, the cumulative impact of successive projects of the same type in the same place, over time is significant.

As a preexisting structure, the Las Palmas Senior Citizens Center will not need to undergo another renovation for another 30-40 years. Proceeding with this project will not result in the renovation of many other related or similar or related projects within the state of California or City of Los Angeles. Therefore, this exception has no application to this project.

3. Significant Effect. This exception applies when, although the project may otherwise be exempt, there is a reasonable possibility that the project will have a significant effect due to unusual circumstances.

The community center has been in operation for at least 60 years. The facility will be closed during construction. This Project does not present any unusual circumstances. The borehole drilling for the parking lot shade structure will be actively monitored, and the spoils checked for paleolithic artefacts such as fossils, following the PRMTP.

The proposed project consists of renovation to an existing building, landscaping, replacement of a fence, and addition of a shade structure in the parking lot. At the project site, construction may require temporary traffic control. Motorists will be notified of traffic changes via temporary street signing and traffic control devices per the WATCH. It is anticipated that traffic in both directions will remain open.

The project shall be performed in accordance with applicable WATCH as required by the California Manual on Uniform Traffic Control Devices (CA MUTCD) published by Caltrans, imposed on projects of this nature. City construction crews will coordinate with schools and the Department of Transportation according and provide flaggers when required. When the activity site encroaches upon a sidewalk, walkway or crosswalk area, pedestrians shall be provided advance warning if they are detoured away from the activity construction site.

The proposed project shall be constructed following any or all the applicable measures below:

1. Construction could occur from 7 a.m. to 9 p.m. Monday through Friday and on Saturday from 8 a.m. to 6 p.m. as allowable by *LAMC § 41.10 - Construction Noise*.

2. Notify all adjacent property owners and land users of the construction length, duration, and hours of noise and vibration producing construction activities, in writing.

3. Provide and make available contact information for sidewalk and street repairs and replacement concerns, on construction activities, prior to and on-site during construction.

The equipment used on site will be tested to maintain noise levels at or below the City standard. Standard conditions and construction practices will be implemented for this project. No unusual construction noise or traffic effects are anticipated. No reasonable possibility has been identified that the project will have a significant effect due to unusual circumstances. As such, this exception does not apply.

Therefore, this exception has no application to this project.

4. Scenic Highway. A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway. As of February 12, 2024, the proposed project is not within a state designated scenic highway or within sight of any state designated scenic highway. Therefore, this exception has no application to this project.

5. Hazardous Waste Site. This exception applies when a project is located on a site listed as a hazardous waste site under Government Code Section 65962.5. As of February 12, 2024, the project site was not listed as a hazardous waste site on *Geotracker* or *Envirostor*. Therefore, this exception has no application to this project.

6. Historical Resources. This exception applies when a project may cause a substantial adverse change in the significance of a historical resource. This exception does not apply to the Project. GPA Consulting (GPA) submitted a technical cultural study which concludes that the Las Palmas Senior Citizens Center is not a historical resource for the purposes of CEQA. A paleontological memo authored by Bargas Environmental Consulting reports that no known paleontological resources were identified within a 1-mile buffer of the Project. The upper 15 to 20 feet of sediments consist of unmapped artificial fill, which have a low potential to contain significant paleontological resources due to their disturbed nature. However, the artificial fill is underlain by Pleistocene-age older alluvial sediments, which have a high paleontological potential since numerous vertebrate fossil-bearing localities have been recovered from Pleistocene-age sediments elsewhere in the vicinity of the Project. A Paleontological Resources Monitoring and Treatment Plan (PRMTP) must be prepared and implemented prior to ground disturbance.

The project does not cause a substantial adverse change in the significance of a historical resource. This exception does not apply.
