F. Concrete and Asphalt Site Improvements Walkways: Compact top 6 inches of existing subgrade and each 8" layer of backfill or fill material at 95% relative density.

3.7 BACKFILLING

A. Prior to Backfilling: Remove debris, trash and form materials from excavations.

B. Inspection Required: Prior to backfilling operations.

C. Placement of Backfill: In layers not exceeding 8-inches thickness, moisten to optimum moisture content and tamp until required 95% relative compaction is secured and finish to suitable elevations to provide for anticipated settlement and shrinkage.

D. Pipe Bedding And Backfill Over Underground Piping And Conduit: Place bedding and backfill material in conformance with provisions specified Subsection 2.1 (D) herein and in Section 02545 - STORM DRAIN SYSTEM, Division 15 - PLUMBING and Division 16 – ELECTRICAL of the Project Manual. Do not place backfill materials until the Inspector has inspected and approved the pipe installation. The bedding shall be compacted and shaped to form a firm base for the pipe and conduit. The initial backfill shall be placed in two lifts. The first lift shall be to the spring line of the pipe or conduit. The initial backfill shall be lightly compacted by light tamping compacted by water densification method. The balance of backfill shall be placed in accordance with Subsection 3.8 (C) herein.

E. For Parking Lot or Demolition Jobs: Use clean material previously removed from excavations or use imported materials as hereinbefore specified subject to approval by the Inspector or Engineer.

F. For Backfill Against Basement Walls: Do not place until such walls have gained sufficient strength to resist backfill loads and backside of such walls have been properly waterproofed without prior approval of the Inspector. Bring backfill up to finish grade or to subgrade for paving as indicated on the drawings.

G. In Planting Areas Holes and Tree Wells: After planting, cultivate and soak the specified backfill mix for a minimum of two days using a common lawn soaker if

specified.

H. For Voids Left by the Removal of Sheeting, Piles and Similar Shoring Supports: Immediately backfill with structural backfill of clean sand which shall be jetted into place to ensure a dense and complete filling of the voids.

I. Slurry Backfill: In areas where specified and/or around the utilities, vaults or other structures where the Soil Engineer determines that it is not practical to attain the required compaction by the mechanical methods or water densification, provide a trench slurry backfill 60-E0.7 (Class 100-E-100).

3.8 SELECT BASE

A. Place in accordance with Section 301-2 - UNTREATED BASE of SSPWC and "Soil Report" recommendations.

B. Locations: Place select base beneath concrete and asphalt concrete yard paving, beneath concrete driveway aprons and concrete gutters in yard areas, building floor slab on grade and elsewhere to thickness noted on the Contract Drawings.

C. Thickness: At least 4 inches under yard concrete paving, at least 4-inches under yard asphalt concrete paving, and at least 4-inches under all structure slabs on grade or as otherwise indicated on the Contract Drawings.

NOTE: Place to thickness matching that of original thickness of select base under existing removed concrete or asphalt concrete paving and make ready to receive paving repair materials. Aggregate base shall be compacted to 95% relative density in accordance with Section 301-2 - UNTREATED BASE of SSPWC.

3.9 SOIL STERILIZATION

Apply specified soil sterilization material to areas to receive select base materials and all exterior area including concrete and asphalt paving, concrete walkway, concrete curb and gutter, by methods recommended by the manufacturer. Certify in writing that the material has been applied.

3.12 DISPOSAL OF EXCESS AND WASTE MATERIALS

A. Removal from City's Property: Remove waste materials, including unacceptable excavated material, trash and debris, and dispose of it off City's property in a legal manner and to conform with the requirements shown in Section 01572 – CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT of Division 1 - General Requirements.

B. Provide written consent of the owner of the property upon which the surplus material is to be deposited, pursuant to Section 01572 – CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT specified above and Section 300-26 - SURPLUS MATERIAL of SSPWC.

END OF SECTION

This page intentionally left blank.

SECTION 02545
STORM DRAIN SYSTEM

PART ONE - GENERAL

1.1 DESCRIPTION

A. Furnish all labor, materials and equipment necessary to provide "on-site" Storm Drain System as shown on the Contract Drawing and specified herein, including:

1. Catch basin
2. Maintenance Holes
3. Diversion Structure
4. Valve Structure
5. Hydrodynamics Separator (HDS)
6. Connection to storm drain main line and/or to street gutters.

B. Repair and construct paving and bases after installation of Storm System.

C. **Related Sections:**

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS and DIVISION 1 - GENERAL REQUIREMENTS and applicable section of the Project Manual.
2. Shoring in Section 02240.
3. Earthwork in Section 02310.
4. Irrigation System in Section 32 80 00.
5. Cast-In-Place Concrete Work in Section 03300.
6. Precast Concrete Work in Section 03400.

1.2 QUALITY ASSURANCE

A. **Bonded Contractor:** For connection to City's Storm Drain System including any catch basin or structure, Contractor specializing in the Storm Drain System connection work of this section shall be preapproved, bonded, and certified by Los Angeles City Bureau of Engineering. Submit certificates verifying Contractor's qualifications prior to start of work.

B. **Labor:** Use adequate numbers of skilled laborers who are thoroughly trained and

experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

C. **Codes and Regulations:** Conform to the applicable Los Angeles City Building Code and Amendments**,** Los Angeles City Bureau of Engineering Standard Plans, and the Standard Specifications for Public Works Construction (SSPWC), latest edition.

1.3 SUBMITTALS

A. Comply with applicable provisions in the Section 01330 **-** SUBMITTALS of DIVISION 1 - GENERAL REQUIREMENTS of the Project Manual.

B. **Product Data:** Within 35 calendar days after the Contractor has received the City's "Notice to Proceed", submit:

1. Materials list of items proposed to be provided under this Section and other related Sections;

2. Manufacturer's Specifications and other data needed to prove compliance with the specified requirements;

3. Manufacturer's recommended installation procedures which, when approved by the City Engineer or the Consultant, will become the basis for accepting or rejecting actual installation procedures used on the Work.

C. Contractor’s proof of qualification.

D. **Shop Drawings:**

1. Shoring Drawings.

a. The hydrodynamic separator units will require a long lead time for shop drawing review and shop inspection. It is recommended that the Contractor submit the shop drawings as early as possible to prevent delays.

2. Submit complete shop fabrication drawings of all pipe, pipe specials, hydrodynamic separators, and joint details. Contractor shall also submit a schedule of pipe marks accompanied by a plan showing the field location of each mark.

E. Testing Data and Reports.

1.4 DELIVERY, STORAGE AND HANDLING

A. Deliver material and products with certified delivery tickets to the job-site where directed by the City Engineer or the Consultant.

B. Store materials on the job located where directed by the City Engineer or the Consultant and not interfering with work operations of this Section.

C. Handle materials safely in a manner avoiding damage prior to and during installation and not damaging work of other trades.

1.5 PROTECTION

A. **Required:**

Furnish, erect and maintain barriers, lights and signs as necessary to protect the public, Contractor's and City's personnel and work under this Contract in accordance with Work Area Traffic Control Handbook until such time for backfilling of trenches and subsequent Contracted Site and "Street Work" operations.

1.6 PERMIT

A. **Required:**

1. Obtain Storm Drain Connection permit for connecting and discharging storm water into City street storm drain system as noted on the Contract Drawing and as noted in Sections of GENERAL CONDITIONS and Section 01112 – DESCRIPTION OF THE WORK in GENERAL REQUIREMENTS of the Project Manual or as otherwise directed by the City Engineer or the Consultant.

1.7 INSPECTION

A. **Required:**

1. All work outside the property lines regarding storm drain line connections to the street storm drain or gutters through sidewalk and curbs or as called for on the Contract Drawings, by the Storm Drain Connection Inspector of the Bureau of Contract Administration. Contractor shall make necessary arrangement in accordance with the permit requirements.

2. All work inside the property lines regarding storm drain lines shall be inspected by the Los Angeles City Department of Building and Safety.

3. Test pipes shall be selected from the lot and tested in accordance with the requirements specified in SSPWC, but not necessary limited to. At the place of manufacture, the City Engineer or Inspector will indicate tentative acceptance of the pipe for delivery by marking with the Agency stamp. Final acceptance will be made only when the project has been completed.

4. All pipe penetration and required fire stopping shall be inspected prior to any wall closure.

B. **Notification:** Contractor shall notify all local governing agencies and arrange for required inspection.

1.8 COORDINATION

A. **Required:** All on-site storm drain work shall be fully coordinated with other Contracted Work operations as per approved work scheduled.

PART TWO-PRODUCTS

2.1 PIPE MATERIAL (As applicable)

A. **Reinforced Concrete Pipe:** Cast Pipe wall type, As per Section 207-2 - REINFORCED CONCRETE PIPE of the Standard Specifications for Public Works Construction (SSPWC), sizes as indicated on the Contract Drawings.

2.2 CONCRETE MATERIALS

A. **Required for Catch Basins:** Concrete having a compressive strength of 3250 psi at 28 days as per Section 303 of the SSPWC and in Section 03300 - CAST-IN-PLACE CONCRETE of the Project Manual.

2.3 CATCH BASIN GRATE AND FRAME

A. Alhambra Foundry Ltd., Alhambra, California, No. A-2012 Standard Heavy Weight Traffic Cast Iron (square or rectangular grate and frame), size as indicated on the Contract Drawings, or equal.

2.4 CURB DRAIN PIPE

A. Rectangular in shape conforming to Los Angeles City Bureau of Engineering Standard Plan S-503, latest edition. Material shall be Alhambra Foundry Rectangular Cast Iron Pipes and adaptors, Part A-470 (Rectangular Cast Iron Pipe and Adaptors) and A-480 (Cast Iron Pipe Adaptors, round to rectangular pipe).

2.5 MISCELLANEOUS MATERIALS (As Applicable)

A. **Miscellaneous Metals:** See Section 05500 - METAL FABRICATIONS of the Project Manual.

B. **Grout:** See Section 03300 - CAST-IN-PLACE CONCRETE of the Project Manual.

C. **Mortar:** Comply with requirements of ASTM C270 - SPECIFICATION FOR MORTAR FOR UNIT MASONRY, Type "M" except the maximum placement time shall be one hour. No mortar shall be used which has begun to set; retempering not permitted.

D. **Pipe Bedding and Backfill Materials:** See Sub-Section 3.3 hereinafter, Section 02310-EARTHWORK of SSPWC and other Sections of the Project Manual.

1. Sand shall be graded as follow:

Sieve size	Percentage Passing Sieves
3/8"	100%
No. 4	60-100%
No. 8	65 - 90%
No. 16	45 - 70%
No. 30	25 - 45%
No. 50	10 - 20%
No. 100	2 - 8%
No. 200	0 - 4%
No. 220	0 - 3%

2. Concrete shall be in accordance with the Los Angeles City Bureau of Engineering Standard Plan S-251, latest edition.

2.6 HYDRODYNAMIC SEPARATORS

A. **General:**

1. Hydrodynamic separators shall be constructed of precast concrete and designed to remove oil and sediment from stormwater.

2. Hydrodynamic separators shall be designed with bypass capability such that flows in excess of the maximum treatment flow rate are routed around the treatment gallery and not allowed to contact the area of sediment storage in order to prevent scour and re-suspension of captured sediment.

3. One City of Los Angeles storm drain message marker or placard shall be placed on each hydrodynamic separator. Consult with the City for specific requirements for placard types and methods of application.

B. **Materials:**

1. Concrete for hydrodynamic separator shall conform to ASTM A478 or ASTM C890 and C913.

2. Cement shall be Type I, II, III Portland cement conforming to ASTM C150 with a minimum compressive strength of 4,000 psi.

3. Pipe openings shall be sized to accept pipes of the specified sizes and materials and shall be sealed by the Contractor with hydraulic cement conforming to ASTM C595M or ASTM C1107.

4. The screen system structure to be a welded aluminum framework spanned by the stainless steel screen. It shall be generally rectangular and the inflow end shall remain open to allow water to enter the screen system. All the panels, access doors, and lids that make up the screen system shall be stainless steel.

5. The stormwater treatment system to have a floating skimmer apparatus for preventing floatable debris from entering the treatment vault outlet. A rubber seal

at the face of the skimmer shall prevent the passage of oils, floating chemicals and debris.

6. Access maintenance hole to be constructed of Cast Iron and shall bear the words “Storm Drain”.

C. **Performance:**

1. The hydrodynamic separators should be able to treat a minimum flow rate of 35 cfs with full trash capture.

2. Total Suspended Solids (TSS) removal of at least 80% average annual reduction with a mean particle size of 150 microns.

3. The combination of installed components shall be designed to withstand AASHTO HS20 loads.

4. The hydrodynamic separators shall have the capacity to store at least 190 cubic feet of sediment without affecting the performance of the unit.

D. **Manufacturer:**

1. Old Castle Infrastructure, NSBB-1020-TC

2. Or Approved Equal

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completions of the Work. Do not proceed until detrimental conditions are corrected as directed by the City Engineer or the Consultant.

3.2 EXCAVATING AND TRENCHING

A. **General:**

1. Conform to the requirements as specified on the drawings, Los Angeles City Plumbing Code, Standard Specifications for Public Works Construction and other sections of the Project Manual. Case 1 Bedding installation of Los Angeles City Bureau of Engineering Standard Plan S-251, latest edition shall be used for all piping laying. Any piping with 8 feet or more cover or backfill, trench width shall not exceed the maximum allowable trench width as shown in Standard Plan S-251.

2. Excavate trenches to provide for a minimum 6-inch thickness of bedding sand below bottom of pipe couplings. There shall be a minimum side clearance of 6 inches on each side.

B. Provide excavation and trenches for storm drain piping systems, concrete catch basins indicated on the Contract Drawings in accordance with applicable requirements specified in Section 02310 - EARTHWORK.

3.3 STORM DRAIN SYSTEM CONSTRUCTION

A. **General:** In strict accordance with pipe manufacturers recommendations and the Los Angeles City Plumbing Code and the SSPWC.

B. **Installation of Pipe:** In accordance with Sec. 306-1.2 INSTALLATION OF PIPE of the SSPWS on unyielding bedding foundations with uniform bearing under full length of pipe barrels; walking on or disturbing pipe in any manner after joints have been made, not permitted; at close of each day's work or whenever work is stopped for any reason, protect ends of pipe with temporary tight fitting closures. Slope as per Contract Drawings.

C. Seal all wall and flooring penetrations and sleeves with applicable fire stopping or sealant material. Obtain inspection prior to wall closure or trench backfill.

D. **Bedding:**

1. Provide for a minimum 6-inch thickness of bedding sand below bottom of pipe barrels; any over-excavations may require concrete pipe bedding and to be filled with slurry backfill or structural backfill in accordance with Standard Plan S-251, latest edition, at Contractor's expense; bedding sand to be tamped and compacted and accurately graded and shaped to support bottom quadrant of pipe, with coupling holes dug prior to placement of pipe.

2. Backfill: Provide sand backfill to an elevation of 12 inches over the top of the pipe and floor in accordance with Section 306-1.3.3 – WATER DENSIFIED BACKFILL. Use clean earth material for remainder of backfill to required finish grade and compact for yard paving.

E. **Pipe Juncture with Concrete Structures:** Set pipe ends as necessary for casting-in-place or grouting-in-place after construction of such structures. Junctures with existing storm drain channels to be in accordance with the standards and specifications of the Los Angeles County Flood Control District.

F. **Fill Joints:** (Other than wedge-lock type) with mortar troweled smooth on inside of pipe; keep mortar joints damp until backfill is placed.

G. **Pipe Juncture with Concrete Structures:** Set pipe ends as necessary for casting-in-place or grouting-in-place after construction of such structures.

3.4 CONCRETE STRUCTURES

A. **General:** Catch basins, gutters, maintenance holes, hydrodynamic separators, etc. as indicated on the Contract Drawings.

B. **Materials:**

1. Concrete: As specified in Sections 03300 CAST-IN-PLACE CONCRETE.

2. Grates, Frames and Covers: As hereinbefore specified.

3. Miscellaneous Metals: As specified in Section 05500 - METAL FABRICATIONS.

C. **Construction:** As indicated on the Drawings and specified in Section 03300 - CAST-IN-PLACE CONCRETE.

D. **Catch Basins:** Section 303-1- CONCRETE STRUCTURE and 303-1.4.4(b) - STANDARD CATCH BASIN of the SSPWC as applicable. Forms to be of 1-inch minimum thick plywood; remove forms minimum 24-hours after concrete pour; top surface of catch basins to conform to drawing details or paving grades and as directed by the City Engineer or the Consultant; steel trowel finish and lightly brushed with bristle brush all exposed surfaces; gratings and frames to be set flush and level with top surface of basin or as otherwise indicated on the Contract Drawings.

E. **Maintenance Holes, Hydrodynamic Separators, Diversion Structure:** Construct at location and to elevations indicated on the Contract Drawings, in accordance with details and materials noted thereon; set precast concrete segments with full mortar joints troweled smooth on interior of maintenance hole; set cover frames in full mortar bed and accurately to meet paving grades.

3.5 BACKFILL

A. As specified in "Sand and Backfill" subsections of Sections 02310 - EARTHWORK and provisions herein, including approval, place approved washed sand 12-inches above top of pipe and the balance of backfill shall be approved clean earth material free from waste material, rock or large clods larger than 1-inch in size. If excavated material is unsuitable or rejected; Contractor shall provide approved imported materials as necessary to complete the work.

B. No backfill material shall be deposited against the concrete structure until the concrete has developed not less than the specified 28 - day compressive strength.

3.6 TESTING (As Applicable)

A. **Required:** Provide personnel and equipment necessary, and perform tests required to demonstrate that the work of this Section has been completed in accordance with the specified requirements.

B. **Hydrostatic Test on Watertight Joints:**

1. Make a hydrostatic test on each watertight joint. Test one sample of each type watertight joint used. If one sample fails because of faulty workmanship, test an additional joint.

2. Demonstrate that joints in reinforced and unreinforced concrete pipe comply with ASTM C443 - SPECIFICATION FOR JOINTS FOR CIRCULAR CONCRETE SEWER AND CULVERT PIPE, USING RUBBER GASKETS.

3. Make tests in concrete pipe and clay pipe at an internal hydrostatic pressure of 10 psi for 24-hours.

4. Replace or repair joints found to be faulty. Repeat the test and repair cycle until joints are demonstrated to meet the specified requirements.

END OF SECTION

This page intentionally left blank

SECTION 02550
LINED REINFORCED CONCRETE PIPE

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the work as indicated in the Contract Documents.

B. This Section covers lined reinforced concrete pipe intended to be used for the construction of sewers, and related structures.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 02310 Earthwork.

B. Section 02585 Maintenance Hole and Precast Vault Construction.

C. Section 03300 Cast-in-Place Concrete.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the applicable reference specifications as specified in the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards.

1. Commercial Standards:

ASTM C76	Specification for Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
ASTM C596	Test Method for Drying Shrinkage of Mortar Containing Portland Cement.
ASTM D 412	Test method for tensile strength and elongation.
ASTM D 2240	Test method for indentation hardness.

2. Standard Specifications SSPWC Sections 207 - 3, 210 - 2, and 311 - 1.

1.4 CONTRACTOR SUBMITTALS

A. Shop drawing submittals shall be made in accordance with the GENERAL REQUIREMENTS and SSPWC Section 2-5.3.2.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Except as modified herein, reinforced concrete pipe shall conform to the requirements of ASTM Designation C 76 for Class II, Wall B, and Type II cement. Unless otherwise specified, pipe shall have tongue and groove joints designed to be self-centering and to leave a recess on the inside of the pipe for pointing with mortar after jointing. Pipe shall be designed for an internal pressure of 26 feet of water, and an external D load as labelled on the Drawings.

B. The size, type, and D-load of the concrete pipe to be furnished shall be as shown on the Drawings, as specified under the bid item of work for the project, or as stated above.

C When pipe joints of the reinforced concrete collar type or of rubber-gasketed type are specified or indicated on the Drawings, joint details shall be submitted to the ENGINEER for acceptance before commencing pipe manufacture.

2.2 MATERIALS

A. Except when otherwise permitted by the ENGINEER, no materials shall be used in manufacturing of the pipe other than water, Portland cement, mineral aggregates and steel conforming to ASTM C 76, with the following exceptions:

1. All cement to be used or furnished shall be Type II low alkali Portland cement conforming to ASTM C 150 or Type IP (MS) Portland-pozzolan cement conforming to ASTM C 595, unless otherwise specified. Either cement shall conform to the low alkali requirements of Table IA of ASTM C150. Type IP (MS) cement shall contain no more than 20 percent pozzolan, which shall be interground with the clinker.

2. Aggregates shall be nonreactive when tested in accordance with ASTM C 289 and evaluated in accordance with Appendix A-1 of ASTM C 33. Aggregates found to be potentially reactive may be used only upon written acceptance of the ENGINEER.

B. All pipe manufactured under the provisions of this Specification shall contain a minimum of 560 lb of cement per cubic yard of concrete unless mix designs with a lower cement content meet the requirements of this Specification and approved by the ENGINEER prior to use.

C. Cement Mortar: Cement mortar shall consist of a mixture of Portland cement, sand, and water. Cement and sand shall first be combined in the proper proportions, and then thoroughly mixed with the required amount of water. Cement mortar shall be proportioned by loose volume in the proportion of 1 part cement to 2 parts sand. The quantity of water to be used in the preparation of mortar shall be only that required to produce a mixture sufficiently workable for the purpose intended. Mortar shall be used as soon as possible after mixing and shall show no visible signs of setting prior to use. Retempering of mortar will not be permitted. Cement, sand, and water for cement mortar shall conform to Section 03300 Cast-in-Place Concrete.

D. Admixtures: No admixtures shall be used in mortar unless otherwise specified or accepted by the ENGINEER.

E. Quick Setting Grout: Quick setting grout shall be high strength, non-staining grout accepted by the ENGINEER prior to use. It shall reach an initial set within 90 minutes at 70 degrees F and shall reach minimum compressive strength of 2,500 psi within 24 hours. Shrinkage shall be less than 0.1 percent when tested, using the test procedures of ASTM C 596. The grout shall be mixed, handled, and placed in accordance with the manufacturer's written instructions.

F. Gaskets for Concrete Pipe: Unless otherwise specified, gaskets shall be manufactured from a synthetic elastomer conforming to SSPWC Section 208-3.

G. Plastic liner shall be in accordance with SSPWC Section 210-2.

PART 3 -- EXECUTION

3.1 INSTALLATION OF LINED REINFORCED CONCRETE PIPE

A. Liner shall be installed accordance with Standard Plan No. S-121, and SSPWC Section 311-1.

3.2 Pipe shall be laid to plan line and grade, with uniform bearing under the full length of the barrel of the pipe. Pipe shall be installed in accordance with SSPWC Section 306 1.2 as modified by Standard Plan S-251. Suitable excavation shall be made to receive the socket or collar, which shall not bear upon the subgrade or bedding. Any pipe which is not in true alignment or shows any undue settlement after laying shall be taken up and relaid at the CONTRACTOR's expense. Pipe shall be laid up-grade with the socket or collar ends of the pipe upgrade unless otherwise authorized by the ENGINEER. Concrete pipe with elliptical reinforcement shall be laid with the minor axis of the reinforcement cage in a vertical position.

3.3 FIELD JOINTING OF LINED REINFORCED CONCRETE PIPE

A. Field jointing shall be in conformance with SSPWC Section 306 -1.2.4.

END OF SECTION

This page intentionally left blank

SECTION 02585
MAINTENANCE HOLE AND PRECAST VAULT CONSTRUCTION

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the work as indicated on the Drawings and specified herein.

B. This section covers the work necessary for the construction of maintenance holes and precast vaults. General maintenance hole and vault details are as shown on the Drawings.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 01330 Shop Drawings/Submittals

B. Section 01453, Sampling, Testing, and Fabrication Inspection.

C. Section 02310 Earthwork

D. Section 03300 Cast-in-Place Concrete.

E. Section 03400 Precast Concrete for hydrodynamic separator and Stormfilter treatment vaults.

F. Section 13200 for Precast Concrete for Modular Buried Stormwater Infiltration System.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the applicable reference specifications as specified in the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards.

1. Commercial Standards:

ASTM A 48	Specification for Gray Iron Castings.
ASTM C 14	Standard Specification for Nonreinforced Concrete Sewer, Storm Drain, and Culvert Pipe.
ASTM C 150	Specification for Portland Cement.
ASTM C 387	Standard Specification for Packaged, Dry, Combined Materials for Concrete and High Strength Mortar.
ASTM C 478	Standard Specifications for Circular Precast Reinforced Concrete Manhole Sections.

AASHTO LRFD with version and modifications per Caltrans's latest Addendum.

2. Standard Specifications: SSPWC Section 206 -3 Gray Iron Casting

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. Shop Drawings: The CONTRACTOR shall furnish complete shop drawings for all precast maintenance hole sections, cast iron frames and covers, and appurtenances for review by the ENGINEER in accordance with **SUBMITTALS** of the GENERAL REQUIREMENTS. This shall include

1. Concrete mix design and structural calculations of non-standard elements, signed and sealed by a California Registered Civil or Structural Engineer.

2. Joint details of all precast sections and jointing between cast-in-place and precast segments.

3. Method of weathertightness, and watertight joints, when groundwater is within five (5) feet from the lowest joint, and associated test reports

4. Joint materials and products including mortars, o-rings, gaskets, etc.

5. Lifting anchor and all other anchor information.

6. Details, products, and appurtenances for all lateral connections, and particular locations.

C. Non-Preapproved Products: For products which are not listed on the online approved products list (http://boe.lacity.org/apm/menu.cfm), the Contractor shall secure the services of a precaster to design, and fabricate the required precast reinforced concrete products, including the preparation of all associated plans, calculations, and documentation of associated appurtenances such as joints, gaskets, sealants, protective liners Type I, etc., to the full satisfaction of the ENGINEER. Calculations and plans shall be signed and sealed by a California registered Civil and/or Structural Engineer. Joints, gaskets, and sealants shall be tested to meet the requirements of the Contract. Non-approved maintenance hole products will not be considered unless there are none listed in the online approved products list.

1.5 DESIGN CRITERIA

A. Design of precast structures and maintenance holes shall conform to S-601-3, including cumulative supplements, and ASTM C478, including AASHTO LRFD with version and modifications per Caltrans' latest addendum.

B. For structures used as part of a sanitary sewer system, surfaces exposed to a corrosive environment shall be lined with an approved Type I liner System. Mortar bed just below frame and cover shall be sealed with approved epoxy sealant.

1.6. QUALITY ASSURANCE

A. Fabrication: Contractor shall coordinate with the Bureau of Contract Administration Materials Control Inspection for required inspection prior to fabrication. See Section 01453 for detail requirements.

B. Field Inspection: All work is subject to inspection including excavation, placement, backfill, and finishing. The CONTRACTOR shall demonstrate that all maintenance holes and precast vault segments have been properly installed, level, with tight joints, at the correct elevations and orientations, and that the backfilling has been carried out in accordance with the Contract Documents. Coordinate with Inspector prior to start of work.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Products used shall be pre-approved products, up to date and in good standing, as listed in the online approved products list (http://boe.lacity.org/apm/menu.cfm), including maintenance holes and frame & covers. Where no acceptable pre-approved product exists, the CONTRACTOR shall retain the services of a precaster to design and fabricate a project specific structure. Plant approval shall be required.

2.2 GRANULAR BASE

A. Granular base shall conform to Section 02310"Earthwork."

2.3 CONCRETE

A. Ready-mixed, conforming to ASTM C 94, Alternate B.

B. Mix design shall conform to SSPWC.

C. The concrete class for maintenance hole bases shall be 660-CW-4000, or 560-B-3250.

D. The concrete class for maintenance holes and precast structures shall be by strength, with a minimum compressive strength of 4,000 psi.

2.4 FORMS

A. Exterior exposed surfaces shall be plywood. Others shall be matched boards, plywood, or other approved material. Provide forms on all vertical surfaces. Trench walls, large rock, or earth will not be approved as form material.

2.5 REINFORCING STEEL

A. For maintenance holes, conform to ASTM A 615, Grade 40, or greater.

B. For precast vaults or structures, conform to ASTM A615 Grade 60, deformed bar.

C. All bars intended to be welded shall conform to ASTM A706 and AWS D1.4.

2.6 POURED-IN-PLACE MAINTENANCE HOLES

A. Poured-in-place type maintenance holes may be used provided all details of construction are accepted by the ENGINEER.

2.7 PRECAST MAINTENANCE HOLE SECTIONS

A. Precast maintenance hole sections shall be minimum 60 inches in diameter, conforming to

Standard Plan S-387, S-142, S-150 and to ASTM C 478. Minimum wall thickness shall be 5 inches for reinforced sections. Provide eccentric cones for all maintenance holes. Cones shall have same wall thickness and reinforcement as maintenance hole section. Top and bottom of all sections shall be parallel. Maintenance hole steps shall be cast in the Precast Sections by the manufacturer of the maintenance hole sections.

B. Joints shall be tongue-and-groove with rubber gaskets conforming to ASTM C 443. The CONTRACTOR's attention is directed to specification for MORTAR hereinafter.

C. Prior to the delivery of any size of precast maintenance hole section on the jobsite, yard tests will be conducted at the point of manufacture. The precast sections to be tested will be selected at random from the stockpiled material which is to be supplied for the job. All test specimens will be mat tested, and shall meet the permeability test requirements of ASTM C 14.

2.8 PRECAST BASE SECTIONS AND BASES

A. At the option of the CONTRACTOR, precast base sections or maintenance hole bases may be used provided all details of construction are approved by the ENGINEER. Base sections shall have the base slab integral with sidewalls. Base slab shall be constructed in accordance with Standard Plan S-140. Tie reinforcing steel to wall steel.

2.9 MAINTENANCE HOLE EXTENSIONS

A. Concrete grade rings for extensions shall be a maximum of 6 inches high and shall be approved by The INSPECTOR before installation.

B. In general, maintenance hole extensions will be used on all maintenance holes in roads or streets or in other locations where a subsequent change in existing grade may be likely. Extensions will be limited to a minimum of 12 inches and a maximum height of 2 feet 6 inches. Finish grade for maintenance hole covers shall conform to finished ground or street surface level, unless otherwise directed by the ENGINEER.

C. For raising of maintenance hole, conform to S-137.

2.10 MORTAR

A. Standard premixed mortar conforming to ASTM C 387 or proportion 1 part Portland cement to 2 parts clean, well-graded sand which will pass a 1/8-inch screen. Admixtures may be used not exceeding the following percentages of weight of cement: Hydrated lime, 10 percent; diatomaceous earth or other inert materials, 5 percent. Consistency of mortar shall be such that it will readily adhere to the pipe when using the standard tongue-and-groove type joint. Mortar mixed for longer than 30 minutes shall not be used.

2.11 PREFORMED SEALANTS

A. Preformed sealants may be used in lieu of mortar type joints and shall be Kent-Seal No. 2 manufactured by Hamilton Kent Manufacturing Company, Kent, OH**;** Ram-Nek, manufactured by K. T. Snyder Company, Inc., Houston, TX; or equal, meeting all requirements of Federal Specification SS-S-00210.

2.12 PIPE STUBOUTS FOR FUTURE SEWER CONNECTIONS

A. Pipe stubouts shall be the same type as approved for use in lateral, main, or trunk sewer

construction. Strength classifications shall be the same class as in adjacent trenches. Where there are two different classes of pipe at a maintenance hole, the higher strength pipe will govern strength classification. Rubber gasketed watertight plugs shall be furnished with each stubout adequately braced against all hydrostatic or air test pressures.

2.13 PRECAST CONCRETE VAULT

A. The precast concrete vault shall be precast with a 28-day, 3,250 psi minimum compressive strength concrete and designed for AASHTO H-20 loading. Minimum dimensions are shown on the Drawings. Provide openings for pipes and grating as shown on the Drawings.

2.14 MAINTENANCE HOLE STEPS

A. Maintenance hole steps shall be made of minimum 3/4-inch stainless steel bar Type 316. Steps shall be 12-inch wide minimum, center-to-center of legs, and shall be drop pattern with a 2 1/2-inch drop. Bends shall be made around a 1-inch radius minimum, 2-inch radius maximum mandrel. There shall be 3-inch minimum embedment in precast concrete maintenance hole sections and 4-1/2-inch minimum projection from the face of concrete at point of embedment to the center of the step. There shall be a 2-inch hook on the embedment end.

B. The installed steps shall be located so as to provide a continuous ladder with steps equally spaced vertically in the assembled maintenance hole at 12 inches ± 3/4-inch. They shall be capable of withstanding a force of 350 pounds, applied at any place on the step and in any direction which projects from the point of application through a diameter of the step cross-section at that point, with no permanent deformation resulting. Steps shall be cast in manhole sections by the manufacturer.

2.15 MAINTENANCE HOLE FRAMES AND COVERS

A. Cast iron of size and shape detailed on the Drawings. Covers shall have the letter “S” or “D” fitted tight in a 3-inch diameter circle in the center of the cover. Frame and cover shall conform to applicable City of Los Angeles Standard Plans. Test per S-601. Frames shall have a minimum clear opening of 30 inches.

B. Non-preapproved products shall conform to Standard Plan S-601 and the following requirements. The more stringent shall apply: Castings shall be tough, close-grained gray iron, sound, smooth, clean, free from blisters, blowholes, shrinkage, cold shuts, and all defects, and shall conform to ASTM A 48, Class 35B. Plane or grind bearing surfaces to ensure flat, true surfaces. Covers shall be true and seat within ring at all points.

PART 3 -- EXECUTION

3.1 EXCAVATION AND BACKFILL

A. Conform to applicable portions of Section 02310 “Earthwork”. Backfill around maintenance holes shall be of the highest quality of trench backfill immediately adjacent, as shown on the Drawings.

3.2 GRANULAR BASE

A. Remove water from the excavation. Place a minimum of 6 - inches of granular base and thoroughly compact with a mechanical or power vibrating tamper to a minimum of 90%

relative compaction.

3.3 CONCRETE BASE

A. Construct concrete base in conformance with the details shown on the Drawings. Vibrate to densify the concrete and screed so that the first precast maintenance hole section to be placed has a level, uniform bearing for the full circumference.

B. Deposit sufficient mortar on base to assure watertight seal between base and maintenance hole wall or place the first precast section of maintenance hole in concrete base before concrete has set, if preferred. First section shall be properly located and plumb.

C. If material in bottom of trench is unsuitable for maintenance hole, excavate below the flow line as directed by ENGINEER, and backfill to required grade with granular base per geotechnical recommendations.

3.4 PLACING PRECAST MAINTENANCE HOLE SECTIONS

A. Clean ends of sections of foreign materials. Thoroughly wet joint with water prior to placing mortar. Place mortar on groove of lower section. Set next section in place. Fill joint completely with mortar of the proper consistency. Trowel interior and exterior surfaces smooth on standard tongue-and-groove joints. Wipe or otherwise clean the excess mortar from the inside of the Keylock joint.

B. When a **Keylock** joint is used, it is the intent that the void between the tongue-and-groove be completely filled with mortar, and that the interior and exterior end faces of the section to be placed seat fully on the previously placed section.

C. Prevent mortar from drying out and cure by applying an approved curing compound or comparable approved method. Chip out and replace all cracked or defective mortar. Completed maintenance holes shall be rigid and watertight.

3.5 PREFORMED PLASTIC GASKETS

A. Carefully inspect precast maintenance hole sections to be joined. Sections with chips or cracks in the tongue shall not be used. Preformed plastic gaskets shall be installed in strict conformance with the manufacturer's recommendations. Only pipe primer furnished by the gasket manufacturer will be approved.

3.6 MAINTENANCE HOLE INVERT

A. Construct maintenance hole inverts in conformance with details shown on the Drawings, and with smooth transitions to ensure an unobstructed flow through maintenance hole. Remove all sharp edges or rough sections which tend to obstruct flow. Where a full section of pipe is laid through a maintenance hole, break out the top section as indicated and cover exposed edge of pipe completely with mortar. Trowel all mortar surfaces smooth.

B. For benches of maintenance holes greater than 48 inches in diameter, line the surface and make it non-skid per SSPWC 311-1.7.

3.7 FLEXIBLE JOINTS

A. Provide joints in all pipe not more than 1.5 feet from maintenance hole walls. Lay pipes entering maintenance holes on firmly compacted granular base. Granular base shall be as specified hereinbefore.

B. Where the last joint of the line laid up to the maintenance hole is more than 1.5 feet from the maintenance hole base, a 6-inch concrete encasement shall be constructed around the entire pipe from the maintenance hole base to within 1.5 feet of the pipe joint. The pipe encasement shall be constructed monolithically with the maintenance hole base. Pipes laid out of the maintenance hole shall be shortened to ensure the first joint is no more than 1.5 feet from the maintenance hole base.

3.8 PIPE STUBOUTS FOR FUTURE SEWER CONNECTIONS

A. Install stubouts in maintenance holes for future sewer connections as shown or as required by the ENGINEER. Maximum length shall be 1.5 feet outside the maintenance hole wall. Grout pipes in precast walls or maintenance hole base to provide watertight seal around pipes. Construct invert channels in accordance with details shown on the Drawings. Provide compacted granular base as specified herein before to undisturbed earth under all stubouts.

B. Install semi-permanent plugs at the end of stubouts with gasket joints similar to sewer pipe being used. Plugs shall be capable of withstanding all internal or external pressures without leakage. All plugs to be braced to prevent blowoffs.

3.9 PERMANENT PLUGS

A. Clean interior contact surfaces of all pipes to be cut off or abandoned as shown. Construct concrete plugs at the end at of all pipes 18 inches or less in diameter. Minimum length of concrete plugs shall be 8 inches. For pipe 21 inches and larger, the plugs may be constructed of common brick or concrete block. Plaster the exposed face of block or brick plugs with mortar. All plugs shall be watertight and capable of withstanding all internal and external pressures without leakage.

3.10 MAINTENANCE HOLE EXTENSIONS

A. Install extensions in conformance with the details shown on the Drawings, and to height determined by the ENGINEER. Lay grade rings in mortar with sides plumb and tops level. Seal joints with mortar as specified for maintenance hole sections. Extensions shall be watertight.

3.11 MAINTENANCE HOLE FRAMES AND COVERS

A. Install frames and covers on top of maintenance holes to positively prevent all infiltration of surface or groundwater into maintenance holes. Frames shall be set in a bed of mortar with the mortar carried over the flange of the ring as shown in the Maintenance Hole Details on the Drawings. Set frames so that tops of covers are flush with surface of adjoining pavement or ground surface, unless otherwise shown or directed.

3.12 MAINTENANCE HOLES OVER EXISTING SEWERS

A. Construct maintenance holes over existing operating sewer lines at locations shown. Perform necessary excavation as specified above, break into existing line, and construct

maintenance hole.

B. Maintain flow through existing sewer lines at all times, and protect new concrete and mortar work for a period of 7 days after concrete has been placed. Advise ENGINEER of plans for diverting sewage flow and obtain ENGINEER's approval before starting. ENGINEER's approval will not relieve CONTRACTOR of responsibility for maintaining adequate capacity for flow at all times and adequately protecting new and existing work.

C. Construct the new base under the existing sewer and the precast sections as specified herein.

D. Break out the existing pipe within the new maintenance hole, cover the edges with mortar, and trowel smooth.

3.13 PRECAST CONCRETE VAULT

A. Install precast concrete vault at the locations shown on the Drawings. Provide necessary excavation and backfill as specified herein.

3.14 HYDROSTATIC TESTING

A. All sewer maintenance holes shall be hydrostatically tested for leakage after installation, but prior to being backfilled. Prior to hydrostatic testing, all maintenance holes shall be visually inspected for leaks. All leaks or cracks shall be repaired by the CONTRACTOR, prior to hydrostatic testing, to the satisfaction of the ENGINEER and the INSPECTOR. All pipes entering the maintenance hole shall be sealed at a point outside the maintenance hole walls so as to include testing of the pipe/maintenance hole joints. Maintenance holes may be filled 24 hours prior to time of testing, if desired, to permit normal absorption into the pipe walls to take place. The maintenance hole shall be filled with water to a level 2 inches below the top of the frame. Safety lines shall be secured to all plugs utilized. After a period of at least one hour to allow the water level to stabilize, the maintenance hole shall be refilled and the water level shall be checked. The water level shall again be checked after a period of 4 hours. If the water level is reduced by more than 1/4-inch, the leakage shall be considered excessive, and the CONTRACTOR shall be required to make all necessary repairs and retest the maintenance hole. The exterior of the maintenance hole shall be inspected during this period for visible evidence of leakage. Visible moisture, sweating, or beads of water on the exterior of the maintenance hole shall not be considered leakage, but any water running across the surface will be considered leakage and shall be repaired to the satisfaction of the ENGINEER and the INSPECTOR regardless of the volume of water lost.

END OF SECTION

SECTION 02600
DUCTILE-IRON VENT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Materials, equipment and incidentals required to install and test ductile iron pipe and fittings for yard vent piping as shown on Drawings and as specified.

a. The word "pipe" is used to refer to pipe, fittings, or appurtenances unless otherwise noted.

2. Yard Piping: Includes piping and fittings extending outward, upward and downward into the ground from the outside face of structures.

3. Locate piping as shown on the Drawings. The Engineer reserves the right to make modifications in locations as may be found desirable to avoid interference between pipes or for other reasons.

B. Related Requirements:

1. Section 2310 Earthwork

1.3 ACTION SUBMITTALS

A. Section 013300 “Submittal Procedures” for submittals requirements.

B. Shop Drawings and Product Data:

1. Including piping layouts, design calculations, warranty information, test reports, in accordance with Section 01330 Shop Drawing Submittals.

1.4 INFORMATIONAL SUBMITTALS

A. Prior to Pipe Shipment:

1. Certified copies of mill tests confirming type of materials used in pipe, and shop testing of pipe to show compliance with requirements of applicable standards, along with a sworn affidavit of compliance that pipe complies with referenced standards.
2. Certified affidavit of compliance from manufacturer stating that pipe, fittings, gaskets, linings and exterior coatings for project have been manufactured and tested in accordance with AWWA and ASTM standards and requirements specified herein.

1.5 QUALIFICATIONS

A. Manufacturer shall meet the following criteria and furnish necessary project information, which demonstrates required experience:

1. Experience that includes successful fabrication (followed by installation, acceptance and service) to AWWA C151 standards of at least 50,000 lineal feet of largest specified diameter or larger ductile iron pipe with similar linings/coatings within the past 5 years.
2. Experience to include successful fabrication of at least 50 fittings in compliance with AWWA C110 or C153 of largest specified diameter or larger with similar lining/coatings within the past 5 years.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Per AWWA C600 and referenced AWWA Standards for shipping, handling and storage procedures.

1. Deliver materials in manufacturer's packaging including application instructions.
2. Handle to prevent injury to pipe, pipe linings and pipe coatings.

    a. Examine pipe and fittings as noted in Division 01. Damage to linings or coatings discovered during examination to be repaired to the satisfaction of Engineer before proceeding with work.

3. Transport pipe to job site on padded bunks or oak timbers and secured with steel banding or nylon tie down straps adequately protecting pipe and coating.

    a. Handle pipe using slings, hooks, pipe tongs or other devices acceptable to Engineer.
    b. Do not use non-cushioned ropes, chairs, wedges, cables or levers when handling finished pipe, fittings or couplings.
    c. Do not drop pipe or fittings.
    d. Do not skid pipe or fittings against each other.
    e. Do not mark pipe or fitting coatings.

f. Utilize padded wooden pipe cradles, or chocks suitable for protecting coatings between and beneath finished pipes when pipes are placed upon rough surfaces.

B. Storage:

1. Do not store pipe on bare ground unless soft sand berms are used to support pipe and is approved by Engineer.
2. Keep materials safe from damage if stored. Interior of pipe, fittings and other appurtenances to be kept free from dirt, excessive corrosion or foreign matter.
3. Do not stack pipe higher than limits recommended by manufacturer. Keep bottom tier off ground using timbers, rails, or concrete. Stacking to conform to manufacturer's recommendations and/or AWWA C600.
4. Store gaskets for mechanical and push-on joints in a cool location out of direct sunlight; not in contact with petroleum products. Use gaskets on a first-in, first-out basis.

C. Protection:

1. Lined and coated pipe: Suitably protected from exposure and heating from sun. Follow procedures recommended by coating and lining system manufacturer.

a. Exposure will not be allowed except for short periods such as installation, assembly and repairs.

2. Metal tools or heavy objects are not permitted to come in contact unnecessarily with finished coating.

a. Workers may walk on coated pipe only when necessary, and only when wearing footwear with rubber or composition soles and heels sufficiently free of dirt and mud so coating remains undamaged.

3. Prevent damage to linings and coatings caused by handling, onsite storage, and exposure to low temperatures (due to embrittlement), high temperatures, or direct sunlight.

1.7 EXISTING CONDITIONS

A. Field Measurements: Verify field locations and sizes of connections to existing piping and equipment prior to submitting pipe lay drawings.

1. Indicate field measurements on Shop Drawings.

1.8 WARRANTY

A. Furnish two year manufacturer's warranty for ductile iron pipe and fittings.

PART 2 - PRODUCTS

2.1 SYSTEMS

A. Assure compatibility between joints of all items supplied.

2.2 DUCTILE IRON PIPE

A. Manufacturers: Provide pipe and fittings supplied by:

1. American Cast Iron Pipe Co.
2. U.S. Pipe and Foundry.
3. Griffin Pipe Products.
4. McWane Company; all pipe divisions.
5. An approved equivalent member of the Ductile Iron Pipe Research Association (DIPRA).

B. Ductile Iron Pipe: Per AWWA C151. Provide in standard lengths as much as possible.

C. Thickness Design: Per AWWA C150, except as follows:

1. Piping 12 inches and Smaller: Minimum Class 350.

2.3 FITTINGS

1. Pipe Fittings: Ductile iron per AWWA C110 or AWWA C153 as applicable. Fittings to have the same pressure rating, as a minimum, of the connecting pipe.

2.4 LININGS, COATINGS & CORROSION PROTECTION

A. Interior Lining:

1. Cement Mortar Lining: Per AWWA C104 double thickness. Cement type per ASTM C150.

B. Exterior Coating

1. Buried pipe installed with bituminous coating per AWWA C151 and C110 respectively.
2. Install buried pipe with polyethylene encasement.

a. Polyethylene Encasement: 8 mils thickness meeting standards per AWWA C105.

1) Three layers of co-extruded linear low-density polyethylene (LLDPE), fused into a single thickness not less than eight mils. Infuse inside surface in contact with pipe exterior with an antimicrobial compound and volatile corrosion inhibitor blend, mitigating microbiologically influenced corrosion galvanic corrosion.
2) Polyethylene encasement shall be V-Bio, as patented by DIPRA.

b. Manufacturers:

1) North Town Company.
2) AA Thread and Seal Tape, Inc.
3) Sigma Corp.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Section 017300 “Execution” for installation examination requirements.

3.2 PREPARATION

A. Section 017300 “Execution” for installation preparation requirements.

B. Handle piping and fittings per “Delivery, Storage, and Handling” Article in Part 1 of this specification.

C. Examine pipe and fittings before laying. Repair any damage to pipe, lining or coatings per manufacturer's recommendations prior to installation.

D. Interior of all pipe, fittings and other appurtenances shall be kept free from dirt, excessive corrosion or foreign matter at all times.

3.3 INSTALLATION

A. Installed per requirements of laying schedule and AWWA C600, unless otherwise specified.

1. Provide firm, even bearing length of pipe. Dig bell holes at each joint. Tamp backfill materials on pipe sides to springline per details on Drawings.
2. Blocking is not permitted.
3. Replace with sound pipe or fitting, defective pipe or fitting discovered after having been laid.
4. When laid, pipe and fittings shall perform to lines and grades required. When laying is not in progress, close open ends of pipe with watertight plug or other approved means.
5. Place sufficient backfill to prevent flotation. Joint deflection not to exceed manufacturer’s recommendation.
6. Pipe Laid Underground: 3 feet cover unless Drawings show otherwise or otherwise specified.
7. Lay pipe such that invert elevations shown on Drawings are not exceeded.
8. Provide fittings, in addition to those shown on Drawings, where required, in crossing utilities which may be encountered upon opening trench. Install solid sleeve closures at locations approved by Engineer.
9. Pipe Interior: Maintain dry and broom clean throughout construction period.

10. Field Cutting Pipe: When required, smooth cut by machine perpendicular to pipe axis. Bevel cut pipe ends per manufacturer's recommendations for spigot end.

    a. Repair coating removed from cut per manufacturer's recommendation and/or coating and lining paragraphs of Part 2 above (whichever method is more stringent in opinion of Engineer).
    b. Cement lining shall be undamaged.
    c. Cutting of restrained joint pipe will not be allowed, unless approved at specific joints in conjunction with use of restrainer glands by EBAA Iron or field adaptable restrained joints.
    d. Where Field Cuts are Permitted" Pipe supplied by factory as "gauged full length".

        1) Gauged Full Length Pipe is Unavailable: Pipe to be field gauged at location of new spigot using a measuring tape, or other means approved by manufacturer, to verify that diameter is within tolerances permitted in Table 1 of AWWA C151.

B. Jointing Ductile-Iron Pipe:

1. Push-On Joints: Install per manufacturer's instructions, AWWA C600 and Appendix B of AWWA C111. If there is conflict, manufacturer's instructions take precedence.

    a. Lay pipe with bell ends looking ahead.
    b. Insert rubber gasket in groove of bell end of pipe.
    c. Clean and lubricate joint surfaces
    d. Align plain end of pipe with bell of pipe to which it is to be joined and pushed home.
    e. Metal feeler shall be used to make certain that rubber gasket is properly seated.

2. Flanged Joints (Non-Buried): Assembled per manufacturer's instructions and Appendix C of AWWA C111. If there is conflict, manufacturer's instructions take precedence.

    a. Ensure there is no restraint on opposite ends of pipe or fitting, which would prevent uniform gasket compression, cause unnecessary stress, bending or torsional strains, or distortion of flanges or flanged fittings.
    b. Adjoining push-on joints are not to be assembled until flanged joints have been tightened.
    c. Tighten flange bolts for uniform gasket compression and sealing.

        1) Leave flange bolts with approximately 1/2 inch projection beyond nut face after tightening.

    d. Encapsulate bolts and nuts using wax sealing tape per AWWA Standard C217.

C. Polyethylene Encasement:

1. Install polyethylene encasement around ductile iron pipe to limits shown on Drawings and in accordance with pipe manufacturer's recommendations.

a. Installed per ANSI/ AWWA C105/A21.5, Method 'A' in accordance with section 2.15 of DIPRA's Installation Guide for Ductile Iron Pipe.

2. Use a fabric type or padded sling when handling pipe to prevent damage to encasement.
3. Seal seams with approved 2 inch wide plastic adhesive tape.
4. Repair encasement rips or tears with tape and film per ANSI/AWWA C105/A21.5.
5. When backfilling do not damage polyethylene encasement.

D. Cathodic Protection Systems:

3.4 CONNECTIONS TO STRUCTURES

A. Where pipe 3 inch diameter or larger horizontally passes from concrete to earth, install two flexible joints spaced 4 feet apart depending on pipe size within 2 feet of exterior wall face, whether shown on Drawings or not.

B. Utilize wall sleeves for pipes passing through walls designed to pass through wall via restrained piping unless otherwise specified.

C. Encase piping underneath structures in reinforced concrete as shown in Drawings.

3.5 FIELD QUALITY CONTROL

A. Replace with sound pipe or fitting, defective pipe or fitting discovered after having been laid.

B. Thoroughly clean pipe and fittings before laying. Keep clean until used in Work.

C. Pipe and fittings, when installed or laid, shall conform to lines and grades required.

3.6 EXHIBIT A

Use as a reference

INTERIOR LININGS AVAILABLE FOR DUCTILE IRON PIPE

Description	Max./ Service (1) Temp. (Degrees F)	Common Uses	Thickness
CEMENT MORTAR (AWWA C104			
With Sealcoat	150 degrees	Salt water	
Without Sealcoat	212 degrees	Drinking Water Non-Septic Gravity Sewers Sanitary sewers Force Mains	Standard per AWWA C104 or double
GLASS		Scum	10 Mil (nominal)
PETROLEUM ASPHALT COATING	150 degrees	Air	1 Mil
PROTECTOR 401 (CERAMIC-FILLED AMINE-CURED EPOXY)	120-150 degrees (2)	Septic sewers Acids (3) Alkali Waste Pickling brine	40 Mil (nominal)
EPOXIES SUITABLE FOR DRINKING WATER (4)	120-150 degrees (2)	Drinking Water Food Processing	24 Mil (minimum)
POLYETHYLENE	120-150 degrees (5)	Septic Sewers Acids (3) Alkali Waste Pickling Brine	40 Mil (nominal)

(1) Maximum service temperatures listed are intended as general guidelines. For higher service temperatures, consult manufacturer for specific recommendations.
(2) Maximum service temperatures for epoxies depends on service conditions and specific formulation. Consult manufacturer for recommendations for elevated temperature service.
(3) Consult manufacturer for specific acid service use.
(4) All epoxies are not suitable for conveying drinking water. Consult manufacturer for recommendations. Many jurisdictions require NSF 61 certifications for linings in contact with drinking water."
(5) Maximum service temperature for polyethylene for acids and alkali waste depends on specific acid or alkali waste and service condition(s). consult manufacturer for recommendations for elevated temperature service.

EXHIBIT B

Use as a Reference

GASKET MATERIALS USED FOR DUCTILE IRON PIPE IN WATER AND SEWERAGE SERVICE

Description	Maximum Service(1,2) Temperature (Degrees F)		Common Uses(3)
	Push-On Gaskets	Mechanical Joint Gaskets	
SBR (Styrene Butadiene)	150 Degrees	120 Degrees	Fresh Water Salt Water Sanitary Sewage
EPDM (Ethylene Propylene)	250 Degrees	225 Degrees	Fresh Water Salt Water Sanitary Sewage Hot Water
Nitrile (NBR) (Acrylonitrile Butadiene)	150 Degrees	120 Degrees Fats, Oils Greases Chemicals	Hydrocarbons
Neoprene(R) (CR) (Polychloroprene)	200 Degrees	200 Degrees Salt Water Sanitary Sewage	Fresh Water
Viton(R); Fluorel(R) (FPM) (4) (Fluorocarbon)	300 Degrees	225 Degrees Acids Petroleum Vegetable Oils	Hydrocarbons

(1) Maximum service temperatures listed are intended as general guidelines for ductile iron pipe gaskets. For service temperatures greater than those listed, consult manufacturers for specific recommendations.

(2) Minimum service temperature is not usually a meaningful parameter for piping gaskets; however, low temperatures during pipeline installation may necessitate precautions. Consult manufacturer for pertinent recommendations.

(3) Water, including sanitary sewage, with low levels of the listed contaminants.

SECTION 02710
YARD WORK AND STREET WORK

PART 1 -- GENERAL

1.1 DESCRIPTION

A. Provide all yard and street work indicated on the Drawings and in other Sections of the Project Manual; including but not limited to:

1. Asphalt concrete paving.
2. Asphalt concrete paving repairs.
3. Fog seal coating.
4. Portland cement concrete paving, sidewalk and driveways.
5. Concrete wheel bumpers.
6. Joint sealant and caulking.
7. Parking lot striping and disabled symbol marking.
8. Street Work: Curbs, gutters, tree guards and gratings.
9. Street paving repairs.
10. Disabled Parking Accessible Signage.

B. Related Sections:

1. Documents affecting work of this Section include but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS, DIVISION 1 - GENERAL REQUIREMENTS and other Sections of the Project Manual.
2. Contractor's Use of the Premises in Section 01140.
3. Storage or Materials and Equipment in Section 01150.
4. Earthwork including excavating, grading and filling and select base materials in Section 02310.
5. Storm Drain System in Section 02545
6. Irrigation System in Sections 02810.
7. Landscape Planting 02932.
8. Cast-in-place Concrete Section 03300.
9. Concrete Paving in Section 02752.
10. Concrete Formwork in Section 03100.
11. Concrete Reinforcement in Section 03200.

12. Joint Sealant in Section 07900.

1.2 QUALITY ASSURANCE

A. Labor: Use adequate number of skilled laborers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

B. Codes and Regulations

1. Conform to the applicable 2020 Los Angeles City Building Code and Amendments, the Standard Specifications for Public Works Construction (SSPWC), State of California Department of Transportation Standard Specifications, Los Angeles City Bureau of Engineering Brown Book, latest edition and provisions hereinafter specified in the Project Manual.

C. Permits: Submit inspection/acceptance certificates required by the governing authorities and pay for all the required permits, plan check, inspections, and fees. Arrange for and make required inspections and tests.

D. Survey: According to Section 01112 - SUMMARY OF THE WORK, the Contractor shall furnish all surveying necessarily for the work. All work shall conform to the lines, elevations, and grades shown on the drawings. The Contractor shall submit the grade sheets to the City Engineer for review.

1.3 ALTERATIONS, REPAIRS AND REPLACEMENTS

A. As required for complete construction of a project; materials and construction to match existing adjacent work where occur in quality and appearance and conform to applicable provisions of the Project Manual.

B. Maintain vehicular and pedestrian traffic in accordance with W.A.T.C.H. (Work Area Traffic Control Handbook, latest edition)

1.4 PROTECTION

A. Required: Furnish, erect and maintain fences, barriers, lights and signs as necessary, in order to protect the public, City personnel, Contractor's personnel, existing work and work of this Section under this Contract.

B. All existing structures beneath the pavement shall be protected from any operation. No impact tool shall be allowed in the demolition of the existing pavement which may affect the existing structure. All sewerage and storm drain structures, utility vault, etc. extending two (2) inches or more above the new subgrade shall be removed by the Contractor to the new subgrade before paving. Structures projecting less than 2 inches above the subgrade may be paved over and later adjusted to grade.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery: Deliver materials, and products and equipment to the job-site where directed by the City Engineer.

B. Storage: Store materials where located on the job-site not interfering with work operations of this Section as directed by the City Engineer and easily accessible when needed to be installed or used.

C. Handling: Handle materials, etc. safely and avoiding damage to such materials prior to installation.

1.6 SUBMITTALS (As Applicable)

A. General: Comply with provisions of SECTION 01330 - SUBMITTALS of DIVISION 1 - GENERAL REQUIREMENTS of the Project Manual.

B. Concrete:

1. Portland Cement Mill Certificate: Submit to the City Engineer of each load showing conformance with the requirements and applicable Section of the SSPWC or otherwise the Testing Laboratory shall test the cement as per ASTM C150 - SPECIFICATION FOR PORTLAND CEMENT.

2. Design Mix and Curing Methods.

C. Asphaltic Concrete:

1. Submit a mix design for asphaltic concrete prepared by a material laboratory under the direction of a California Registered Engineer.

2. Certificates: Submit certificates signed by the materials producer and the asphalt paving Subcontractor, stating that materials meet or exceed the specified requirements prior to any fabrication. Submit the certified delivery tickets for each truckload of asphaltic material delivered to the job site.

D. Product Data: Submit to the City Engineer the data on all proprietary items, materials, etc. to be used in the work of this Section, as conforming to the specified requirements of this Section.

E. Shop Drawings:

1. Submit material, testing reports, mix designs, and other pertinent information for the asphalt concrete pavements.

2. Submit the joint layouts in concrete pavements.

F. Spreading Schedule: At least five (5) working days prior to commencing work, the Contractor shall submit its spreading schedule to the City Engineer for approval. The schedule shall allow residents on the street to be sealed ample “on street” parking within a reasonable distance from their homes. The Contractor shall notify the residents and businesses of the work and shall post temporary “No Parking” signs.

1.7 RECORD DRAWINGS

A. Required: Clearly mark changes, deletions and/or additions to the work of this Section conforming to provisions of Section 30 - RECORD DRAWINGS AND RECORD PROJECT MANUAL of the GENERAL CONDITIONS of the Project Manual.

1.8 REMOVAL AND CLEAN UP

Remove and recycle all surplus materials, debris and rubbish resulting from work of this Section conforming to provisions of Section 01572 - SOLID RESOURCE MANAGEMENT and Section 01740 - CLEANING of DIVISION 1 - GENERAL REQUIREMENTS of the Project Manual.

PART 2 -- PRODUCTS

2.1 CONCRETE MATERIALS

A. Furnish concrete material, form work and reinforcing in accordance with applicable requirements specified in the drawings and Section 03300 - CAST-IN-PLACE CONCRETE, Section 03100 - CONCRETE FORM WORK, Section 03200 - REINFORCEMENT, and Section 03345 - CONCRETE FINISHING, respectively.

B. Form work conforming to Section 03100 – CONCRETE FORM WORK.

C. Concrete conforming to Section 03300 – CAST-IN-PLACE CONCRETE.

D. Reinforcement steel or wire mesh conforming to Section 03200 - REINFORCEMENT.

E. Caulking for Expansion and Control Joints: As specified in Section 07920.

2.2 ASPHALT CONCRETE MATERIALS

A. In accordance with Section 203-6 - ASPHALT CONCRETE and mix in accordance with Section 203-6.5 - PROPORTIONING of the SSPWC. Unless otherwise specified, reclaimed asphalt pavement (RAP), RAP Bituminous material or mixture shall not be used without City Engineer's approval and payment adjustment.

B. Asphalt: PG64-10-75 Viscosity grades conforming to State of California Department of Transportations, Standard Specifications Section 92-1.02(B).

C. For 4-Inch and Thicker A.C. Paving, and for Parking Lot Projects: Two course applications, Class B – PG64-10-75 with 3/4-inch (maximum) size aggregates for first course. Top course (second course) shall be 2" inches thick wearing surface course, Class C2 – PG64-10-75 with ½-inch maximum size aggregates.

2.3 MISCELLANEOUS MATERIALS

A. Aggregate Base (Select Base): As specified in Section 02310 - EARTHWORK.

B. Soil Sterilant: As specified in Section 02310 - EARTHWORK.

C. Asphalt Fog Seal Coating: A fog sealant, slow setting type emulsified asphalt (Grade SS-1) of Section 203 - EMULSIFIED ASPHALT, and Section 203-9 - SEAL COAT ASPHALT BASED of the SSPWC; diluted with equal parts of water.

D. Slurry Coating Materials: Material shall be a mixture of asphalt emulsion, quick setting type, CRS-1slow-set type, SS-1h or CCS-1h conforming to the requirements of Section 203-3 EMULSIFIED ASPHALT, a Type I Fine Basic Aggregate graduation using No. 8 maximum nominal size aggregate, conforming to the requirements of Section 37-2 of the State of California Department of Transportation Standard Specifications or Rock Dust, conforming to the requirements of Section 200-1.2 - CRUSHED ROCK AND ROCK DUST of SSPWC, and water shall be potable and compatible with the other ingredients of the slurry. Additive shall be a type approved by the City Engineer.

E. Prime Coat: Consisting of Grade SC-250 liquid asphalt, applied at a rate between 0.45 L/m^2 and 1.15 L/m^2 (0.10 and 0.25 gallon per square yard), conforming to Section 302-5.3 - PRIME COAT of the SSPWC.

F. Tack Coat/Paint Binder: Grade SS-1h emulsified asphalt at an approximate rate of 0.25 L/m5 to 0.45 L/m5 (0.05 to 0.10-gallon per square yard), conforming to Section 302-5.4 - TACK COAT of the SSPWC.

G. Adhesive for Securing of Concrete Wheel Bumpers to Concrete Paving: An epoxy two-component type, long curing, manufactured by Edeco, Furance, Andrew Brown or Adhesive Engineering Company.

H. Parking Lot Striping Material: Fuller "Traffic Line Paint" or J. E. Bauer Co. "Zonelac Traffic Paint" or other colors as otherwise noted on drawings. Color shall be white except that accessible be parking emblem and adjacent parking stall lines shall be blue color. The coating shall be minimum 15 mils thick.

I. Wood Headers: In accordance with Section 302-5.5 - DISTRIBUTION AND SPREADING of the SSPWC 2" x 6" inch size (within 2" inches of the thickness of the pavement) edging with 2" x 4" stakes or as otherwise noted or detailed on the drawings. Construction Heart Grade Redwood (S1S1E).

J. Grout: Non-shrink grout; Embeco by Master Builders, Inc., 8978 Haven Ave. #A, Rancho Cucamonga, CA 91730 (800) 228-3315 or equal.

K. Disabled Accessibility Parking Signage: As specified in Section 10442 - DISABLED ACCESSIBILITY PARKING SIGNAGE.

2.4 CONCRETE WHEEL BUMPERS

A. Units: Precast reinforced concrete bumpers**;** manufactured by Consley and Montigney, El Monte, California, phone (626) 283-2771, or equal. Provide two bumpers of each specified size for testing by the Inspector to verify conformance with the requirements.

B. Size: Four feet long, 5-3/8" high x 7-5/8" wide with a side chamfered to produce a top side 2-1/8" wide as otherwise detailed on the Drawings.

C. Materials:

1. Minimum 3250 psi concrete at 28 days.

2. Two 3/4" diameter x 24" long steel drift pins or pipes by length indicated on the Drawings.

3. Two ½ inch reinforcing bars x length of unit with minimum 1 inch cover.

D. Construction:

1. Forms and Reinforcement: In accordance with requirements of Section 03300 - CAST-IN-PLACE CONCRETE.

2. Form holes for drift pins or pipe, locate 9" from each end of unit. Reinforcing to run full length of the unit.

3. Finish the units for simulate poured-in-place concrete without rock pockets, broken corners and other defects.

E. Curing: Allow units to cure fully 28 days before installation.

PART THREE - EXECUTION

3.1 JOB-SITE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed.

1. Correct conditions detrimental to timely and proper completion of the work, as directed by the City Engineer.

2. Do not proceed until such detrimental conditions are corrected.

B. Comply with stormwater pollution control measures as indicated in Section 02310 - EARTHWORK of the Project Manual.

3.2 ASPHALT CONCRETE PAVING

A. Materials: As hereinbefore specified.

B. Subgrade Preparation: Prior to placing the selected base materials, compact the upper 6" of subgrade to 95% relative compaction, as per Section 301-1 - SUBGRADE PREPARATION of SSPWC. Suitably roll subgrade to provide a smooth surface to a tolerance of plus or minus 0.04 ft. in accordance with Section 301-1.2 - PREPARATION OF SUBGRADE of the SSPWC.

C. Soil Sterilization: Apply specified soil sterilant to areas to be paved, by method recommended by the manufacturer. Certify in writing that the material has been applied.

D. Select Base: Place the Select Base materials to thickness [indicated on the drawings], in accordance with Section 301-2 - UNTREATED BASE of the SSPWC, after the subgrade preparation is completed.

E. Asphalt Paving Thickness and Courses:

1. Thickness as indicated on the Drawings.

2. Course; Construct a pavement in 2 course(s) unless indicated otherwise.

G. Construction:

1. General: In accordance with Section 302-5.5 - DISTRIBUTION AND SPREADING of the SSPWC thereto.

2. Prime Coat: Apply to the subgrade or aggregate base prior to placing the asphalt concrete and subbase; and to other surfaces designated by the City Engineer.

3. Tack Coat: Apply to concrete surfaces abutting new A. C. paving at least 24 hours prior to laying new work; apply to the surface of any course before the succeeding course or all cold pavement joints, curbs, gutters, manholes and the like. All the surfaces shall be free of water, foreign material or duct when the tack cold is applied.

4. Laying and Compaction: In accordance with Section 302-5.5 DISTRIBUTION AND SPREADING and Section 302.5.6 - ROLLING of the SSPWC.

If the asphalt concrete base course is 6" inches or thicker, the Contractor may at its option, construct the base course in one paving operation, in accordance with the Los Angeles City Standard Plan S-610, latest edition and the SSPWC.

5. Finish asphalt concrete surfaces smooth and even, to indicated elevations without low spots, hollow or irregularities and properly sloped for drainage.

H. Testing:

1. Upon completion, the pavement shall be true to grade and cross section. When a straight edge is laid on the finished surface, the surface shall not vary from the edge of the straightedge no more than ⅛" inches, except at the intersection or at the change of grade.

2. Flood Tests: In the presence of the Inspector or City Engineer and prior to acceptance of the work, water flood tests by water tank truck. All depressions where water ponds shall not exceed a depth of more than ⅛" fill.

3. Any area that is not within this tolerance shall be brought to grade by removing the paving material in the area to be repaired by an approved. Provide a minimum laying depth of 1" inches of the new pavement material at the joint line. Repairs shall not be made to the pavement surface by feather edging at the joints.

I. After the bituminous surfacing has passed the tests, including the flood test, clear and allow to dry, then apply one coat of a seal coat to the surface, in accordance with Subsection 37-4.04 of the California State Department of Transportation Standard Specifications. The seal coat shall not be applied to the newly constructed asphalt concrete surface until thirty (30) days after spreading and compacting the new asphalt concrete. After 30 days, the surface of the newly constructed asphalt concrete shall be washed with a strong detergent such as trisodium phosphate and rinsed before the application of the seal coat.

3.3. ASPHALT SEAL COATING

A. Required: Over existing repaired new asphalt concrete paving where noted on the Drawings.

B. Material: As hereinbefore specified for fog seal coating. A representative sample of the aggregate shall be taken in accordance with the requirements.

C. Surface Preparation:

1. Repairs: As hereinbefore specified but not necessarily limited to.

2. Clean all existing asphalt concrete surfaces of oil, grease, and foreign materials. Remove existing striping by approved methods and leave surfaces dry.

D. Weather Limitations: Execute work when pavement and atmosphere are about 60 degrees Fahrenheit and when no precipitations are expected within 24 hours. The Contractor shall not apply any seal coat if the weather is not suitable for the application. The Contractor shall notify the City Engineer and the Inspector minimum 24 hours in advance of the date the Contractor intends to begin work.

E. Protection: Provide as required to avoid getting seal coat materials on exposed concrete, masonry and/or miscellaneous building surfaces and fixed equipment and yard improvements.

F. Application: Single application by spray method at a rate of 0.15 to 0.30 gallons/square yards of surface depending on dryness and texture of the asphalt concrete surface, will conveniently seal small cracks and surface voids.

Asphaltic emulsion shall not be applied a greater distance than can be immediately covered by screenings. The cut off of the asphaltic emulsion shall be made on building paper or a similar material spread over the surface, which shall then be removed and disposed in a manner satisfactory to the City Engineer. Immediately following the application of the asphaltic emulsion, it shall be covered with screenings spread within 10% of the required rate per square yard.

G. Curing: Maintain coated surfaces free from traffic for at least four (4) days. Maintenance includes the distribution of screenings over the surface to absorb any free bituminous material, to cover any area deficient in cover coat material, to prevent formation of corrugation, and perform light brooming.

3.4 "STREET WORK" ASPHALTIC CONCRETE REPAIRS

A. Required: As necessary to accommodate construction of new storm and sewerage pipings, curbs, gutters and driveways as indicated on drawings; as necessary due to excavation, trenching and utility connections. Provide a minimum laying depth of 1" inches of the new pavement material at the join line. Repairs shall not be made to pavement surfaces by feather-edging at the joints.

B. Application: Upon completion of all work within existing asphalt concrete paved areas, Contractor shall repair the existing asphalt concrete paving conforming to requirements of the SSPWC and the Los Angeles City Bureau of Engineering standards as follow:

1. Properly remove and repair subgrade, sub-base and aggregate base as approved by the City Engineer or Inspector to match existing adjoining work. Identify the mixture or density of existing adjoining work and submit the proposed mix design to the City Engineer for approval.

2. Soil Sterilization: Apply weed killers (soil sterilant) on areas to be paved with asphalt concrete; soil sterilant to be applied as recommended by the manufacturer; The Contractor shall certify in writing that material has been applied.

3. Tack coat surfaces of existing asphalt concrete surfaces as per 302-5.4 - TACK COAT of the SSPWC over which new materials will be laid of edges of existing saw cut asphalt concrete and/or concrete, and other structures against which new asphalt concrete will be placed, terminate tack coats on concrete surfaces at top of asphalt concrete paving.

4. Lay new asphalt concrete paving conforming to Section 302-5.6.2 - DENSITY AND SMOOTHNESS of the to match adjoining work [using material of a heavier density than the "in-place" adjacent work. Use hot smoothing iron to obtain inconspicuous, straight and flush joint lines. Properly grade to provide the desired drainage as indicated on the Drawings. When a ten-foot straightedge is laid on the finish surface parallel to the centerline of the roadway, the surface shall not vary from the edge of the straightedge more than ⅛” inch, except at intersections or at changes of grade.

3.5 "ON-SITE" ASPHALT CONCRETE PAVING REPAIRS

A. Required: To remove and replace defective asphalt concrete paving, base, holes, cracks and other defects, etc. Provide a minimum laying depth of 1" inches of the new pavement material at the join line. Repairs shall not be made to the pavement surfaces by featheredging at the joins.

B. Materials: As hereinbefore specified.

C. Subgrade Preparation:

1. Properly remove all damaged paving and base, compact existing subgrade top 6" to 95% relative compaction in accordance with Section 301-1.3 of the SSPWC.

2. Properly roll subgrade to a smoothness tolerance of plus or minus 0.04 ft.

3. Place select base materials to thickness matching existing adjacent materials in accordance with Section 301-2 - UNTREATED BASE of the SSPWC.

D. Asphalt Concrete Paving Repairs:

1. General: In accordance with Section 302-5 - ASPHALT CONCRETE PAVEMENT of the SSPWC.

2. Tack coat cut surfaces of existing saw-cut asphalt concrete and/or concrete against which new asphalt materials will be placed at least 24 hours prior to laying new asphalt materials. Terminate tack coating on concrete surfaces at level with top of new asphalt concrete paving.

3. Lay asphalt concrete paving materials to thickness matching that of adjacent asphalt concrete surfaces. Make smooth, even and flush with adjacent surfaces without low-spots, hollows or irregularities. Use hot smoothing irons to obtain straight and flush joint lines. Properly grade paving repairs to provide desired drainage as indicated on the Drawing. When a straight edge is laid on the finish surface it shall not vary from the straight edge more than 1/8 inch except at intersections or at changes of grade].

3.6 CONCRETE SIDEWALK, CURB AND GUTTER

A. General: In accordance with the requirements in the SSPWC, Section 03300 - CAST-IN-PLACE CONCRETE, and Section 07920 - CAULKING AND SEALANT.

B. Locations: Where indicated on the Drawings.

C. Materials: As hereinbefore specified.

D. Preparation:

1. Concrete shall be removed and disposed off, in accordance with Section 300-1.3 REMOVAL AND DISPOSAL OF THE MATERIALS of the SSPWC.

2. Compact existing subgrade and [4" inches thick] base material, in accordance with Section 301-2 - UNTREATED BASE of the SSPWC.

3. Concrete shall be placed on the subbase to the required depth. The surface of concrete shall be floated by [finishing machine method] [transverse float method] and dragged on by burlap.

4. Concrete driveway shall be [Case 1] [Case 2] [Case 3] [Case 4], 4" inches thick, and constructed per [locations and details], [as indicated on the drawings] and conform to the Los Angeles City Bureau of Engineering Standard Plan S-440, latest edition.

8. Type C Integral Curb and Concrete pavement shall be constructed per locations and details, as indicated on the drawings and conforms to the Los Angeles City Bureau of Engineering Standard Plan S-410, latest edition.

3.7 INSTALLATION OF CONCRETE WHEEL BUMPERS

A. Locations: Where indicated on the Drawings.

B. On Asphalt Concrete: secure in place with steel drift pins or pipe driven to at least 1/4" below top of a surface of the bumper unit. Fill holes with non-shrink grout to top surface of unit.

3.8 PARKING LOT STRIPING, LETTERS, ARROWS [AND/OR HELIPORT MARKINGS**]**

A. Materials: As hereinbefore specified.

B. Lines: 4" wide or as indicated on the Drawings.

C. Letters: Sizes and strokes as indicated on the Drawings**.** Minimum dry paint thickness shall be 15 mils.

D. Arrows: 10" stroke with proportionate head.

E. Handicapped Parking Striping: Sizes and colors are in conformance with the State of California, Code of Regulations, Title 24. An International Symbol of Accessibility symbol shall be stenciled at the rear of the parking space. Each accessible parking unloading zone shall be marked.

F. Traffic Striping**:** As indicated on the drawings and in conformance with Section 310-5.6.5 - TRAFFIC STRIPES AND MARKINGS of SSPWC.

G. Preparation: All surfaces to be free of dirt, grease or other foreign materials. Remove existing markings by sandblasting or other approved methods.

H. Application: Apply one heavy undiluted coat with traffic line painting equipment in locations indicated on the Drawings in uniform coverage, free from light spots and with all edges clean-cut and true. Paint by spray can shall not be allowed. Minimum dry paint thickness shall be 15 mils.

3.9 DISABLED ACCESSIBILITY PARKING SIGN

A. Required: On walls and where indicated on the Contract Drawings and specified in Section 10443 - DISABLED ACCESSIBILITY PARKING SIGNAGE complying with State of California, Code of Regulation, Title 24.

B. Materials and Fabrications: Constructed of 3M Scotchlite Brand reflective sheeting laminated to 18-gage heavy duty sheet steel and silkscreened in transparent blue with "Disabled Symbol" and/or the appropriate message in white. Sign to have a weather-resistant finish.

C. Size: Not less than 18-inches wide x 27-inches high with lettering not less than 1" inch in height.

D. Installation: Provide a sign in a conspicuous space at each entrance to off-street parking facilities and immediately adjacent to and visible from each stall or space. Install concrete footing and post, in accordance with the detail and requirement as shown on the

Contract Drawings, Section 10443 - DISABLED ACCESSIBILITY PARKING SIGNAGE and Section 03300 - CAST-IN-PLACE CONCRETE of the Project Manual. Mount on a wall on a post on a fence at height noted on the Contract Drawing in plumb and level position and secured in place. Construct concrete paving over construct asphaltic concrete paving around backfill around the concrete footing in accordance with the details shown on the drawings.

END OF SECTION

SECTION 02730
PERMEABLE PAVING

PART 1-GENERAL

1.01 WORK INCLUDED:

A. Furnish and place permeable asphalt paving and subbase courses.

1.02 RELATED WORK:

A. Preparation of sub-base – see section 02310 EARTHWORK.

1.03 SUBMITTALS:

A. Manufacturer's product data.

B. Documentation of installer's experience.

C. Manufacturer's installation instructions.

1.04 QUALITY ASSURANCE:

A. Manufacturer. Company specializing in the production of permeable asphalt paving.

B. Installer. Company specializing in the installation of permeable asphalt paving with 3 years' experience.

1.09 WARRANTY:

A. Installation:

1. Installer shall provide a one- (1) year written guarantee.

PART 2 – PRODUCTS

2.01 MATERIALS:

A. The permeable asphalt course aggregate asphaltic mix to comply with the following:

1. 100% passing of 0.75 inch sieve
2. 85-100% passing of 0.50 inch sieve
3. 55 to 75% passing of 0.375 inch sieve
4. 10 to 25% passing of No. 4 sieve
5. 5 to 12% passing of No. 8 sieve

6. 2 to 4% passing of No. 200 sieve
7. Binder Content (AASHTO T164) of 5.8 to 6.5%
8. Air Void Content (ASTM D6752) 16 to 22%
9. Draindown (ASTM D6390) less than or equal to 0.3%
10. Retained Tensile Strength (AASHTO 283) greater than or equal to 80%
11. Cantabro abrasion test on unaged samples less than or equal to 20%
12. Cantabro abrasion test on 7 day aged samples less than or equal to 30%

B. Permeability of asphalt:

1. The asphalt to have a minimum permeability rate of 1.0 inches per hour.

PART 3 – EXECUTION

3.01 PREPARATION:

A. The base courses both filter and reservoir course shall be shaped to grade and cross section with an allowable tolerance of 2" (relative to specified dimensions below finish design elevation).

3.02 PERVIOUS ASPHALT:

A. Pervious pavement to be placed in 1-in thick lifts using track pavers.
B. Pervious asphalt to be compacted with two to four passes of a 10-ton roller.
C. Restrict traffic for at least 24 hours after final rolling.

3.02 FILTER COURSE:

A. The permeable base thickness should be determined by a soils engineer who can evaluate the native soil and intended use of the pavement (CBR/R value and Traffic Index). Base material should be open graded of same size and conform to ASTM specifications (clean, free of clay particles or other contaminants). Crushed rock used can range from 1/2” to 3/4” size. Filter Course to be approximately 2” thick.

3.03 RESERVOIR COURSE:

A. Reservoir course should be crushed rock, open graded of same size and conform to ASTM specifications (clean, free of clay particles or other contaminants).

Crushed rock used can range from 1" to 2" size. Bedding course to be approximately 10" thickness.

3.03 TESTING:

A. Cantabro abrasion test to be performed by an independent laboratory on one unaged sample per 1,000 sq-ft of paving surface.

B. Cantabro abrasion test to be performed by an independent laboratory on one 7 day aged samples per 1,000 sq-ft of paving surface.

C. The paved area to be tested in a minimum of four locations to show a minimum permeable rate of 1.0 inches of water per hour.

END OF SECTION

SECTION 02752
CONCRETE PAVING

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes cast-in-place concrete, including formwork, reinforcement, concrete materials, mixture design, placement procedures, joints and finishes.

1.2 SUBMITTALS

A. Mix designs: submit to the ENGINEER for review and approval. Mix design shall be signed by a licensed California Structural or Civil Engineer. Indicate amounts of mixing water to be withheld for later addition at project site, if any.

B. Material information: for each of the following, as provided by manufacturers:

1. Admixtures.
2. Form release agents.
3. Steel reinforcement and accessories.
4. Joint filler products.

C. Load tickets: in addition to the CONTRACTOR's copy, deliver a legible copy of each load ticket from the producer to the BCA inspector. Load ticket shall state quantities of all material in each load and shall be signed by weigh master. The BCA inspector shall record on each copy, the slump and location where placed on the job. Maintain tickets at jobsite.

D. Material test reports: for the following, from a qualified testing agency:

1. Aggregates: include service record data indicating absence of deleterious expansion of concrete due to alkali aggregate reactivity.

1.3 QUALITY ASSURANCE

A. Installer qualifications: CONTRACTOR shall employ on the project an installer qualified as ACI-Certified Flatwork Technician and Finisher and a supervisor who is an ACI-certified Concrete Flatwork Technician.

B. Quality control: do not commence placement of concrete until mix designs have been reviewed and approved by the PROJECT MANAGER or ENGINEER, and until copies are at the jobsite.

C. Batch plant inspections: required for all structural concrete. Inspection shall be by a CITY BCA material control inspector. The CONTRACTOR shall notify the inspector at least 24 hours in advance of mixing time. The BCA materials inspector shall be present at the beginning of each day of batching and shall perform the following:

1. Check plant and equipment quality.
2. Check identity of materials.
3. Check aggregate grading, characteristics, and water content.
4. Verify mix designs being used.
5. Check proportioning and loading of concrete materials.
6. Issue certifications of quality and quantity of materials as batched.
7. After verification of above, return to the jobsite for placement inspection.

D. Continuous placement inspection: required for all structural concrete and to be performed by an LADBS certified deputy inspector approved by the PROJECT MANAGER. The BCA inspector shall perform the following procedures:

1. Verify condition and adequacy of forms and reinforcement placement.
2. Ensure that concrete is of required quality and consistency.
3. Ensure that all requirements and conditions of concrete placement are met.
4. Make slump tests and secure cylinders.
5. Provide written reports at regular intervals reporting concrete practices.

E. Mockups: provide approx. 4-foot by 4-foot mockups to adequately portray the specified finishes, reveals, formwork, joints, etc. For each concrete finish indicated on the plans and listed below for the ENGINEER's approval prior to commencing concrete work. CONTRACTOR shall continue to construct mock-ups until an approved mock-up for each specified finish is produced at no additional cost to the CITY. Acceptable mock-ups shall be made the job standard for each finish, and workmanship. Protect accepted mock-ups from damage until completion and acceptance of the work represented by the mock-ups. Remove mock-up panel(s) from the site at completion of the project, unless otherwise instructed by PROJECT MANAGER.

1. Specified finishes to be mocked up:

a. Concrete paving: medium broom finish, unless otherwise noted.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Steel reinforcement: deliver, store, and handle steel reinforcement to prevent bending and damage. Avoid damaging coatings on steel reinforcement.

1.5 FIELD CONDITIONS

A. Hot-weather placement: comply with ACI301 and as follows:

1. Maintain concrete temperature below 90 deg F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water.

2. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade uniformly moist without standing water, soft spots, or dry areas.

PART 2 – PRODUCTS

2.1 STEEL REINFORCEMENT

A. Reinforcing bars: shall be ASTM A615/A615m, Grade 60, deformed.

B. Plain-steel wire: shall be ASTM A1064a/A1064m, as drawn.

2.2 REINFORCEMENT ACCESSORIES

A. Joint dowel bars: ASTM A615/A615m, Grade 60, plain-steel bars, cut true to length with ends square and free of burrs.

B. Bar supports: bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded-wire reinforcement in place. Manufacture bar supports from steel wire, plastic, or precast concrete and of greater compressive strength than concrete.

2.3 CONCRETE MATERIALS

A. Cementitious materials:

1. Portland Cement: all cement shall be Type II, low alkali Portland Cement conforming to ASTM C150 (201-1.2).

2. Fly ash: ASTM C618, class F.

B. Normal-weight aggregates: the aggregates for all concrete construction shall be fractured face aggregates obtained from a quarry that is certified non-reactive by an approved testing laboratory as approved by the Bureau of Contract Administration, (201-1.2.2). Unless otherwise noted.

1. Maximum coarse-aggregate size: 3/4-inch nominal.

C. Water: ASTM C94/C94m and potable.

2.4 CONCRETE MIXTURES

A. Concrete specified by class: placed concrete shall be Class 520-C-2500, maximum 4-inch slump unless otherwise noted on Contract Drawings. Pumped concrete shall be Class 560-E-2500, maximum 6-inch slump unless otherwise noted on Contract Drawings. A complete delivery receipt shall be required for each truckload of concrete delivered. The receipt shall be given to the BCA Inspector, (201-1.1.2).

1. Minimum compressive strength: 2,500 PSI at 28 days.

2. Slump limit: 4-inches, plus or minus 1-inch.

2.5 CONCRETE MIXING

A. Ready-mixed concrete: measure, batch, mix, and deliver concrete according to ASTM C94/C94m and ASTM C1116/C1116m and furnish batch ticket information to BCA inspector.

1. When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

2.6 CONCRETE JOINT MATERIALS

A. Expansion joint material: expansion joint material shall be min. 3/8-inch-thick closed-cell, polyethylene low resistance joint filler, by Celltex Ltd., or approved equal.

B. End of pour joints: end of pour joints shall be min. 3/8-inch-thick closed-cell, polyethylene low resistance joint filler, by Celltex Ltd., or approved equal.

C. Joint urethane sealant: expansion and isolation joint sealant material shall be a urethane elastomeric sealant for concrete pavement shall be Sikaflex®-1A
By Sika Corporation, or an approved equal, (201-3). Color to match concrete.

PART 3 – EXECUTION

3.1 STEEL REINFORCEMENT INSTALLATION

A. General: comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, ice, and other foreign materials that reduce bond to concrete.

C. Accurately position, support, and secure reinforcement against displacement. Locate and support reinforcement with bar supports to maintain minimum concrete cover. Do not tack weld crossing reinforcing bars.

D. Securely fasten steel reinforcement and wire ties against shifting during concrete placement. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.

3.2 JOINTS IN CONCRETE

A. General: construct joints true to line with faces perpendicular to surface plane of concrete.

B. Construction joints: install so strength and appearance of concrete are not impaired, at locations indicated or as approved by ENGINEER.

1. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints unless otherwise indicated.

2. Form keyed joints where indicated. Embed keys at least 1-1/2 inches into concrete.

3. Space vertical joints in walls as indicated. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible

C. Contraction joints in slabs-on-grade: form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at minimum one-fourth of the concrete thickness as follows:

1. Tooled joints: form contraction joints after initial floating by grooving and finishing each edge of joint to a radius of 1/8-inch. Repeat tooling of contraction joints after applying surface finishes. Eliminate tool marks on concrete surfaces.

2. Saw-cut joints: form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch-wide joints into concrete when cutting action does not tear, abrade, or otherwise damage surface and before concrete develops random contraction cracks.

D. Isolation joints in slabs-on-grade: after removing formwork, install joint-filler strips at slab junctions with vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.

1. Extend joint-filler strips full width and depth of joint, terminating not less than 1/2-inch or more than 1-inch below finished concrete surface where joint sealants are indicated.

E. Doweled expansion joints: shall be placed against previously constructed concrete structures or as indicated in the plans (303-5.4.2) and the applicable details. Install dowel bars and support assemblies at joints where indicated. Lubricate one-half of dowel length to prevent concrete bonding to one side of joint. Install per details.

3.3 CONCRETE PLACEMENT

A. Before placing concrete, verify that installation of formwork, reinforcement, and embedded items is complete and that required inspections are completed.

B. Deposit concrete continuously in such thickness that no new concrete is placed on concrete that has hardened enough to cause seams or planes of weakness. If a section cannot be placed continuously, provide construction joints as indicated.

1. Deposit concrete in horizontal layers of depth not to exceed formwork design pressures.

2. Maintain reinforcement in position on chairs during concrete placement.

3. Screed slab surfaces with a straight-edge and strike off to correct elevations.

4. Slope surfaces uniformly to drains where required, and as indicated on Contract Drawings.

3.4 FINISHING FLOORS AND SLABS

A. General: comply with ACI 302.1R recommendations for screeding, re-straightening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.

B. Rotary float finish: consolidate surface with power-driven floats or by hand floating if area is small or inaccessible to power-driven floats. Re-straighten, cut down high spots, and fill low spots. Repeat float passes and re-straightening until surface is left with a uniform, smooth, granular texture. Apply rotary float finish only to surfaces indicated.

C. Broom finish: apply a broom finish to exterior concrete platforms, steps, ramps, and elsewhere as indicated.

1. Immediately after float finishing, slightly roughen the trafficked surface with fiber-bristle broom perpendicular to main traffic route. Match finish(es) in approved mock-up for each finish type.

3.5 MISCELLANEOUS CONCRETE ITEM INSTALLATION

A. Repairs and filling: fill in holes and openings left in concrete structures after work of other trades is in place unless otherwise indicated. Mix, place, and cure concrete, as specified, to blend with in-place construction. Provide other miscellaneous concrete filling indicated or required to complete the work.

3.6 CONCRETE PROTECTION AND CURING

A. General: protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 301 for hot-weather protection during curing. Cure formed concrete according to ACI 308.1.

B. Exposed un-formed surfaces: begin curing slabs, sidewalks, driveway approaches, walkways and other exposed surfaces immediately after finishing concrete.

3.7 JOINT SEALING

A. For expansion and isolation joints in concrete: remove dirt, debris, saw cuttings, curing compounds, etc. From joints; leave contact faces of joints clean and dry.

B. Install approved joint sealer according to manufacturer's written instructions and applicable details.

3.8 CONCRETE SURFACE REPAIRS

A. Defective concrete: repair and patch defective areas when directed by BCA Inspector. Remove and replace concrete that cannot be repaired and patched to ENGINEER's approval.

B. Repairing un-formed surfaces: test un-formed surfaces, such as floors and slabs, for finish and verify surface tolerances specified for each surface. Correct low and high areas. Test surfaces sloped to drain for trueness of slope and smoothness; use a sloped template.

1. Repair finished surfaces containing defects. Surface defects include spalls, pop-outs, honeycombs, rock pockets, crazing and cracks in excess of 0.01 inch wide or that penetrate to reinforcement or completely through unreinforced sections regardless of width, and other objectionable conditions.

2. Repair defective areas, except random cracks and single holes 1 inch or less in diameter, by cutting out to the nearest control joints and replacing with fresh concrete. Remove defective areas with clean, square cuts and expose steel reinforcement with at least a 3/4-inch clearance all around. Dampen concrete surfaces in contact with patching concrete and apply bonding agent. Mix patching concrete of same materials and mixture as original concrete, except without coarse aggregate. Place, compact, and finish to blend with

adjacent finished concrete. Cure in same manner as adjacent concrete.

3. Repair random cracks and single holes 1-inch or less in diameter with patching mortar. Groove top of cracks and cut out holes to sound concrete and clean off dust, dirt, and loose particles. Dampen cleaned concrete surfaces and apply bonding agent. Place patching mortar before bonding agent has dried. Compact patching mortar and finish to match adjacent concrete. Keep patched area continuously moist for at least 72 hours.

3.9 FIELD QUALITY CONTROL

A. Special inspections: engage a LADBS Deputy Special Inspector and qualified testing to perform field tests and inspections and prepare test reports when required by Codes or Contract Drawings.

B. Required inspections. BCA Inspector shall inspect the following prior to concrete placement:

1. Steel reinforcement placement.
2. Verification of use of required design mixture.
3. Concrete placement, including conveying and depositing.

C. Samples: BCA Inspector will select and take samples for testing during the course of the work as considered necessary. Cost of testing will be paid for by the CITY.

D. Rejected materials: CONTRACTOR shall remove off the site all concrete below specified strength.

E. Cost of removal and retesting: CONTRACTOR shall pay for full cost of removal of rejected concrete and its replacement with concrete if specified strength and retesting.

END OF SECTION

SECTION 02795
BALLFIELD INFIELD SURFACE

1.1 SECTION INCLUDES

A. This section includes the supply and installation of stabilized crushed aggregate infield surface mix, as indicated in the Contract Documents.

1.2 SUBMITTALS

A. The CONTRACTOR shall make all required materials submittals in accordance with the General Requirements.

B. The CONTRACTOR shall make substitution submittals in accordance with the General Requirements.

C. CONTRACTOR shall submit following in accordance with material submittal procedures:

1. Manufacturer’s product data sheet.

2. Physical sample of infield surface material (1-quart minimum).

1.3 MOCK-UP

A. All work and materials are subject to inspection and approval by the Bureau of Contract Administration (BCA) Inspector and the ENGINEER. Any work done without proper inspection will be subject to rejection per Section 2-11 of the Standard Specifications for Public Works Construction. The CONTRACTOR shall notify the Bureau of Contract Administration (BCA) Inspector and PROJECT MANAGER three (3) days prior to requested inspection of the following for approvals:

1. Approval of sub-grade preparation by BCA Inspector of ENGINEER prior to installation of infield surface material.

2. Upon completion, CONTRACTOR shall request inspection and approval of installation by ENGINEER.

B. Mock-Up: CONTRACTOR shall install 20 square feet minimum of stabilized crushed aggregate infield surface mix including subgrade preparation, at a location approved by the ENGINEER.

1. ENGINEER shall review and approve mock-up before proceeding with rest of stabilized crushed aggregate paving.

2. Approved mock-up may remain as part of completed Work, subject to approval by ENGINEER.

1.4 DELIVERY AND HANDLING

Material shall be delivered to the site pre-mixed by supplier. CONTRACTOR shall protect the stabilized crushed aggregate infield surface mix from contamination.

1.5 SEQUENCING

A. Do not install work specified in this section prior to approval of sub-grade preparation per Section 310000 - EARTHWORK.

B. Do not install stabilized crushed aggregate surfacing when base material is wet or saturated to field capacity.

C. CONTRACTOR shall coordinate work specified in this Section with work specified in other Sections to minimize disturbance of, and operation of heavy equipment over, installed stabilized crushed aggregate surface.

PART 2: PRODUCTS

2.1 MATERIALS

A. For ballfields with NO GRASS INFIELD: The Stabilized Crushed Aggregate Infield Surface Mix: The infield surface shall be “Pro-Gold Softball Mix” as distributed by Gail Materials (951) 667-6106 or an approved equal. The infield material shall be a minimum 4” thick profile.

B. For ballfields WITH GRASS INFIELD: The Stabilized Crushed Aggregate Infield Surface Mix: The infield surface shall be “Pro-Gold Infield Mix Plus” as distributed by Gail Materials (951) 667-6106 or an approved equal. The infield material shall be a minimum 4” thick profile.

PART 3: EXECUTION

3.1 METHODS

A. The stabilized crushed aggregate infield surface mix shall be premixed by the distributor before delivery to the site. The subgrade for areas beneath the infield surface shall be compacted to 90% relative compaction – *do not compact adjacent turf areas*.

3.2 PLACEMENT

A. Place the infield mix on prepared sub-grade compacted to 90% relative compaction. Level to desired grade and cross section of 4” minimum depth. A 10’ by 10’ area centered over each future base pad location shall be six (6) inches deep in lieu of the standard four (4) inches depth for the rest of the infield. Grade infield area so that all areas achieve a .5% minimum slope, and no depressions are created that can retain water.

3.3 WATERING

A. Water thoroughly to achieve full depth moisture penetration of the entire stabilized infield mix profile. Stabilizer is water-activated: to achieve adequate saturation of stabilized infield mix profile, a minimum of 25 to 45 gallons of water per ton must be applied. During water application randomly test for penetration depth using a probing device until the entire profile is adequately wetted.

B. *Do not begin compaction for minimum of 6 hours after completion of wetting*. Compaction must be completed within 24 hours of wetting.

3.4 COMPACTION

A. Upon full moisture penetration, compact the infield surface material to 85% relative compaction with a min. 1,000 lb. Static drum roller. *Do not use a vibratory compactor or vibratory setting on the drum roller.*

B. Take care in compacting stabilized infield mix when adjacent to planting and irrigation systems. Hand tamping with 8” or 10” hand tamp is recommended in areas where large equipment could damage irrigation or hardscape.

3.5 INSPECTION

A. The finished surface of stabilized infield mix shall be smooth, uniform and solid. There shall be no evidence of chipping or cracking. Cured and compacted infield shall be firm throughout profile with no spongy areas. Loose material shall not be present on or below the surface. Any significant irregularities in the surface shall be repaired to the uniformity of entire installation.

3.6 REPAIR

A. To repair, excavate damaged area to a depth of 2” minimum, and scarify exposed stabilized crushed aggregate surface. Apply replacement material to the excavated area and compact. Thoroughly water the material and allow the material to cure, but not completely dry out. Re-compact the material, ensuring that the final grade and crown are maintained. Do not use a vibratory compactor.

END OF SECTION

SECTION 02810
IRRIGATION

PART ONE – GENERAL

1.1 DESCRIPTION

A. Work Included:

1. All labor, materials, equipment, appliances, fixtures and tests necessary for complete demolition of existing irrigation system and a new operating irrigation system as indicated on the Contract Drawings.

B. Related Work:

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS in DIVISION 1 - GENERAL REQUIREMENTS and other Sections of the Project Manual.

2. Site Clearing and Grubbing in Section 02210.

1.2 SUBMITTALS

A. The Contractor shall make all required materials submittals in accordance with Article 10 of the General Requirements. For all materials not approved upon the first submittal, Contractor is responsible to promptly resubmit for approval**,** necessary data concerning a substitution for a disapproved item or piece of equipment.

B. The Contractor shall make substitution submittals in accordance with Article 11 of the General Requirements.

C**.** Submit copies of the following:

1. Complete list of irrigation materials and miscellaneous hardware complete with descriptions and/or photographs and manufacturer’s literature. Clearly mark or underline proposed items.

1.3 QUALITY ASSURANCE

A. Codes and Regulations: Contractor shall obtain and pay for all required permits. Deliver all permits and submit certifications of compliance to the BCA Inspector and the Project Manager.

1.4 GENERAL REQUIREMENTS

A. Approvals by the Engineer: Before commencement of irrigation installation, Contractor shall obtain:

1. All approvals on required submittals hereinafter specified.

2. Approval of all re-submittals requested by the City Engineer.

3. Contractor shall make a detailed staked layout on the work site of the proposed trenching locations for all mainline, control wire conduit, and valve manifolds for approval by City Engineer prior to trenching.

4. Contractor shall make a detailed staked layout on the work site of the proposed head locations for approval by City Engineer prior to lateral line trenching.

B. Required Inspections: Notify the City Inspector at least 72 hours prior to time of required inspection.

1. IRRIGATION MAINLINE PRESSURE TEST: The pressure test shall take place under the direction of the BCA Inspector.

2. IRRIGATION COVERAGE TEST: After installation of heads and lateral lines etc., entire irrigation system shall be tested for coverage. Contractor shall notify the BCA Inspector, Project Manager, Landscape Architect and designated Recreation and Parks Regional maintenance staff three (3) days before the scheduled test.

C. Existing Utilities and Plant Materials: Protect utilities and/or plant materials not designated for removal or modification in place

against damage resulting from work of this Contract. Perform any removal and/or modifications only on approval or instruction from the City Engineer or in accordance with applicable provisions noted or specified.

D. Verification of Dimensions and Quantities: Verify site conditions, contract drawings, all dimensions and quantities prior to the bid. Furnish the quantities as necessary to do the specified work. Notify the Project Manager of any discrepancies between the Contract Drawings and the site conditions prior to beginning work. Do not work in areas where such discrepancies occur until further instruction by the City Engineer.

E. Record Drawings: Comply with provisions of the General Requirements. Contractor shall accurately dimension the location and depths of all piping, valves, and control equipment as installed. Indicate with suitable colored ink on one set of prints of the Contract Drawings to produce a record of complete installations to be kept on the job and up-to-date at all times during construction. At the completion of the work and prior to Final Inspection, the Contractor shall copy his record "as installed" data, using red ink, onto a set of clean prints. The Contractor shall certify to the completeness and accuracy of the "as installed" information indicated on the prints with his signature and deliver the signed prints to the Project Manager for review prior to the completion of the Plant Establishment Period.

Dimension from two permanent points of reference, building corners, sidewalk, or road intersections, the location of the following items:

1. Connection to existing water lines.
2. Connection to existing electrical power.
3. Gate valves.
4. Routing of all pressure lines. Indicate dimensional location at 100' intervals.
5. Irrigation control valves.
6. Routing of control wiring.
7. Quick coupling valves.
8. Controller.
9. Other related equipment as directed by the Architect.

10. Sleeve locations.

F. Water and Power Services: Upon award of contract, the Contractor shall contact the Department of Water and Power to arrange and pay for the installation of all required water and electrical meters and services. Service connections shall be as shown on the Contract Drawings or as designated by the utility company. Upon final acceptance of the project, the Contractor shall transfer billing to the City of Los Angeles, Department of Recreation and Parks as directed by the Project Manager.

G. Guarantee: In accordance with provisions of the GENERAL CONDITIONS, contractor shall guarantee the entire irrigation system against defects in materials and workmanship for a period of one year from the date of final acceptance of the Project.

1. The entire irrigation system shall be warranted to be free from defects in materials and workmanship, and installed in accordance with the irrigation plans, specifications and the SSPWC. The Contractor shall be required to repair or replace any defects in material or workmanship which may develop within one (1) calendar year from the date of acceptance, excepting ordinary wear and tear and unusual abuse or neglect. Further, the Contractor shall be required to make any necessary repairs within 48 hours of notification at no cost to the City. If the Contractor or his agent fail to make such repairs within the stipulated time, the City shall make such repairs or have repairs made by a third party and bill the Contractor for all expenses that accrue from making such repairs.

2. The City reserves the right to make temporary repairs as necessary to keep the irrigation system equipment in operating condition. The exercise of this right by the City will not relieve the Contractor of his responsibilities under the terms of the guarantee.

3. Contractor shall repair any settlement of backfilled trenches which may occur during a one year period after final acceptance by the City Engineer, to the City Engineer's satisfaction, without expense to the City, including the complete restoration of all damaged planting, paving, or other improvements of any kind.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery: Deliver products to the job-site in their manufacturer's original containers, with labels intact and legible.

B. Storage: Store piping, materials, fitting, etc. at the job-site where directed by the City Engineer until such time for installation.

C. Handling: Promptly remove damaged materials and unsuitable items from the job-site and promptly replace with materials meeting the specified requirements, at no added cost to the City.

PART TWO - PRODUCTS

2.1 MATERIALS

A. General: Provide recently manufactured materials of the best grade of each respective kind.

B. Pipe and Fittings: The type of pipe material and fittings designated on the Contract Drawings, or as hereinafter specified shall be:

1. Steel Pipe: Galvanized standard weight Schedule 40 steel water pipe complying with ASTM A53 - SPECIFICATION FOR PIPE, STEEL, BLACK AND HOT-DIPPED, ZINCH-COATED, WELDED AND SEAMLESS; jointed with galvanized, threaded, standard weight malleable iron fittings, and/or couplings.

2. Plastic Irrigation Pipe: High impact rigid polyvinyl chloride PVC 1220 (Type I, Grade 2), conforming to ASTM D1785 - SPECIFICATION FOR POLY (VINYL CHLORIDE) (PVC) PLASTIC PIPE, SCHEDULES 40 & 80 and CLASS 200. The minimum pressure rating to be not less than indicated therein for the schedule and size listed.

3. DOMESTIC WATER LINES FOR DRINKING FOUNTAINS: Install water piping in accordance with the latest edition of the Uniform Building Code and all local ordinances. Prior to allowing human consumption of water from newly installed drinking fountains the contractor shall perform domestic

sterilization procedures as indicated in applicable details and provide testing results to document compliance with the standards indicated. New drinking fountains shall be turned off or otherwise made inoperable until this testing is successfully completed and approved.

a. Domestic Cold Water Piping ABOVE GRADE: Piping shall be ASTM B88 Type “L” seamless hard drawn copper tubing with ANSI B 16.22 wrought copper fittings. Joints shall be made up with lead-free, nickel bearing alloy solder such as Harris Bridget.

b. Domestic Cold Water Piping BELOW GRADE: Piping shall be ASTM B88 Type “K” seamless hard drawn copper tubing with ANSI B 16.22 wrought copper fittings. Joints shall be made up with lead-free, nickel bearing alloy solder such as Harris Bridget.

4. All Pipes: Shall be homogeneous throughout and free from cracks, holes, foreign materials, blisters, deleterious wrinkles, and dents.

5. Solvent-welded Schedule 40 PVC plastic pipe and fittings shall be used for pipe sizes up to and including 2½ inch for installation of irrigation pressure lines and lateral lines.

6. Class 200 PVC gasketed pipe with ductile iron fittings and restraints as detailed on Contract Drawings shall be used for continuously pressurized pipe of sizes of 3-inch up to and including 6-inch diameter.

7. Schedule 80 PVC plastic pipe and threaded fittings shall be used only when threaded joints are specified, or otherwise permitted by the City Engineer.

8. All piping shall be permanently marked with the following: Manufacturer's name or trademark, size, schedule, and type of pipe, working pressure at 73 degrees F. and National Sanitation Foundation (N.S.F.) approval.

9. Ductile iron fittings for restrained plastic pipe shall be manufactured of ductile iron, Grade 65-45-12 in accordance with ASTM A536. Fittings shall have deep bell push-on joints with gaskets meeting ASTM F477. All ductile iron fittings

shall be manufactured by HARCO Fittings, or approved equal.
http://www.harcofittings.com

a. Valve to pipe restraints shall consist of ductile iron (ASTM A536) grip rings with machined serrations and ductile iron restraint rods. The ring that grips the pipe shall meet the requirements of UNI-B-13-94. The restraint rod nuts shall be made from low alloy steel to AWWA/ANSI C111/A21.11 or ductile iron to ASTM A536.

b. Fitting to pipe restraints shall allow the full rating of the pipe on which it is used. Grip rings and restraint structures shall be made of ductile iron to ASTM A536. Grip ring serrations (gripping features) shall be fully machined or cast. Clamp bolts and nuts shall meet or exceed ASTM A307.

c. Pipe to pipe restraints shall allow the full rating of the pipe on which it is used. Grip rings and bell rings shall be made of ductile iron to ASTM A536. Grip ring serrations (gripping features) shall be fully machined or cast. Restraint rod nuts shall be of low alloy steel to AWWA/ANSI C111/A21.11. Clamp bolts and nuts shall meet or exceed ASTM A307. Pipe to pipe restraint shall meet or exceed the full rating of the pipe on which it is used.

9. Gasket lubricant for push on fittings shall be non-toxic, odorless, tasteless and shall not support bacteria. Use ‘Seal Lube”, SK#87710 by IPS Weldon Corp. or equal.

C. Valves and Valve Boxes:

1. General: Provide valves of the type and capacity designated on the Contract Drawings and with the requirements specified herein. All valves shall be capable of continuous performance at a working pressure of 200 psi or less.

2. Gate Valves and mainline isolation Valves: *in sizes 2.5-inch and smaller* shall be *bronze* type, non-rising stem, solid wedge gate valve; Nibco T-113-LF or approved equal.

3. Mainline isolation Valves: *in sizes 3-inch and larger* shall be Nibco #P-619-RW IPS PVC push-on type resilient wedge cast iron gate valve with electrostatically applied fusion-bonded epoxy 8-20 mil. thick inside and outside, or approved equal.

4. Automatic Control Valves: Electrically operated, cast brass or bronze normally closed globe valve, capable of with manual flow control adjustment and manual operation capability, readily disassembled for servicing, slow opening and closing, and self-flushing. Reclaimed water compatible. Rainbird EFB-CP Series or Toro 220 series, or approved equal.

5. Quick-Coupling Valves: shall be 1” type with two-piece red brass construction with a locking thermoplastic rubber cover. The Contractor shall provide one quick coupler key with hose swivel for each five quick couplers installed. Rainbird model #44LRC or approved equal.

6. Valve Boxes shall be constructed of polypropylene or equivalent material for maximum durability, UV protection and corrosion resistance. The plastic body, excluding extensions, shall have pipe slots on each end and the plastic body shall have two (2) resting points for the lid to sit securely and flush. The plastic lid shall have molded diamond tread-pattern for skid resistance. Valve boxes shall have a lockable lid using a hex-bolt to secure the cover.

   For Remote Control Valves:
   The dimensions of the box shall be 14.5" L x 9.4" W, Model VB-STD-H by Rainbird, or approved equal. The lid shall be permanently heat-embossed with station number for each valve.

   For Quick Couplers and Gate Valves:
   The dimensions of the box shall be 13.75 inches bottom diameter and 10" top diameter. Model VB-10RND-H by Rainbird, or approved equal.

   Boxes are to be installed per the applicable details. The lid shall be permanently heat-embossed as follows (paint is not acceptable):

Gate Valve	GV
Remote Control Valve	RCV
Quick Coupler Valve	QC
Master Valve	MV
Flow Meter	FM

D. Backflow Prevention - Reduced Pressure Zone Assembly and Wye Strainer:

1. The Reduced Pressure Zone Assembly shall consist of two independently operating, spring loaded, “Y” pattern check valves and one hydraulically dependent differential relief valve. Mainline valve body and caps including relief valve body and cover shall be ductile iron with Fusion epoxy coated internal and external AWWA C550. Check valve and relief valve components shall be constructed so they may be serviced without removing the valve body from the line. Shutoff valves shall be flange-mounted ductile iron NRS resilient wedge gate valve AWWA C509 (Standard) with Fusion epoxy coating.

   The assembly shall be rated to 175psi working pressure and water temperature range from 33°F to 140°F. The lead-free Reduced Pressure Zone Assemblies shall comply with state codes and standards, where applicable, requiring reduced lead content. The assembly shall meet the requirements of AWWA Standard Code C511; and approved by the Foundation for Cross-Connection Control and Hydraulic Research at the University of Southern California. The Reduced Pressure Zone Assembly shall be Febco LF860-NRS, or approved equal.

2. Wye-Strainer: The main body shall be flange-mounted ductile iron with fusion epoxy coating inside and outside, the strainer screen shall be 300 series stainless steel #225 mesh. Screens shall be accessible for cleaning without removing the device from the line. The “Y” type strainer shall be a Zurn Wilkins Model FSC type, or approved equal.

3. Backflow Device Enclosure: shall be of a vandal resistant nature manufactured of formed cold rolled steel tubing and rod, coated with a performance polymer alloy. All locking and mounting hardware shall be manufactured entirely of stainless steel. Each enclosure shall have amounting pad

which shall be used as installation frame. Enclosure hardware on the mounting frame shall be stainless steel. The backflow cage enclosure shall remain bolted to frame in open and closed positions. Enclosure and door shall close with concealed locking tab with hole to accept padlock. Enclosure shall be powder-coated dark green. By Strongbox, SBBC-CR series or approved equal. https://strongbox.com

E. Irrigation Heads:

1. Pop-up spray head: bodies shall have a 4", 6" or 12" pop-up stroke. The body of the spray head shall be constructed of corrosion and UV-resistant, heavy-duty A.B.S. The spray head body shall have a factory-installed drain check valve capable of checking up to 10 feet in elevation change. The spray head body shall have a standard pressure-regulating device as an integral part of the pop-up riser maintaining a constant nozzle outlet pressure of 30 or 45 PSI with inlet pressures of up to 100 PSI. Nozzles shall be matched precipitation rate, fixed spray or multiple-stream, rotating type or other as noted on Contract Drawings. As manufactured by Rainbird Corporation, Toro Company or approved equal, models # 1804, 1806, 1812, or 1845.

2. Pop-up Gear Driven Rotor Head: The body of the rotor head shall be constructed of corrosion and UV-resistant, heavy-duty A.B.S. The rotor head body shall have a factory-installed drain check valve capable of checking up to 10 feet in elevation change. The full or part-circle rotor head shall be a single stream, water lubricated, gear drive type capable of both full circle and/or part circle operation in the same unit as noted on Contract Drawings. The rotor head shall have a screen attached to the drive housing to filter inlet water, protect the drive from clogging and simplify its removal for cleaning and flushing of the system. The rotor head body shall have a 1" (26/34) female (NPT or BSP) bottom inlet. The rotor head shall have a standard rubber cover which designates each adjustment opening from the top. Pop-up height as measured from the top of the cover to the centerline of the nozzle orifice shall be at least 5 inches. The rotor shall have a stainless steel covered nozzle turret and riser stem. As manufactured by Rainbird Corporation or the Toro Company or approved equal.

3. Root Watering System: The RWS assembly shall consist of a perforated polyethylene rigid mesh cylinder 18” long x 4” diameter or 10” long x 2” diameter with an integrated pressure compensating bubbler and optional check valve. The assembly shall be preconfigured with swing joint assembly or spiral barbed fittings to enable the RWS to be directly connected to PVC or polyethylene lateral drip lines, and shall have a plastic locking grate cover. Manufactured by Rainbird Corporation, or approved equal.

4. SA Swing Joint Assemblies: The Swing Assemblies shall be used as a flexible swing joint assembly for 1/2” inlet sprinklers. The pipe shall be flexible black tubing constructed of linear low density polyethylene material with a wall thickness of 0.090”and an inside diameter of 0.490”. The fittings shall be constructed of UV-resistant, thermoplastic material. The Swing Assembly shall have an operating pressure rating of 80 psi at 110° F. As manufactured by Rain Bird Corporation, Glendora, California or approved equal.

5. TSJ (PRS) Swing Joint Assemblies: The swing joints shall be used as a height adjustable connector between lateral lines and 3⁄4" or 1" sprinklers or quick coupler valves. The swing joint shall be molded from rigid PVC, Type 1, cell classification 12454-B, conforming to ASTM D1784, with a pressure rating of 315 psi at 73° F when tested in accordance with ASTM D3139, including 60 minutes at 790 psi, and short term exposure of 1000 psi without leakage. All NPT threads, sockets, and spigots shall be Schedule 80 per ASTM D2464 and D2467. All components shall be factory preassembled, available with 3⁄4” or 1" inlet/outlet and in lengths of 12” and 18". All rotating joints shall be modified stub ACME threads. All rotating joints shall have two EPDM rubber O-rings for positive sealing and thread protection.

   The pressure regulating system (PRS) shall consist of the outlet elbow of a Rain Bird Turf Swing Joint (TSJ). The TSJ-PRS shall allow pressure to increase uniformly within the rotor up to the preset regulation pressure before regulation occurs. Pressure regulation shall be provided to rotors with 3⁄4" and 1" inlets by means of a spring-loaded diaphragm attached to a flow tube. The regulator housing shall be constructed of high strength PVC. All metal components

shall be made of stainless steel. The diaphragm shall be a fabric reinforced elastomer.

F. Automatic Controller Unit: The Controller shall be capable of fully automatic or manual operation with an interface to a two-wire path for decoder-based irrigation control. The controller shall provide flow sensing capability and management and a station capacity expandable to 200 stations. Controller shall include: automatic Et calculations and The ability to use any of four different Et sources as the basis for Et calculations; Cycle-and-Soak or conventional start times; Four independently controlled programs with 5 selectable start times for a total of 20 possible cycles per day or Cycle-and-Soak with unlimited start times; Flow sensing capability to monitor system flow and responds to high, low, unscheduled and no-flow conditions; Detection of valve wiring faults and automatic field wire detection enabling the controller to sense a short in the field wire and instantly turn off that station; Optional internet control via wireless cellular communication; manufactured by Rain Master Control Systems or approved equal.

1. The automatic controller shall be enclosed in a Heavy Duty Stainless Steel Top Entry Enclosure model SB-22SS by Strongbox or approved equal.

2. Valve decoders: shall be Rainmaster TW-D-1 Single valve AC decoder, TW-D-2 Dual valve AC decoder, TW-D-4 Quad valve AC decoder, TW-LA-1 Lightning arrestor (every 600 feet) as indicated in the Contract Drawings. Install and connect to 2-wire path per manufacturer’s instructions and as indicated in the Contract Drawings. All decoders must be manufactured by SAME manufacturer and compatible with the 2-wire controller system specified.

3. Sensor wire: provide per manufacturer’s requirements, and install in conduit per below.

G. Control Wire:

1. Connection between the automatic controller and the valve decoders shall be made with polyethylene double-jacketed or UF-B UL PVC double-jacketed two-conductor solid core wire designed for direct burial with insulation 3/16 inch (.060") thick, high density, sunlight resistant incased in an outer jacket of Polyethylene or PVC conforming to ICEA S-

GL-402 or NEMA WC5, having a minimum wall thickness of .045 inches. Two-wire Polyethylene 'twisted' cable and single strand 14 gauge PVC coated irrigation wire are not acceptable.

2. 2-WIRE Conductor SIZING**:** Standard wire lengths for straight line installation i.e. wire distance to the furthest device without any loop:

Wire Size(gauge)	#14	#12
Total loop Length	10,000'	14,800'
Distance to furthest valve	5,000'	7,400'

3. All 2-wire conductors shall be installed in a 1-1/4” diameter sch. 80 PVC conduit per details. Distance between pull boxes shall not exceed 200’.

4. Low voltage control wire conductors between the 2-wire decoders and the valves shall be U.L. approved direct burial Type U.F., 600 volt, No. 14 AWG solid copper. Use a different color wire for each valve in the manifold grouping.

H. Wire Connectors: Control wire connections shall be made with 3-M brand of DBY or DBR Direct Burial Splice kits, or approved equal. The splice kit shall consist of a one-piece malleable plastic bulb body with internal locking fingers, filled with re-enterable gel sealant and a Scotchlok Electrical Spring Connector. Materials shall be as follows:

1. Connector shall be a flame retardant PVC insulator with a steel spring and shell within. Connector shall be a non-crimping system.

2. Tube material shall be clear see-through polypropylene.

3. Gel material shall be hixotropic calcium organic complex.

4. Wire sizes and numbers of wires per connector shall be as follows:

Connector:	Color:	No. and Size of Wires:
3M Model DBY	Yellow	Max. 4-12 gage UF wires

3M Model DBR	Red	Max. 3-14 gage UF wires

I. Concrete Thrust Blocks: Provide concrete thrust blocks per details where applicable for plastic pipes with 3" inch diameter or larger, and all backflow preventer assemblies. The portland cement concrete used for concrete thrust blocks shall be 470-B-2000 concrete.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

Examine the area of work and conditions under which work of this Section will be performed. Correct any conditions detrimental to timely and proper completion of the work prior to commencing installation of irrigation equipment.

3.2 IRRIGATION SYSTEM INSTALLATION:

A. General:

1. The Irrigation system layout shown on the Contract Drawings shall be considered as diagrammatic. The Contractor shall make adjustments where necessary to conform to actual field conditions unless otherwise noted or as directed by the City Engineer at no additional cost to the City.

2. All piping shown on the Contract Drawings in paved areas but running parallel and adjacent to planted areas, is done for clarity only and is to be installed inside the planting area whenever possible.

3. Specimen trees (24-inch or larger size box) may be planted before installing the irrigation system upon written approval from the Project Manager. Contractor shall re-route irrigation lines conflicting with specimen plant locations to clear the root ball by twenty-four (24) inches minimum at no additional cost to the City. Watering of all specimen trees planted before completion of the irrigation system shall be the Contractor’s responsibility.

4. Contractor shall make all required water and utility connections as shown on the Contract Drawings or as required by the utility company. Replace all sidewalks, curbs or paving removed or damaged by the installation of required utilities to the satisfaction of the BCA Inspector.

B. Trench Excavating and Backfilling: Size trenches and other excavations to accommodate the irrigation system components, conduits, pipe bedding material and other required elements indicated on Contract Drawings. Provide a minimum of 6” of side clearance on outside of the piping or conduit to assure proper installation and access for inspections.

1. See TREE PROTECTION REQUIREMENTS in the Landscape Planting Specifications for all trenching within the protected root zone of an existing tree.

2. Unless otherwise specified, the minimum depth of cover over pipelines and conduits shall be as follows:

a. Control wire conduit - 30-inches (36-inches under roadways and parking lots).

b. Other Control Wiring - Depth of mainline, or a minimum of 24-inches cover if without any mainline.

c. Irrigation Mainline: 24-inches for piping 3” and smaller; 30-inches for piping 4” and larger.

d. Lateral lines - 12-inches.

3. Make the bottom of trenches true to grade and free of protruding stones, roots or other matter which would prevent proper bedding of pipe or other facilities.

4. All trench backfill shall be performed in accordance with approved soils report. Pipe bedding shall be clean site soil, free of all rocks, debris, etc. over 1/2" diameter. Bed pipe in at least 4-inches of finely divided material to provide a firm, uniform bearing. Surround the pipe with additional finely divided material to at least 6-inches over the top of the pipe. Bedding shall be placed in 6-inch maximum lifts. Backfill shall be site soil placed above the bedding to finish grade.

There shall be no rocks over 2" in greatest dimension or organic matter in the backfill. All bedding and backfill shall be properly moisture conditioned and compacted at each lift. All trenches shall have a minimum relative compaction of 90%. Compaction shall be tested by the City at locations to be determined by the Geotechnical Engineer.

5. Finished trenches shall be flush with adjacent finish grades. The Contractor shall be responsible for maintaining the trenches flush and smooth with adjacent surface grade until final acceptance of the project. After compaction has been approved, trenches in existing turf areas shall be re-planted per "Method A" lawn repair of the Landscape Planting Specifications, unless otherwise noted.

C. Irrigation Pipeline Installation - General: Execute trench excavating and backfilling, including the depth of cover over the pipeline, in accordance with requirements above.

1. Pipe layout as shown on irrigation plan is diagrammatic. Contractor shall route piping in planted areas in the most expedient manner consistent with the requirements set forth herein, including avoidance of tree roots.

2. When two or more pipelines are installed in the same trench, separate the pipelines by a minimum horizontal clear distance of 12-inches. Install piping such that each pipe, valve, or other component may be serviced or replaced without disturbing the others.

2. During installation of pipe, fittings, valves, and other components, prevent soil or foreign matter from entering the system. Temporarily cap or plug all open ends at completion of installation operations.

3. All changes in pipe size shall be made with reducer fittings. No close nipples or bushings shall be used.

4. Where irrigation piping crosses a vehicular roadway or other paving, sleeve all pipe and conduit inside a Schedule 40 PVC sleeve of a minimum of two pipe sizes larger than the piping to pass through it under the paving at the depth of the mainline or 30 inches minimum. All sleeves shall extend a minimum of 3 feet beyond the edges of paving.

5. Pipe or irrigation components of dissimilar metals shall be separated by an approved "Dielectric" coupling.

D. Steel Pipe:

1. Square cut and ream pipe ends to full size with a long taper reamer.

2. Cut threads with clean sharp dies.

3. Make joints with a non-toxic, non-hardening joint compound applied to the male threads only.

4. Wrap steel pipe embedded in the ground with seamless 10 mil F.D.S. Safe-T-clad tape. Spiral wrap pipe with uniform laps. Apply the second layer of wrap in the reverse direction of the first layer of wrap.

5. Joints and any remaining unwrapped portion of the pipeline shall be similarly wrapped after pressure testing.

E. Solvent Welded Plastic Pipeline:

1. Join plastic pipe with slip type solvent welded fittings, threaded fittings as specified. Install steel pipe first when plastic pipe is joined to steel pipe.

2. Cut pipe square, externally chamfer approximately 10-15 degrees, and remove all burrs and fins.

3. Prior to the application of the P.V.C. solvent cement, prepare all surfaces to be solvent welded with tetrahydrofuran primer tinted purple. Make solvent welded joints in accordance with ASTM D2855 - PRACTICE FOR MAKING - SOLVENT - CEMENTED JOINTS WITH POLY (VINYL CHLORIDE) (PVC) PIPE AND FITTINGS. Use a solvent approved by the pipe manufacturer.

4. Install plastic pipe in accordance with ASTM D2774 - PRACTICE FOR UNDERGROUND INSTALLATION OF THERMOPLASTIC PRESSURE PIPING and the requirements herein. Exercise care in assembling a pipeline with solvent welded joints so that stress on previously made

joints is avoided. Handling of the pipe following jointing, such as lowering the assembled pipeline into the trench, shall not occur prior to the set times specified by the manufacturer.

5. Apply solvent to pipe ends in such a manner that no material is deposited on the interior surface of the pipe or extruded into the interior of the pipe during jointing. Wipe off excess cement on the exterior of the joint immediately after assembly.

6. Make threaded pipe joints using Teflon tape or other approved jointing material. Do not use solvent with threaded joints. Protect pipe from tool damage during assembly. Use vises with padded jaws and strap wrenches for installation of fittings and nipples. Remove and replace any plastic pipe which has been nicked, scarred, or otherwise damaged.

7. Snake plastic pipe from side to side in the trench to allow 1-foot of expansion and contraction per 100 feet of straight run.

8. Do not expose the pipeline to water for 24 hours after the last solvent welded joint is made.

F. Bell and Spigot Gasketed Pipeline:

1. Join plastic pipe with “push-on” type gasketed fittings with mechanical restraints as detailed and specified.

2. Cut pipe square, externally chamfer approximately 10-15 degrees, and remove all burrs and fins. Remove and replace any plastic pipe which has been nicked, scarred, or otherwise damaged.

3. Align pipe sections straight. Clean all debris from the bell areas of the fitting and install gasket so that it is completely seated in the groove with no raised areas.

4. Apply lubricant to the installed gasket and to beveled end of the cut pipe or to the spigot end of the pipe or fitting. Align the pipe with fitting and push together by hand or with pry bars on the end of the fitting or with two pry bars using the lugs on the fitting. Insert until the reference line mark is even

with edge of the fitting bell.

5. Install mechanical restraints per details and manufacturer's instructions.

6. Snake plastic pipe from side to side in the trench to allow 1-foot of expansion and contraction per 1000 feet of straight run.

G. Installation of Valves, Valve Boxes, and Special Equipment:

1. General: Install all valves and other equipment in strict accordance with the details, and make readily accessible for manual operation, maintenance or replacement.

2. Install isolation or gate valves of the same size as the pipeline in which they are installed, unless otherwise indicated.

3. Install all valves below ground housed in a covered valve box with a securable lid that will permit access for field servicing. Boxes shall be set flush with existing grade, including sloped areas, and all soil within 12 inches of the perimeter of the box shall be compacted per the trench repair section of this specification. Boxes are to be positioned per details.

4. Set valve boxes per applicable details and set valves at sufficient depth to provide clearance between the cover and valve handle or key when the valve is in the fully open position. Do not cover valve with pea gravel.

5. Install backflow preventers per applicable details with pipe supports and the accessories necessary to properly secure the assembly where required. Install backflow preventers per prevailing codes. All Backflow devices shall be certified by a licensed inspector as required by the County Health Department Test Instructions, Water Pollution Control Section after installation at the Contractor's expense.

6. No equipment shall be installed closer than 12 inches to any paved surface, unless separated from the paved surface by a wall, fence, curb, or similar barrier, or installed underground.

H. Irrigation Head Installation and Adjustment:

1. General: In accordance with the requirements of Subsection 3.2 of this Section, flush and pressure test all mains and flush lateral lines before installing irrigation heads.

2. Irrigation Head Placement and Spacing:

a. Irrigation plans are designed, as a minimum standard, for head-to-head coverage on all spray heads. Head locations shall be determined by referencing the irrigation plan and using the head spacing listed in the irrigation head legend. Accuracy of final installation shall be within plus or minus 12 inches for all rotary heads having a throw of 30 feet or greater; within plus or minus 4 inches for all head types with a throw of under 30 feet. Do not exceed the maximum irrigation head spacing shown on the Contract Drawings.

b. Prior to head installation, Contractor shall mark the proposed locations of all irrigation heads in the field for review and approval by the Engineer. Contractor shall make any adjustments to head locations requested by the Engineer at that time at no additional expense to the City. Contractor shall provide minimum 48 hours notice prior to the requested time of inspection.

3. Head Installation:

a. Do not exceed the maximum irrigation head spacing shown on the Contract Drawings.

b. Install all irrigation heads 3-inches clear of adjacent walks, curbs, paving, headers, and similar improvements. Adjust all heads to flush with the final finish grade - adjusting for depth of sod in turf areas if needed.

c. All soil within 12 inches of the perimeter of the head shall be compacted as indicated in applicable details.

d. All irrigation heads shall be installed on swing joint

assemblies as shown on details.

4. Irrigation Head Adjustment:

   a. When all irrigation heads are installed and the irrigation system is operating, adjust and balance each section or unit with all section control valves fully open to obtain uniform 100% head to head coverage.

   b. Adjust irrigation heads having adjustable pin nozzles, screws or orifices to provide optimum distribution of water over the coverage pattern. Without additional cost to the City, Contractor shall substitute larger or smaller nozzles in irrigation heads and/or add or omit sprinkler heads as necessary to obtain uniform coverage to meet MWELO requirements. Any requested modification shall not alter the total GPM to a degree to require a major revision of pipe sizing.

   c. At no time is the irrigation system to cause excessive overspray on adjacent paved areas, or cause any erosion to the site.

   d. Low Head Drainage: The Contractor shall install in-line drainage swing check valves where necessary to prevent low head drainage or as indicated on contract drawings.

I. Automatic Control System Installation:

1. General: Install a complete automatic irrigation 2-wire control system, including the automatic controller, automatic control valves, decoders and wiring, and all necessary accessories and utility service connections.

2. Install the automatic controller outside of the coverage pattern of the irrigation system at the location designated on the Contract Drawings. Verify location with City Engineer prior to installation.

3. Install a separate disconnect switch between the source of power and the controller inside the controller enclosure per details. Provide grounding per details and manufacturer's instructions.

4. Install all electrical service wiring per Electrical Code in galvanized steel electrical conduit from the service point to the controller. The minimum service wire shall be No. 12 AWG copper 600 volt, Type THW or THWN or larger, as required by the controller manufacturer. Locate splices only in specified pull boxes and make splices with a waterproof packaged kit approved for underground use. Set pull boxes to finish grade on a 12-inch deep layer of one (1) inch crushed rock.

5. All 2-wire control wire shall be installed in 1-1/4" SCH 80 PVC conduit per details, with a maximum run of 200' between pull boxes. Install conduit in the same trench as irrigation mainline per trenching detail where possible. Low voltage control wire conductors between the 2-wire decoders and the valves shall be installed in 1/2" SCH 80 PVC conduit per details.

6. Wire connectors shall be DBY or DBR as manufactured by 3M Corp. Control wires shall be stripped of 1/2 inch of insulation USING A WIRE-STRIPPING TOOL SPECIFICALLY MADE FOR THAT PURPOSE, inserted into the electrical spring connector, and the connector twisted in a clockwise direction until the wires are tight. Insert the completed splice into the gel-filled tube, and check visually to confirm that the wire nut has been pushed past the fingers and is seated in the bottom of the tube. Position wires in wire channels and close insulator cover. Make splices in control wire in accordance with the requirements for service wire. Leave at least 2-feet of coiled slack at each splice and point of connection inside of valve boxes.

7. Testing Electrical Components: Field tests shall be performed by the Contractor on all irrigation system conductors in accordance with the requirements specified herein prior to performing the functional tests. Where conductors are installed by trenching and backfilling, such tests shall be performed after at least six (6) inches of backfill material has been placed over the conductors and backfill material has been compacted.

    a. Prior to the start of the functional testing, the Contractor shall perform the following tests on all irrigation system

electrical conductors in the presence of the BCA Inspector.

b. Each circuit shall be tested for continuity and open circuits.

c. Each circuit shall be tested for grounds.

d. An insulation resistance test at 500-volts DC shall be made on each circuit between the circuit and the ground. The insulation resistance shall not be less than 10-megohms on all circuits.

e. The functional test for all the electric automatic irrigation system(s) shall consists of a minimum of fifteen (15) working days of operation during which time the controller shall complete at least three (3) complete cycles automatically for each station. The lengths and frequencies of the cycles will be determined by the City's representative. If unsatisfactory performance of the system develops, the condition shall be corrected and the test repeated until fifteen (15) working days of continuous, satisfactory operation is obtained.

f. The functional test shall be satisfactorily completed prior to the start of the plant establishment period.

g. Repair to the irrigation system wiring shall be made within five (5) working days of a malfunction or damage to any portion of the system.

8. Contractor shall leave the control system in operating condition with an operational chart mounted within the controller cabinet upon completion of the work.

3.3 FLUSHING AND TESTING

A. After completion, and prior to the installation of any terminal fittings, thoroughly flush the entire pipeline system to remove dirt, scale, or other material. After flushing, conduct the following tests in the sequence listed below. Provide all equipment, materials, and labor necessary to perform the tests. Conduct all tests in the presence of the City Inspector.

1. The irrigation system mainlines shall be pressure tested for 24 hours at 125 p.s.i. with all control valves in place and closed. During the test, the Contractor shall provide pressure gauges downstream from the backflow device and upstream from the farthest remote control valve in the system. Air pressure testing of the irrigation system is acceptable if approved by the BCA inspector. Placement of control wires shall be verified before mainline trenches are backfilled after pressure test.

2. After installation, the irrigation lateral lines shall be thoroughly flushed in the presence of the BCA inspector. Each valve and lateral system shall be flushed commencing with the head closest to the valve and proceeding to the farthest head.

3. Irrigation Coverage Test: After installation of heads and lateral lines etc., entire irrigation system shall be tested for coverage. The BCA Inspector, Project Manager, Contractor and Recreation and Parks Regional maintenance staff shall be notified three (3) days before the scheduled test. Perform the coverage test for each zone after irrigation heads have been installed and demonstrated that each section or unit in the irrigation system is balanced to provide uniform and adequate coverage of the areas serviced. Correct deficiencies in the system in accordance with the requirements of Subsection 3.2(G)4.

4. Operational Test: Evaluate the performance of all components of the automatic control system for manual and automatic operation. During the maintenance period, and at least 15 days prior to final inspection, set the controller on automatic operation so that the system will operate satisfactorily during such period. Make all necessary repairs, replacements, and adjustments until all equipment, electrical work, controls, and instrumentation are functioning in accordance with the Contract Documents.

3.4 OPERATING MANUALS AND EQUIPMENT

A. Furnish the City with 2 bound copies of operating and maintenance manuals for all irrigation system equipment such as automatic

controller, valves, heads, etc.

B. Explain in detail all irrigation equipment operations, watering schedule and maintenance procedures to the City personnel as directed by the Project Manager before completion of the project.

C. Provide the City with a reduced legible copy of the "As-Installed" Irrigation Plan hermetically sealed in a plastic cover to be affixed inside the controller cover.

3.5 RECORD DRAWINGS

Irrigation record drawings shall include the following: Dimension the following locations from two permanent points of reference (building corners, sidewalks, road intersections, etc.):

a. Connection to existing water lines
b. Connection to existing electrical power
c. Gate valves
d. Mainline routing and/or directional turns (dimension maximum 100 feet along routing).
e. Remote control valves
f. Air and pressure relief valves
g. Master valves/flow sensors
h. Control wire routing
i. Quick coupling valves
j. Lightning protection (rod, plate, etc.)
k. Pull boxes
l. Irrigation controllers
m. Backflow prevention units

END OF SECTION

This page has been left intentionally blank.

SECTION 02820
CHAIN LINK FENCING AND GATES

PART ONE - GENERAL

1.1 SUMMARY

A. All permanent chain link fencing, gates and appurtenances as indicated on the Contract Drawings and as specified herein, and as needed for complete and proper installation.

B. Related Work Sections:

1. Concrete Work in Section 03300.

1.2 QUALITY ASSURANCE

A. Labor: Use adequate number laborer's who are thoroughly trained and skilled in the fencing trade and who are completely familiar with the specified requirements and methods needed for the proper executions of the work of this Section.

B. Codes and Regulations: Perform all work in strict accordance with applicable Government Codes and Regulations, meeting all "Safety Standards" of CAL/OSHA, County and the current Los Angeles City Building Code and applicable Amendments.

C. Qualification of Fabricators: Provide adequate number of fabricators who are thoroughly familiar with the specified requirements regarding fabrication of fencing fabrics, posts and gates.

D. Quality of All Materials and Accessories: All materials and accessories shall conform with the requirements of the Standard Specifications for Public Works Construction (SSPWC) and specified herein.

1.3 SUBMITTALS

A. General: Comply with applicable provisions the GENERAL REQUIREMENTS and other Sections of the Project Manual.

B. Product Data:

1. CONTRACTOR shall provide Shop drawings in sufficient detail to show layout of fence and gate, elevation details, fabrication, assembly, hardware, installation, anchorages and interface of work of this Section with work of adjacent trades.

2. Manufacturer's Specifications and other data needed to prove compliance with the specified requirements for chain link fabric, posts and rails.

3. Manufacturer's recommended installation procedures which when reviewed and approved by the ENGINEER, will become the basis for accepting or rejecting actual installation procedures used on the Work.

4. Vinyl coating and color for chain link fabric. Note: For special post coating, use section 206-6.1 of SSPWC.

1.4 PRODUCT HANDLING

A. Protection: Protect fencing fabric, posts and gate assemblies before, during and after installation. Properly package and identify and note location of unassembled items (hardware, etc.) for protection against damage.

B. Delivery: Deliver all items to be built into concrete or masonry work in time, so as not to delay construction and installation operations.

PART TWO - PRODUCTS AND FABRICATION

2.1 MATERIALS

A. General: All materials for fencing, posts and gates and fasteners to be new and hot-dipped galvanized.

B. Galvanizing: Where noted on drawings or Specified herein, metal products shall be hot-dipped galvanized, and comply with requirements of Section 210-3 - GALVANIZING of SSPWC, except as modified herein.

C. Fabric:

1. Galvanized steel chain link fabric shall conform to ASTM A392 - SPECIFICATION FOR ZINC COATED STEEL CHAIN LINK FENCE FABRIC and A817 - SPECIFICATION FOR METALLIC - COAT STEEL WIRE FOR CHAIN LINK FENCE FABRIC. Fabric shall be 2-inch mesh of

9-gage steel wire (minimum 75,000 psi tensile strength) galvanized with 1.2 oz/ft^2 zinc, in single fabric width for the entire height. Top and bottom selvedges shall be knuckled.

Vinyl coated galvanized steel fabric, when specified, shall conform to ASTM F 668, Class 2b, "fused and adhered", and meet the galvanizing requirements contained in this section, (206-6.3).

2. Fabric Tie: 11 gage galvanized steel used to fasten the fabric to posts, rails and gate frame.

D. Posts:

1. Schedule 40 Standard weight pipe conforming to ASTM F-1083 **-** SPECIFICATION FOR PIPE, STEEL, HOT-DIPPED ZINC - COATED (GALVANIZED) WELDED, FOR FENCE STRUCTURES.

2. Line Posts: 2 3/8-inch O.D. complete with malleable iron eye-top of suitable design to provide moisture-proof cap.

3. Terminal (End) and/or Corner Posts: 2 7/8-inch O.D. with malleable iron moisture-proof cap.

4. Gate Posts: 4-inch O.D. complete with malleable iron moisture-proof cap.

E. Top and Bottom Rails: 1-5/8 inch O.D. standard weight steel pipe complete with end caps and end clamps for attachment to posts.

F. Horizontal and Diagonal Bracing:

1. Horizontal Rails with Diagonal Bracing to all end sections: Intermediate horizontal rail, 1-5/8-inch O.D. standard weight steel pipe complete with end caps and clamps for attachment to posts.

2. Diagonal: 3/8-inch diameter steel truss rods complete with turn buckles and attachments to post.

G. Tension Wire: For fabric of 9-gage and heavier use 6-gage galvanized coiled spring steel wire.

H. Galvanizing Repair Material: Galvanized surfaces which have been damaged in transport or during installation shall be re-coated using the metalizing process or zinc oxide, zinc dust paint per Section 210-3.5 of the SSPWC.

I. Galvanized Steel Brace Bands, Tension Bands or Bars and Tension Rods: Brace bands shall be galvanized**,** minimum of 3/16 inch x 3/4-inch wide; tension bands or bars shall be 3/16 inch x 3/4-inch wide and tension rods shall be 3/8 inch diameter galvanized steel rod with galvanized turnbuckles or other suitable tightener or tightening devices.

2.2 GATE HARDWARE

A. Swinging Gate:

1. Hinges: Heavy-duty ball and socket, industrial service**,** offset type**,** minimum 3 inch in width.

2. Latch for Single Swing Gate: Heavy malleable iron, fork type with provisions for padlocking.

3. Latch for Double Swing Gate: Heavy center drop rod latch assembly with provisions for padlocking. For hold-back sleeves provide steel pipe of diameter greater than of drop rod diameter and of length indicated on the Drawing.

2.3 GATE CONSTRUCTION

A. Swinging Gate Frame Construction:

1. All welded, fabricated of 1-7/8 inch O.D., galvanized steel pipe; all welded joints ground smooth and coated with a galvanizing repair material; all in accordance with reviewed Shop Drawings.

2. Frame Bracing: Use galvanized steel truss rods with galvanized turn buckles as hereinbefore specified.

3. Fabric: Same as hereinbefore specified for fencing, placed on exterior side of gate frame, as indicated, in same manner as specified for fencing.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the work. Do not proceed until detrimental conditions are corrected.

3.2 CHAIN LINK FENCE INSTALLATION

A. Post Setting: In concrete foundations per applicable detail/s; set plumb, at specified height and spacing, in straight alignment for uniform installation as indicated on the Drawings.

1. Excavating and Backfilling: Neatly and accurately excavate foundation holes for posts as indicated. Compact subgrade or any loose material. Solidly and firmly backfill around completed concrete foundations with excavated earth materials to finish grade or to proper elevation, as necessary for required paving as applicable.

2. Concrete Footings: Minimum 2500 psi concrete or as otherwise specified on drawings and conforming to the most recent edition of Los Angeles City Building Code and applicable Amendments. Finish top of footing smooth and even, sloped to shed water and with edges at finish grade of adjoining ground or adjusted for paved surfaces. Allow concrete to attain at least 75% of its 28-day strength before installation of fencing components.

C. Top Rail: Extend through post eye-top caps and attach ends to corner, gate, and/or terminal (end) posts.

D. Horizontal and Diagonal Bracing:

1. Horizontal Rail: Locate mid-height in fencing panels adjacent to gates, corner, and terminal (end) posts.

2. Diagonal Bracing: Extend from the joint of horizontal brace (with adjacent post) diagonally to the base of gate, corner, or terminal post.

E. Chain Link Fabric:

1. The fabric shall be installed so that the edge extends beyond the top rail and the bottom rail by 1 inch. The bottom of the fabric shall extend to within 1 inch maximum of the natural ground or final grade. High points of ground shall be excavated to clear the bottom of the fabric and depression shall be filled and compacted to within 2 inches of the bottom of fabric. Secure fabric to tension wire with galvanized clip rings or wire ties spaced not more than 18 inches apart.

2. Tightly stretch and secure to line posts, with adequate tie wires, space maximum 18-inches apart or as recommended by manufacturer.

3. Secure fabric to top rail, terminal (end) and gate posts by means of heavy, galvanized steel bands bolted to 1/4-inch x 3/4-inch tension bars passing vertically through full height of fabric 16 inches interval.

3.3 SWINGING GATE INSTALLATION

A. Properly hang or set gate(s) in plumb and level position for full opening without interference and adjust the hardware for smooth and trouble-free operation and inspect latching and locking hardware for proper alignment and function.

3.4 MISCELLANEOUS

A. Use U-shaped tie wires, conforming to diameter of pipe to which attached, clasping pipe and fabric firmly with ends twisted at least two full turns.

B. Bend ends of wire to minimize hazards to persons and clothing.

C. Fasteners:

1. Install galvanized nuts for tension band and hardware bolts on side of fence opposite fabric side.

2. Peen the ends of bolts to prevent removal of the nuts.

D. Repairs: Repair fencing coatings damaged in the shop or during field erection using a hot-applied repair compound applied in accordance with repair compound manufacturer's recommendations as approved by the

City Engineer; at no added cost to the City.

E. Cleanup: Comply with provisions of the GENERAL REQUIREMENTS regarding removal from the jobsite; rubbish, all equipment, unused materials, temporary structures and/or facilities no longer required.

END OF SECTION

This page intentionally left blank

SECTION 02840
CONCRETE WHEEL BUMPERS

PART 1 GENERAL

1.1 SUMMARY

A. Furnish and install concrete wheel bumpers (wheel stops) as indicated on the drawings and specified.

B. Product Data: Submit information describing the materials used in the manufacture of the wheel bumpers.

PART 2 PRODUCTS

2.1 MATERIALS

A. Concrete shall conform to the following:

1. Minimum compressive strength: 4,000 pounds per square inch (psi) minimum at 28 days.

2. Air content: 5 to 8 percent.

3. Size of bumpers shall be as indicated on the drawings.

B. Reinforcing bars shall be deformed billet steel conforming to ASTM A615, Grade 60.

C. Anchor stakes for driving into the ground shall be No. 4 reinforcing bars or steel pipe conforming to ASTM A53.

D. Adhesive for Securing of Concrete Wheel Bumpers: An epoxy two-component type, long curing, manufactured by Edeco, Furance, Andrew Brown, Adhesive Engineering Company, or equal.

PART 3 EXECUTION

3.1 INSTALLATION ON ASPHALT PAVEMENTS

A. Secure bumpers in place with steel stakes, two per bumper, driven to at least 1/4-inch below top surface of the bumper, through the pavement and not less than 12 inches into the subgrade.

3.2 INSTALLATION ON PORTLAND CEMENT CONCRETE PAVEMENTS

A. Secure bumpers in place with 2-component epoxy adhesive. Surfaces to receive adhesive to be free of laitance, dirt, loose particles or other foreign matter and shall be completely cured and dry.

B. Slightly roughen the smooth surfaces as recommended by the adhesive manufacturer to provide for proper bond. Properly cure the adhesive after placing of bumper unit.

END OF SECTION

This page intentionally left blank

SECTION 02932
LANDSCAPE PLANTING

PART ONE - GENERAL

1.1 DESCRIPTION

A. Work Included:

1. All labor, materials, equipment, and tools necessary to provide and execute: soil preparation and amendments; planting of new trees, plants, shrubs, ground cover and sod; all required testing and inspections; maintenance and establishment of new landscape plantings as indicated on the Contract Drawings, specified herein and as needed for complete and proper installation and maintenance.

1.2 SUBMITTALS

A. The CONTRACTOR shall make all required materials submittals in accordance with the General Requirements.

B. The CONTRACTOR shall make substitution submittals in accordance with the General Requirements.

C. Submit copies of the following:

1. Complete list of landscape plant materials soil amendments, fertilizers, herbicides, and miscellaneous hardware complete with descriptions and/or photographs and manufacturer’s literature. Clearly mark or underline proposed items.

1.3 QUALITY ASSURANCE

A. Codes and Regulations: CONTRACTOR to obtain and pay for all required permits. Deliver all permits and submit certifications of compliance to the CITY ENGINEER.

1.4 GENERAL REQUIREMENTS

A. Required Approvals by the ENGINEER: No work included in this Section shall be commenced until the following are completed and approved:

1. Any required agricultural suitability and fertility analysis or testing and weed/pest control prior to placing topsoil or soil amendments.

2. All work on irrigation system prior to start of landscape planting work.

3. All reviews on required submittals and re-submittals requested by the ENGINEER for materials included in this section.

B. Inspection: All work and materials are subject to inspection and approval by the Bureau of Contract Administration (BCA) Inspector and the PROJECT MANAGER. Any work done without proper inspection will be subject to rejection per Section 2-11 of the Standard Specifications for Public Works Construction. The CONTRACTOR shall notify the Bureau of Contract Administration (BCA) Inspector and PROJECT MANAGER three (3) days prior to requested inspection of the following for approvals:

1. For all finish grades in planting areas following all weed/pest control, soil fertilizing and conditioning, prior to landscape container planting, and after rolling in turf areas.

2. Inspection of all plant materials under 24" box size shall be at the time of delivery to the job site. This inspection will be for compliance with the caliper, height and spread requirements if given on the plant legend and for the general health, structure and appearance of plants. The CONTRACTOR shall also stake all tree planting locations at this time for review and approval by the ENGINEER.

3. Tagging of 24" box or larger trees at the grower with Recreation and Parks tags. This inspection will be for compliance with the caliper, height and spread requirements if given on the plant legend and general health, structure and appearance of plants. All trees shall be tagged by the ENGINEER or authorized representative.

4. All completed landscape planting and irrigation work for approval to begin the plant maintenance and plant establishment period.

C. Existing Plant Materials: Protect all existing plant materials, not designated for removal or modification, in place against damage

resulting from work of this Contract. Perform any removal and/or trimming only on approval or instructions from the CITY ENGINEER or in accordance with applicable provisions noted or specified on the Contract Drawings. CONTRACTOR shall replace all damaged existing plant material with like type and size material. If an acceptable replacement is not available, CONTRACTOR shall pay damages to the CITY for the value of the damaged tree as assessed by the tree value formula in the ISA Guide for Establishing Value of Trees and Other Plants.

D. Tree Protection Requirements: See sheet LP03 and LP04.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery:

1. Delivery of plant material shall begin only when it is ready for plant installation and after the inspections are made and any required soil samples and tests have been reviewed by the PROJECT MANAGER. All materials furnished for the work shall be not less than the approved submittal. Upon delivery, CONTRACTOR shall tag one plant of each variety for identifying purposes.

2. Notify the ENGINEER of a scheduled delivery a minimum of 48 hours in advance so the plant materials may be inspected upon arrival at the jobsite. All plant material judged by the ENGINEER at the time of delivery as unacceptable shall be removed immediately from the jobsite by the CONTRACTOR. All trees not accompanied with the tags signed placed the ENGINEER or the authorized representative*,* or plants not correspondent with contract requirements shall be rejected and immediately removed from the job site.

3. Protect plants during delivery against damage to root balls or desiccation of leaves. Protect trees during transport by tying in the branches and covering all exposed branches.

4. Deliver fertilizer to the jobsite in the original and unopened containers bearing manufacturer's guarantee chemical analysis, name, trademark or trade name in conformance with Federal and Local law. In lieu of containers, fertilizer may be furnished in bulk and a certificate indicating the above information shall accompany each delivery.

B. Storage:

1. Store plants, trees, etc. at the jobsite where directed by the PROJECT MANAGER.

2. Keep fertilizer in dry storage away from contaminants. Loose fertilizers and soil amendments shall be kept covered with a tarp.

3. Store plants not installed on the day of arrival at the jobsite as follows:

a. Outside storage to be protected from wind.

b. Keep plants in containers in a moist condition until planted by watering with fine mist spray.

C. Handling: Transport and handle plants with care to ensure protection against injury.

PART TWO - PRODUCTS

2.1 MATERIALS

A. Topsoil: The type and thickness of topsoil shall be as shown on the plans. If not shown, the topsoil shall be the existing class "C" on-site topsoil and amended as indicated.

B. Fertilizers and Conditioning Materials: Comply with the applicable requirements of the State Agricultural Code. All fertilizing materials shall be packaged, first grade, commercial quality products identified by source, type of material, weight and manufacturer's guaranteed analysis. Fertilizing material shall not contain toxic ingredients or fillers in quantities harmful to human, animal, or plant life.

1. Agricultural Gypsum: Hydrated calcium sulfate product containing 23 percent calcium and 18 percent sulfur with a guaranteed analysis of 84 percent calcium sulfate.

2. General Purpose Fertilizer: Shall be Gro-Power Plus fertilizer, having a minimum analysis of 5-3-1 (N-P-K) derived from ammonium phosphate, urea, sulfate of potash, compost and sulfides and oxides of iron, manganese and zinc, with 1.00% Alkyl Naphthalene Sodium Sulfonate soil penetrant as manufactured by

Gro-Power Inc., 5065 Telephone Avenue, Chino, CA 91710 (909) 393-3744, or an approved equal. https://www.gropower.com

3. Fertilizer Tablets**:** Fertilizer tablets shall be Tri-C Myco Tabs planting tablets, 1.7 gram 17-9-5 (N-P-K) as manufactured by TRi-C Organics Inc., (800) 590-3301, or an approved equal. https://www.tricorganics.com

4. Non-Selective Herbicide**:** Shall be Finale™, by BASF, or an approved equal. All herbicides, when required, shall be specified and applied by a licensed Pest Control Advisor in a manner consistent with the manufacturer's product labelling. Prior to application, CONTRACTOR shall submit proposed herbicide and a diagram showing the area of application for approval to the PROJECT MANAGER.

5. Pre-Emergent Herbicide**:** Shall be Specticle G Pre Emergent Granular Herbicide, by Bayer Environmental Sciences, or an approved equal applied at the rate of 2.3 lb./1000 sf. All pre-emergent herbicides, when required, shall be specified and applied by a licensed Pest Control Advisor per the manufacturer's recommendations.

6. Granular Humic Acid Soil Conditioner: Shall be LIVE EARTH HUMATE SOIL CONDITIONER [PLUS GYPSUM] or Tri-C Humate [Tri-C Humate Plus with Gypsum] or approved equal. Contact Todd Burns, Live Earth Products, Inc. (661) 978-7307 for availability, or TRi-C Organics Inc., (800) 590-3301 https://www.tricorganics.com, or an approved equal. Apply per manufacturer's instructions.

7. Soil Penetrant**:** Shall be "Ground Breaker" by Green As it Gets, Inc. or approved equal. Soil penetrant shall contain organic yucca and kelp extracts. Soil penetrant MAY NOT contain alcohol. Apply soil penetrant per manufacturer's instructions. Contact: Green As It Gets Inc., 300 Morning Drive, Bakersfield, CA 93306 Phone: 1-800-476-0034. https://www.greenasitgets.com

8. Organic Soil Amendment**:** "Type 1" organic soil amendment shall be a relatively dry and friable fine-textured organic composite that is well-composted and nitrogen stabilized, derived from composted greenwaste or processed wood products, and free of foreign matter including animal waste and any viable plant, tree or weed seed.

99% of material shall pass through a 1/2" screen. CONTRACTOR shall submit a sample of the organic soil amendment to the PROJECT MANAGER for approval prior to installation.

All Organic Soil Amendment shall conform with the following criteria:

a. The pH of the material shall be between 6 to 7.5.

b. Salinity: material shall have a maximum saturation extract conductivity of 2.50 millisiemens per centimeter.

c. Boron content of the saturated extract shall be less than 1.0 parts per million.

d. Sludge-based or animal waste materials are not allowed.

e. Carbon:Nitrogen ratio is less than 25:1.

f. All compost shall be aerobic without malodorous presence of decomposition products.

g. Maximum total permissible pollutant concentrations in amendment in parts per million on a dry weight basis:

Arsenic	20	Copper	150	Selenium	50
Cadmium	15	Lead	200	Silver	10
Chromium	300	Mercury	10	Vanadium	50
Cobalt	50	Molybdenum	60	Zinc	300
Nickel	100				

9. Top Dress Mulch**:** Shall be well-seasoned composted tree chip mulch, free all foreign matter including weed and tree seeds. Mulch chip size shall be minimum one (1) inch in diameter and not more than four (4) inches in diameter. Submit a sample of mulch and source to the PROJECT MANAGER for approval prior to application.

C. Plant Materials:

1. Availability & substitutions: No substitutions of plant species, type, cultivar, size etc. will be accepted without prior approval of PROJECT MANAGER. CONTRACTOR is expected to utilize all reasonable nursery resources in the Southern California region before determining if a specified material is unavailable. When

plants of a specified kind or size are determined by PROJECT MANAGER to be not available, substitution may be made upon approval by the ENGINEER, in accordance with the General Conditions. CONTRACTOR shall provide information regarding his attempts to locate such material.

2. All Plants: The plant names shown or listed on the Contract Drawings shall conform to the “Sunset Western Garden Book”, latest edition unless otherwise specified. In all cases, botanical names take precedence over common names. One plant of each variety shall be tagged for identifying purposes.

3. Quality: All plants shall have a growth habit normal to the species in accordance with U.S.A. Standards for Nursery Stocks, latest editions; shall be sound, healthy, vigorous and free from insect pests, plant disease, sun scalds, weeds, fresh bark abrasions, excessive abrasions or other objectionable disfigurements. Tree trunks shall have normal well-developed branch systems. All plant materials shall have vigorous and fibrous root system, not root bound and shall be free of kinked or girdling roots. The CONTRACTOR shall be responsible for the condition of all plants, planted or otherwise, until final acceptance by the CITY and termination of maintenance period

4. Sod: Shall be of the type designated on the planting plan, or an approved equal. Sod shall be delivered to the job site within 24 hours of being cut at the nursery, and COMPLETELY installed within 12 hours of delivery to the job site. The sod shall be machine cut to between 3/8” and 5/8” thick, not including top growth or thatch.

5. All plants shall be inspected and approved prior to planting as per provisions of Subsection 1.4(B) specified above

D. Tree Stakes:

1. Wood tree stakes 2-inches in diameter by 8-feet long, lodgepole grade, pressure-treated, capable of standing in the ground at least two years.

   a. All trees in non-turf areas as indicated on the Contract Drawings

shall be *double staked* per detail.

b. All trees in turf areas as indicated on the Contract Drawings shall be *triple staked* per detail.

E. Slope Stabilization and Erosion Control Material: Jute Mesh material shall be light weight, brown color, fire retardant, open weave construction and shall have a minimum 4-year longevity. Material shall handle maximum water flow of 8 feet per second.

PART THREE - EXECUTION

3.1 GENERAL

A. The Landscape work shall not be performed at any time when it may be subject to damage by climatic conditions.

B. The CONTRACTOR shall verify all dimensions shown on the Contract Documents and at the site.

C. In case of conflict between the plant schedule totals and total plant count of the contract documents, the CONTRACTOR shall provide the higher number of plants.

D. Delivery of material shall begin only when it is ready for the work and after the inspections are made and the required samples and tests have been reviewed by the ENGINEER. All materials furnished for the work shall be not less than the reviewed sample.

E. The CONTRACTOR shall provide temporary fencing, barricades, covering, or other protection to preserve existing landscaping items indicated to remain and to protect the adjacent properties and other structures from damages by the landscape and other contract work.

F. The CONTRACTOR shall abide by the Tree Preservation Guidelines, Section 1.4.D herein for all trees indicated to remain.

G. The CONTRACTOR shall remove and/or relocate landscape items such as trees, shrubs, grass, other vegetation, improvements, and obstructions as shown on Drawings or specified otherwise. All plant material to be removed shall be disposed of off the site in a legal and proper manner.

3.2 SURFACE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the work. Do not proceed until detrimental conditions are corrected.

3.3 AGRICULTURAL SUITABILITY AND FERTILITY ANALYSIS TESTS

A. General**:** CONTRACTOR shall submit the existing Class C Topsoil for Agricultural Suitability and Fertility Analysis. CONTRACTOR shall sample a minimum of three typical locations of existing on-site soil proposed to be used for topsoil and submit them to a certified soil laboratory for required soil analysis. The location of the soil sample and intent of the soil analysis are to provide the following:

1. Accurate soil amendment and fertilizer recommendations with regards to type, quantity and procedure to create suitable planting soil for plant material which includes trees, shrubs, ground covers and turf.

2. Identify any potential problems in the relationship between specified of plant materials and existing soil conditions that may ultimately affect plant growth.

3. For on-site soil, use a soil probe or soil auger to remove soil core samples. Otherwise use a shovel to dig a hole to the desired depth. Sample the soil from the side of the hole by scraping it with a trowel. The tools need to be clean and not rusty. Avoid sampling when the soil is too wet.

B. CONTRACTOR shall provide the ENGINEER with a copy of the completed report with recommendations for soil amendments and fertilization for initial planting, as well as any measures to be taken during the plant establishment period. on laboratory letterhead for review prior to commencement of soil preparation.

C. Agricultural Suitability and Fertility Analysis:

1. Must include pH measurement in the Saturation Extract, Electrical Conductivity of the saturation extract and Sodium Adsorption Ratio of the saturation extract.

2. The following nutrients and elements must be determined with an approved extraction method. Interpretation data must be given citing concentrations which are considered to be low, medium and high: Boron, Calcium, Copper, Iron, Magnesium, Manganese, Molybdenum, Phosphorus, Potassium, Sodium, Sulfur, and Zinc

a. The saturation extract must be analyzed for Calcium, Magnesium, Sodium, Boron, Chloride, Nitrate and Sulfate.

b. The following trace metals must be measured by the DTPA extract: Aluminum, Arsenic, Cadmium, Chromium, Cobalt, Lead, Lithium, Nickel, Selenium, Silver, Strontium, Tin and Vanadium.

c. The presence of Calcium Carbonate and/or Magnesium Carbonate must be determined.

d. Soil Texture and Organic Matter content may be estimated or determined by commonly used methods.

e. Interpretation of nutritional deficiencies or excesses and potential toxicities must be given.

3.4 GRADING AND SITE PREPARATION:

A. Rough Grading:

1. Earthwork and Topsoil Placement: Shall include excavation and backfilling for the irrigation system and the preparation for the spreading, densification, cultivation and raking of topsoil, including fertilization and conditioning.

B. Topsoil Preparation and Amendment:

1. After completion of *all necessary trenching and backfill* for electrical, irrigation, or drainage piping and conduit, bring planting areas to approximate finish grade, including construction of landscape mounds, before performing soil amendment. CONTRACTOR shall account for the amount of fertilizer and soil amendments to determine the appropriate grade.

2. Turf Areas: For all TURF planting areas *outside of tree protection zones,* Class "C" on-site ("native") topsoil shall be scarified and cultivated to a uniform, finely divided condition to a depth of 12 inches. Soil shall not be worked when it is so wet as to cause excessive compaction to cause the formation of large clods; or so dry as to create excessive dust. All soil amendments shall then be broadcast evenly at the rate as specified below (or per the recommendations of the approved agricultural suitability and fertility analysis if directed by the PROJECT MANAGER)**,** and then

thoroughly and uniformly incorporated to the depth of 12 inches**.** Prior to planting, the top 3 inches of all planting areas (including slopes) shall be free of weeds, stones and other deleterious matter 1-inch diameter and larger.

a. All turf planting areas shall receive the following soil amendments per 1,000 square feet:

4 cubic yards, Type I organic soil amendment
15 lbs. Agricultural Gypsum
50 lbs. Gro-Power Plus fertilizer

b. Topsoil shall be restored to a smooth finish grade after amendment process is complete and irrigated thoroughly to activate amendments and fertilizers.

3. Non-Turf Area Bulk Amendment**:** For all continuous areas designated on plans for tree, shrub and groundcover planting areas *outside of tree protection zones*, the Class "C" on-site ("native") topsoil shall be scarified to a depth of 1 inch, taking care not to damage surface roots.

a. After scarification, apply “GROUND BREAKER” soil penetrant to all planting areas at a rate of 1 gallon per 1,000 square feet per manufacturer’s instructions.

b. 2 hours minimum after applying soil penetrant, all planting areas shall receive the following soil amendment per 1,000 square feet:
   - 50 lb. GRANULAR HUMIC ACID SOIL CONDITIONER

c. Soil amendment shall be evenly broadcast on the surface and uniformly cultivated into the top 6” of the soil and *thoroughly irrigated*. Soil shall not be worked when it is so wet as to cause excessive compaction or to cause the formation of large clods; or so dry as to create excessive dust. Prior to planting, the top 3 inches of soil (including slopes) shall be free of weeds, stones and other deleterious matter 1-inch diameter and larger.

4. For all planting areas *inside of tree protection zones*, the Class "C" on-site ("native") topsoil shall be scarified to a depth of 1 inch, taking care not to damage surface roots.

a. After scarification, apply “GROUND BREAKER” soil penetrant to

all planting areas at a rate of 1 gallon per 1,000 square feet per manufacturer's instructions.

b. 12 hours minimum after applying soil penetrant, all planting areas shall receive the following soil amendment per 1,000 square feet:
   - 20 lb. GRANULAR HUMIC ACID SOIL CONDITIONER

c. Soil amendment shall be evenly broadcast on the surface and uniformly cultivated into the top 1" of the soil and *thoroughly irrigated*. Soil shall not be worked when it is so wet as to cause excessive compaction or to cause the formation of large clods; or so dry as to create excessive dust. Prior to planting, the top 3 inches of soil (including slopes) shall be free of weeds, stones and other deleterious matter 1-inch diameter and larger.

5. For individual tree and shrub planting outside of designated bulk soil amendment areas, backfill shall be 100% Class "C" on-site ("native") topsoil uniformly amended with GRANULAR HUMIC ACID SOIL CONDITIONER at the rate specified below:

   15 gallon: 1/2 cup (US) per plant
   24" box: 2 cups (US) per plant
   36" box: 6 cups (US) per plant
   48" box: 10 cups (US) per plant

6. Incorporation of all soil amendments shall be performed in the presence of the BCA Inspector, and at that time CONTRACTOR shall furnish the BCA Inspector with delivery tickets to verify the source, kind and quantities delivered and applied. Furnish PROJECT MANAGER duplicate copies of the material invoices as required in Subsection 1.2 (C).

C. Finish Grading:

1. Make finish grade smooth, uniform and free of abrupt grade changes and depressions to insure proper surface drainage.

2. Finish grade below adjacent paving, curbs or headers shall be 1.5 inches in shrub or ground cover areas and 3/4 inch in sodded lawn areas.

3. Water soil after spreading of fertilizer and/or soil conditioning materials and allow it to settle to provide a stable surface. After the

soil has dried out to a workable condition, regrade, rake and smooth to the required grades and contours, eliminating any erosion scars. Finished surfaces shall be clean and suitable for planting.

4. Finish grading shall insure proper drainage of site. Surface drainage shall be away from all building foundations at a minimum of 2% or in accordance grades shown on Contract Drawings.

5. Turf Areas**:** Finish grading of turf areas shall take place after the soil has dried out to a workable condition following the soil preparation operations. The soil shall be remodeled and smoothed to the required grades and contours, then rolled in two directions at right angles with a water ballast roller weighing 200 to 300 pounds maximum. Any resulting irregularities in the grade after the initial rolling shall be re-raked, cut or filled, then re-rolled until the grade is free from irregularities. No trucks, tractors or other heavy objects shall be taken over the areas at any time. The final finish grade shall be smooth, uniform, without abrupt changes in grade, within one-tenth of a foot of the grades shown on the plan. No turf areas shall exceed 5:1 slope. Final grade must be approved by the CITY ENGINEER or BCA Inspector prior to seeding or sodding. (801-2.3).

3.5 WEED ABATEMENT

A. General: Unless specified otherwise, weed abatement shall apply to all planting areas. The abatement operation shall commence before planting but only after removals, grading, hardscape construction, installation of irrigation system, soil preparation, and fine grading of planting areas have been completed.

B. All herbicides for weed control shall be applied with a photosensitive dye which will produce a contrasting color when sprayed upon the ground. The dye shall be applied in a manner so as not to leave any stain upon finished surfaces.

C. The following precautions shall be observed in handling and applying herbicides:

1. Before applying, the CONTRACTOR shall read and understand all instructions provided by the manufacturer.

2. Herbicide product shall not be used when winds are gusty or in excess of 8 miles per hour, or when any other conditions exist which would result in drift.

3. DO NOT USE any combinations of pressure and nozzle type or adjustment that result in misting.

4. Do not apply during rain, or if rain is forecast within twelve hours. If rain occurs within a twelve-hour period after application, material must be reapplied after application area has sufficiently dried out.

5. CONTRACTOR shall observe extreme care not to allow spray to contact plant material designated to remain, or in adjacent areas. Use cardboard, plywood, or other appropriate material to shield plant materials outside of the treatment area from overspray.

6. Do not apply to bare ground.

D. Herbicide Application: Pesticides must be applied by a licensed Pest Control Applicator in accordance with the requirements of the California Food and Agricultural Code and specified herein. The CONTRACTOR shall abide by all laws and codes governing weed abatement operations including but not limited to CAL-OSHA requirements and The Healthy School Act of 2000 (AB2260). Prior to herbicide application CONTRACTOR shall:

1. Notify the PROJECT MANAGER a minimum of 72 hours in advance of each application of pesticide/herbicide and shall indicate the hours during which the application will occur. No applications shall be made on Saturdays, Sundays, or legal holidays, unless otherwise prior approval by the PROJECT MANAGER in writing.

2. Notify the Pest Management Supervisor of the RAP Forestry Division at (213) 485-4826. Do not add other products to any herbicide mix, including spreader, stickers, or surfactants, unless required by the label directions and approved by the RAP Pest Management Supervisor.

3. Prior to any approved pesticide applications at any RAP facility with a Recreation Center or Child Care Center, the CONTRACTOR is required to notify the Recreation Center Director a minimum of 72 hours in advance of each application.

4. Submit to the BCA Inspector and to RAP Forestry a “Pest Control Recommendation Form” prepared by a licensed Pest Control Advisor, and a provide completed and accurate SDS (Safety Data Sheet) to be kept at the site of application. The area of application shall be posted as such and barricaded for public safety and information (site construction fencing is deemed adequate for this purpose when present).

5. Any questions regarding pesticide application and procedures at Recreation and Parks facilities shall be directed to the PROJECT MANAGER/BCA Inspector and the RAP Forestry group, Vegetative Management at (213) 485-4826.

E. “Grow and Kill” method: The CONTRACTOR shall adhere to the following steps:

1. Clear and grub the surface of the designated planting area by mechanical means or by hand, removing all surface vegetation (excepting any trees, shrubs or turf designated to remain per plans and notes), rocks, debris, etc. Do not disturb the roots or compact soil around any existing vegetation to remain or within designated Tree Protection Zones, and do not remove any topsoil during clearing work.

2. “Grow Period”: Water all planting areas daily or as needed to keep soil evenly moist and promote weed germination and growth for a period of a minimum of *three weeks*. If, in the opinion of the ENGINEER the “Grow Period” irrigation was insufficient to achieve adequate germination, the “Grow Period” may be extended in minimum 7-day intervals at no additional expense to the CITY.

3. “Kill Period”: At the conclusion of the grow period and approval by the ENGINEER, treat all emergent weeds within the planting area with approved herbicide per the submitted and approved “Pest Control Recommendation Form” following the manufacturer’s instructions and labelling - *taking care to protect all trees, shrubs, turf etc. designated to remain*. If nutsedge (nutgrass) is determined to be present in any of the planting areas by the ENGINEER during the “Grow Period”, CONTRACTOR will be required to apply a separate selective herbicide manufactured specifically for the control of nutsedge at no additional cost to the CITY until nutsedge is completely eradicated.

4. After spraying, do not water or otherwise disturb treated areas for a

minimum period of two (2) weeks.

5. After the two-week kill period, remove all dead vegetation. If any living plants are observed, the entire plant, including roots, shall be removed by hand, minimizing physical disturbance of the soil.

F. Herbicide Damage: New and/or existing plants which in the opinion of the ENGINEER have been damaged, disfigured, or stunted by the application of herbicide shall be replaced in kind (type, size, and age) by the CONTRACTOR at their expense.

3.6 PLANTING

A. General: All plant materials, including plants previously approved at the nursery, shall be inspected by the ENGINEER prior to planting. The CONTRACTOR shall be responsible for the condition of all plants, planted or otherwise, until final acceptance by the CITY and termination of maintenance and establishment period. CONTRACTOR shall be obligated to honor all requirements of warranty as indicated herein.

1. Perform planting with materials and equipment according to procedures favorable to the optimum growth of the plant. Do not plant during high wind conditions.

2. Except as noted for specimen planting, do not start planting operations until the completion of weed suppression and completion and acceptance of the irrigation system

3. Large boxed trees may be planted prior to hardscape installation or irrigation completion to facilitate construction and avoid damage to completed work with written approval from the PROJECT MANAGER. CONTRACTOR shall re-route irrigation lines in conflict with boxed tree locations to clear the root ball by 24” minimum at no additional cost to CITY.

B. Protection and Storage:

1. Keep all plant materials delivered to the jobsite in a healthy condition for planting. Do not crowd containers together in a manner that adversely affects plant foliage or growing conditions.

2. Do not allow plants to dry out or suffer physical damage from other construction activities. Protect from heavy winds.

C. Layout and Plant Locations:

1. Plant locations indicated on the Contract Drawings are approximate.

2. CONTRACTOR shall lay out each plant in its intended planting location as shown on the plan while the plant is still in the container and obtain approval of the layout from the ENGINEER *prior to installation*.

3. Prior to planting, the CONTRACTOR may be directed to alter the layout of plants by direction of the ENGINEER, without additional compensation to the CONTRACTOR.

4. For “on center” plant spacing, locate the first row of plants in areas designated at one-half the specified spacing from the edge. Do not stretch the maximum specified spacing for each species as shown on the plans.

D. Container Plants Backfill Mix:

1. Unless specified otherwise or recommended by the approved agricultural suitability and fertility analysis and approved by the PROJECT MANAGER, container plants shall be backfilled with 100% amended site soil.

a. Each plant pit shall also receive Tri-C Myco Tabs 1.7 gram 17-9-5 (N-P-K) planting tablets as shown in the relevant planting details, and as follows:

Container Size	
1 gallon	= 2 tablet
5 gallon	= 8 tablets
15 gallon	= 16 tablets
Boxed Trees	= 10 tablets per inch of trunk diameter, with a minimum of 20 tablets per tree.

b. Some plant species may be designated not to receive any planting tablets. Refer to legend on Planting Plan.

E. Tree and Shrub Planting:

1. Prior to planting, irrigation system installation and soil amendment shall be completed and approved. Soil shall be thoroughly irrigated beforehand, and suitably moist for planting. *Do not plant in dry soil*.

2. Make planting holes approximately square with vertical sides *no greater than the depth of the plant container* (or such depth as needed so that the root crown has the correct relationship to adjacent finished grade per the planting details) and approximately twice the width of the plant container or rootball and larger if necessary to permit handling and planting without injury to the root system. Lightly scarify native soil at the bottom of planting holes.

3. Do not plant plants with a broken or cracked rootball. Such plants shall be considered defective and rejected. Rejected plants shall be removed promptly from the job site.

4. Open and remove plant containers in such a manner that the plant roots are not injured. Do not pull plants out of the pot by the stalk.

5. Scarify native soil at the bottom of planting holes.

6. If soil is not adequately moist, apply water to planting hole and allow to drain. Set the plant approximately in the center of the planting hole and add backfill under rootball if needed to adjust the root crown to correct grade.

7. Backfill the balance of the planting hole with moist, amended site soil; firming the backfill by hand or with tools to assure all air pockets have been removed, and settlement will be minimized. After planting, all plants shall be plumb with the root crown at its natural depth with respect to finish grade.

8. Prune or remove any broken or damaged minor limbs. Any major damage to plant material shall be brought to the attention the ENGINEER for evaluation. Trees or shrubs with major broken limbs shall be considered defective and rejected. Rejected plants shall be removed promptly from the job site.

9. For any trees installed prior to completion of irrigation system: form a circular watering basin 6-inches high and slightly larger than the planting hole to accommodate temporary hand watering. Make the bottom of the basin level with surrounding finish grade. Watering

basin berms shall be removed during fine grading process and before application of top-dress mulch.

10. Tree Edging: Where trees are planted in lawn area, a minimum 4-foot diameter circle around each tree shall be maintained free of lawn area to avoid the growth-reducing effects of lawn area on trees. Mulch shall be placed in the circle. This circle shall be kept clear of lawn area by the CONTRACTOR for the duration of the maintenance period.

11. Install vines per planting detail. Remove nursery stakes and affix all branches to walls or fences per notes and details on Contract Drawings.

F. Turf Planting: Soil amendment, irrigation installation, weed abatement, and fine grading shall be completed and approved before seeding or sod installation.

1. Hydro-Seeded Turf Planting: The seed, fertilizer, fiber and other materials in the slurry mixture shall be as specified on Contract Drawings and other applicable sections of these Specifications. All material shall be of appropriate type that will disperse into a uniform slurry when mixed with water. The mixture shall form an absorbent porous mat after placement. Do not apply when the wind velocity exceeds five miles per hour or is detrimental to the uniform distribution of the slurry.

a. The lawn seed mix for lawn planting shall contain the following materials at the rates specified:

1. Mulch Fiber Eco-Fiber Wood Fiber, 2000 lbs./acre
2. Stabilizer – Environ-Mend , 150 lbs./acre. Add slowly to tank to avoid clumping
3. Fertilizer – Starter Fertilizer (15-15-15) , # 400 lbs./acre. Incorporate additional elements as needed by soil test.

b. If seeding of turf areas is done during cool-season (between October 1st and March 1st) mix shall be 6/lbs / 1000 SF

50% Stovers ‘Grand Slam FS’ perennialryegrass blend

40% Stovers ‘Arden 15’ hybrid bermuda grass

10% Stovers ‘365SS’ Kentucky Bluegrass blend

c. If seeding of turf areas is done during warm-season (between March 1st and October 1st) mix shall be 6/lbs 1000 SF

50% Stovers ‘Grand Slam FS’ perennial ryegrass blend
30% Stovers ‘Arden 15’ hybrid bermuda grass
20% Stovers ‘365SS’ Kentucky Bluegrass blend

d. The CONTRACTOR shall supply a delivery receipt to the BCA Inspector certifying conformance with the specified hydroseed mix and indicating that the slurry has not been mixed for longer than two hours. Slurry which has been mixed longer than two hours shall be recharged with 50 percent more of the specified seed mix, at the CONTRACTOR's expense, (801-4.8.2(b)). Delivery tickets shall be forwarded to the PROJECT MANAGER/BCA Inspector.

f. Use a green coloring additive in the slurry for the visual inspection purposes during application. Apply the slurry under pressure at the specified rates indicated in the Contract Drawings. Moisten areas to be seeded with irrigation beforehand, but not surface wet at the time of application. Keep the hydraulically seeded areas moist during the germination period and avoid puddling.

g. See additional information in Section 22 HYDROSEEDING

1. Sod Planting: The type of sod and the area to be sodded shall be in accordance with the Contract Drawings. Sod shall be machine cut to between 3/8” and 5/8” thick, not including top growth or thatch.

   a. Site shall be fine graded to the specified thickness of the sod below finish grades. Soil conditioning and fine grading shall be completed before sodding. No heavy equipment shall operate over the site after grading is completed.

   b. The site shall be moist but not wet when sod is laid. Sod shall be laid with closely fitted joints, and the ends of the strips shall be staggered forming a running bond pattern. Openings shall be plugged with sod or topsoil. Within 2 hours after installing sod and before rolling, the sod shall

be lightly irrigated. All seams and joints shall then be rolled with a 200-300 lb. water ballast roller until the sod is well bonded to the soil below.

c. The sodded areas shall then be watered thoroughly to penetrate the subsoil at least 8 inches. Watering shall be repeated as necessary to keep the sod moist until rooted into the subgrade. Sodded areas shall be protected against all traffic until the sod is well established.

2. Turf Repair: All trenches shall be fully compacted, and the grade brought flush with the adjacent undisturbed finish grade. This repair shall include areas of irrigation or other piping trenches, conduit trenches or where vehicles or equipment has damaged the existing turf. Turf repair shall be accomplished using "Method A" hand seeding; or existing sod shall be carefully cut, removed, and reused to re-sod trenches after backfilling and compaction. CONTRACTOR shall use seed/sod to match existing turf type in areas being repaired unless directed otherwise by the ENGINEER.

3.7 TREE STAKING AND GUYING

A. Tree Staking: See planting legend for what type of staking shall be used for each tree type, if any shall be used. Stake trees with 2" diameter x 10' long lodgepole pine stakes as indicated on the Drawings and details.

1. After planting, all trees shall be re-staked promptly per details.

2. Remove any existing nursery stakes first before installing new lodgepole stakes.

3. All trees in turf areas shall be triple staked unless noted otherwise. Stakes shall be placed in a circular pattern around tree, evenly spaced 1/3 circle apart.

4. All trees in non-turf areas shall be double staked, unless noted otherwise. Align stakes with the direction of strongest seasonal winds.

5. DO NOT drive stakes into the rootball of any newly planted trees.

3.8 MAINTENANCE AND PLANT ESTABLISHMENT

A. General Maintenance: Maintain all areas Inside of work on a continuous basis as they are completed *during the progress of the work and during the plant establishment period*.

1. CONTRACTOR shall maintain the entire area of work until final acceptance of the Contract by the CITY. Maintenance activities shall include continuous operations of picking up trash, watering, weeding (including all broadleaf weeds in lawn areas), mowing, rolling, edging, fertilization, spraying & pest control of insects and rodents, reseeding & plant replacement (irrespective of cause), or any other operations necessary to provide normal healthy plant growth.

2. Any malfunctions of, or damage to the irrigation system due to workmanship or materials or as caused by the CONTRACTOR in the execution of his work shall be repaired by the CONTRACTOR within 24 hours at his own expense. The CONTRACTOR is responsible for keeping all plant material sufficiently watered during any irrigation failures.

B. Plant Establishment Period:

1. The Plant Establishment Period shall be for a minimum period of 90 days unless extended as described in this section. The Plant Establishment Period shall be started when all planting and irrigation related work has been completed in accordance with the contract documents and approved by the PROJECT MANAGER. CONTRACTOR shall request a review of completed work by the PROJECT MANAGER at the appropriate time to determine if the Plant Establishment period may begin. A field notification will be issued to the CONTRACTOR to establish the effective beginning date of the plant establishment period.

2. The designated plant establishment period is part of the total contract time. The plant establishment period will be extended at fourteen (14) day intervals if, at the end of the plant establishment period, the planting, irrigation and other improvements do not reflect the intent of the plans and specifications. All extensions of

the plant establishment period shall be subject to the assessment of liquidated damages, (801-6).

3. All lawns shall be of the grass seed or sod specified and shall be free from all broadleaf weeds. The lawn shall not be allowed to grow higher than three (3) inches and shall be mowed to a 1½" - 2" inch height. The lawn shall be mowed at least weekly during the Plant Establishment Period. All lawn areas shall have 95 percent coverage with bare areas not exceeding three square inches at the end of the Plant Establishment Period. 60 days after commencement of Plant Establishment Period, CONTRACTOR shall apply a slow release 38-0-0 granular fertilizer at a rate of 15 pounds per 1000 sq. ft. to all lawn areas and irrigate immediately afterwards. The fertilizer shall be applied in the presence of the BCA Inspector.

4. All trees and shrubs shall be healthy and vigorous in appearance throughout the duration of the Plant Establishment Period. Upon notice from the PROJECT MANAGER, the CONTRACTOR shall replace within seven (7) days of such notice at his own expense, any and all plant materials and/or sod which, for any reason dies or is damaged while under the CONTRACTORS care, or does not meet or exceed the quality of appearance and growth condition at the time of planting. Replacement shall be made with the same plant species and varieties as indicated or specified for the original planting. All replacement plants are subject to the same inspection requirements set forth in these specification for the original plant installation.

5. During the plant establishment period, all damage caused by erosion shall be repaired by the CONTRACTOR at his own expense within three (3) working days.

6. Broken or vandalized tree stakes shall be repaired or replaced by the CONTRACTOR at his own expense within seven (7) days.

7. During the plant establishment period, the irrigation system shall be operated in the automatic mode, unless otherwise permitted by the ENGINEER. No hand watering or manual station operations should be performed without notifying the ENGINEER. CONTRACTOR shall be responsible for setting an appropriate watering schedule for all irrigation zones, such as to provide adequate watering for each plant type, but not so much as to create any wasteful or unhealthful growing conditions. CONTRACTOR shall be

responsible for modifying the watering schedule as needed to accommodate changing weather conditions.

C. Final Inspection/Final Acceptance:

1. Upon completion of the plant establishment period, a final inspection for acceptance will be performed by the BCA Inspector and ENGINEER or authorized representative. The CONTRACTOR shall request for inspection at least three (3) working days prior to the anticipated date. For this inspection, the site must be thoroughly cleared of all debris and excess material removed. If work fails to pass final inspection, any subsequent inspection must be rescheduled as per above, and will be charged to the CONTRACTOR.

2. If the plant establishment period is satisfactorily completed ahead of other work included in the Contract, the plants establishment shall be extended and shall be the responsibility of the CONTRACTOR until all other work has been completed and accepted by the CITY.

3.9 GUARANTEE

A. General: All shrubs and ground covers shall be guaranteed for a period of ninety (90) days from the end of the Plant Establishment Period. All trees and shrubs 15-gallon size or larger shall be guaranteed for a period of one (1) year from the end of the Plant Establishment Period. CONTRACTOR shall provide a written guarantee for the above materials as a part of the final close out package.

B. Deficiencies: Should any deficiencies develop within the specified guarantee period, CONTRACTOR shall correct such deficiencies to the full satisfaction of the ENGINEER without added expense to the CITY. All replacement plants shall be subject to a new guarantee for a period as described herein above.

END OF SECTION

SECTION 03100
CONCRETE FORMWORK

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all materials for concrete formwork, bracing, shoring, and supports and shall design and construct all falsework and scaffolding, all in accordance with the provisions of the Contract Documents.

B. DEFINITIONS

1. Exposed Concrete: All concrete that is visible in the finished work, including concrete to be painted.

2. Unexposed Concrete: All other concrete that is concealed in the finished work, including plastered surfaces and attic and utility spaces.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 02310 Earthwork.

B. Section 03200 Reinforcement Steel.

C. Section 03250 Concrete Accessories.

D. Section 03300 Cast-in-Place Concrete.

E. Section 03315 Grout.

F. Section 03370 Concrete Curing.

G. Section 07900 Joint Sealants.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference standards and Standard Specifications as specified in the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable:

1. Government Standards:

PS 1	U.S. Product Standard for Concrete Forms, Class I
PS 20	American Lumber Softwood Standard
CSS	Caltrans Standard Specifications

2. Commercial Standards:

ACI 350.5	Specification for Environmental Structural Concrete
ACI 347R-14	Guide to Formwork for Concrete
ACI 117	Standard Tolerances for Concrete Construction and Materials

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. The following submittals and specific information shall be provided.

1. Formwork and shoring Calculations and Drawings: The CONTRACTOR shall comply with all the latest applicable Sections of the Division of Industrial Safety, Construction Safety Orders. In addition, formwork and shoring must be designed, fabricated, erected, supported, braced, and maintained so that it will be capable of supporting without failure all vertical and lateral loads that might be applied to the formwork. Drawings and plans, including all revisions for the jack layout, formwork (including shoring equipment), working decks, and scaffolds, must be available at the jobsite. All shoring equipment (including equipment used in reshoring operations) must be inspected prior to erection to determine that the equipment meets the requirements specified in the formwork drawings. **Plans and Calculations shall be prepared and signed by a Civil Engineer, registered in the State of California.** A copy of the falsework plan or shoring layout shall be available on the job site at all times. The Engineer who designed the formwork or vertical shoring shall personally inspect such work and provide a written certification that the work conforms to the design.

2. The CONTRACTOR shall file with the City detailed plans of the formwork and shoring to be used. Such plans and calculations shall be in sufficient detail to indicate the general layout, pattern layout, dimensioned to precisely locate grooves, form panel jointing, and similar features. The submittal shall also include sizes of members, anticipated stresses, grade of materials to be used, and typical soil conditions.

3. The CONTRACTOR shall provide shop drawings of the following:

   a. Form Release Compound

   b. Form Ties and Spreaders

   c. Pertinent dimensions, openings, details of construction, types of connections, materials, joint arrangement and details, ties and shores, location of framing, studding and bracing, and temporary supports.

   d. Joint Locations

   e. Notes to formwork erector showing size and location of conduits and piping embedded in concrete.

   f. Procedure and schedule for removal of shores and installation and removal of reshores.

   g. Installation Instructions

4. Review of submittals will be for appearance, performance, and strength of completed structure only. Approval by the Engineer will not relieve Contractor of responsibility for the strength, safety, or correctness of methods used, the adequacy of equipment, or from carrying out the work as shown on Contract Documents.

1.5 QUALITY ASSURANCE

A. Tolerances: The variation from established grade or lines shall be in accordance with ACI 350.5and ACI 117, unless noted otherwise.

B. Laborers: Use adequate number of skilled laborers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

C. Prior to construction of formwork for concrete beams and slabs above grade, Contractor shall conduct a meeting at the site to determine and define all cambers required for the project. ENGINEER, Contractor and Contractor's formwork installer shall be in attendance at this meeting.

D. Engage a licensed surveyor to verify that work is within specified tolerances. Surveyor shall report in writing to the ENGINEER, with copy to Contractor, certifying work as acceptable or indicating deviations from allowable tolerances.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials for forms in timely manner to ensure uninterrupted progress.

B. Store materials by methods that prevent damage and permit ready access for inspection and identification.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Except as otherwise expressly accepted by the ENGINEER, all lumber brought on the job site for use as forms, shoring, or bracing shall be new material. All forms shall be smooth surface forms and shall be of the following materials:

Walls	-	Steel or plywood panel
Columns	-	Steel, plywood or fiber glass
Roof, floor, deck and soffit	-	Plywood, Steel Panels
All other work	-	Steel panels, plywood or tongue and groove lumber

2.2 FORM AND FALSEWORK MATERIALS

A. Materials for concrete forms, formwork, and falsework shall conform to the following requirements:

1. Lumber shall be Douglas Fir or Southern Pine, construction grade or better, in conformance with U.S. Product Standard PS20.

2. Plywood for concrete formwork shall be new, waterproof, synthetic resin bonded, exterior type Douglas Fir or Southern Pine plywood manufactured especially for concrete formwork and shall conform to the requirements of PS 1 for Concrete Forms, Class I, and shall be edge sealed.

3. Form materials shall be metal, wood, plywood, or other material approved by the ENGINEER that will not adversely affect the concrete and will facilitate placement of concrete to the shape, form, line, and grade shown. Metal forms shall be an approved type that will accomplish such

results.

Forms for exposed exterior concrete surfaces shall be American Plywood Association (APA) High Density Overlay (HDO) Plyform Class I Ext. 48" X 96" X 3/4" minimum thickness.

Forms for other concrete surfaces shall be American Plywood Association (APA) Douglas Fir B-B Plyform Class I Exterior PS 1, 3/4-inch minimum thickness.

4. Tube forms: Sonoco “Seamless Sonotubes”, Alton Building Products “Sleek Seamless Standard Wall”, or equal, type leaving no marks in concrete, 1-piece lengths for full required height.

B. Unless otherwise shown, exterior corners in exposed concrete members shall be provided with 3/4-inch chamfers. Re-entrant corners in concrete members shall not have fillets unless otherwise shown.

C. Forms and falsework to support the roof and elevated floor slabs shall be designed for the total dead load, and a minimum construction live load of 30 psf.

2.3 FORM TIES

A. Form ties with integral waterstops shall be provided with a plastic cone or other suitable means for forming a conical hole to insure that the form tie may be broken off back of the face of the concrete. The maximum diameter of removable cones for rod ties, or of other removable form-tie fasteners having a circular cross-section, shall not exceed 1-1/2-inches; and all such fasteners shall be such as to leave holes of regular shape for reaming.

B. Form ties for water-retaining structures shall have integral waterstops. Alternate form ties consisting of tapered through-bolts at least 1 inch (25 mm) in diameter at smallest end or through-bolts that utilize a removable tapered sleeve of same minimum size may be used. Install in forms so that large end is, where applicable, on liquid or backfilled side of the wall. Clean, fill, and seal form tie hole with rubber plug installed from the liquid or backfilled side and non-shrink cement grout to provide watertight form tie holes. Make repairs needed to make watertight.

2.4. FORM RELEASE COMPOUND

A. Form release compound shall be water based, non-staining clear coating free from oil, bond-breaking form coating, and not grain-raising. Provide form release compound that is VOC compliant for the area used.

2.5 EARTH FORMS

Unless otherwise approved by ENGINEER concrete for footings may NOT be placed directly against vertical excavated surfaces.

PART 3 -- EXECUTION

3.1 GENERAL

A. Erect formwork, shoring and bracing according to ACI 350.5. Forms to confine the concrete and shape it to the required lines shall be used wherever necessary. The CONTRACTOR shall assume full responsibility for the adequate design of all forms, and any forms which are unsafe or inadequate in any respect shall promptly be removed from the WORK and replaced at the CONTRACTOR's

expense. A sufficient number of forms of each kind shall be provided to permit the required rate of progress to be maintained. The design and inspection of concrete forms, falsework, and shoring shall comply with applicable local, state and Federal regulations. Plumb and string lines shall be properly installed before concrete placement and shall be maintained during placement. Such lines shall be used by CONTRACTOR's personnel and by the INSPECTOR and shall be in sufficient number and properly installed. During concrete placement, the CONTRACTOR shall continually monitor plumb and string line form positions and immediately correct deficiencies.

B. Concrete forms shall conform to the shape, lines, and dimensions of members as called for on the Drawings, and shall be substantial, free from surface defects, and sufficiently tight to prevent leakage. Forms shall be properly braced or tied together to maintain their position and shape under a load of freshly-placed concrete. If adequate foundation for shores cannot be secured, trussed supports shall be provided.

C. Camber: Place suitable jacks, wedges, or similar means to induce camber and to correct settlement in forms before and during concrete placing. Camber shall be as determined in pre-installation meeting specified above. In general, formwork shall be capable of accommodating camber of 1/8" per 10' of span plus 1/4".

3.2 FORM DESIGN

A. All forms shall be true in every respect to the required shape and size, shall conform to the established alignment and grade, and shall be of sufficient strength and rigidity to maintain their position and shape under the loads and operations incident to placing and vibrating the concrete. Suitable and effective means shall be provided on all forms for holding adjacent edges and ends of panels and sections tightly together and in accurate alignment so as to prevent the formation of ridges, fins, offsets, or similar surface defects in the finished concrete. Plywood, 3/4-inch and greater in thickness, may be fastened directly to studding if the studs are spaced close enough to prevent visible deflection marks in the concrete. The forms shall be tight so as to prevent the loss of water, cement and fines during placing and vibrating of the concrete. Specifically, the bottom of wall forms that rest on concrete footings or slabs shall be provided with a gasket to prevent loss of fines and paste during placement and vibration of concrete. Such gasket may be a 1- to 1-1/2-inch diameter polyethylene rod held in position to the underside of the wall form. Forms shall be cleaned of debris prior to concrete placement.

B. Actual form design shall conform to ACI 347R-14.

C. For concrete mixes characterized as self-consolidating concrete, high performance concrete, or known to contain components that can potentially extend the plastic state of the concrete, the forms shall be designed to sustain the resulting hydrostatic pressure for the total pour height or pressure head for that day of pour, whichever is more. For such mixes, appropriate set-time tests shall be conducted in preparation of the mix design and this information made available to the form designer.

3.3 CONSTRUCTION

A. Vertical Surfaces: All vertical surfaces of concrete members shall be formed.

B. Construction Joints: Concrete construction joints will not be permitted at locations other than those shown or specified, except as may be acceptable to the ENGINEER. When a second lift is placed on hardened concrete, special precautions shall be taken in the way of the number, location, and tightening of ties at the top of the old lift and bottom of the new to prevent any unsatisfactory effect whatsoever on the concrete. Pipe stubs and anchor bolts shall be set in the forms where required.

C. Provide for openings, offsets, keyways, recesses, moldings, reglets, chamfers, blocking, screeds, bulkheads, anchorages, inserts and other features as required. Fill form joints to produce smooth surfaces, intersections, and arrises. Use polymer foam or equivalent fillers at joints and where forms abut or overlap existing concrete to prevent leakage of mortar.

D. Set embedded piping and rough hardware in forms to be embedded in concrete in a manner so that the required strength of the structure will not be reduced. Do not cut any reinforcement.

D. Apply form release compound on formwork in accordance with manufacturer's instructions prior to placing of reinforcing steel, anchorages, and embedded items.

E. Construct forms suitable for removal without hammering or prying against and damaging the concrete.

F. Openings in Forms: Provide as required to facilitate cleaning and inspection. Close such openings immediately after cleaning and before placement of concrete. Provide air relief holes in formed top surfaces of concrete elements as required.

H. Form Ties:

1. Embedded Ties: Holes left by the removal of form tie cones shall be clean and rough before being filled with mortar as specified for "Finish of Concrete Surfaces" in Section 03300, "Cast-in-Place Concrete". Wire ties for holding forms will not be permitted. No form-tying device or part thereof, other than metal, shall be left embedded in the concrete. Ties shall not be removed in such manner as to leave a hole extending through the interior of the concrete members. The use of snap-ties which cause spalling of the concrete upon form stripping or tie removal will not be permitted. If steel panel forms are used, rubber grommets shall be provided where the ties pass through the form in order to prevent loss of cement paste. Where metal rods extending through the concrete are used to support or to strengthen forms, the rods shall remain embedded and shall terminate not less than 1-inch back from the formed face or faces of the concrete.

2. Removable Ties: Where taper ties are approved for use in non water bearing structures, the larger end of the taper tie shall be on the wet side of walls in water retaining structures. After the taper tie is removed, the hole shall be thoroughly cleaned and roughened for bond. A precast neoprene or polyurethane tapered plug shall be located at the wall centerline. The hole shall be completely filled with non-shrink grout for water bearing and below-grade walls. The hole shall be completely filled with non-shrink or regular cement grout for above-grade walls which are dry on both sides. Exposed faces of walls shall have the outer 2-inches of the exposed face filled with a cement grout which shall match the color and texture of the surrounding wall surface.

I. Coordination:

1. Provide slots, openings, chases, recesses, grounds, nailers and screeds required by other trades and subsequent work.

2. Ensure that conduit, pipes, sleeves, anchors, hangers and ties are secured in forms before concrete is placed.

3.4 REUSE OF FORMS

Forms may be reused only if in good condition and only if acceptable to the INSPECTOR. Light sanding between uses will be required wherever necessary to obtain uniform surface texture on all exposed concrete surfaces. Exposed concrete surfaces are defined as surfaces which are permanently exposed to view. In the case of forms for the inside wall surfaces of water retaining

structures, unused tie rod holes in forms shall be covered with metal caps or shall be filled by other methods acceptable to the INSPECTOR.

3.5 REMOVAL OF FORMS

Careful procedures for the removal of forms shall be strictly followed, and this work shall be done with care so as to avoid damage the concrete. No heavy loading on green concrete will be permitted.

1. Do not remove formwork until concrete has attained sufficient strength to support its own weight and all superimposed loads including construction loads and to permit form and falsework removal with complete safety.

2. In the case of concrete members subject to bending stresses, where the member relies upon forms for vertical support, forms shall remain in place until test cylinders attain a minimum comprehensive strength of 75 percent of the 28-day strength specified in Section 03300, "Cast in-Place Concrete", provided, that no forms shall be disturbed or removed under individual panel or unit before the concrete in the adjacent panel or unit has attained 75 percent of the specified 28-day strength and has been in place for a minimum of 7 days.

3. Forms for roofs and elevated slabs shall remain in place a minimum of 10 days after concrete has been placed.

4. Forms for all vertical walls and columns shall remain in place at least 3 days after the concrete has been placed.

5. Formwork removal shall also be subject to the curing requirements of section 3370 of these specifications and as authorized by the ENGINEER.

6. Reshore structural members as specified below because of design requirements or construction conditions to permit successive construction.

The time required to establish concrete strength shall be determined by the ENGINEER based on test cylinders made for this purpose from the concrete placed and in accordance with ACI 301 and the curing requirements of section 3300. If the time so determined is more than the minimum time specified above, then that time shall be used as the minimum length of time. Forms for all parts of the WORK not specifically mentioned herein shall remain in place for periods of time as determined by the ENGINEER.

3.6 FORMWORK TOLERANCES

A. Deflection: Limit deflection of forming surfaces from concrete pressure to L/240.

B. Finish Lines: Position formwork to maintain hardened concrete finish lines within following permissible deviations.

1. Variation from Plumb:

In 10'-0"	1/4” max.
In any story or 20'-0"	3/8” max.
In 40'-0" or more	3/4” max.

2. Variation from Level or Grades Indicated

In 10'-0"	1/4” max.
In any bay or 20'-0" maximum	3/8”
In 40'-0" or more	3/4” max.

C. Building Lines: Variation of linear building lines from established position in plan and related position of columns, walls and partitions:

1. In any bay or 10'-0" maximum	1/2”
2. In 40'-0" or more	1”

D. Slab Openings: Variations in size and location of sleeves and slab openings shall not exceed 1/4”.

3.7 MAINTENANCE OF FORMS

Forms shall be maintained at all times in good condition, particularly as to size, shape, strength, rigidity, tightness, and smoothness of surface. Forms, when in place, shall conform to the established alignment and grades. Before concrete is placed, the forms shall be thoroughly cleaned. The form surfaces shall be treated with a nonstaining mineral oil or other lubricant acceptable to the ENGINEER. Any excess lubricant shall be satisfactorily removed before placing the concrete. Where field oiling of forms is required, the CONTRACTOR shall perform the oiling at least two weeks in advance of their use. Care shall be exercised to keep oil off the surfaces of steel reinforcement and other metal items to be embedded in concrete.

3.8 FALSEWORK

A. The CONTRACTOR shall be responsible for the design, engineering, construction, maintenance, and safety of all falsework, including staging, walkways, forms, ladders, and similar appurtenances, which shall equal or exceed the applicable requirements of the provisions of the OSHA Safety and Health Standards for Construction, the requirements of the Construction Safety Orders of the California Division of Industrial Safety, and the requirements specified herein.

B. All falsework shall be designed and constructed to provide the necessary rigidity and to support the loads. Falsework for the support of a superstructure shall be designed to support the loads that would be imposed if the entire superstructure were placed at one time.

C. Falsework shall be placed upon a solid footing, safe against undermining, and protected from softening. When the falsework is supported on timber piles, the maximum calculated pile loading shall not exceed 20 tons. When falsework is supported on any portion of the structure which is already constructed, the load imposed by the falsework shall be spread, distributed, and braced in such a way as to avoid any possibility of damage to the structure.

D. Reshoring:

1. Minimum reshoring with falsework shall consist of not less than half the full required falsework added under the last placed floor over which full falsework is to be placed for the next floor above. Leave reshoring in place for at least 10 days after the floor above is placed, but in no case remove falsework until the next concrete placing has attained a compressive strength equal to 75% of that required for the 28 days age as determined by controlled test cylinders.

2. Maintain a form and falsework removal record.

END OF SECTION

SECTION 03200
REINFORCEMENT STEEL

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish, fabricate, and place all concrete reinforcement steel, welded wire fabric, couplers, and concrete inserts for use in reinforced concrete and masonry construction and shall perform all appurtenant work, including all the wires, clips, supports, chairs, spacers, and other accessories, all in accordance with the Contract Documents.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03100 Concrete Formwork.

B. Section 03250 Concrete Accessories.

C. Section 03300 Cast-in-Place Concrete.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference standards of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable:

1. Commercial Standards:

ACI 350.5	Specification for Environmental Structural Concrete
ACI 315	Details and Detailing of Concrete Reinforcement.
ACI 318	Building Code Requirements for Reinforced Concrete.
ACI 350	Code Requirements for Environmental Engineering Concrete Structures.
ACI 530	Building Code Requirements & Specifications for Masonry Structures
WRI	Manual of Standard Practice for Welded Wire Fabric.
AWS D1.4	Structural Welding Code - Reinforcing Steel.
ASTM A 82	Specification for Steel Wire, Plain, for Concrete Reinforcement.
ASTM A 1064	Specification for Carbon-Steel Wire and Welded Wire Reinforcement.
ASTM A 615	Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
ASTM A 706	Low-alloy Deformed Steel Bars for Concrete Reinforcement
CRSI	Manual of Standard Practice
CRSI	Recommended Practice for Placing Bar Supports, Specifications and Nomenclature

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS (GR).

B. Buy Clean California Act.

a. For project specifications that include GR Section 1601, Buy Clean California Act, bidders shall submit current Environmental Product Declarations (EPDs) for each type of reinforcing steel material (A615, A706) from the originating mill used in the project as well as corresponding mill certifications. When material comes from different mills, an EPD and mill certification will be required for each mill from which the material has been obtained.

b. An EPD must conform to the following:
1) Shall be facility-specific manufacturer/mill EPD.
2) Be independently verified in accordance with ISO 14025 (Type III).
3) Be developed according to the guidelines of the applicable Product Category Rule (PCR), as identified by the Department of General Services, State of California.
4) Have a valid date that has not expired.
5) Shall not exceed the Global Warming Potential (GWP) limit as required by GR Section 1601.

c. EPD shall be submitted concurrently with the product's submittal for review and approval.

d. Specified epoxy-coated or other specified coated reinforcing steel are exempt from having an associated EPD.

C. The following submittals and specific information shall be provided.

1. The CONTRACTOR shall furnish shop bending diagrams, placing lists, splice lengths and location, and drawings of all reinforcement steel prior to fabrication.

2. Details of the concrete reinforcement steel and concrete inserts shall be submitted by the CONTRACTOR at the earliest possible date after receipt by the CONTRACTOR of the Notice to Proceed. Details of reinforcement steel for fabrication and erection shall conform to ACI 315 and the requirements specified and shown. The shop bending diagrams shall show the actual lengths of bars, to the nearest inch measured to the intersection of the extensions (tangents for bars of circular cross section) of the outside surface. The shop drawings shall include bar placement diagrams which clearly indicate the dimensions of each bar splice.

3. Where mechanical couplers are required or permitted to splice reinforcement steel, the CONTRACTOR shall submit Los Angeles City Department of Building and Safety's Research Report approval and manufacturer's literature which contains instructions and recommendations for installation for each type of coupler used; certified test reports which verify the load capacity of each type and size of coupler used; and shop drawings which show the location of each coupler with details of how it is to be installed in the formwork.

4. If reinforcement steel is required or permitted to be spliced by welding at any location, the CONTRACTOR shall submit mill test reports which shall contain the information necessary for the determination of the carbon equivalent as specified in AWS D1.4. The CONTRACTOR shall submit a written welding procedure for each type of weld for each size of bar which is to be spliced by welding; merely a statement that AWS procedures will be followed is not acceptable.

1.5 QUALITY ASSURANCE

A. The CONTRACTOR shall make provisions for sampling reinforcing steel delivered to the job site. Two sampling bars, cut from different bars and 3 feet in length for bar sizes # 3 through # 5 and 5 feet in length for bars sizes # 6 and larger, shall be taken from each 25 tons or fraction thereof, of each size and heat number delivered to the job site. When the name of the manufacturer, heat identification number, or chemical analysis is not known, the sampling interval shall be each 2.5 tons or fraction thereof, of each bar size and heat number. Tests shall consist of 2 bent tests and 2 tensile tests. Costs of initial tests will be paid by the CITY. Additional tests due to material failing initial tests shall be paid by the CONTRACTOR.

B. If reinforcement steel is welded at any location, the CONTRACTOR shall submit certifications of procedure qualifications for each welding procedure used and certification of welder qualifications, for each welding procedure, and for each welder performing the work. Such certification and qualifications shall be as required by the Los Angeles Department of Building and Safety.

C. The CONTRACTOR shall provide samples of each type of weld used in the work in a quantity and of dimensions adequate for testing. At the discretion of the INSPECTOR, radiographic testing of direct butt welds will be performed. The CONTRACTOR shall provide assistance necessary to facilitate testing. The CONTRACTOR shall repair any weld which fails to meet the requirements of AWS D1.4. The costs of testing will be paid by the CITY; except, the costs of all tests which fail to meet specified requirements shall be paid by the CONTRACTOR.

D. The CONTRACTOR shall provide to the INSPECTOR written identification of reinforcement steel by manufacturer's heat number and mil certification, and the fabricator's release number and type from the point of fabrication to the place of final incorporation of the rebar into the work.

1.6 MARKING AND SHIPPING

A. Tag bundled bars with identification, and transport and store so as not to damage any material. Use metal tags indicating size, length and other marking shown on placement drawings. Maintain tags after bundles are broken.

PART 2 -- PRODUCTS

2.1 REINFORCEMENT STEEL

A. All reinforcement steel for all cast-in-place reinforced concrete construction shall conform to the following requirements:

1. Bar reinforcement shall conform to the requirements of ASTM A615, Grade 60 Billet Steel Reinforcement with supplementary requirement S-1, and ASTM A706 for rebars subject to welding, or as otherwise shown.

2. Bar reinforcement for wall boundary elements, special moment frames, or when subject to welding, shall conform to ASTM A706, unless noted otherwise.

3. Welded wire fabric reinforcement shall conform to the requirements of ASTM A1064 and the details shown; provided, that welded wire fabric with longitudinal wire of W9.5 size wire shall be either furnished in flat sheets or in rolls with a core diameter of not less than 10 inches; and provided further, that welded wire fabric with longitudinal wires larger than W9.5 size shall be furnished in flat sheets only.

4. Spiral reinforcement may be cold-drawn steel wire conforming to the requirements of ASTM A82, when approved by the ENGINEER.

5. All reinforcements shall be shop fabricated. Bending of reinforcing in the field will not be

allowed.

7. Reinforcement with any of the following defects will not be acceptable and be immediately removed from the site:

   a. Bar lengths, depths, and/or bends exceeding the specified fabrication tolerances.

   b. Bends or kinks not shown on the Drawings

   c. Bars with reduced cross-section due to excessive rusting or other cause.

B. Accessories:

1. Accessories shall include all necessary chairs, slab bolsters, concrete blocks, tie wires, dips, supports, spacers, and other devices to position reinforcement during concrete placement. Slab bolsters shall have gray plastic-coated legs.

2. Concrete blocks (dobies), used to support and position reinforcement steel, shall have the same or higher compressive strength as specified for the concrete in which it is located. Where the concrete blocks are used on concrete surfaces exposed to view, the color and texture of the concrete blocks shall match that required for the finished surface. Wire ties shall be embedded in concrete block bar supports.

3. Use bar supports complying with CRSI recommendations, unless otherwise shown on the Contract Drawings.

4. Do not use wood, brick, or other non-complying material.

5. For slabs on grade, use supports with sand plates or horizontal runners where base material will not support chair legs.

6. For exposed-to-view completed concrete surfaces, where legs of supports are in contact with forms, provide supports with either hot-dip galvanized or plastic-protected legs. CONTRACTOR's selection subject to the ENGINEER's approval.

2.2 MECHANICAL COUPLERS

A. Mechanical couplers shall comply with the applicable Department of Building and Safety's Research Report. Location of the Mechanical Couplers shall be approved by the ENGINEER. The couplers shall develop a tensile strength which exceeds 125 percent of the yield strength of the reinforcement bars being spliced at each splice. CONTRACTOR to provide the required number of couplers and bars for testing in accordance with the Report

B. Where the type of coupler used is composed of more than one component, all components required for a complete splice shall be supplied. This shall apply to all mechanical splices, including those splices intended for future connections.

C. The reinforcement steel and coupler used shall be compatible for obtaining the required strength of the connection. Clearance and coverage requirements shall be maintained at all times.

D. Couplers which are located at a joint face shall be a type which can be set either flush or recessed from the face as shown. The couplers shall be sealed during concrete placement to completely eliminate concrete or cement paste from entering. After the concrete is placed, couplers intended for future connections shall be plugged and sealed to prevent any contact with water or other corrosive materials. Threaded couplers shall be plugged with plastic plugs which have an O-ring seal.

E. Hot-forged sleeve-type couplers shall not be used.

2.3 WELDED SPLICES

A. Welded splices shall be provided where shown and where approved by the ENGINEER. All welded splices of reinforcement steel shall develop a tensile strength which exceeds 125 percent of the yield strength of the reinforcement bars which are connected. Provide two samples of each bar size for testing. When welding is to be done in the field, provide field prepared samples. Preparation shall be made by welder actually preparing the production run.

B. All materials required to conform the welded splices to the requirements of AWS D1.4 shall be provided.

C. All welding shall be performed by City of Los Angeles certified welders. All shop welding shall be performed at shops of a City of Los Angeles approved fabricator.

PART 3 -- EXECUTION

3.1 GENERAL

A. All reinforcement steel, welded wire fabric, couplers, and accessories shall be fabricated, and placed in accordance with the requirements of the City of Los Angeles Building Code, CRSI Recommended Practices and Manual, and WRI, and the supplementary requirements specified herein.

3.2 FABRICATION

A. General: Reinforcement steel shall be accurately formed to the dimensions and shapes shown, and the fabricating details shall be prepared in accordance with ACI 315, ACI 117 and ACI 350.5 (as applicable), except as modified by the Drawings. Bars shall be bent cold.

B. The CONTRACTOR shall fabricate reinforcement bars for structures in accordance with bending diagrams, placing lists, and placing drawings. Said drawings, diagrams, and lists shall be prepared by the CONTRACTOR as specified under GENERAL REQUIREMENTS.

C. Fabricating Tolerances: Bars used for concrete reinforcement shall meet the following requirements for fabricating tolerances:

1. Sheared length: ± 1 inch

2. Depth of truss bars: + 0, - 1/2 inch

3. Stirrups, ties, and spirals: ± 1/2 inch

4. All other bends: ± 1 inch

3.3 PLACING

A. Placing: Reinforcement steel shall be accurately positioned as shown and shall be supported and wired together to prevent displacement, using annealed iron wire ties or suitable clips at intersections. All reinforcement steel shall be supported using approved accessories and chairs which are strong and rigid enough to prevent any displacement of the reinforcement steel and shall comply with the applicable Department of Building and Safety's Research Report. Where concrete is to be placed on the ground, supporting concrete blocks (or dobies) shall be used, in sufficient numbers to support the bars without settlement, but in no case shall such support be continuous. All concrete blocks used to support reinforcement steel shall be tied to the steel with wire ties which are embedded in the blocks. Use care not to damage vapor barriers where they occur.

B. The portions of all accessories in contact with the formwork shall be made of concrete, plastic, or

steel coated with a 1/8-inch minimum thickness of plastic which extends at least 1/2-inch from the concrete surface. Plastic shall be gray in color.

C. Tie wires shall be bent away from the forms in order to provide the specified concrete coverage.

D. Bars additional to those shown which may be found necessary or desirable by the CONTRACTOR for the purpose of securing reinforcement in position shall be provided by the CONTRACTOR at its own expense.

E. Placing Tolerances: Unless otherwise specified, reinforcement placing tolerances shall be within the limits specified in ACI 117 except where in conflict with the requirements of the City of Los Angeles Building Code.

F. Bars may be moved as necessary to avoid interference with other reinforcement steel, conduits, or embedded items. If bars are moved more than one bar diameter, or enough to exceed the above tolerances, the resulting arrangement of bars shall be reviewed and accepted by the ENGINEER.

G. Welded wire fabric reinforcement placed over horizontal forms shall be supported on slab bolsters having gray, plastic-coated standard type legs as specified in Paragraph B herein. Slab bolsters shall be spaced not less than 30 inches on centers, shall extend continuously across the entire width of the reinforcement mat, and shall support the reinforcement mat in the plane shown.

H. Welded wire fabric placed over the ground shall be supported on wired concrete blocks (dobies) spaced not more than 3 feet on centers in any direction. The construction practice of placing welded wire fabric on the ground and hooking into place in the freshly placed concrete shall not be used.

3.4 SPACING OF BARS

A. Spacing of reinforcement shall comply with ACI 350.5 requirements.

3.5 SPLICING

A. General: Reinforcement bar splices shall only be used at locations shown. When it is necessary to splice reinforcement at points other than where shown, the character of the splice and location shall be as acceptable to the ENGINEER.

B. Splices of Reinforcement: The length of lap for reinforcement bars per standard details on structural drawings. Stagger splices in horizontal wall bars at least 48” longitudinal in alternate bars and opposite faces.

C. Splices in column spiral reinforcement, when necessary, shall be made by welding or by a lap of 1-1/2 turns.

D. Field welding of bars: In accordance with the approved submittal. Continuous inspection required.

E. Mechanical couplers: Install in accordance with the approved submittal.

F. Bending or Straightening: Reinforcement shall not be straightened or rebent in a manner which will injure the material. Bars with kinks or bends not shown shall not be used. All bars shall be bent cold, unless otherwise permitted by the ENGINEER. No bars partially embedded in concrete shall be field-bent except as shown or specifically permitted by the ENGINEER.

3.6 CLEANING AND PROTECTION

The surfaces of all reinforcement steel and other metalwork to be in contact with concrete shall be thoroughly cleaned of all dirt, grease, loose scale and rust, grout, mortar and other foreign substances immediately before the concrete is placed. Where there is delay in depositing concrete,

reinforcement shall be reinspected and, if necessary recleaned. Bars with reduced cross-section due to excessive rusting or other cause will not be acceptable for use and shall be replaced by the CONTRACTOR at no additional cost to the CITY.

3.7 FIELD QUALITY CONTROL

A. Inspection: Secure inspection and acceptance from INSPECTOR before concrete is placed. Make arrangements in advance for geotechnical inspection of foundations, continuous inspection as required, and/or structural observation by the designated registered design professional prior to concrete placement.

SECTION 03250
CONCRETE ACCESSORIES

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies to install all concrete accessories to complete the Work including cast-in-place anchor bolts (also known as anchor rods), epoxy grouted anchor bolts or dowels and, expansion or adhesive anchors, in accordance with the requirements of the Contract Documents.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03300 Cast-in-Place Concrete.

B. Section 03315 Grout.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference standards and Standard Specifications of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable.

1. Commercial Standards:

AISC Code of Standard Practice for Steel Buildings and Bridges

AISC Specifications for the Design, Fabrication and Erection of Structural Steel for Buildings

ASTM A 36	Specifications for Carbon Structural Steel
ASTM A 153	Specifications for Zinc Coating (Hot Dip) on Iron and Steel Hardware
ASTM A 193	Specifications for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service
ASTM A 194	Specifications for Carbon and Alloy Steel Nuts for Bolts for High-Pressure and High-Temperature Service
ASTM A 307	Specifications for Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength
ASTM A 449	Specifications for Quenched and Tempered Steel Bolts and Studs
ASTM A 615	Specifications for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement
ASTM B 633	Specifications for Electrodeposited Coatings of Zinc on Iron and Steel

ASTM B 695	Specifications for Coatings of Zinc Mechanically Deposited on Iron and Steel
ASTM F 436	Specifications for Hardened Steel Washers
ASTM F 1554	Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. The following submittals and specific information shall be provided.

1. High Strength Anchor Bolts: The CONTRACTOR shall provide mill certificates and certified compliance with ASTM [F 1554; A 449 with F 436].

2. The CONTRACTOR shall submit shop drawings for all welded or fabricated items for use as anchors.

3. The CONTRACTOR shall submit catalog cuts and manufacturer's recommendations, with applicable City of Los Angeles Research Reports, for all expansion and adhesive anchors, and anti-seize thread lubricants.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Anchor Size: Anchor size shall be as specified or shown on plans.

B. Anchor Material:

1. Water-containment or sanitary structures, immersion service, or exposed exterior locations: Stainless steel.

2. Other locations: Galvanized steel as permitted by the corresponding ASTM except as listed in the contract drawings.

C. Anchor Length: Sufficient to extend through the nut(s) and not more than 1/4 inch beyond the nut when exposed while meeting the required embedment as indicated on the contract drawings or as required by the associated Los Angeles Department of Building and Safety's Research Report.

2.2 ANCHOR GRADES

A. Anchor Bolts and Nuts:

1. High Strength: ASTM F 1554 Grade 105, galvanized. Provide with corresponding galvanized hardened washers.

2. Stainless steel: ASTM A 193 and A 194, Type 316N, Grade 8MN.

3. Unspecified: ASTM F 1554 Grade 36, galvanized.

4. Galvanizing: Hot dipped as required per ASTM F 1554 When protected from the atmosphere, moisture and sewage gases, ASTM B 695 is also acceptable.

5. Other Coatings: As specified in the contract drawings.

B. Flat Washers: Same material and finish as nut and bolt. For high strength bolts, use ASTM F 1554.

C. Anti-Seize Thread Lubricant for use with stainless steel anchors:

1. Jet-Lube "Nikal"
2. Never-Seez "Pure Nickel Special"
3. Permatex "Nickel Anti-Seize"
4. Or an approved equal.

D. Reinforcing Steel Dowels: ASTM A 615, Grade 60. Same diameter as spliced rebar, or #4 minimum.

E. Expansion and Adhesive Anchors: Use only anchor types and styles with Research Report approval by the Los Angeles Department of Building and Safety.

1. Simpson Strong-tie “Strong-Bolt 2”
2. Hilti "Kwik-Bolt TZ"
3. Or an approved equal.

PART 3 -- EXECUTION

3.1 PROJECT CONDITIONS

A. Examine the areas and conditions under which the work will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until detrimental conditions are corrected.

3.2 CAST-IN-PLACE ANCHOR BOLTS

A. Provide templates or other means to ensure accurate placement. Provide sufficient threads to allow for a nut to be placed on the concrete side of the template.

B. Anchor bolts shall be clean and free of all coatings which may impair bonding with concrete.

C. Provide two nuts and a washer with each anchor bolt. Provide an additional locknut when indicated on the Drawings.

D. High Strength Bolts: Install such that ASTM Grade markings are visible after casting into concrete.

3.3 EPOXY-GROUTED ANCHOR BOLTS OR DOWELS

A. Provide templates or other means to ensure accurate placement.

B. Anchor bolts or dowels shall be clean and free of all coatings which may impair bonding with epoxy.

C. Provide two nuts and a washer with each anchor bolt. Provide an additional locknut when indicated on the Drawings.

D. High Strength Bolts: Install such that ASTM Grade markings are visible after casting into concrete.

E. Do not disturb bolt or dowel until epoxy grout has cured and reached full strength.

3.4 EXPANSION AND ADHESIVE ANCHORS: Install per Los Angeles Department of Building and Safety Approved Research Report and manufacturer's recommendations, whichever is more restrictive. Provide nuts and washers of same material and finish as anchor body.

3.5 STAINLESS STEEL ANCHORS. After installation of stainless steel anchor bolts or expansion anchors, lubricate threads before fastening.

END OF SECTION

SECTION 03290
JOINTS IN CONCRETE

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall construct all joints and bearing pads in concrete at the locations shown. Joints required in concrete structures are of various types and will be permitted only where shown, unless specifically accepted by the ENGINEER.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03100 Concrete Formwork.

B. Section 03200 Reinforcement Steel.

C. Section 03300 Cast-in-Place Concrete.

D. Section 07900 Joint Sealants.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference standards of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable:

1. Federal Specifications:

TT-S-0227E(3)	Sealing Compound, elastomeric type, Multi-component for Caulking, Sealing, and Glazing Buildings and Other Structures).

2. U.S. Army Corps of Engineers Specifications:

CRD-C572	Corps of Engineers Specification for Polyvinylchloride Waterstop

3. Other Government Standards:

CSS	Caltrans Standard Specifications.

4. Commercial Standards:

ASTM C 920	Standard Specification for Elastomeric Joint Sealants.
ASTM D 624	Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomers.
ASTM D 638	Standard Test Method for Tensile Properties of Plastics.
ASTM D 746	Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.

ASTM D 1751	Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types).
ASTM D 1752	Standard Specification for Preformed Sponge Rubber, Cork and Recycled PVC Expansion Joint Fillers for Concrete Paving and Structural Construction.
ASTM D 2240	Test Method for Rubber Property -- Durometer Hardness.

1.4 TYPES OF JOINTS

A. Construction Joints: When fresh concrete is placed against a hardened concrete surface, the joint between the two pours is called a construction joint. Unless otherwise specified, all joints in water bearing members shall be provided with a waterstop and sealant groove of the shape specified and as shown on the plans.

B. Control Joints (Weakened Plane): The function of the control joint is to provide a weaker plane in the concrete, where shrinkage cracks will probably occur. A groove, of the shape and dimensions as shown on the plans, is formed or saw-cut in the concrete and shall be filled with a joint sealant material as specified in the Paragraph in Part 2 entitled "Joint Sealant."

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with GENERAL REQUIREMENTS.

B. The following submittals and specific information shall be provided.

1. Waterstops: Prior to use of the material required under this contract, qualification samples shall be submitted. Such samples shall consist of extruded or molded sections of each size or shape to be used. The material sample shall be representative of the material to be furnished under this contract. The balance of the material to be used under this contract shall not be produced until after the ENGINEER has reviewed and approved the qualification samples.

2. Joint Sealant: Prior to ordering the sealant material, the CONTRACTOR shall submit to the ENGINEER for review and approval, data to show compliance with the requirements of the Contract Documents. Certified test reports from the sealant manufacturer on the actual batch of material being supplied indicating compliance with the above requirements shall be furnished the ENGINEER before the sealant is used on the job.

3. Shipping Certification: The CONTRACTOR shall provide written certification from the manufacturer as an integral part of the shipping form, to show that all of the material shipped to this project meets or exceeds the physical property requirements of the Contract Documents. Supplier certificates are not acceptable.

4. The CONTRACTOR shall submit placement shop drawings showing the location and type of all joints for each structure.

1.5 QUALITY ASSURANCE

A. Waterstop manufacturer shall demonstrate five years (minimum) continuous, successful experience in production of waterstops.

B. Waterstop Inspection: It is required that all waterstop field joints shall be subject to inspection, and no such work shall be scheduled or started without having made prior arrangements with the INSPECTOR to provide for the required inspections. Not less than 24 hours notice shall be provided to the INSPECTOR for scheduling such inspections.

C. All field joints in waterstops shall be free of misalignment, bubbles, inadequate bond, porosity, cracks, offsets, and other defects which would reduce the potential resistance of the material to water pressure at any point. All defective joints shall be replaced with material which shall pass said inspection, and all faulty material shall be removed from the site and disposed of by the CONTRACTOR at its own expense.

D. The following waterstop defects represent a partial list of defects which shall be grounds for rejection:

1. Offsets at joints greater than 1/16-inch or 15 percent of material thickness, at any point, whichever is less.

2. Exterior crack at joint, due to incomplete bond, which is deeper than 1/16-inch or 15 percent of material thickness, at any point, whichever is less.

3. Any combination of offset or exterior crack which will result in a net reduction in the cross section of the waterstop in excess of 1/16-inch or 15 percent of material thickness at any point, whichever is less.

4. Misalignment of joint which result in misalignment of the waterstop in excess of 1/2-inch in 10 feet.

5. Porosity in the welded joint as evidenced by visual inspection.

6. Bubbles or inadequate bonding.

E. Waterstop Samples: Prior to use of the waterstop material in the field, a sample of a fabricated metered cross and a tee constructed of each size or shape of material to be used shall be submitted to the ENGINEER for approval. These samples shall be fabricated so that the material and workmanship represent in all respects the fittings to be furnished under this contract. Field samples of fabricated fittings (crosses, tees, etc.) will be selected at random by the INSPECTOR for testing. When tested, they shall have a tensile strength across the joints equal to at least 600 psi.

F. Construction Joint Sealant: The CONTRACTOR shall prepare adhesion and cohesion test specimens as specified herein, at intervals of 5 working days while sealants are being installed.

G. The sealant material shall show no signs of adhesive or cohesive failure when tested in accordance with the following procedure in laboratory and field tests:

1. Sealant specimen shall be prepared between 2 concrete blocks (1-inch by 2-inch by 3-inch). Spacing between the blocks shall be 1/2-inch. Coated spacers (2-inch by 1-1/2-inch by 1/2-inch) shall be used to insure sealant cross-sections of 1/2-inch by 2 inches with a width of 1/2-inch.

2. Sealant shall be cast and cured according to manufacturer's recommendations except that curing period shall not exceed 24 hours.

3. Following curing period, the gap between blocks shall be widened to one inch. Spacers shall be used to maintain this gap for 24 hours prior to inspection for failure.

H. Store waterstops under tarps to protect from oil, dirt, and sunlight.

1.6 GUARANTEE

A. The CONTRACTOR shall provide a 5-year written guarantee of the entire sealant installation against faulty and/or incompatible materials and workmanship, together with a statement that it agrees to repair or replace, to the satisfaction of the CITY, at no additional cost to the CITY, any such defective areas which become evident within said 5-year guarantee period.

PART 2 -- PRODUCTS

2.1 PVC WATERSTOPS

A. General: Waterstops shall be extruded from an elastomeric polyvinyl chloride compound containing the plasticizers, resins, stabilizers, and other materials necessary to meet the requirements of these Specifications. No reclaimed or scrap material shall be used. The CONTRACTOR shall obtain from the waterstop manufacturer and shall furnish to the ENGINEER for review, current test reports and a written certification of the manufacturer that the material to be shipped to the job meets the physical requirements as outlined in the U.S. Army Corps of Engineers Specification CRD-C572 and those listed herein.

B. Flatstrip and Center-Bulb Waterstops: Flatstrip and center-bulb waterstops shall be as detailed and as manufactured by: Kirkhill Rubber Co., Brea, California; Greenstreak, St. Louis, MO; Progress Unlimited, Inc., New York, New York; or an approved equal; provided, that at no place shall the thickness of flat strip waterstops, including the center bulb type, be less than 3/8-inch.

C. Multi-Rib Waterstops: Multi-rib waterstops, where required, shall be as detailed and as manufactured by Progress Unlimited, Inc., New York, New York; Greenstreak, St. Louis, MO, or an approved equal. Prefabricated joint fittings shall be used at all intersections of the ribbed-type waterstops.

D. Other Types of Waterstops: When other types of waterstops, not listed above are required and shown, they shall be subjected to the same requirements as those listed herein.

E. Waterstop Testing Requirements: When tested in accordance with the specified test standards, the waterstop material shall meet or exceed the following requirements:

Physical Property, Sheet Material	Value	ASTM Std.
Tensile Strength-min (psi)	1750	D 638, Type IV
Ultimate Elongation-min (percent)	350	D 638, Type IV
Low Temp Brittleness-max (degrees F)	-35	D 746
100 Percent Modulus (psi)	1000	D 638
Accelerated Extraction (CRD-C572)		
Tensile Strength-min (psi)	1500	D 638, Type IV
Ultimate Elongation-min (percent)	300	D 638, Type IV
Effect of Alkalies (CRD-C572)		
Change in Weight (percent)	+0.25/-0.10	------
Change in Durometer, Shore A	+5	D 2240
Finish Waterstop		
Tensile Strength-min (psi)	1400	D 638, Type IV
Ultimate Elongation-min (percent)	280	D 638, Type IV

F. Accessories

1. Provide factory made waterstop fabrications for all changes of direction, intersections, and transitions leaving only straight butt joint splices for the field.

2. Provide hog rings or grommets spaced at 12 inches on center along length of waterstop.

3. Provide Teflon coated thermostatically controlled waterstop splicing irons for field butt splices.

2.2. HYDROPHILIC WATERSTOP:

A. Installation Adhesives: Use with expansive waterstops as recommended by waterstop manufacturer.

B. Acceptable Manufacturers: Provide products manufactured by one of the following or equal:

1. Greenstreak Plastic Products: Hydrotite CJ-1020-2K.

2. Mitsubishi: Adeka Ultraseal MC-2010MN.

2.3 JOINT SEALANT

A. Joint sealant shall be polyurethane polymer designed for bonding to concrete which is continuously submerged in water.

B. Joint sealant material shall meet the following requirements:

Work Life	45 - 90 minutes
Time to Reach 20 Shore "A" Hardness (at 77 degrees F, 200 gr quantity)	24 hours, maximum
Ultimate Hardness	30 - 40 Shore "A"
Tensile Strength	250 psi, minimum
Ultimate Elongation	400 percent, minimum
Tear Resistance (Die C ASTM D 624)	75 pounds per inch of thickness, minimum
Color	Light Gray

For bridge structures, additional requirements of CSS Section 51 shall also apply.

C. All polyurethane sealants for waterstop joints in concrete shall conform to the following requirements:

1. Sealant shall be 2-part polyurethane with the physical properties of the cured sealant conforming to or exceeding the requirements of ASTM C 920 or Federal Specification TT-S-00227 E(3) for 2-part material, as applicable.

2. For vertical joints and overhead horizontal joints, only "non-sag" compounds shall be used; all such compounds shall conform to the requirements of ASTM C 920 Class B, or Federal Specification TT-S-0027 E(3), Type II.

3. For plane horizontal joints, the self-leveling compounds which meet the requirements of ASTM C 920 Class A, or Federal Specification TT-S-0027 E(3), Type I shall be used. For joints subject to either pedestrian or vehicular traffic, a compound providing non-tracking characteristics, and having a Shore "A" hardness range of 25 to 35, shall be used.

4. Primer materials, if recommended by the sealant manufacturer, shall conform to the printed recommendations of the sealant manufacturer.

D. All sealants, wherever shown, or required hereunder shall be Rubbercalk 2101-I or 270 as manufactured by Products Research Company; GS 102 or GS 1102 as manufactured by General Sealants Corp; or an approved equal. For sanitary structures mastic/sealant material shall be Ram Nek Sealant by Henry Co.; Sika Flex 1A, Sikadur 51 NS by Sika Corp.

E. Sealants for non-waterstop joints in concrete shall conform to the requirements of Section 07900, "Joint Sealants". Mastic joint sealer shall be a material that does not contain evaporating solvents; that will tenaciously adhere to concrete surfaces; that will remain permanently resilient and pliable; that will not be affected by continuous presence of water and will not in any way contaminate potable water; and that will effectively seal the joints against moisture infiltration even when the joints are subject to movement due to expansion and contraction. The sealer shall be composed of special asphalts or similar materials blended with lubricating and plasticizing agents to form a tough, durable mastic substance containing no volatile oils or lubricants and shall be capable of meeting the test requirements set forth hereinafter, if testing is required by the ENGINEER.

2.4 PREFORMED JOINT FILLER

A. Preformed joint filler material shall be of the preformed non-extruding type joint filler constructed of cellular neoprene sponge rubber or polyurethane of firm texture. Bituminous fiber type will not be permitted. All non-extruding and resilient-type preformed expansion joint fillers shall conform to the requirements and tests set forth in ASTM D 1752 for Type I, except as otherwise specified herein.

B. Unless otherwise noted, preformed joint filler shall be a non-extruding, resilient, bituminous type conforming to the requirements of ASTM D 1751.

2.5 BACKING ROD

A. Backing rod shall be an extruded closed-cell, polyethylene foam rod. The material shall be compatible with the joint sealant material used and shall have a tensile strength of not less than 40 psi and a compression deflection of approximately 25 percent at 8 psi. The rod shall be 1/8-inch larger in diameter than the joint width except that a one-inch diameter rod shall be used for a 3/4-inch wide joint.

2.6 BOND BREAKER

A. Bond breaker shall be Super Bond Breaker as manufactured by Burke Company, San Mateo, California; Hunt Process 225-TU as manufactured by Hunt Process Co., Santa Fe Springs, California; Select Cure CRB as manufactured by Select Products Co., Upland, California; or an approved equal. It shall contain a fugitive dye so that areas of application will be readily distinguishable.

PART 3 -- EXECUTION

3.1 GENERAL

A. Unless otherwise shown, waterstops of the type specified herein shall be embedded in the concrete across joints as shown. All waterstops shall be fully continuous for the extent of the joint. Splices necessary to provide such continuity shall be accomplished in conformance to printed instructions of manufacturer of the waterstops. The CONTRACTOR shall take suitable precautions and means to support and protect the waterstops during the progress of the work and shall repair or replace at its own expense any waterstops damaged during the progress of the work. All waterstops shall be stored so as to permit free circulation of air around the waterstop material.

B. When any waterstop is installed in the concrete on one side of a joint, while the other half or portion of the waterstop remains exposed to the atmosphere for more than 2 days, suitable precautions shall be taken to shade and protect the exposed waterstop from direct rays of the sun during the entire exposure and until the exposed portion of the waterstop is embedded in concrete.

3.2 SPLICES IN WATERSTOPS

A. Splices in waterstops shall be performed by heat sealing the adjacent waterstop sections in accordance with the manufacturer's printed recommendations and the following requirements:

1. The material not be damaged by heat sealing.

2. The splices have a tensile strength of not less than 60 percent of the unspliced materials tensile strength.

3. The continuity of the waterstop ribs and of its tubular center axis be maintained.

B. Butt joints of the ends of two identical waterstop sections may be made while the material is in the forms.

C. All joints with waterstops involving more than 2 ends to be jointed together, and all joints which involve an angle cut, alignment change, or the joining of 2 dissimilar waterstop sections shall be prefabricated by the CONTRACTOR prior to placement in the forms, allowing not less than 24-inch long strips of waterstop material beyond the joint. Upon being inspected and approved, such prefabricated waterstop joint assemblies shall be installed in the forms and the ends of the 24-inch strips shall be butt welded to the straight run portions of waterstop in place in the forms.

3.3 JOINT CONSTRUCTION

A. Setting Waterstops:

1. In order to eliminate faulty installation that may result in joint leakage, particular care shall be taken of the correct positioning of the waterstops during installation. Adequate provisions must be made to support the waterstops during the progress of the WORK and to insure the proper embedment in the concrete. The symmetrical halves of the waterstops shall be equally divided between the concrete pours at the joints. The center axis of the waterstops shall be coincident with the joint openings. Maximum density and imperviousness of the concrete shall be insured by thoroughly working it in the vicinity of all joints

2. In placing flat-strip waterstops in the forms, means shall be provided to prevent them from being folded over by the concrete as it is placed. Unless otherwise shown, all waterstops shall be held in place with light wire ties on 12-inch centers which shall be passed through the edge of the waterstop and tied to the curtain of reinforcing steel. Horizontal waterstops, with their flat face in a vertical plane, shall be held in place with continuous supports to which the top edge of the waterstop shall be tacked. In placing concrete around horizontal waterstops, with their flat face in a horizontal plane, concrete shall be worked under the waterstops by hand so as to avoid the formation of air and rock pockets.

3. Adequate means shall be provided for anchoring the waterstop in concrete. Waterstops shall be positioned so that they are equally embedded in the concrete on each side of the joint.

4. Hydrophilic Waterstops:

a. Clean and prepare joint surfaces, install primers or adhesives, and install expansive waterstops on dry surfaces in accordance with manufacturer's instructions, including concrete cure, temperature conditions, and splices.

b. Use mechanical fasteners to secure expansive waterstops to previously placed vertical and overhead concrete surfaces and other locations, as recommended by manufacturer. Protect installed waterstops from moisture and keep dry until subsequent placement of concrete.

B. Joint Location:

Construction joints, and other types of joints, shall be provided where shown. When not shown, construction joints shall be provided at 25-foot maximum spacing for all concrete construction, subject to the approval of the ENGINEER, unless noted otherwise. Where joints are shown spaced greater than 25 feet apart, additional joints shall be provided to maintain the 25-foot maximum spacing. The location of all joints, of any type, shall be submitted for acceptance by the ENGINEER.

C. Joint Preparation:

Special care shall be used in preparing concrete surfaces at joints where bonding between two sections of concrete is required. Unless otherwise shown, such bonding will be required at all horizontal joints in walls. Surfaces shall be prepared in accordance with the requirements of Section 03300, "Cast-in-Place Concrete." Except on horizontal wall construction joints, wall to slab joints or where otherwise shown or specified, at all joints where waterstops are required, the joint face of the first pour shall be coated with a bond breaker as specified herein.

D. Construction Joint Sealant:

1. Construction joints in water-bearing floor slabs, and elsewhere as shown, shall be provided with tapered grooves which will be filled with construction joint sealant. The material used for forming the tapered grooves shall be left in the grooves until just before the grooves are cleaned and filled with joint sealant. After removing the forms from the grooves, all laitance and fins shall be removed, and the grooves shall be sand-blasted. The grooves shall be allowed to become thoroughly dry, after which they shall be blown out; immediately thereafter, they shall be primed and filled with the construction joint sealant. The primer used shall be supplied by the same manufacturer supplying the sealant. No sealant will be permitted to be used without a primer. Care shall be used to completely fill the sealant grooves. Areas designated to receive a sealant filler shall be thoroughly cleaned, as outlined for the tapered grooves, prior to application of the sealant.

2. Sealant application shall be in accordance with the manufacturer's printed instructions. The surfaces of the groove for the sealant shall not be coated. Concrete next to waterstops shall be placed in accordance with the requirements of Section 03300, Cast-in-Place Concrete.

3. The primer and sealant shall be placed strictly in accordance with the printed recommendations of the manufacturer, taking special care to properly mix the sealant prior to application. All sealant shall cure at least 7 days before the structure is filled with water.

4. All sealant shall be installed by a competent waterproofing specialty contractor who has a successful record of performance in similar installations. Before work is commenced, the crew doing the WORK shall be instructed as to the proper method of application by a representative of the sealant manufacturer.

5. Thorough, uniform mixing of 2-part, catalyst-cured materials is essential; special care shall be taken to properly mix the sealer before its application. Before any sealer is placed, the CONTRACTOR shall arrange to have the crew doing the WORK carefully instructed as to the proper method of mixing and application by a representative of the sealant manufacturer.

5. Any joint sealant which after the manufacturer's recommended curing time for the job conditions of the WORK hereunder, fails to fully and properly cure shall be completely removed; the groove shall be thoroughly sandblasted to remove all traces of the uncured or partially cured sealant and primer, and shall be re-sealed with the specified joint sealant. All costs of such removal, joint treatment, re-sealing, and appurtenant work shall be at the expense of the CONTRACTOR.

END OF SECTION

SECTION 03300
CAST-IN-PLACE CONCRETE

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all materials for concrete in accordance with the provisions of this Section and shall form, mix, place, cure, repair, finish, and do all other work as required to produce finished concrete, in accordance with the requirements of the Contract Documents.

B. The following types of concrete shall be covered in this Section:

1. Structural Concrete: Concrete to be used in all cases except where noted otherwise in the Contract Documents.

2. Sitework Concrete: Concrete to be used for curbs, gutters, sidewalks, pavements, fence and guard post embedment, and underground duct bank encasement unless otherwise shown.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03100 Concrete Formwork

B. Section 03200 Reinforcement Steel

C. Section 03250 Concrete Accessories

D. Section 03290 Joints in Concrete

E. Section 03315 Grout

F. Section 03370 Concrete Curing

G. Section 07900 Joint Sealants

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference standards and the Standard Specifications of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable.

1. Commercial Standards:

ACI 117	Specification for Tolerances for Concrete Construction and Materials
ACI 305.1	Specification for Hot Weather Concreting
ACI 306.1	Standard Specification for Cold Weather Concreting
ACI 318	Building Code Requirements for Structural Concrete
ACI 347R	Guide to Formwork for Concrete
ACI 350	Code Requirements for Environmental Engineering Concrete Structures

ACI 350.5	Specification for Environmental Concrete Structures
ASTM C 31	Standard Practice for Making and Curing Concrete Test Specimens in the Field
ASTM C 33	Standard Specification for Concrete Aggregates
ASTM C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens
ASTM C 40	Standard Test Method for Organic Impurities in Fine Aggregates for Concrete
ASTM C 42	Standard Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete
ASTM C 88	Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
ASTM C 94	Standard Specification for Ready-Mixed Concrete
ASTM C 109	Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in Cube Specimens)
ASTM C 117	Standard Test Method for Materials Finer than No. 200 Sieve in Mineral Aggregates by Washing
ASTM C 131	Standard Test Method for Resistance to Degradation of Small-Sized Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
ASTM C 136	Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
ASTM C 143	Standard Test Method for Slump of Hydraulic-Cement Concrete
ASTM C 150	Standard Specification for Portland Cement
ASTM C 157	Standard Test Method for Length Change of Hardened Hydraulic-Cement Mortar and Concrete
ASTM C 192	Standard Practice for Making and Curing Concrete Test Specimens in the Laboratory
ASTM C 260	Standard Specification for Air-Entraining Admixtures for Concrete
ASTM C 311	Standard Test Methods for Sampling and Testing Fly Ash or Natural Pozzolans for Use in Portland-Cement Concrete
ASTM C 494	Standard Specification for Chemical Admixtures for Concrete
ASTM C 595	Standard Specification for Blended Hydraulic Cements
ASTM C 596	Standard Test Method for Drying Shrinkage of Mortar Containing Hydraulic Cement
ASTM C 618	Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete

ASTM C 989	Standard Specification for Slag Cement for Use in Concrete and Mortars
ASTM C 1157	Standard Performance Specification for Hydraulic Cement
ASTM C 1293	Standard Test Method for Determination of Length Change of Concrete Due to Alkali-Silica Reaction
ASTM C 1567	Standard Test Method for Determining the Potential Alkali-Salica Reactivity of Combinations of Cementitious Materials and Aggregate (Accelerated Mortar-Bar Method)
ASTM C 1602	Standard Specification for Mixing Water Used in the Production of Hydraulic Cement Concrete
ASTM C 1603	Standard Test Method for Measurement of Solids in Water-Suggest you add as it relates to ASTM C1602
ASTM D 2419	Standard Test Method for Sand Equivalent Value of Soils and Fine Aggregate

2. Government Standards:

CSS	Caltrans Standard Specifications

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with GENERAL REQUIREMENTS.

B. The following submittals and specific information shall be provided.

1. Mix Designs: Prior to beginning the WORK, the CONTRACTOR shall submit to the ENGINEER, for review, and acceptance, preliminary concrete mix designs for each class and type of concrete specified herein. The mix designs shall be designed by an independent testing laboratory acceptable to the ENGINEER. All costs related to such mix design shall be borne by the CONTRACTOR.

Each concrete mix submittal shall contain the following information, as applicable:

a. Location and purpose of the mix.
b. Slump on which the design is based.
c. Total gallons of water per cubic yard, and the water/cementitious materials ratio (w/cm).
d. Brand, type, composition and quantity of cement.
e. Brand type, composition and quantity of fly ash, slag cement, silica fume.
f. Specific Gravity, source and gradation of each aggregate.
g. Ratio of fine to total aggregate per cubic yard.
h. Weight (surface dry) of each aggregate per cubic yard.
i. Brand, type, and ASTM designation, active chemical ingredients and quantity of each admixture.
j. Copy of the Building and Safety Research Report Approval for each concrete admixture.
k. Air content.
l. Compressive strength based on 7-day and 28-day compression tests, including standard deviation calculations, corroborative data (if applicable), and required average comprehensive strength per ACI 318.
m. Time of initial and final set.
n. Certification stamp and signature by a Civil or Structural engineer registered in the State of California, experienced in concrete mix design.
o. Certificate of Compliance for Cement.

p. Concrete pour sequence.

q. Buy Clean California Act

1.) For project specifications that include GR Section 1601, Buy Clean California Act, bidders shall submit current Environmental Product Declarations (EPDs) for each concrete mix design, from the originating ready-mix plant used in the project. When material comes from different plants, an EPD will be required for each plant from which the material will be obtained.

2.) An EPD must conform to the following:
   a) Shall be facility-specific manufacturer/plant EPD.
   b) Be independently verified in accordance with ISO 14025 (Type III).
   c) Be developed according to the guidelines of the applicable Product Category Rule (PCR), as identified by the Department of General Services, State of California.
   d) Have a valid date that has not expired.
   e) Shall not exceed the Global Warming Potential (GWP) as required by GR Section 1601.

3.) EPD shall be submitted concurrently with each mix submittal for review and approval.

2. Certified Delivery Tickets: Where ready-mix concrete is used, the CONTRACTOR shall provide certified weighmaster delivery tickets at the time of delivery of each load of concrete. Each certificate shall show the public weighmaster's signature, and the total quantities, by weight of cement, sand, each class of aggregate, admixtures, and the amounts of water in the aggregate and added at the batching plant as well as the amount of water allowed to be added at the site for the specific design mix. Each certificate shall, in addition, state the mix number, total yield in cubic yards, and the time of day, to the nearest minute, corresponding to when the batch was dispatched, when it left the plant, when it arrived at the job, the time that unloading began, and the time that unloading was finished.

3. When a water reducing admixture is to be used, the CONTRACTOR shall furnish mix designs for concrete both with and without the admixture.

4. The CONTRACTOR shall furnish a Certificate of Compliance signed by the supplier identifying the type of fly ash and stating that the fly ash complies with ASTM C 618 and these Specifications, together with all supporting test data prior to the use of the fly ash the sample represents. The supporting data shall also contain test results confirming that the fly ash in combination with the cement and water to be used meets all strength requirements and is compatible with air-entraining agents and other admixtures.

5. The CONTRACTOR shall submit to the ENGINEER for review the design mix for fly ash concrete together with the design mix for Portland cement (non-fly ash) concrete as specified in this Section.

1.5 QUALITY ASSURANCE

A. Laborers: Use adequate number of skilled laborers who are thoroughly trained and experienced in the necessary crafts and completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

B. Compliance with Regulations: All materials shall comply with the current rules and regulations of the local air quality management district, with the rules regarding volatile organic compounds, and with FDA rules and regulations for dangerous substances in construction products.

C. Concrete Manufacturer: Furnish concrete from licensed commercial ready-mix concrete plants conforming to ASTM C94 and approved by City of Los Angeles Department of Building and Safety. Requirements herein govern when exceeding ASTM C94.

D. Continuous Inspection: Construct structural concrete exceeding 2,500 psi compressive strength under continuous inspection of DEPUTY INSPECTOR. Obtain inspection and approval of forms and reinforcing by CONTRACTOR's Independent Testing/Inspection Laboratory three (3) working days before placing structural concrete in order to be verified by ENGINEER.

E. Tests on component materials and for compressive strength and shrinkage of concrete will be performed as specified herein. Test for determining slump will be in accordance with the requirements of ASTM C 143.

F. The cost of all laboratory tests on cement, aggregates, and concrete compressive strength, will be borne by the CITY. However, the CONTRACTOR shall be responsible for all other required tests and shall be charged for the cost of any additional tests and investigation on work performed which does not meet the specifications.

G. Concrete for testing shall be supplied by the CONTRACTOR at no cost to the CITY, and the CONTRACTOR shall provide assistance and facilities to the INSPECTOR in obtaining samples, and disposal and cleanup of excess material.

H. Field Compression Tests:

1. Compression test specimens will be taken during construction from the first placement of each concrete mix used and at intervals thereafter as selected by the INSPECTOR to insure continued compliance with these specifications. Each set of test specimens will be a minimum of 4 cylinders.

2. Compression test specimens for concrete shall be made in accordance with ASTM C 31. Specimens shall be 6-inch diameter by 12-inch high cylinders.

3. Compression tests shall be performed in accordance with ASTM C 39. Two 6"x12" test cylinders will be tested at 7 days as necessary and two at 28 days. Any remaining cylinders will be held to verify test results, if needed.

I. Evaluation and acceptance of Compressive Strength Concrete shall be based on the following criteria:

1. Concrete shall be sampled and tested in accordance with the ACI 350.5.

2. Acceptance of concrete placed shall be based on 28-day compressive strength test results. A 28-day compressive strength test shall consist of the average compressive strength of two 6"x12" concrete test cylinders fabricated from a single load of fresh concrete except that, if a cylinder should show evidence of improper handling, molding, or testing, said cylinder shall be discarded and the compressive strength test shall then consist of the remaining cylinder.

3. Concrete compressive strength tests representing concrete poured-in-place, shall attain the 28-day compressive strength specified in the specifications or as shown on the plans.

4. In-place concrete represented by a compressive cylinder strength test failing to meet the specified 28-day compressive strength shall be removed from the work at no cost to the CITY. Also, the CONTRACTOR shall at its own expense make any corrective changes in the mix deemed necessary by the ENGINEER. The changes in the mix proportions or placement procedures shall be approved by the ENGINEER prior to the placement of any additional concrete subsequent to a failing compressive strength test.

5. As an alternative to the removal of concrete represented by a failed cylinder compressive strength test and subject to the approval of the ENGINEER, the concrete represented by the failed compressive strength cylinder test or tests may be cored in place. The corings shall be completed no later than 10 days from notification of failure by the ENGINEER. The cores shall be taken by the CONTRACTOR in the presence of the INSPECTOR and tested at the CONTRACTOR's expense in accordance with ASTM C 42 by a certified laboratory acceptable to the INSPECTOR. The cores shall be 4 inch diameter (min.) unless otherwise directed by the

ENGINEER. At least three cores shall be taken in each area represented by a failed 28-day concrete compressive strength cylinder test. Unless otherwise directed by the ENGINEER, the cores shall be tested wet following a 40-hour submergence. If each core tests at least 85 percent of the specified 28-day compressive strength or greater, the concrete represented may be accepted provided the CONTRACTOR accepts the payment provisions stated below. Concrete represented by failing core tests shall not be paid for and shall be removed by the CONTRACTOR from the work at no cost to the CITY.

6. Payment to the CONTRACTOR for concrete accepted by the ENGINEER based on core test results but represented by failing compressive cylinder test results shall be reduced as follows:

   a. When the result of a single compressive cylinder strength test is less than the specified 28-day compressive strength but 95 percent or more of the 28-day compressive strength, the CONTRACTOR shall pay the CITY per cubic yard for each in-place cubic yard of concrete represented by the deficient compressive strength cylinder test as determined by the actual sampling interval; and.

   b. When the result of a single compressive strength cylinder test is less than 95 percent of the specified 28-day compressive strength but is acceptable based on core test results taken in accordance with Subsection 1.5.I.5, the CONTRACTOR shall pay the CITY **[$20]** per cubic yard for each in-place cubic yard of concrete represented by the deficient compressive strength cylinder test as determined by the actual sampling interval.

J. Shrinkage Tests:

1. Perform Shrinkage tests on the design mix for Structural Concrete. The tests shall conform to ASTM C157 as modified by SASTM C 596 for curing, storage, and comparator readings. Use concrete specimens. Do not use mortar specimens.

2. Allowable shrinkage limitations shall be as specified in Part 2, herein.

K. Construction Tolerances: The CONTRACTOR shall set and maintain concrete forms and perform finishing operations so as to ensure that the completed work is within the tolerances specified in Section [03100] “Concrete Formwork”. Surface defects and irregularities are defined as finishes and are to be distinguished from tolerances.

L. For each class of fly ash, all testing and sampling procedures shall conform with these Specifications and ASTM C 311, including the restriction that one sample weighing 4 pounds shall be taken from at least each 200 tons of fly ash supplied.

M. Separate storage facilities shall be provided for fly ash and other supplementary cementitious materials (SCM). All SCM shall be stored in such a manner as to permit ready access for the purpose of inspection and sampling and suitably protected against contamination or moisture. Should any SCM show evidence of contamination or moisture or be otherwise unsuitable, the INSPECTOR may reject it and require that it be removed from the site. Each SCM used in concrete for this project shall be from the same source.

PART 2 -- PRODUCTS

2.1 CONCRETE MATERIALS

A. Materials shall be delivered, stored, and handled so as to prevent damage by water or breakage. Only one brand of cement shall be used. Cement reclaimed from cleaning bags or leaking containers shall not be used. All cement shall be used in the sequence of receipt of shipments.

B. All materials furnished for the work shall comply with the requirements of ACI 350.5, as applicable.

C. Storage of materials shall conform to the requirements of ACI 350.5.

D. Materials for concrete shall conform to the Standard Specifications and the following requirements.

1. Concurrent with strength design criteria, concrete shall also be proportioned to provide the requisite durability to satisfy the exposure conditions imposed by either environment and/or service. Durability, in this context, refers to the ability of the concrete to resist deterioration from the environment or service in which it is placed. Concrete proportioned in accordance with ACI 318, or ACI 350 for sanitary structures, chapter 4, Durability Requirements, will meet this criteria.

2. Cementitious Materials:

    a. Portland Cement shall conform to ASTM C 150, Type II.
    b. Supplementary Cementitious Materials:
        i. Fly ash shall conform to ASTM C 618, Class F.
        ii. Slag cement shall conform to ASTM C 989, Grade 100 or 120.

3. Aggregates shall be obtained from pits acceptable to the INSPECTOR, shall be non-reactive, and shall conform to ASTM C 33. Lightweight sand for fine aggregate will not be permitted.

    a. When tested in accordance with ASTM C 40, the fine aggregate shall produce a color in the supernatant liquid no darker than the reference standard color solution.

    b. When tested in accordance with ASTM C 131, the coarse aggregate shall show a loss not exceeding 42 percent after 500 revolutions, or 10.5 percent after 100 revolutions.

    c. When tested in accordance with ASTM C 88, the loss resulting after five cycles shall not exceed 10 percent for fine or coarse aggregate when using sodium sulfate.

    d. When tested in accordance with ASTM C 117, materials finer than No. 200 sieve shall not exceed 1% for gravel, and 1.5% for crushed aggregate.

    e. When tested in accordance with ASTM D 2419, the California sand equivalent values operating range shall not be below 71%.

    f. Fine and coarse aggregates used shall not cause expansion of mortar bars greater than 0.1 percent in 16 days when tested in accordance with ASTM C 1567 using project proposed cement or expansion result of the concrete prisms greater than 0.4 percent at 1 year when tested in accordance with ASTM C 1293. If aggregates proposed do not meet this requirement, then satisfy either subparagraph below:

        i. Total equivalent Akali content of the cement: DO not exceed 0.60 percent as provided in the optional chemical requirements of ASTM C 150.

        ii. Fine and coarse aggregates used shall not cause expansion of mortar bars greater than 0.1 percent in 16 days when tested in accordance with ASTM C 15678 and using the cement and fly ash proposed for the project. Proportions of cement-fly ash mix shall be the same as those proposed for the project.

4. Ready-mixed concrete shall conform to the requirements of ASTM C 94.

5. Water for mixing shall conform to ASTM C 1602 and be clean and free from objectionable quantities of silty organic matter, alkali, salts, and other impurities. The use of qualifying recycled water is encouraged**.** Mixing water that contains non-potable water should comply with ASTM C1602 Section 4 and Section 5 including Table 1 and Table 2.

6. Admixtures: The ENGINEER may require the use of admixtures or the CONTRACTOR may propose to use admixtures to control the set, effect water reduction, increase workability or enhance durability. In either case, the addition of an admixture shall be at the CONTRACTOR's expense. The use and continued use of an admixture shall be approved by the ENGINEER. Admixtures specified herein, other than calcium chloride, shall conform to the requirements of

ASTM C 494 or other standards specified in this Section. The required quantity of cement shall be used in the mix regardless of whether or not an admixture is used. Admixtures shall contain no free chloride ions, be non-toxic after 30 days, and shall be compatible with and made by the same manufacturer as the air entraining admixture.

These admixtures shall not be used in greater doses than those recommended by the manufacturer or permitted by the ENGINEER. The permitted dosage of the admixture shall not exceed that which will result in an increase in the drying shrinkage of the concrete in excess of 20 percent when used in precast or prestressed concrete, or 10 percent when used in any other structural concrete. The strength of concrete containing the admixture in the amount proposed shall, at the age of 48 hours and longer be not less than that of similar concrete without the admixture. The admixture shall not adversely affect the specified air content, unless permitted by the ENGINEER.

a. Set controlling admixture shall be either with or without water-reducing properties. Where the air temperature at the time of placement is expected to be consistently over 80 degrees F, a set retarding admixture conforming to ASTM C 494, Type B or D, such as Sika Corporation's Plastiment, BASF Corporation's MasterSet R Series or MasterSet DELVO Series, GCP applied Technologies (formerly W. R. Grace), Recover or Daratard 17 or an approved equal shall be used. Where the air temperature at the time of placement is expected to be consistently under 40 degrees F, a set accelerating admixture conforming to ASTM C 494 Type C or E, such as Sika Corporation's Plastocrete 161FL, BASF Corporation's MasterSet AC 534 or MasterSet FP 20, GCP applied Technologies (formerly W. R. Grace), Daraset 400 or Polarset or an approved equal shall be used.

b. Normal and mid-range water reducing admixtures shall conform to ASTM C 494, Type A, and shall be BASF Corporation's MasterPozzolith Series, MasterPolyheed series, GCP applied Technologies (formerly W. R. Grace), ADVA series, Zyla series, WRDA series or approved equal. The quantity of admixture used, and the method of mixing shall be in accordance with the manufacturer's instructions and recommendations.

c. High range water reducer shall conform to ASTM C 494, Type F or G.

   If the high range water reducing admixture is added to the concrete at the batch plant, it shall be, ADVA series ADVA 190, ADVA 198, ADVA 140M as manufactured by GCP Applied Technologies (formerly W. R. Grace) MasterRheobuild 1000, MasterGlenium Series, or PS 1466 as manufactured by BASF Corporation; or an approved equal. High range water reducer shall be added to the concrete after all other ingredients have been mixed and initial slump has been verified.

   If the high range water reducer is added to the concrete at the job site, it shall be used in conjunction with a normal water reducer and shall be MasterPozzolith 700 or MasterPozzolith 322 and MasterGlenium 7500 or MasterGlenium 3030, as manufactured by BASF Corporation; ADVA series ADVA 190, ADVA 198, ADVA 140M and Zyla Series, Zyla 625 or WRDA series, WRDA 64 as manufactured by GCP Applied technologies (formerly W. R. Grace**);** or an approved equal. Concrete shall have a slump of 3-inches ± 1/2-inch prior to adding the high range water reducing admixture at the job site. Slump shall not exceed 9 inches for concrete after addition of high-range water-reducing admixture. The high range water reducing admixture shall be accurately measured and pressure injected into the mixer as a single dose by an experienced technician. A standby system shall be provided and tested prior to each day's operation of the job site system.

   Concrete shall be mixed at mixing speed for a minimum of 30 mixer revolutions after the addition of the high range water reducer.

d. Air-entraining admixture meeting the requirements of ASTM C 260, such as BASF Corporation's MasterAir Series or, GCP Applied Technologies (formerly W. R. Grace Daravair or Darex series**,** approved equal, shall be used. Sufficient air-entraining agent

shall be used to provide a total air content of 3 to 4 percent; provided that, when the mean daily temperature in the vicinity of the worksite falls below 40 degrees F for more than one day, the total air content provided shall be 5 to 6 percent. The CITY reserves the right, at any time, to sample and test the air-entraining agent received on the job by the CONTRACTOR. The air-entraining agent shall be added to the batch in a portion of the mixing water. The solution shall be batched by means of a mechanical batcher capable of accurate measurement.

e. Shrinkage-reducing admixture shall conform to ASTM C 494, Type S, and shall be BASF Corporation's MasterLife SRA 20, MasterLife CRA 007, GCP Applied Technologies (formerly W. R. Grace) Eclipse series or approved equal.

f. Calcium Chloride: Except as otherwise provided herein, calcium chloride will not be permitted to be used in concrete.

2.2 CURING MATERIALS

A. Materials for curing concrete shall conform to Section 03370 "Curing Concrete", Part 2.

2.3 NON-WATERSTOP JOINT MATERIALS

A. Materials for non-waterstop joints in concrete shall conform to Section [03290] "Joints In Concrete", Part 2.

2.4 MISCELLANEOUS MATERIALS

A. Dampproofing agent shall be an asphalt emulsion, such as [MasterSeal 610, MasterSeal 614 or MasterSeal 615 (formerly Hydrocide 600, Hydrocide 700 & Hydrocide 700B) by BASF Corporation], GCP Applied Technologies (formerly W. R. Grace) Darapel, [Flintkote C-13-E Foundation Coating], or an approved equal.

B. Epoxy adhesives shall be per the following products for the applications specified:

1 For bonding freshly-mixed, plastic concrete to hardened concrete, Sikadur Hi-Mod Epoxy Adhesive, as manufactured by Sika Corporation; MasterEmaco ADH 326 (formerly Concresive Liquid LPL) as manufactured by BASF Corporation; or an approved equal.

2 For bonding hardened concrete or masonry to steel, MasterEmaco ADH 327RS (formerly Concresive Paste SPL), Colma-Dur Gel, Sikadur Hi-Mod Gel, or an approved equal.

C. Drypack: Field mixture of 1 part Portland cement to 2 parts fine aggregate mixed to a damp consistency such that a ball molded in the hands will stick together and hold its shape. At CONTRACTOR's option, the specified admixture may be added for increased workability at lower water/cement ratio. In lieu of field mixing, CONTRACTOR may use factory mixed drypack material, such as BASF Corporation "MasterFlow 100" or Euclid "Euco Dry Pack Grout", or an approved equal.

D. Expansion Joint Filler: Asphalt impregnated fiber or non-extruding foam type, conforming to ASTM D994 and D1751, or D1752.

E. Construction Joint Materials: "Key-Kold", "Kwik-Joint" of profiles indicated, or an approved equal.

F. Bonding Agent: "Weld-Crete", manufactured by Larsen Products Co. or "MasterEmaco ADH" Series (formerly Concresive Series), as manufactured by BASF Corporation, or an approved equal.

2.5 CONCRETE DESIGN REQUIREMENTS

A. General: Concrete shall be composed of cement, SCM, admixtures, aggregates and water. These materials shall be of the qualities specified. The exact proportions in which these materials are to be used for different parts of the work will be determined during the trial batch. In general, the mix shall be designed to produce a concrete capable of being deposited so as to obtain maximum density and minimum shrinkage and, where deposited in forms, to have good consolidation properties and maximum smoothness of surface. Mix designs with more than 41 percent of sand of the total weight of fine and coarse aggregate shall not be used. The aggregate gradations shall be formulated to provide fresh concrete that will not promote rock pockets around reinforcing steel or embedded items. The proportions shall be changed whenever necessary or desirable to meet the required results at no additional cost to the CITY. All changes shall be subject to review by the ENGINEER.

B. W/cm and Compressive Strength: The minimum compressive strength and cement content of concrete shall be not less than that specified in the following tabulation.

Type of Work	Min. 28-Day Compressive Strength (psi)	Aggregate Gradation	Cement per cu yd (sacks)	Max w/cm (by weight)
Structural Concrete *:	4,000	C	7.0	0.42
Sitework concrete:	3,000	C	5.5	0.54

Note: One sack of cement equals 94 lb.
* Use “B” Aggregate gradation when placing conditions permit.

C Adjustments to Mix Design: The mixes used shall be changed whenever such change is necessary or desirable to secure the required strength, density, workability, and surface finish and the CONTRACTOR shall be entitled to no additional compensation because of such changes.

D. Fly ash/pozzolan/ground granulated blast furnace slag may be used per requirements of the Standard Specifications, when approved by the ENGINEER as a partial cement replacement in concrete as follows:

1 Fly ash shall replace not more than 20 percent by weight of the Portland cement in the design mix. The design mix shall contain a minimum of 7 sacks of cement per cubic yard before the replacement is made.

2 Fly ash for hydraulic/liquid containing structures shall be Class F fly ash only. Fly ash for all other structures shall be Class C or F fly ash.

3 If ground granulated blast furnace slag is used in lieu of fly ash, the content of ground granulated blast furnace slag shall be in the range of 25-45 percent of total cement plus ground granulated blast furnace slag content, by weight.

2.6 CONSISTENCY

The quantity of water entering into a batch of concrete shall be just sufficient, with a normal mixing period, to produce a concrete which can be worked properly into place without segregation, and which can be compacted by the vibratory methods herein specified to give the desired density, impermeability and smoothness of surface. Subject to the w/c ratio requirements of section 2.5, the quantity of water shall be changed as necessary, with variations in the nature or moisture content of the aggregates, to maintain uniform production of a desired consistency. The consistency of the concrete in successive batches shall be determined by slump tests in accordance with ASTM C 143. The slumps shall be as follows:

Part of Work	Slump (in)
With high range water reducer added	9-inches max
Other work	per Standard Specifications

2.7 TRIAL BATCH AND LABORATORY TESTS

A. Before placing any concrete, a Department of Building and Safety certified testing laboratory approved by the ENGINEER shall prepare, within 30 calendar days after the date of the Notice to Proceed, a trial batch of each concrete mix, based on the preliminary concrete mixes submitted by the CONTRACTOR. During the trial batch the aggregate proportions may be adjusted by the testing laboratory using the two coarse aggregate size ranges to obtain the required properties. If one size range produces an acceptable mix, a second size range need not be used. Such adjustments shall be considered refinements to the mix design and shall not be the basis for extra compensation to the CONTRACTOR. All concrete shall conform to the requirements of this Section, whether the aggregate proportions are from the CONTRACTOR's preliminary mix design, or whether the proportions have been adjusted during the trial batch process. The trial batch shall be prepared using the aggregates, cement and admixture proposed for the project. The trial batch materials shall be of a quantity such that the testing laboratory can obtain 3 drying shrinkage, and 10 compression test specimens from each batch. The cost of not more than 3 laboratory trial batch tests for each specified concrete strength shall be borne by the CONTRACTOR. Any additional trial batch testing required shall be performed at the expense of the CONTRACTOR.

The trial batch procedure may be waived when test data of prior performance of the proposed mix design, performed by a Department of Building and Safety certified testing laboratory, is presented by the CONTRACTOR and approved by the ENGINEER.

The requirements of this section may be waived for concrete mixes specified by the Class per the Standard Specifications.

B. The determination of compressive strength will be made by testing 6-inch diameter by 12-inch high cylinders; made, cured and tested in accordance with ASTM C 192 and ASTM C 39. Five compression test cylinders shall be tested at 7 days and 5 at 28 days. The average compressive strength for the 5 cylinders tested at 28 days for any given trial batch shall not be less than the appropriate sections of ACI 318 of the specified compressive strength.

C. A sieve analysis of the combined aggregate for each trial batch shall be performed according to the requirements of ASTM C 136. Values shall be given for percent passing each sieve.

2.8 SHRINKAGE LIMITATION

A. The maximum concrete shrinkage for specimens cast in the laboratory from the trial batch, as measured at 25-day drying age shall be 0.036 percent. The CONTRACTOR shall only use a mix design for construction that has first met the trial batch shrinkage requirements.

2.9 MEASUREMENT OF CEMENT AND AGGREGATE

The amount of cement and of each separate size of aggregate entering into each batch of concrete shall be determined by direct weighing equipment furnished by the CONTRACTOR and acceptable to the ENGINEER; provided that, where batches are so proportioned as to contain an integral number of conventional sacks of cement, and the cement is delivered at the mixer in the original unbroken sacks, the weight of the cement contained in each sack may be taken without weighing as 94 pounds.

2.10 MEASUREMENT OF WATER

The quantity of water entering the mixer shall be measured by a suitable water meter or other measuring device of a type acceptable to the ENGINEER and capable of measuring the water in

variable amounts within a tolerance of one percent. The water feed control mechanism shall be capable of being locked in position so as to deliver constantly any specified amount of water to each batch of concrete, and the meter shall include a set-back register with a readily visible vertical face and double hands indicating in cubic feet and decimals thereof. A positive quick-acting valve shall be used for a cut-off in the water line to the mixer. The operating mechanism must be such that leakage will not occur when the valves are closed

2.11 READY-MIXED CONCRETE

A. At the CONTRACTOR's option, ready-mixed concrete may be used meeting the requirements as to materials, batching, mixing, transporting, and placing as specified herein and in accordance with ASTM C 94, including the following supplementary requirements.

B. Ready-mixed concrete shall be delivered to the site of the work, and discharge shall be completed within 90 minutes after the addition of the cement to the aggregates or before the drum has been revolved 250 revolutions, whichever is first. In hot weather, or under conditions contributing to quick stiffening of the concrete, the ready-mixed concrete shall be discharged before the temperature of the concrete exceeds 90 degrees F.

C. Truck mixers shall be equipped with electrically-actuated counters by which the number of revolutions of the drum or blades may be readily verified. The counter shall be of the re-settable, recording type, and shall be mounted in the driver's cab. The counters shall be actuated at the time of starting mixers at mixing speeds.

D. Each batch of concrete shall be mixed in a truck mixer for not less than 70 revolutions of the drum or blades at the rate of rotation designated by the manufacturer of equipment. Additional mixing, if any, shall be at the speed designated by the manufacturer of the equipment as agitating speed. All materials including mixing water shall be in the mixer drum before actuating the revolution counter for determining the number of revolutions of mixing.

E. Truck mixers and their operation shall be such that the concrete throughout the mixed batch as discharged is within acceptable limits of uniformity with respect to consistency, mix, and grading. If slump tests taken at approximately the 1/4 and 3/4 points of the load during discharge give slumps differing by more than 2-inches when the specified slump is more than 3-inches, the mixer shall not be used on the work unless the causing condition is corrected and satisfactory performance is verified by additional slump tests. All mechanical details of the mixer, such as water measuring and discharge apparatus, condition of the blades, speed of rotation, general mechanical condition of the unit, and clearance of the drum, shall be checked before a further attempt to use the unit will be permitted.

F. Each batch of ready-mixed concrete delivered at the job site shall be accompanied by a certified weighmaster delivery ticket furnished to the INSPECTOR in accordance with the Paragraph in Part 1 entitled "Certified Delivery Tickets".

G. The use of non-agitating equipment for transporting ready-mixed concrete will not be permitted. Combination truck and trailer equipment for transporting ready-mixed concrete will not be permitted. The quality and quantity of materials used in ready-mixed concrete and in batch aggregates shall be subject to continuous inspection at the batching plant by the INSPECTOR.

PART 3 -- EXECUTION

3.1 PROPORTIONING AND MIXING

A. Proportioning: Proportioning of the concrete mix shall conform to the requirements of Chapter 3 "Proportioning" of ACI 350.5; provided that the maximum slump for any concrete shall not exceed 4-inches except when the use of high range water reducer is permitted which increases the maximum slump to 9-inches.

B. Mixing: Mixing of concrete shall conform to the requirements of Chapter 7 of said ACI 350.5 Specifications and SSPWC. Whichever is most stringent shall apply.

C. Slump: Maximum slumps shall be as specified herein in Section 2.6.

D. Retempering: Retempering of concrete or mortar which has partially hardened will not be permitted.

3.2 PREPARATION OF SURFACES FOR CONCRETING

A. General: Wet wood forms sufficiently to tighten up cracks. Wet other materials sufficiently to reduce adsorption and to help maintain concrete workability. Earth surfaces shall be thoroughly wetted by sprinkling, 24 hours prior to the placing of any concrete, and these surfaces shall be kept moist by frequent sprinkling up to the time of placing concrete thereon. The surface shall be free from standing water, mud, and debris at the time of placing concrete.

B. Screeds: Set screeds at walls and maximum 8’ centers between. Set to provide level floor. Check with an instrument level, transit, or laser during placing operation to maintain level floor.

C. Expansion Joint Filler: Install where slabs abut buildings and elsewhere as indicated. Install full depth of concrete with top level with finished surface of concrete.

D. Joints in Concrete: Concrete surfaces upon or against which concrete is to be placed, where the placement of the old concrete has been stopped or interrupted so that, as determined by the ENGINEER, the new concrete cannot be incorporated integrally with that previously placed, are defined as construction joints. The surfaces of horizontal joints shall be given a compacted, roughened surface for good bond. Except where the Drawings call for joint surfaces to be coated, the joint surfaces shall be cleaned of all laitance, loose or defective concrete, and foreign material. Such cleaning shall be accomplished by sandblasting followed by thorough washing. All pools of water shall be removed from the surface of construction joints before the new concrete is placed.

E. After the surfaces have been prepared all approximately horizontal construction joints shall be covered with a layer of mortar approximately two-inch thick, or as shown on the plans. The mortar shall have the same proportions of cement and sand as the regular concrete mixture. The water-cement ratio of the mortar in place shall not exceed that of the concrete to be placed upon it, and the consistency of the mortar shall be suitable for placing and working in the manner hereinafter specified. The mortar shall be spread uniformly and shall be worked thoroughly into all irregularities of the surface. Wire brooms shall be used where possible to scrub the mortar into the surface. Concrete shall be placed immediately upon the fresh mortar. When casting deep walls (more than 6 feet high) over slabs or footings, in lieu of the two-inch thick mortar, a 6-inch lift of a rich pea gravel mix with the same water-cement ratio as the wall concrete shall be placed and spread uniformly. Wall concrete shall follow immediately and shall be placed upon the fresh pea gravel mix.

F. Embedded Items: No concrete shall be placed until all formwork, installation of parts to be embedded, reinforcement steel, and preparation of surfaces involved in the placing have been completed and ACCEPTED by the INSPECTOR at least 24 hours before placement of concrete. All surfaces of forms and embedded items that have become encrusted with dried grout from concrete previously placed shall be cleaned of all such grout before the surrounding or adjacent concrete is placed.

G. Conduits and Sleeves:

1. Locate so as not to reduce the strength of construction. Do not place pipes, except conduits in a slab of less than 3-1/2" thickness.

2. In supported concrete slabs, do not bury conduit having any outside diameter greater than 33% of the thickness of the slab. Increase slab thickness locally to meet this requirement.

3. Do not place conduit between the bottom of reinforcing steel and the bottom of supported slab.

4. In placing conduits at slabs on earth, place below the reinforcement, and encase in concrete by increasing thickness of the slab locally to at least 3" of concrete around the conduit on all sides.

H. All inserts or other embedded items shall conform to the requirements herein.

I. All reinforcement, anchor bolts, sleeves, inserts, and similar items shall be set and secured in the forms where shown or by shop drawings and shall be acceptable to the INSPECTOR before any concrete is placed. Accuracy of placement is the responsibility of the CONTRACTOR.

J. Where concrete is to be cast against old concrete, (greater than 60 days of age), the surface of the old concrete shall be thoroughly cleaned and roughened by sand-blasting, exposing the aggregate. In concrete shear-walls, suspended slabs and roof slabs, the interface surface at construction joints shall be roughened to a full amplitude of one quarter inch. The hardened surface shall be cleaned of all latent foreign material and washed clean, prior to the application of an epoxy bonding agent.

K. Concrete shall not be placed in any structure until all water entering the space to be filled with concrete has been properly cut off or has been diverted by pipes, or other means, and carried out of the forms, clear of the work. Concrete shall not be deposited underwater nor shall the CONTRACTOR allow still water to rise on any concrete until the concrete has attained its initial set. Water shall not be permitted to flow over the surface of any concrete in such manner and at such velocity as will injure the surface finish of the concrete. Pumping or other necessary dewatering operations for removing ground water, if required, will be subject to the review of the ENGINEER.

L. Corrosion Protection: Pipe, conduit, dowels, and other ferrous items required to be embedded in concrete construction shall be so positioned and supported prior to placement of concrete that there will be a minimum of 2-inches clearance between said items and any part of the concrete reinforcement. Securing such items in position by wiring or welding them to the reinforcement will not be permitted.

M. Openings for pipes, inserts for pipe hangers and brackets, and the setting of anchors shall, where practicable, be provided for during the placing of concrete.

N. Anchor bolts shall be accurately set, and shall be maintained in position by templates while being embedded in concrete.

O. Cleaning: The surfaces of all metalwork to be in contact with concrete shall be thoroughly cleaned of all dirt, grease, loose scale and rust, grout, mortar, and other foreign substances immediately before the concrete is placed.

3.3 HANDLING, TRANSPORTING, AND PLACING

A. General: Do not place concrete during rain or adverse weather conditions without means to prevent all damage. Conform to requirements specified hereinafter whenever concrete placement is required during cold or hot weather. Placing of concrete shall conform to the applicable requirements of ACI 350.5 and the requirements of this Section.

B. Non-Conforming Work or Materials: Concrete which upon or before placing is found not to conform to the requirements specified herein shall be rejected and immediately removed from the work. Concrete which is not placed in accordance with these Specifications, or which is of inferior quality, shall be removed and replaced by and at the expense of the CONTRACTOR.

C. Concrete shall not be placed except in the presence of duly authorized representative of the INSPECTOR. The CONTRACTOR shall notify the INSPECTOR in writing at least 48 hours in advance of placement of any concrete.

D. Placement in Wall Forms: Concrete shall not be dropped through reinforcement steel or into any deep form, whether reinforcement is present or not, causing separation of the coarse aggregate from the mortar on account of repeatedly hitting rods or the sides of the form as it falls, nor shall concrete

be placed in any form in such a manner as to leave accumulation of mortar on the form surfaces above the placed concrete. In such cases, some means such as the use of hoppers and, if necessary, vertical ducts of canvas, rubber, or metal shall be used for placing concrete in the forms in a manner that it may reach the place of final deposit without separation. In no case shall the free fall of concrete exceed 4 feet below the ends of ducts, chutes, or buggies. Concrete shall be uniformly distributed during the process of depositing and in no case after depositing shall any portion be displaced in the forms more than 6 feet in horizontal direction. Concrete in forms shall be deposited in uniform horizontal layers not deeper than 2 feet; and care shall be taken to avoid inclined layers or inclined construction joints except where such are required for sloping members. Each layer shall be placed while the previous layer is still soft. The rate of placing concrete in forms shall not exceed 5 feet of vertical rise per hour.

E. Casting New Concrete Against Old: An approved epoxy adhesive bonding agent shall be applied to the old surfaces according to the manufacturer's written recommendations. This provision shall not apply to joints where waterstop is installed, see Section [03290], "Joints in Concrete".

F. Conveyor Belts and Chutes: All ends of chutes, hopper gates, and all other points of concrete discharge throughout the CONTRACTOR'S conveying, hoisting and placing system shall be so designed and arranged that concrete passing from them will not fall separated into whatever receptacle immediately receives it. Conveyor belts, if used, shall be of a type acceptable to the ENGINEER. Chutes longer than 50 feet will not be permitted. Minimum slopes of chutes shall be such that concrete of the specified consistency will readily flow in them. If a conveyor belt is used, it shall be wiped clean by a device operated in such a manner that none of the mortar adhering to the belt will be wasted. All conveyor belts and chutes shall be covered. Sufficient illumination shall be provided in the interior of all forms so that the concrete at the places of deposit is visible from the deck or runway.

G. Placement in Slabs: Concrete placed in sloping slabs shall proceed uniformly from the bottom of the slab to the top, for the full width of the pour. As the work progresses, the concrete shall be vibrated and carefully worked around the slab reinforcement, and the surface of the slab shall be screeded in an up-slope direction.

H. Temperature of Concrete: The temperature of concrete when it is being placed shall be not more than 90 degrees F nor less than 40 degrees F in moderate weather, and not less than 50 degrees F in weather during which the mean daily temperature drops below 40 degrees F. Concrete ingredients shall not be heated to a temperature higher than that necessary to keep the temperature of the mixed concrete, as placed, from falling below the specified minimum temperature. If concrete is placed when the weather is such that the temperature of the concrete would exceed 90 degrees F, the CONTRACTOR shall employ effective means, such as precooling of aggregates and mixing water using ice or placing at night, as necessary to maintain the temperature of the concrete, as it is placed, below 90 degrees F. The CONTRACTOR shall be entitled to no additional compensation on account of the foregoing requirements.

I. Cold Weather Placement:

1. Earth foundations shall be free from frost or ice when concrete is placed upon or against them. Fly ash concrete shall not be placed when the air temperature falls below 50 degrees F.

2. Normal Concrete: When the temperature is below 40 degrees F, the temperature of the concrete placed in the forms shall be at least 60 degrees F. When the temperature is below 30 degrees F, the temperature of the concrete as mixed shall be 65°F. In all cases, when the daily average temperature is below 40 degrees F, the concrete shall be kept at 55 degrees F for the 72 hours, and then allowed to drop uniformly to the air temperature over the next 24 hours. Concrete temperature shall be measured by placing a thermometer 2" below the top of the concrete being placed.

3. Air-entrained concrete shall be kept at the above temperature for 27 hours and above freezing for an additional 72 hours.

4. No calcium chloride shall be used to accelerate hardening of concrete. CONTRACTOR to certify that any additive used does not contain calcium chloride.

5. If low temperature accelerating admixture is proposed, adjust concrete mix as required and obtain approval of the ENGINEER.

6. All concrete materials, reinforcement, forming materials and ground with which concrete is to come in contact shall be free of frost.

7. The covering or other protection used in connection with the curing shall remain in place and intact for at least 24 hours.

8. The work shall be protected from the elements, flowing water, and defacements of any nature during the construction operations.

9. Conform to the provisions of ACI 306.1R-16, except as modified herein.

J. Hot Weather Placement:

Conform to ACI 305.1 and the following requirements:

1. Take extra care to reduce the temperature of the concrete being placed, and to prevent rapid drying of newly placed concrete. When the outdoor ambient temperature is more than 90 degrees F, shade the fresh concrete as soon as possible after placing, use an evaporation reducer or fogging to minimize rapid drying. and start curing as soon as the surface of the fresh concrete is sufficiently hard to permit it without damage.

2. Concrete placement temperatures shall be controlled by the CONTRACTOR and shall not be limited to:

   a. Shading and cooling the aggregate;

   b. Avoiding use of hot cement;

   c. Cooling mixing water by additions of ice;

   d. Insulating water supply lines and tanks; and

   e. Insulating mixer drums or cooling them with sprays or wet burlap.

K. Cast-in-place concrete shall be homogeneous throughout the structural element. The methods used to place shall prevent segregation. Placement of concrete for bridge structures shall conform to Section 51-1 of the CSS.

3.4 PUMPING OF CONCRETE

A. General: If the pumped concrete does not produce satisfactory end results, the CONTRACTOR shall discontinue the pumping operation and proceed with the placing of concrete using conventional methods.

B. Pumping Equipment: The pumping equipment must have 2 cylinders and be designed to operate with one cylinder only in case the other one is not functioning. In lieu of this requirement, the CONTRACTOR may have a standby pump on the site during pumping.

C. The minimum diameter of the hose (conduits) shall be 4-inches.

D. Pumping equipment and hoses (conduits) that are not functioning properly, shall be replaced.

E. Aluminum conduits for conveying the concrete will not be permitted.

F. Gradation of coarse aggregates shall conform to ASTM C 33 and shall be as close to the middle range as possible.

G. Gradation of fine aggregate shall conform to ASTM C 33, with 15 to 30 percent passing the number 50 screen and 5 to 10 percent passing the number 100 screen. The fineness modulus of sand used shall not be over 3.00.

H. Field Control: Concrete samples for slump per ASTM C 143 and test cylinders per ASTM C 31 and C 39.

3.5 ORDER OF PLACING CONCRETE

A. The order of placing concrete in all parts of the work shall be acceptable to the ENGINEER. In order to minimize the effects of shrinkage, the concrete shall be placed in units as bounded by construction joints shown. The placing of units shall be done by placing alternate units in a manner such that each unit placed shall have cured at least 7 days before the contiguous unit or units are placed, except that the corner sections of vertical walls shall not be placed until the 2 adjacent wall panels have cured at least 14 days.

B. The surface of the concrete shall be level whenever a run of concrete is stopped. To insure a level, straight joint on the exposed surface of walls, a wood strip at least 3/4-inch thick shall be tacked to the forms on these surfaces. The concrete shall be carried about 1/2-inch above the underside of the strip. About one hour after the concrete is placed, the strip shall be removed and any irregularities in the edge formed by the strip shall be leveled with a trowel and all laitance shall be removed.

3.6 TAMPING AND VIBRATING

A. As concrete is placed in the forms or in excavations, it shall be thoroughly settled and compacted, throughout the entire depth of the layer which is being consolidated, into a dense, homogeneous mass, filling all corners and angles, thoroughly embedding the reinforcement, eliminating rock pockets, and bringing only a slight excess of water to the exposed surface of concrete during placement. Vibrators shall be high speed power vibrators (8,000 to 10,000 rpm) of an immersion type in sufficient number and with (at least one) standby units as required.

B. Operation of Vibrators: Do not horizontally transport concrete in forms with vibrators nor allow vibrators to contact forms or reinforcing. Push vibrators vertically into the preceding layers that are still plastic and slowly withdraw, producing maximum obtainable density in concrete without creating voids or segregation. In no case disturb concrete that has partially set. Vibrate at intervals not exceeding two-thirds the effective visible vibration diameter of the submerged vibrator. Avoid excessive vibration that causes segregation. Use and type of vibrators shall conform to ACI 309 "Recommended Practice for Consolidation of Concrete".

C. Correction of Segregation: Before placing next layer of concrete, and at the top of last placement for vertical elements, remove concrete containing excess water or fine aggregate or showing deficiency of coarse aggregate and fill the space with compacted concrete of correct proportions.

D. Care shall be used in placing concrete around waterstops. The concrete shall be carefully worked by rodding and vibrating to make sure that all air and rock pockets have been eliminated. Where flat-strip type waterstops are placed horizontally, the concrete shall be worked under the waterstops by hand, making sure that all air and rock pockets have been eliminated. Concrete surrounding the waterstops shall be given additional vibration, over and above that used for adjacent concrete placement to assure complete embedment of the waterstops in the concrete.

E. Concrete in walls shall be internally vibrated and at the same time rammed, stirred, or worked with suitable appliances, tamping bars, shovels, or forked tools until it completely fills the forms or

excavations and closes snugly against all surfaces. Subsequent layers of concrete shall not be placed until the layers previously placed have been worked thoroughly as specified. Vibrators shall be provided in sufficient numbers, with standby units as required, to accomplish the results herein specified within 15 minutes after concrete of the prescribed consistency is placed in the forms. The vibrating head shall be kept from contact with the surfaces of the forms. Care shall be taken not to vibrate concrete excessively or to work it in any manner that causes segregation of its constituents.

3.7 FINISHING CONCRETE SURFACES

A. General: Surfaces shall be free from fins, bulges, ridges, offsets, honeycombing, or roughness of any kind, and shall present a finished, smooth, continuous hard surface. Allowable deviations from plumb or level and from the alignment, profiles, and dimensions shown are defined as tolerances and are specified in Part 1, herein. These tolerances are to be distinguished from irregularities in finish as described herein. Aluminum finishing tools shall not be used.

B. Formed Surfaces: Formed surfaces for all structures other than building structures and bridge decks, shall be finished per Section 303-1.9 of Standard Specifications. Concrete for bridge decks shall be finished per CSS Section 51-1.17. Concrete for building and retaining wall structures shall be finished per architectural finish as specified hereon, or as shown on Drawings.

C. Finishing of Formed Surfaces (As Applicable):

1. General: After removal of forms, give the concrete surfaces one or more of the finishes specified below where so indicated on the Contract Drawings. Revise the finishes as needed to secure the approval of the ENGINEER.

C. Finishing of Unformed Top Surfaces of slabs, floors, walls, and curbs in accordance with Aci 350.5.

1. Unspecified Finish: In accordance with ACI 350.5, unless otherwise stated below:

a. Light Troweled Finish: For top slabs or floors intended as walking surfaces.

3.8 CURING AND DAMPPROOFING

Curing and Dampproofing shall conform to Section 03370 “Curing Concrete”, Part 3.

3.9 PROTECTION

The CONTRACTOR shall protect all concrete against injury until final acceptance by the CITY. Fresh concrete shall be protected from damage due to rain, hail, sleet, or snow. The CONTRACTOR shall provide such protection while the concrete is still plastic and whenever such precipitation is imminent or occurring. Immediately following the first frost in the fall, the CONTRACTOR shall be prepared to protect all concrete against freezing. After the first frost, and until the mean daily temperature in the vicinity of the worksite falls below 40 degrees F for more than one day, the concrete shall be maintained at a temperature not lower than 50 degrees F for at least 72 hours after it is placed.

The CONTRACTOR shall protect all concrete against injury or damage from excessive heat, lack of moisture, overstress, or any other cause until final acceptance by the CITY. Particular care shall be taken to prevent the drying of concrete and to avoid roughening or otherwise damaging the surface. Any concrete found to be damaged, or which may have been originally defective, or which becomes defective at any time prior to the final acceptance of the completed work, or which departs from the established line or grade, or which, for any other reason, does not conform to the requirements of the Contract Documents, shall be satisfactorily repaired or removed and replaced with acceptable concrete at the CONTRACTOR'S expense.

3.10 TREATMENT OF SURFACE DEFECTS

A. As soon as forms are removed, all exposed surfaces shall be carefully examined, and any irregularities shall be immediately rubbed or ground in a satisfactory manner in order to secure a smooth, uniform, and continuous surface. Plastering or coating of surfaces to be smoothed will not be permitted. No repairs shall be made until after inspection by the ENGINEER. In no case will extensive patching of honeycombed concrete be permitted. Concrete containing minor voids, holes, honeycombing, or similar depression defects shall be repaired as specified herein. Concrete containing extensive voids, holes, honeycombing, or similar depression defects, shall be completely removed and replaced. All repairs and replacements herein specified shall be promptly executed by the CONTRACTOR at its own expense.

B. Defective surfaces to be repaired shall be cut back from true line a minimum depth of 1/2-inch over the entire area. Feathered edges will not be permitted. Where chipping or cutting tools are not required in order to deepen the area properly, the surface shall be prepared for bonding by the removal of all laitance or soft material, and not less than 1/32-inch depth of the surface film from all hard portions, by means of an efficient sandblast. After cutting and sandblasting, the surface shall be wetted sufficiently in advance of shooting with shotcrete or with cement mortar so that while the repair material is being applied, the surfaces under repair will remain moist, but not so wet as to overcome the suction upon which a good bond depends. The material used for repair purposes shall consist of a mixture of one sack of cement to 3 cubic feet of sand. For exposed walls, the cement shall contain such a proportion of Atlas white Portland cement as is required to make the color of the patch match the color of the surrounding concrete.

C. Holes left by tie-rod cones shall be reamed so as to leave the surfaces of the holes clean and rough. These holes then shall be repaired in an approved manner with non-shrink grout. Holes left by form-tying devices having a rectangular cross-section, and other imperfections having a depth greater than their least surface dimension, shall not be reamed but shall be repaired in an approved manner with non-shrink grout.

D. All repairs shall be built up and shaped in such a manner that the completed work will conform to the requirements of this Section, as applicable, using approved methods which will not disturb the bond, cause sagging, or cause horizontal fractures. Surfaces of said repairs shall receive the same kind and amount of curing treatment as required for the concrete in the repaired section.

E. Prior to filling any structure with water, all cracks that may have developed shall be repaired to the satisfaction of the ENGINEER. This repair method shall be done on the water bearing face of members. Prior to backfilling, faces of members in contact with fill, which are not covered with a waterproofing membrane, shall also have cracks repaired as specified herein.

END OF SECTION

SECTION 03315
GROUT

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all materials for grout in accordance with the provisions of this Section and shall form, mix, place, cure, repair, finish, and do all other work as required to produce finished grout, in accordance with the requirements of the Contract Documents.

B. All grouts shall be City of Los Angeles approved product. The CONTRACTOR shall submit a copy of the Los Angeles Research Report with submittals.

C. The following types of grout shall be covered in this Section:

1. Non-Shrink Grout: This type of grout is to be used wherever grout is shown in the Contract Documents, unless another type is specifically referenced.

2. Concrete (Cement) Grout.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03250 Concrete Accessories.

B. Section 03300 Cast-in-Place Concrete.

C. Section 03400 Precast Concrete.

D. Section 03740 Concrete Repair.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference standards of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable.

1. Commercial Standards:

CRD-C 621	Corps of Engineers Specification for Non-shrink Grout
ASTM C 109	Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in or 50-mm Cube Specimens)
ASTM C 531	Standard Test Method for Linear Shrinkage and Coefficient of Thermal Expansion of Chemical- Resistant Mortars, Grouts, Monolithic Surfacings, and Polymer Concretes
ASTM C 579	Standard Test Methods for Compressive Strength of Chemical-Resistant Mortars, Monolithic Surfacings, and Polymer Concretes
ASTM C 827	Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens of Cementitious Mixtures
ASTM C 1107	Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Non-Shrink)

ASTM D 696	Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between -30°C and 30°C with a Vitreous Silica Dilatometer

2. Other Government Standards:

CSS	Caltrans Standard Specifications.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with GENERAL REQUIREMENTS.

B. The following submittals and specific information shall be provided.

1. The CONTRACTOR shall submit certified test results verifying the compressive strength, shrinkage, and expansion requirements specified herein; and manufacturer's literature containing instructions and recommendations on the mixing, handling, placement and appropriate uses for each type of non-shrink and epoxy grout used in the work.

1.5 QUALITY ASSURANCE

A. Field Tests:

1. Compression test specimens will be taken during construction from the first placement of each type of grout, and at intervals thereafter as selected by the ENGINEER to insure continued compliance with these specifications. The specimens will be made by the INSPECTOR

2. Compression tests and fabrication of specimens for concrete (cement) grout and non-shrink grout will be performed as specified in ASTM C 109 at intervals during construction as selected by the ENGINEER. A set of three specimens will be made for testing at 7 days, 28 days, and each additional time period as appropriate.

3. All grout, already placed, which fails to meet the requirements of these specifications, is subject to removal and replacement at the cost of the CONTRACTOR.

4. The cost of all laboratory tests on grout will be borne by the CITY, but the CONTRACTOR shall assist the INSPECTOR in obtaining specimens for testing. However, the CONTRACTOR shall be charged for the cost of any additional tests and investigation on work performed which does not meet the specifications. The CONTRACTOR shall supply all materials necessary for fabricating and containing the test specimens.

B. Construction Tolerances: Construction tolerances shall be as specified in the Section 03300, "Cast-in-Place Concrete," except as modified herein and elsewhere in the Contract Documents.

PART 2 -- PRODUCTS

2.1 CONCRETE (CEMENT) GROUT

A. Concrete (Cement) Grout: Cement grout shall be composed of one part cement, three parts sand, and the minimum amount of water necessary for the mixture to flow under its own weight. Where needed to match the color of adjacent concrete, white Portland cement shall be blended with regular cement as needed. In addition, where needed, an approved admixture may be added to increase workability at a low water/cement ratio. The minimum compressive strength at 28 days shall be 4000 psi.

B. Concrete (cement) grout materials shall be as specified in Section 03300, "Cast-in-Place Concrete".

2.2 PREPACKAGED GROUTS

A. Non-Shrink Grout:

1. Non-shrink grout shall be a prepackaged, inorganic, non-gas-liberating when tested in accordance with C1107, non-metallic, cement-based grout requiring only the addition of water. Manufacturer's instructions shall be printed on each bag or other container in which the materials are packaged. The specific formulation for each class of non-shrink grout specified herein shall be that recommended by the manufacturer for the particular application.

2. Class A non-shrink grouts shall have a minimum 28 day compressive strength of 5,000 psi; shall have no shrinkage (0.0 percent) and a maximum 4.0 percent expansion in the plastic state when tested in accordance with ASTM C 827; and shall have no shrinkage (0.0 percent) and a maximum of 0.2 percent expansion in the hardened state when tested in accordance with CRD C 621.

3. Class B non-shrink grouts shall have a minimum 28 day compressive strength of 5,000 psi and shall meet the requirements of CRD C 621.

4. Application:

a. Class A non-shrink grout shall be used for the repair of all holes and defects in concrete members which are water bearing or in contact with soil or other fill material, grouting under all equipment base plates, and at all locations where grout is specified in the contract documents; except, for those applications for Class B non-shrink grout and epoxy grout specified herein. Class A non-shrink grout may be used in place of Class B non-shrink grout for all applications.

b. Class B non-shrink grout shall be used for the repair of all holes and defects in concrete members which are not water-bearing and not in contact with soil or other fill material, grouting under all base plates for structural steel members, and grouting railing posts in place.

2.3 CURING MATERIALS

Curing materials shall be as specified in Section 03300, "Cast-in-Place Concrete" for cement grout and as recommended by the manufacturer of prepackaged grouts.

2.4 CONSISTENCY

The consistency of grouts shall be that necessary to completely fill the space to be grouted for the particular application. Dry pack consistency is such that the grout is plastic and moldable but will not flow. Where "dry pack" is called for in the Contract Documents, it shall mean a grout of that consistency; the type of grout to be used shall be as specified herein for the particular application.

2.5 MEASUREMENT OF INGREDIENTS

A. Measurements for cement grout shall be made accurately by volume using containers. Shovel measurement shall not be allowed.

B. Prepackaged grouts shall have ingredients measured by means recommended by the manufacturer.

PART 3 -- EXECUTION

3.1 GENERAL

A. All surface preparation, curing, and protection of cement grout shall be as specified in Section 03300, "Cast-in-Place Concrete". The finish of the grout surface shall match that of the adjacent concrete.

B. The manufacturer of Class A non-shrink grout and epoxy grout shall provide on-site technical assistance upon request. All costs related to this requirement shall be borne by the CONTRACTOR.

C. All mixing, surface preparation, handling, placing, consolidation, and other means of execution for prepackaged grouts shall be done according to the instructions and recommendations of the manufacturer.

3.2 CONSOLIDATION

Grout shall be placed in such a manner, for the consistency necessary for each application, so as to assure that the space to be grouted is completely filled.

END OF SECTION

SECTION 03370
CONCRETE CURING

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The Contractor shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the work as indicated on the Drawings and specified herein.

B. This section covers the work necessary for the concrete curing requirements.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03100 Concrete Formwork.

B. Section 03300 Cast-In-Place Concrete.

D. Section 03400 Precast Concrete.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference standards and Standard Specifications of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, as applicable.

1. Federal Specifications:

UU-B-790A (Int.Amd. 1) Building Paper, Vegetable Fiber (Kraft, Waterproofed, Waterproofed, water Repellant and Fire Resistant)

2. Commercial Standards:

ACI 308	Standard Practice for Curing Concrete
ASTM C 156	Standard Test Method for Water Loss [from a Mortar Specimen] Through Liquid Membrane-Forming Curing Compounds for Concrete
ASTM C 171	Specifications for Sheet Materials for Concrete Curing
ASTM C 309	Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete

3. Government Standards:

CSS	Caltrans Standard Specifications

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

1.5 QUALITY ASSURANCE

A. Quality Control Data:

1. Curing Compound: Manufacturer's Certification of Compliance, to include statement that product meets ASTM C 309 additional permeability requirement, and coverage.

2. Retardant For Exposed Aggregate Finish on Formed Surface: Manufacturer's Certification of Compliance including statement that product is suitable for and will meet job requirements.

3. Curing method, procedures and method of application to be used shall be in compliance with the requirements as specified herein.

PART 2 -- PRODUCTS

2.1 CURING MATERIALS

A. Materials for curing concrete as specified herein shall conform to the Standard Specifications and the following requirements:

1. Polyethylene sheet for use as concrete curing blanket shall be white and conform to ASTM C 171. The loss of moisture when determined in accordance with the requirements of ASTM C 156 shall not exceed 0.055 grams per square centimeter of surface.

2. Polyethylene-coated waterproof paper sheeting for use as concrete curing blanket shall consist of white polyethylene sheeting free of visible defects, uniform in appearance, having a nominal thickness of 2 mils and permanently bonded to waterproof paper conforming to the requirements of Federal Specification UU-B-790A (Int. Amd. 1). The loss of moisture, when determined in accordance with the requirements of ASTM C 156, shall not exceed 0.055 gram per square centimeter of surface.

3. Polyethylene-coated burlap for use as concrete curing blanket shall conform to ASTM C 171. The loss of moisture, when determined in accordance with the requirements of ASTM C 156, shall not exceed 0.055 grams per square centimeter of surface.

4. Curing mats for use in Curing Method 6 as specified herein, shall be heavy shag rugs or carpets or cotton mats quilted at 4-inches on center. Curing mats shall weigh a minimum of 12 ounces per square yard when dry.

5. Evaporation retardant shall be a material such as MasterKure ER 50 (formerly Confilm) as manufactured by Masterbuilders, Cleveland, OH; or an approved equal**.**

B. Curing Compound:

1. Curing compound shall consist of a liquid which, when applied to fresh concrete by means of a spray gun, will form an impervious membrane over the exposed surfaces of the concrete.

2. Concrete curing compounds shall be designated by type as follows:

Type 1-D - Clear or translucent with red fugitive dye.

3. Provide curing compound meeting requirements of ASTM C 309, with additional requirement that permeability not exceed 0.039 gm/square cm/72 hours, when tested in accordance with ASTM C 156 standards.

4. Provide evaporation retardant where required to prevent rapid evaporation of water from fresh exposed concrete.

5. When pigmented curing compounds are used, at the time of use, the compound shall be thoroughly mixed, with the pigment uniformly dispensed throughout the mixture.

PART 3 -- EXECUTION

3.1 CURING AND DAMPPROOFING METHODS

General: All concrete shall be cured for not less than 10 days after placing, in accordance with the methods specified herein for the different parts of the work and described in detail in the following paragraphs.

Surface to be Cured or Dampproofed	Method
Unstripped forms	1
Wall sections with forms removed	6
Construction joints between footings and walls, and between floor slab and columns	2
Encasement concrete and thrust blocks	3
All concrete surfaces not specifically provided for elsewhere in this Paragraph	4
Floor slabs on grade	5
Roof and slabs not on grade	6
Exterior buried surfaces of roof slabs and basement walls	7
All liquid and water retaining structures	2

Method 1: Wooden forms shall be wetted immediately after concrete has been placed and shall be kept wet with water until removed. If steel forms are used the exposed concrete surfaces shall be kept continuously wet until the forms are removed. If forms are removed within 10 days of placing the concrete, curing shall be continued in accordance with Method 6, herein.

Method 2: The surface shall be covered with burlap mats which shall be kept wet with water for the duration of the curing period, until the concrete in the walls has been placed. No curing compound shall be applied to surfaces cured under Method 2.

Method 3: The surface shall be covered with moist earth not less than 4 hours, nor more than 24 hours, after the concrete is placed. Earthwork operations that may damage the concrete shall not begin until at least 7 days after placement of concrete.

Method 4: The surface shall be sprayed with a liquid curing compound.

1 Curing compound shall be applied in 2 coats according to the manufacturer's printed instructions. The direction of application of the second coat shall be perpendicular to the first. The second coat shall be applied when the first coat is dry to touch, but not to exceed 4 hours. Each coat shall be applied at a rate not more than 200 square feet per gallon and in such a manner as to cover the surface with a uniform film which will seal thoroughly.

2 Where the curing compound method is used, care shall be exercised to avoid damage to the seal during the curing period. The CONTRACTOR shall maintain and monitor the curing compound membrane for a minimum of 10 days. Should the seal be damaged or broken before the expiration of this curing period, the break shall be repaired immediately by the application of additional curing compound over the damaged portion.

3 Wherever curing compound may have been applied by mistake to surfaces against which concrete subsequently is to be placed and to which it is to adhere, said compound shall be entirely removed by wet sandblasting just prior to the placing of new concrete.

4 Application of the curing compound to the concrete shall commence as soon as the finished surface of the concrete reaches a uniformly damp appearance with no free water on the surface. Curing compound shall also be applied no later than 2 hours after removal of forms from contact with formed surfaces or after the placement of concrete on the subgrade. At any point, the application rate shall be within 50 square feet per gallon of the nominal rate and the average application rate shall be within 25 square feet per gallon of the nominal rate specified when tested in accordance with California Test 535.

5 Repairs required to be made to formed surfaces shall be made within the said 2-hour period; provided, however, that any such repairs which cannot be made within the said 2-hour period shall be delayed until after the curing compound has been applied. When repairs are to be made to an area on which curing compound has been applied, the area involved shall first be wet-sandblasted to remove the curing compound, following which repairs shall be made as specified herein.

6 At the time of use, pigmented curing compounds shall be maintained in a thoroughly mixed condition. Containers of curing compound shall remain air-tight when not in use.

7 The CONTRACTOR shall apply curing compound in the presence of the INSPECTOR. Curing compound shall be applied to form a continuous and uniform membrane.

Method 5: Immediately after the concrete has been screeded, it shall be treated with a liquid evaporation retardant. The retardant shall be used again after each work operation as necessary to prevent drying shrinkage cracks.

1. Immediately after each square foot of the concrete has been finished, it shall be given a coat of curing compound in accordance with Method 4, herein. Not less than one hour nor more than 4 hours after the coat of curing compound has been applied, the surface shall be wetted with water delivered through a fog nozzle, and concrete-curing blankets shall be placed on the slabs. The curing blankets shall be polyethylene sheet, polyethylene-coated waterproof paper sheeting or polyethylene-coated burlap. The blankets shall be laid with the edges butted together and with the joints between strips sealed with 2-inch wide strips of sealing tape or with edges lapped not less than 3-inches and fastened together with a waterproof cement to form a continuous watertight joint.

2. The curing blankets shall be left in place during the 10-day curing period and shall not be removed until after concrete for adjacent work has been placed. Should the curing blankets become torn or otherwise ineffective, the CONTRACTOR shall replace damaged sections. During the first 3 days of the curing period, no traffic of any nature and no depositing, temporary or otherwise, of any materials shall be permitted on the curing blankets. During the remainder of the curing period, foot traffic and temporary depositing of materials that impose light pressure will be permitted only on top of plywood sheets 5/8-inch minimum thickness, laid over the curing blanket. The CONTRACTOR shall add water under the curing blanket as often as necessary to maintain damp concrete surfaces at all times.

Method 6: Concrete slabs shall be treated with an evaporation retardant as specified in Method 5. The concrete shall be kept continuously wet by the application of water for a minimum period of at least 10 consecutive days beginning immediately after the concrete has been placed or forms removed. Heavy curing mats shall be used as a curing medium to retain the moisture during the curing period. The curing medium shall be weighted or otherwise held in place to prevent being dislodged by wind or any other causes. Until the concrete surface is covered with the curing medium the entire surface shall be kept damp by applying water using nozzles that atomize the flow so that the surface is not marred or washed. The curing blankets and concrete shall be kept continuously wet by the use of sprinklers or other means both during and after normal working hours. Immediately after the application of water has terminated at the end of the curing period, the curing medium shall be removed and curing compound immediately applied in accordance with Method 4, herein. The CONTRACTOR shall dispose of excess water from the curing operation to avoid damage to the work.

Method 7:

1. Method 6 shall be used for curing.

2. Immediately after completion of curing the surface shall be sprayed with a dampproofing agent consisting of an asphalt emulsion. Application shall be in 2 coats. The first coat shall be diluted to 1/2 strength by the addition of water and shall be sprayed on so as to provide a maximum coverage rate of 100 square feet per gallon of dilute solution. The second coat shall consist of an application of the specified material, undiluted, and shall be sprayed on so as to provide a maximum coverage rate of 100 square feet per gallon. Dampproofing material shall be as specified herein.

3. As soon as the asphalt emulsion, applied as specified herein, has taken an initial set, the entire area thus coated shall be coated with whitewash. Any formula for mixing the whitewash may be used which produces a uniformly coated white surface and which so remains until placing of the backfill. Should the whitewash fail to remain on the surface until the backfill is placed, the CONTRACTOR shall apply additional whitewash.

3.2 EVAPORATION RETARDANT APPLICATION PROTECTION

A. Spray onto surface of fresh concrete immediately after screeding to react with surface moisture.

B. Reapply after smoothing surface with a bull float to ensure continuous, compacted monomolecular layer until final finishing is completed.

C. After finishing, apply water curing as specified.

3.3 CURING AND PROTECTION IN COLD WEATHER

A. Concrete shall not be placed during cold weather where conditions would require procedures as specified in ACI 306.

B. The Engineer, at his option, may allow cold weather placement of concrete if an extended period of cold weather is anticipated.

C. Water curing of concrete may be reduced to 6 days during periods when the mean daily temperature in the vicinity of the worksite is less than 40 degrees F; provided that, during the prescribed period of water curing, when temperatures are such that concrete surfaces may freeze, water curing shall be temporarily discontinued.

D. Concrete cured by an application of curing compound will require no additional protection from freezing if the protection at 50 degrees F for 72 hours is obtained by means of approved insulation in contact with the forms or concrete surfaces; otherwise, the concrete shall be protected against freezing temperatures for 72 hours immediately following 72 hours protection at 50 degrees F. Concrete cured by water curing shall be protected against freezing temperatures for 3 days immediately following the 72 hours of protection at 50 degrees F.

E. Discontinuance of protection against freezing temperatures shall be such that the drop in temperature of any portion of the concrete will be gradual and will not exceed 40 degrees F in 24 hours. In the spring, when the mean daily temperature rises above 40 degrees F for more than 3 successive days, the specified 72-hour protection at a temperature not lower than 50 degrees F may be discontinued for as long as the mean daily temperature remains above 40 degrees F; provided, that the concrete shall be protected against freezing temperatures for not less than 48 hours after placement.

F. Where artificial heat is employed, special care shall be taken to prevent the concrete from drying. Use of unvented heaters will be permitted only when unformed surfaces of concrete adjacent to the heaters are protected for the first 24 hours from an excessive carbon dioxide atmosphere by application of curing compound; provided, that the use of curing compound for such surfaces is otherwise permitted by these Specifications.

END OF SECTION

SECTION 03400
PRECAST CONCRETE

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the precast concrete work in accordance with the Contract Documents.

B. This Section covers the design, fabrication, delivery and installation of all plant precast concrete units, including connections, complete, in place, as shown and specified.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03315 Grout.

B. Section 07900 Joint Sealants.

C. Section 13200 Modular Buried Stormwater Infiltration System

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with reference standards of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards, ~~or~~ as applicable:

1. Commercial Standards:

ACI 301	Specifications for Structural Concrete
ACI 304	Guide for Measuring, Mixing, Transporting and Placing Concrete
ACI 311	Guide for Concrete Plant Inspection and Testing of Ready-Mixed Concrete
ACI 315	Details and Detailing of Concrete Reinforcement
ACI 318	Building Code Requirements for Reinforced Concrete
ACI 347	Guide to Formwork for Concrete
AWS A5.4	Welding Rods and Electrodes
AWS D1.1	Welding and Cutting
AWS D1.4	Structural Welding Code – Reinforcing Steel
ASTM A 184	Standard Specification for Welded Deformed Steel Bar Mats for Concrete Reinforcement

ASTM A 193	Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications
ASTM A 194	Standard Specification for Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High-Pressure and High-Temperature Service, or Both
ASTM A 351	Standard Specification for Castings, Austenitic, for Pressure-Containing Parts
ASTM A 580	Standard Specification for Stainless Steel Wire
ASTM A 615	Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement
ASTM A 666	Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar
ASTM A 775	Standard Specifications for Epoxy-Coated Reinforcing Steel Bars
ASTM A 1064	Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete
ASTM C 33	Standard Specification for Concrete Aggregates
ASTM C 67	Standard Test Methods for Sampling and Testing Brick and Structural Clay Tile
ASTM C 127	Standard Test Method for Relative Density (Specific Gravity) and Absorption of Coarse Aggregate
ASTM C 128	Standard Test Method for Relative Density (Specific Gravity) and Absorption of Fine Aggregate
ASTM C 150	Specification for Portland Cement
ASTM C 173	Standard Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method
ASTM C 204	Standard Test Method for Fineness of Hydraulic Cement by Air-Permeability Apparatus
ASTM C 231	Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method
ASTM C 260	Standard Specification for Air-Entraining Admixtures for Concrete
ASTM C 311	Standard Test Methods for Sampling and Testing Fly Ash or Natural Pozzolans for Use in Portland Cement Concrete

ASTM C 494	Standard Specification for Chemical Admixtures for Concrete
ASTM D 2240	Test Method for Rubber Property -- Durometer Hardness
AWS B2.1	Specification for Welding Procedure and Performance Qualification
AWS D1.4	Structural Welding Code - Reinforced Steel
PCI MNL-116	Manual for Quality Control for Plants and Production of Structural Precast Concrete Products
PCI MNL-117	Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products
PCI MNL-121	Manual for Structural Design of Architectural Precast Concrete

2. Government Standards:

CSS	Caltrans Standard Specifications.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. Shop Drawings:

1. Shop drawings shall provide details in accordance with ACI 315 and ACI 318 including installation details.

2. Shop drawings, including design computations, shall be stamped and signed by a civil or structural engineer registered in the State of California and shall be approved by the ENGINEER.

3. Shop drawings shall indicate precast unit identification marks, location of units in the WORK, elevations, fabrication details, welding details, reinforcement, connections, dimensions, interface with adjacent members, and special handling instructions in sufficient detail to cover manufacture, handling, and erection. Shop drawings shall include erection drawings. Shop drawings shall also include design computations for above mentioned drawings.

4. Shop drawings shall be divided into complete separate submittals for each structure. Each complete submittal shall consist of a schedule and shop drawings.

a. Schedule: Showing all exterior elevations of the structure, including all precast concrete enclosure faces exposed to view, in its associated shop drawing submittal. Elevations at a minimum scale of 1/8" = 1'-0" shall be drawn, identifying the type and location of each segment by a number which corresponds to the segment number appearing on an associated shop drawing; this same number shall be permanently marked on the back of each segment as they are fabricated.

b. Shop Drawings: Showing all elevations, dimensions, horizontal and vertical sections, openings, inserts, reinforcing, anchorage devices, pick-up points, details, design computations, and other requirements for each different type of panel to be incorporated into the portion of the project covered by the submittal. Drawings shall be 24 inches x 36 inches maximum.

C. Mix Proportions: Prior to commencing operations, including fabrications of the precast concrete for any mock-up, a statement shall be submitted giving the nominal maximum aggregate size and proportions of all ingredients that will be used in the manufacture of concrete. The statement shall include test results from an approved testing laboratory, with certification stamp and signature by a Civil or Structural Engineer registered in the State of California. No substitutions shall be made in materials used in the concrete mix without approval and additional tests to verify that the concrete properties are satisfactory. A copy shall be submitted of concrete mix with each set of samples.

D. Test Reports: Tests for compressive strength of concrete shall be performed by an approved independent commercial testing laboratory at no cost to the CITY. Copies of test reports including all test data and all test results shall be submitted for review and approval of the ENGINEER.

E. Certificates of Compliance: Certificates of compliance shall be submitted attesting that materials and products meet or exceed specified requirements.

F. Manufacturer's Qualifications: Prior to commencing operations, a statement shall be submitted giving the qualifications of the precast concrete Manufacturer, and evidence that the Manufacturer and plant are PCI certified.

1.5 QUALITY ASSURANCE

A. General Requirements: Design precast members under direct supervision of a professional structural engineer experienced in design of precast concrete units, registered in the State and conforming to requirements of PCI MNL-121 and to ACI 318.

1. Precast Manufacturer and erectors shall be qualified in accordance with PCI MNL-117 and MNL-116.

2. Welding shall be in accordance with AWS D1.1, AWS D12.1, AWS B2.1, and AWS A5.4.

3. Manufacture, Transportation and Installation: The Manufacturer shall specialize in providing precast products and services normally associated with precast concrete construction with high quality architectural finishes similar to that indicated on drawings, using procedures complying with PCI MNL-116 and MNL-117, and PCI plant certified for at least 5 years.

4. Use adequate number of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and methods needed for proper performance of the work of this Section.

B. CONTRACTOR is responsible for all damage that may occur while installing precast concrete structures after delivery. Repair procedures are to be submitted for approval by the ENGINEER.

1.6 DESIGN REQUIREMENTS

A. General: The precast concrete panel and connection designs shown hereon represent minimum precast construction requirements. The Manufacturer shall verify the panel and connection designs for all handling, erection, and service conditions, and shall provide any additional materials necessary to meet the design conditions.

B. Standards and Loads (Building structures only): The precast panel and connection design and construction shall conform to all applicable codes and AISC Specification for the Design, Fabrication and Erection of Structural Steel for Buildings. The precast or prefabricated, nonbearing, nonshear wall panels and connections which are attached to or enclose the exterior, shall resist, in addition to initial handling and erection loads and dead loads, the following forces:

1. Wind pressure and load combinations relative to panel design in accordance with the latest edition of LABC.

2. Seismic loads relative to panel design in accordance with the latest edition of Los Angeles Building Code.

3. The design shall be based on a differential temperature of 50 degrees F between interior and exterior faces of the units and an 80 degrees (40 degrees from erected temperature) average panel temperature differential.

4. Stresses due to restrained volume changes caused by shrinkage and temperature differentials shall be accounted for.

C. Connections (Building structures only): Prior to submitting shop drawings, the CONTRACTOR shall verify the precast connection designs shown against the aforementioned and following design criteria and provide any additional materials necessary to meet the design conditions.

1. The panel joints shall be designed to accommodate an in-plane movement between stories of 0.005 times the story height in inches but not less than 3/4-inch.

2. Panel connections shall accommodate building movement and permit panels to move freely so as not to resist in plane deformation of the main frame structural system. Adjustment shall be provided to accommodate misalignment of structure without permanent distortion, damage to components, racking of joint connection, breakage of seals, or moisture penetration.

D. Concrete Mix: The concrete mix shall be designed by the Manufacturer, with certification stamp and signature by a Civil or Structural Engineer registered in the State of California, and approved by the ENGINEER, using the materials and quantities specified to meet all of the requirements of this specification.

1. Proportioning of Concrete Mixes: Mixes shall be proportioned by weight except water and admixtures may be batched by volume if desired. Trial mixes and testing to meet requirements of the strengths of concrete specified is the CONTRACTOR's responsibility. Design mix shall contain similar materials as those proposed for use in the WORK.

2. Admixtures: Concrete shall contain an air entraining admixture in proportion so as to provide 4 percent plus or minus 1 percent total air in the concrete as determined by ASTM C 173 or C 231. Set retarding admixtures may be used provided cement content is not reduced. Water reducing admixtures may be used provided they are

used in the mix design studies. High-range water reducers (superplasticizers) shall be used only where specifically called for in this Section, otherwise superplasticizers shall not be used without written approval from the ENGINEER. No admixture may contain chlorides, bromides, or fluorides.

3. Water: Clean, potable water. The CONTRACTOR shall provide tests to assure that no more than 200 parts per million total aggregated content of chlorides, bromides, and fluorides are present.

4. If a variance from the Local Authority is required for the precast concrete mix design, the CONTRACTOR shall be responsible for submitting and obtaining the 5,000 psi precast concrete mix variance. The admixtures used in the mix design shall be used in approved combinations and proportions in accordance with the local requirements.

E. Formwork: Formwork shall be designed to withstand high-frequency vibration and to ensure finished units.

F. Pickup Points and Boxouts: Pickup points, boxouts, and inserts on panel faces and surfaces to be exposed are prohibited except as approved by the ENGINEER.

1.7 DELIVERY, STORAGE AND HANDLING

A. General: Deliver precast concrete units to the job-site in such quantities and at such times as to assure the continuity of construction. Precast members shall be handled to position consistent with their shape and design; they shall be lifted and supported from design incorporated support points and provided with strong backs and other devices as required. Lifting or handling equipment shall be capable of maintaining units during manufacture, storage, transportation, erection, and in position for fastening.

B. Blocking and supports, lateral restraints and protective materials during transport and storage shall be clean, nonstaining, without causing harm to exposed surfaces, including temporary support to prevent bowing and warping. Lateral restraints shall be provided to prevent undesirable horizontal movement. Edges and exposed faces of members shall be protected to prevent straining, chipping, or spalling of concrete.

C. Units shall be marked with date of production and final position in structure in location not visible after erection.

D. Precast units shall be stored off the ground in a manner to keep markings visible, and to prevent cracking, distortion, warping, staining or other physical damage, and they shall be protected from weather, marring, and overload.

E. Stainless Steel Hardware: Stainless steel hardware shall be transported, handled, stored, and protected in wood crates.

PART 2 -- PRODUCTS

2.1 CONCRETE MATERIALS

A. Cement: ASTM C 150, Type II, "low alkali," white color. "Low alkali" requirement may be waived if not reactive as defined in Appendix to ASTM C 33. Submit laboratory test reports.

B. Aggregate: ASTM C 33, 1/2-inch maximum coarse aggregate size fine aggregate ratio to total aggregate volume = 0.35 min, 0.55 max.

1. Water Absorption, Coarse Aggregate: ASTM C 127.

2. Water Absorption, Fine Aggregate: ASTM C 128.

C. Reinforcing Steel: ASTM A 615, Grade 60, deformed epoxy coated in accordance with ASTM A 775.

D. Welded Wire Fabric:

1. Plain: ASTM A 1064, epoxy coated.

2. Deformed Steel: ASTM A 1064, epoxy coated.

3. Fabricated Steel Bar or Rod Mats: ASTM A 184, epoxy coated.

E. Tie Wire: ASTM A 580, Type 316L, cold finished annealed, Huntington Alloy Co. "Monel", "Inconel", or an approved equal.

F. Air Entrainment Admixture: ASTM C 260.

G. Water Reducing or Retarding Admixtures: ASTM C 494, Type C, D, or F/G, with no chloride, bromide, and fluoride ingredients. Use MasterPozzolith R 300 manufactured by Master Builders, Plastiment manufactured by Sika Chemical Corp., or an approved equal.

H. Silica Fume Slurry Admixture: 45 to 50 percent silica fume, water, and superplasticizer as dispersant. Silica Fume: 85 percent amorphous silicon dioxide in accordance with ASTM C 311; loss on ignition shall not exceed 6 percent and moisture shall not exceed 3 percent in accordance with ASTM C 311. Surface area not less than 10,000 square meters per kilogram at bed porosity of 0.50 in accordance with ASTM C 204.

Reduce water in mix by 5.6 to 9.5 lbs for each gallon of slurry added to mix, as recommended by slurry Manufacturer used.

Add Los Angeles City approved slurry to concrete mix to achieve 7.5 percent dry silica fume by weight of cement. Mixing procedures as recommended by silica fume slurry manufacturer. Sika "Sikacrete-950 DP"; GCP Applied Technologies (formerly W.R. Grace) "Force 10,000 D" or approved equal. Submit applicable Los Angeles Research Report with shop drawing submittal.

I. Pigment: Pure mineral type, color-resistant to alkalis, nonfading. Color as required to produce finished concrete matching color and appearance of prebid sample and the 72-inch by 72-inch sample at the ENGINEER's field office.

2.2 SUPPORT DEVICES

Unless otherwise specified on the project plans, the following requirements shall apply:

A. Connecting and support devices, bolts, nuts, washers, inserts, and anchorage devices exposed to view, moisture, or weather shall be hot-dipped galvanized steel.

B. Anchorage devices shall be fabricated from ASTM A 36, and shall be hot-dip galvanized in accordance with ASTM A 123.

2.3 ACCESSORIES

Unless otherwise specified on the project plans, the following requirements shall apply:

A. Plates, Angles, Anchors, studs, and other metal accessories exposed to view, moisture, or weather shall be hot-dipped galvanized steel.

B. Reglets: Plastic, shaped and flanged to remain in place once cast; tape closed to prevent concrete intrusion.

C. Bearing Pads: Neoprene, molded to size or cut from molded sheet, 70-80 Type A durometer, ASTM D 2240.

D. Sealant: Specified in Section 07900, "Joint Sealants."

E. Gaskets: ASTM C 509, preformed, firm, cellular, neoprene, sized to be under constant compression at the joints, and manufactured in lengths to minimize field splices.

F. For bridge structures, expansion and fixed joints and bearings shall conform with CSS Section 51-1.12.

2.4 FORMS AND MOLDS

A. Forms: Manufacturer's standard with smooth, hard, dense, and rigid casting surface; without bow, warpage, oil canning, or other imperfections. Comply with PCI MNL 117, Division V, Section 2, Article 5.2.1.

B. Form Release Agent: Manufacturer's standard, nonstaining, nonpetroleum based; compatible with concrete surface sealer.

C. Surface Sealer: Clear, flat, penetrating, nonyellowing, nonclouding solution; high concentration of organosilane in an aqueous alcoholic vehicle which is designed to provide water repellent concrete surfaces from which graffiti can be easily removed. Oil-type silicones, paraffins, waxes, vinyls, modified urethanes, or acrylics shall not be used. Sealant shall be tested by Manufacturer and proved compatible with surface sealer.

D. Molds: Fabricate using steel, concrete, fiberglass, reinforced plastic or wood.

   a. Selection of materials for molds shall be at manufacturer's option, except that wood shall not be use without specific prior approval of the ENGINEER.

   b. Cast elements in molds of rigid construction, accurate in detail with precise corners and arises, and designed to provide close control of dimensions, radii, and details as indicated on the Contract Drawings.

c. Prior to casting of precast elements, molds shall have surface joints, radii, and corners filled, ground, filed, straightened, or otherwise removed to provide finished concrete surface that is smooth and dense, free of honeycombing, air pockets, offsets, sinkages, or other irregularities.

d. Mold Release Agents: Synthetic resin or organic compound containing no wax, oil, silicates, or varnish, and compatible with specified coatings, sealants, fresh concrete, curing process, and adhesives.

e. Cast molds with release agents to facilitate removal of elements from molds.

2.5 MIX

Silica Fume Concrete: Minimum 5,000 psi (unless noted otherwise on the project plans), 28-day compressive strength; aggregate 3/8-inch max; water - 305 lbs per cu yd; cement - 750 lbs per cu yd; w/c ratio 0.40 max; slump range 3 inches to 5 inches with silica fume slurry; air entrainment 4 percent plus or minus 1 percent; 7.5 percent dry silica fume by weight of cement, provided through specified silica fume slurry; add superplasticizer to achieve desired working slump for precast concrete as may be required by silica fume slurry Manufacturer. Add colorant as required to achieve match with ENGINEER's sample. Moist cure by spray mist.

2.6 FABRICATION

A. General: Precast concrete units shall be fabricated by a licensed shop in accordance with ACI 318, PCI MNL-116 (structural features), PCI MNL-117 (nonstructural features, surface treatments, patching, and tolerances). Plant records and quality control program shall be maintained during production of precast units. Records and access to plant shall be available to the ENGINEER upon request.

Rigid molds shall be used, constructed to maintain precast unit uniform in shape, size, and finish, free from castings and dents, gouges, oil canning, or other irregularities that will adversely affect appearance or strength of units. Consistent quality shall be maintained during manufacture.

Equipment for handling epoxy-coated reinforcing bars shall have protected contact areas. Bundles of coated bars shall be lifted at multiple pickup points to prevent bar-to-bar abrasion from sags in the bundles. Coated bars or bundles of coated bars shall not be dropped or dragged. Coated bars shall be stored on protective cribbing. The maximum amount of damage shall not exceed 2 percent of the surface area of each bar.

Reinforcing steel, anchors, inserts, plates, angles, and other cast-in-place items shall be embedded as indicated on shop drawings. Reinforcement shall be fabricated and placed in conformance with ACI 318. No tack welding of or to reinforcement permitted. Welding when allowed shall conform to AWS D1.4 requirements. No carbon steel chairs, spacers, nails or tie wire shall be used in positioning reinforcing and embedments.

Adequate reinforcing steel shall be provided to control cracking. Maximum permissible crack width:

Surfaces exposed to weather:	0.005 inch.
Surfaces exposed to view but not weather:	0.01 inch

Connecting devices, plates, angles, items fit to steel framing members, inserts, bolts, and accessories shall be fabricated to permit initial placement and final attachment.

Anchors, inserts, lifting devices, and other accessories shall be placed and embedded in accordance with approved shop drawings, accurately positioned in their designed location and anchored to prevent dislocation during panel construction. Do not use powder actuated fasteners for surface attachment of accessory items except as specifically approved by the ENGINEER and specifically accepted by the precast unit manufacturer. Flashing reglets shall be placed and embedded continuous and straight, with lifting devices to permit removal after erection.

Units shall be moist cured with water mist to develop concrete quality and to minimize surface drying and appearance blemishes such as nonuniformity, staining, or surface cracking.

Precast units shall be removed from formwork using procedures conforming to PCI MNL-117. Minor patching in plant acceptable, providing structural adequacy and appearance of units are not impaired. Each precast unit shall be identified with corresponding code on erection drawings, in location not visible to finished work.

Repair of damaged epoxy coating, when required, shall be made with patching material conforming to ASTM A 775. Repair shall be in accordance with the material Manufacturer's recommendations.

B. Fabrication and Tooling of Stainless Steel Connections and Embedments: All tools used during fabrication shall be made of stainless steel. Use of carbon steel tools is prohibited.

Welding of stainless steel shall conform to AWS A5.4, AWS B2.1 and AWS D1.1, using tungsten inert gas procedures and 316L filler metal for stainless steel to stainless steel and 309 filler metal for stainless steel to carbon steel. Surfaces shall be sanded smooth (do not grind), and oxidized discoloration removed (blue heat tint). Threaded parts of stainless steel bolts shall be lubricated with graphite suspended in alcohol (Neo-Lube) every time that nut is run on or off the threads. No other lubricant is acceptable.

Erection slings, cables, blocking, hardware and restraints shall be nonmetallic or stainless steel. Cribbing or crating shall be wood.

2.7 FINISH OF PRECAST UNITS

A. Backs and Sides (Unexposed Edges): Smooth, dense, uniform surface free from blemishes. Defects in backs and sides (unexposed edges) shall be repaired as approved.

B. Faces: Appearance, color, and texture finish of all panels shall match appearance, color and texture of the approved sample panels constructed by the CONTRACTOR. Panels that do not match shall be rejected. Repairs will be acceptable only if structural adequacy and appearance of product are not impaired and the repair and surrounding area match the approved sample panels at the ENGINEER's field office.

Mechanical finishing of panels at precast plant shall be at essentially the same age (or strength) of concrete to assure finished appearance is uniform from panel to panel.

To reduce possibility of stains occurring during transportation and erection, sealer shall be applied at the plant as recommended by Manufacturer and the precaster and shall be guaranteed in writing that sealer will not alter or yellow the original precast concrete color in

any way and that it is compatible with the joint sealants to be used on the project. Seal finish surfaces of precast units to be exposed in completed work as follows: apply a uniform coat of surface sealer in accordance with Manufacturer's written instructions. Apply sealer by method and in quantity required to provide coverage specified by sealer Manufacturer. Forty-eight hours after application of sealer, apply water to face of each panel in sufficient quantity to determine if full sealer coverage was achieved. Panels not fully sealed shall be resealed and retested. A second coat shall be applied at the jobsite after erection and cleanup in accordance with the Manufacturer's instructions.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Examination: The CONTRACTOR shall verify that the structure, anchors, devices, and openings are ready to receive work of this Section. Beginning of installation means acceptance of existing condition.

B. Preparation: The CONTRACTOR shall provide for erection procedures and induced loads, during erection, maintain temporary bracing in place until final support is provided, provide necessary hoisting equipment and safety and protective devices.

C. Erection: The units shall be erected in accordance with approved shop/erection drawings without damage to shape or finish or adjacent work. Damaged panels shall be replaced or repaired. Unless otherwise shown, members shall be erected level and plumb within allowable tolerances.

The CONTRACTOR shall align and maintain uniform horizontal and vertical joints as erection progresses, provide approved shims and wedges as required, and when members required adjustment beyond design or tolerance criteria, discontinue affected work. Units shall be secured in place and field welded, scratches and otherwise damaged steel surfaces shall be touched up.

Field fabrication and erection of stainless steel shall conform to the procedures outlined in the paragraph entitled "Fabrication and Tooling of Stainless Steel Connectors and Embedments."

The vertical units shall be set dry, without grout, attaining joint dimension with lead or plastic shims and spacers.

Pickup points, boxouts, inserts, bearing surfaces, and open spaces at connections and joints shown shall be grouted with non-shrink grout system(s) recommended by the manufacturer of the precast units, in accordance with Section 03315, "Grout". The color and texture of concrete surfaces of adjacent areas shall be finished to match in the same plane. Provide forms or other acceptable method to retain the grout in place until it is sufficiently hard to support itself. Pack spaces with stiff grout material, tamping voids completely full. Place the grout in a manner to finish smooth, plumb, and level with adjacent concrete surfaces. Keep grouted surfaces damp for not less than 24-hours after grout has taken its initial set. Promptly remove grout material from exposed surfaces before its hardens.

D. Tolerances: In accordance with requirements of PCI MNL-117 unless otherwise indicated.

1. Variation from Plane of Location: 1/4-inch in 10 feet and 3/8-inch in 100 feet maximum, compensating not cumulative.

2. Offset from True Alignment between Two Connecting Members: 1/4-inch maximum.

3. Out of Square: 1/8-inch in 10 feet maximum, noncumulative.

4. Variation in Dimensions Indicated in Shop Drawings: Plus or minus 1/8-inch.

5. Misalignment of Anchors, Inserts, Openings: 1/8-inch, maximum.

6. Bowing or Warpage of Units: 1/700 of panel dimension.

7. Exposed Joint Dimension: 3/4-inch plus or minus 1/8-inch.

8. Location of Reglets: 1/4-inch from true position.

E. Joint Sealing: Specified in Section 07900, Joint Sealants.

3.2 CLEANING

A. Not sooner than 72 hours after joints are sealed, faces and other exposed surfaces of precast units shall be cleaned using a cleaning detergent recommended by the sealer manufacturer and water applied with a soft bristle brush, and thoroughly rinsed using clean water or other approved procedures.

B. Units shall be cleaned when temperature and humidity conditions are such that surfaces dry rapidly (e.g., 70 degrees F and rising, 50 percent Relative Humidity or less).

C. Discolorations which cannot be removed by these procedures shall be considered defective work and repaired or replaced as directed by ENGINEER.

D. Just before final acceptance by the ENGINEER, clean precast units to remove dirt and stains.

3.3 PROTECTION

Adjacent surfaces shall be protected from damage during sealing and cleaning operations and against damage, disfiguration or discoloration from subsequent operations. Noncombustible shielding shall be used during welding operations.

END OF SECTION

SECTION 03740
CONCRETE REPAIR

PART 1 -- GENERAL

1.1 THE REQUIREMENT

This section covers the work, including materials, testing, and workmanship necessary to structurally repair cracks and damaged surface areas (or spalls) in the concrete of the structures stated herein. Cracks shall be repaired by the injection of an epoxy resin adhesive. Spalls shall be repaired using an epoxy mortar as specified. Cracks and spalls requiring repair will be field located and identified by the CONTRACTOR during leak testing. Some cracks regardless of size may not be designated by the ENGINEER for repair.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03300 Cast-In-Place Concrete.

B. Section 03315 Grout.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference standards of the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards.

1. Commercial Standards:

ASTM C 579	Standard Test Methods for Compressive Strength of Chemical-Resistant Mortars, Grouts, Monolithic Surfacings and Polymer Concretes
ASTM D 482	Standard Test Method for Ash from Petroleum Products
ASTM D 638	Standard Test Method for Tensile Properties of Plastics
ASTM D 648	Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position
ASTM D 664	Standard Test Method for Acid Number of Petroleum Products by Potentiometric Titration
ASTM D 695	Standard Test Method for Compressive Properties of Rigid Plastics
ASTM D 790	Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials
ASTM C 881	Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete
ASTM C 882	Standard Test Method for Bond Strength of Epoxy-Resin Systems Used With Concrete By Slant Shear
ASTM D 1652	Standard Test Methods for Epoxy Content of Epoxy Resins

2. Government Standards:

CSS Caltrans Standard Specifications.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. The CONTRACTOR shall submit certified test results verifying the compressive strength, shrinkage, and expansion requirements specified herein; and manufacturer's literature containing instructions and recommendations on the mixing, handling, placement and appropriate uses for each type of non-shrink and epoxy grout used in the work.

C. The CONTRACTOR shall submit detailed written description of the epoxy injection procedures, including desired injection pressures, the proposed procedures when a crack appears to be taking no epoxy or the epoxy does not exude from the adjacent port, and the proposed procedures if the desired injection pressures cannot be attained or the crack appears to be taking an excessive amount of epoxy.

D. The CONTRACTOR shall prepare mock-ups at locations in the job site where directed by the ENGINEER. The approved mock- ups will be used as data for comparison of works installed under this Section and for acceptance or rejection of same work. The mock-ups shall remain on site during the construction

1.5 QUALITY ASSURANCE

A. The following quality control test and certificate is required under this Specification:

1. Test Requirements: Compression tests and fabrication of specimens for epoxy grout will be performed as specified in ASTM C 579, Method B, at intervals during construction as selected by the ENGINEER but no less than after every 200 sq. ft. of applied grout. A set of three specimens will be made for testing at 7 days, and each earlier time period as appropriate. Tests shall be conducted by a qualified testing laboratory approved by the City of Los Angeles and acceptable to the ENGINEER at the CONTRACTOR's expense.

2. Certification and Test Report: Manufacturer shall certify that every batch of material supplied meets the Specifications and shall furnish copies of actual test reports on each batch.

B. Labor: Use adequate number of skilled works who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and methods needed for the proper performance of the work of this Section.

1.6 PACKAGING, LABELING, STORAGE

A. Packaging: The adhesive material shall be packaged in new, sealed containers. Each container will be clearly labeled.

B. Label Information: The label shall include, in a clear and distinct manner, the following information:

1. Manufacturer name.

2. Product name and lot number.

3. ANSI Hazard Classification and appropriate recommended ANSI precautions for handling.

4. Mix ratio by volume.

C. Storage: The adhesive shall be stored at ambient temperatures between 32 and 120 degrees F. If stored at temperatures outside these limits, the adhesive material shall be tested at the CONTRACTOR's expense prior to use to determine if the adhesive material meets the requirements of this Specification.

PART 2 -- PRODUCTS

2.1 GENERAL

A. The use of a manufacturer's name and model or catalog number is for the purpose of establishing the standard of quality and general configuration desired only. Products of other manufacturers will be considered in accordance with the GENERAL REQUIREMENTS.

B. Like items of materials provided hereunder shall be the end products of one manufacturer in order to achieve structural compatibility, singular responsibility, and standardization for appearance, maintenance, and replacement.

C. Epoxy products shall be as manufactured by Sika Corp., Lyndhurst, NJ; or an approved equal, meeting the requirements specified hereinafter.

2.2 CRACK WIDTH

Large cracks are defined as being wider than 0.015 inch. Small cracks are defined as cracks with width equal to 0.015 inch or less.

2.3 ADHESIVE FOR INJECTION

A. Unless otherwise specified hereon, the epoxy adhesive used for injection for concrete structures shall comply with the following material specification. For non-sanitary structures, in lieu of the requirements of this section, the CONTRACTOR may submit Los Angeles Department of Building and Safety approved Research Reports on products intended for use, subject to review and approval by the ENGINEER.

1. This Specification defines a two-component structural epoxy adhesive to be processed through continuous positive displacement in-line metering and in-line mixing equipment for injection into cracks or other voids in concrete structures for bonding or grouting. Batch mix pumps shall not be allowed.

2. Properties of the two-component epoxy adhesive:

a. Part A shall be a blend of modified epoxy resins:

		Specification Requirements	
	Test Method	Large Cracks	Small Cracks**
Color	Visual	Clear Amber Liquid	Light Amber Liquid
Viscosity @ 40 ± 3 deg F, cps	Brookfield RVT Spindle No. 4 @ 20 rpm	6,000-8,000	
Viscosity @ 77 ± 3 deg F, cps	Brookfield RVT Spindle No. 4 @ 20 rpm	400-700	375 cps max. @ 50 rpm

Epoxide Equivalent Weight	ASTM D 1652* See Appendix C	160-176
Ash Content, %	ASTM D 482	1 max.

* Method modified to use perchloric acid in acetic acid.
** The specified requirements for the epoxy blend for small cracks shall meet the requirements for large cracks except as shown.

b. Part B shall be a modified amine curing agent:

		Specification Requirements	
	Test Method	Large Cracks	Small Cracks**
Color	Visual	Black Liquid	Dark Amber Liquid
Viscosity @ 40, ± 3 deg F, cps	Brookfield RVT Spindle No. 4 @ 20 rpm	700-1,400	
Viscosity @ 77, ± 3 deg F, cps	Brookfield RVT Spindle No. 2 @ 20 rpm	105-240	150 cps max. Using Spindle No. 1 @ 50 rpm
Amine Value, mg KOH/g	ASTM D 664*	490-560	
Ash Content, %	ASTM D 482	1 max.	

* Method modified to use perchloric acid in acetic acid.
** The specified requirements for the epoxy blend for small cracks shall meet the requirements for large cracks except as shown.

3. Properties of the Uncured Adhesive: When mixed in the mix ratio specified on the label on the adhesive, containers shall be:

		Specification Requirements	
	Test Method	Large Cracks	Small Cracks**
Pot Life (60-gram mass) @ 77 ± 4 deg F	(As hereinafter specified)	13-25 minutes minimum	15-30 minutes minimum
Pot Life (60-gram mass) @100 ± 3 deg F	(As hereinafter specified)	5 minutes minimum	N/A
Viscosity @ 40, ± 3 deg F	Brookfield RVT Spindle No. 4 @ 20 rpm	4,400 cps	600 cps
Viscosity @ 75-77 deg F	Brookfield RVT Spindle No. 2 @ 20 rpm	375-350 cps	175-140 cps

4. Properties of the Adhesive: When cured for 7 days at 77 ∀ 3 degrees F and conditioned at test temperature 12 hours prior to test, unless otherwise specified, shall be:

		Specification Requirements	
	Test Method	Large Cracks	Small Cracks**
Ultimate Tensile Strength, psi	ASTM D 638	8,000 min.	5,000 min.
Tensile Elongation @ Break, %	ASTM D 638	4.2 max.	3.0 max.
Flexural Strength, psi	ASTM D 790	10,000 min.	10,000 min.
Flexural Modulus, psi	ASTM D 790	$5.5x10^5$ min.	$4.5x10^5$ min.
Compressive Yield Strength, psi	ASTM D 695*	15,000 min.	12,000 min.
Compressive Modulus psi	ASTM D 695*	$4.0x10^5$ min.	$2x10^5$ min.
Heat Deflection Temperature	ASTM D 648*	127 deg F min.	140 deg F min.
Slant Shear Strength (5,000 psi Compressive Strength Conc.)	AASHTO T 237**		
Cured 3 days @ 40 40 deg F – Wet Conc.		3,500 psi min.	
Cured 1 day @ 77 deg F - Dry Conc.		5,000 psi min.	
Cured 3 days @ 77 deg ± 3 deg F		5,000 psi min.	

* Test specimens must be cured in a manner such that the peak exothermic temperature of the adhesive does not exceed 100 degrees F.

** See referenced specifications for method of preparation of test specimens.

B. Epoxy for injection shall conform to ASTM C 881 and shall be Los Angeles City Department of Building and Safety approved epoxy. The epoxy shall be Sikadur 35 Hi-Mod LV or Sikadur 52, manufactured by Sika Corporation, or an approved equal.

2.4 POT LIFE TEST

A. Pot life test for components A and B, as described in Section 2.3, shall conform to the following:

1. Condition both A and B Components (as defined in Section 2.3) to required temperature.

2. Measure components in ratio of Component B as stated on the manufacturer's label into a 2 ounce (fluid) paper cup.

3. Start stopwatch immediately and mix the components for 60 seconds using a wooden tongue depressor and taking care to scrape the sides and bottom of cup periodically.

4 Probe the mixture once with the tongue depressor every 30 seconds, starting 2 minutes prior to

the minimum specified pot life.

5. The time at which a soft stringy mass forms in the center of the cup is the pot life.

2.5 FABRICATION OF SLANT SHEAR SPECIMENS

A. Fabrication of slant shear specimens for testing bond of injectable adhesives to wet concrete at 40 degrees F, as required by Section 2.3, shall conform to the following:

1. Scope: This method of test is intended for the preparation of diagonal concrete mortar blocks used in determining the slant shear strength of low viscosity injectable adhesives according to AASHTO T 237 when the concrete is wet.

B. Materials:

1. Diagonal concrete mortar blocks prepared in accordance with AASHTO Test Method T 237 and cured to produce a mortar with compressive strength of 5,000 psi or greater.

2. Paraffin wax.

3. Masking Tape: 3/4-inch wide.

4. Suitable 20-mil thick shim stock.

C. Preparation:

1. Place a 20-mil shim between the diagonal faces of two blocks and align them so that the ends and sides are square. Bind the block in this position with masking tape covering the gap between the blocks. Leave only enough of the gap between the blocks on one face uncovered for the removal of the shim and the application of the adhesive. Paint melted paraffin wax over the masking tape. A shallow dam may be built up around the opening using paraffin wax or modeling clay to help retain the adhesive.

2. Apply a suitable capping compound to each end of the specimen to produce smooth surfaces perpendicular to the longitudinal axis of the block.

3. Remove the shim stock from the gap opening. Soak the specimen in water at 40 degrees, ∀3 degrees F for at least 24 hours.

4. After soaking, remove the specimen and shake the water from the surface and out of the crack.

5. Prepare the liquid adhesive. Within 5 minutes after removing specimen from water, start to flow adhesive into the crack so that no air bubbles are entrapped. Place specimen in 40 ∀ 3 degrees F ambient for curing within 15 minutes after it has been removed from water for bonding. At no time during the 15 minutes should the specimen be exposed to an environment above 77 degrees F.

6. Cure the specimen for 72 ∀4 hours at 40 ∀ 3 degrees F.

2.6 SURFACE SEAL

A. Physical Properties: The material used as a surface seal must have adequate strength and adhesion to confine the injection adhesive in the crack being repaired until the injected adhesive has cured. The surface seal material shall have adequate strength to hold the injection fittings firmly in place and to resist injection pressures adequately to prevent leakage during injection.

B. Appearance: After the injection adhesive has cured, the surface seal must be capable of being removed.

C. Epoxy paste sealer for caulking cracks and installing injection port devices. The epoxy paste sealer shall be Sikadur 33, manufactured by Sika Corporation, or an approved equal.

2.7 EQUIPMENT FOR METERING, MIXING, AND INJECTING

A. Type: The equipment used to meter and mix the two injection adhesive components and to inject the mixed adhesive into the crack shall be portable, positive displacement type pumps with in-line metering. The equipment used shall be manufactured by the epoxy manufacturer and/or approved in writing by the epoxy manufacturer. Pumps shall have interlocks to provide positive ratio control of exact proportions of the two components at the nozzle. The pumps shall be electric or air powered.

B. Discharge Pressure: The injection equipment shall have automatic pressure controls and the capability of discharging the mixed adhesive at pressures up to 200 psi, +5 percent, and maintaining that pressure.

C. Automatic Shutoff Control:

1. The injection equipment shall be equipped with sensors on both the Component A and B reservoirs that will automatically stop the machine when only one component is being pumped to the mixing head.

2. CONTRACTOR shall provide a standby injection pump of the same ratio, setting forth each primary injection pump used on the project. Each material of different mix ratio shall have its own primary injection pump as well as standby backup pump.

3. All pumps of dual resin system epoxy resins shall be manufactured by the epoxy resin suppliers or shall be approved in writing by the epoxy resin manufacturer so as to immediately compensate for any changes in resins.

D. Pressure Check Test:

1. Method: The mixing head of the injection equipment shall be disconnected and the two adhesive component delivery lines shall be attached to the pressure check device. The pressure check device shall consist of two independent valved nozzles capable of controlling flow rate and pressure by opening or closing the valve. There shall be a pressure gauge capable of sensing the pressure buildup behind each valve. The valves on the pressure check device shall be closed and the equipment operated until the gauge pressure on each line reads 160 psi. The pumps shall be stopped and the gauge pressure shall not drop below 150 psi within 3 minutes.

2. Frequency of Pressure Check Test: The pressure check test shall be run for each injection equipment unit, as a minimum, at the beginning and at the end of every day that the unit is used in the work of crack repair to verify. A pressure test shall also be run at the start of any injection work when the equipment has been out of use for more than 45 minutes at any time during the day.

2.8 EPOXY MORTAR REPAIR

A. The manufacturer shall certify, in writing, its applicability in bonding to damp concrete surfaces and to the uses intended in this project. Submit applicable City of Los Angeles Department of Building and Safety Research Report for ENGINEER's review and approval.

B. The mortar mix design shall be Concresive 1470 mortar, Adhesive Ownering Co., San Carlos, CA; Sika Top, 123 Plus, for hand-applied method, manufactured by Sika Corporation, or an approved equal. The actual mix design shall be submitted by the manufacturer using the specified resin, Sand #1 and Sand #2, or a pre-engineered sand blended especially for stated products by the manufacturer.

C. Anti-Corrosion Coating for reinforcement shall conform to ASTM C 882 and shall be Los Angeles City Department of Building and Safety approved. The coating shall be Sika Armatic 110 EpoCem, manufactured by Sika Corporation, or an approved equal.

D. The finished repair shall have a color which matches the surrounding concrete's color as best as possible.

E. Submit technical data (physical and chemical properties) available on the repair agent for review. Also submit data (client name, location, and description of work) on at least two similar jobs that the applicator has used the surface repair agent in the last 2 years.

PART 3 -- EXECUTION

3.1 GENERAL

A. CONTRACTOR is responsible for all cracks in concrete that occur in the field. Crack repair procedures are to be followed as specified herein.

3.1 QUALIFICATIONS OF ADHESIVE APPLICATORS

A. All adhesive injection shall be performed by an applicator who has demonstrated the capability to inject concrete cracks, repairing them to the quality specified.

B. All applicators shall submit evidence of experience in injecting concrete cracks with epoxy resin.

C. Evidence of experience shall include a complete list of adhesive injection work accomplished in the last 3 years for at least 10,000 lineal feet of crack injection experience including the following information:

1. Name of Owner.
2. Name of person to contact and telephone number.
3. Address of completed work.
4. Lineal footage of crack injection repair.
5. Type of structure.
6. Description of work including materials and equipment used.

D. Epoxy injection shall be performed by a licensed certified applicator of the manufacturer of the epoxy meeting these Specifications and the applicator shall be approved by the epoxy manufacturer.

E. The applicator shall submit to the ENGINEER a statement in addition to applicator's previous experience in performing comparable work, business and technical organization and plant available to be used in performing work; along with proposed technique, material, and equipment for review prior to startup.

3.2 WORKMAN'S QUALIFICATION

A. The applicator's foreman engaged in the epoxy injection process shall have satisfactorily completed a program of instruction in the methods of restoring concrete structures utilizing the specific epoxy injection process indicated. The curriculum shall include theory on the nature and causes of cracking in concrete, methods for permanently repairing damaged concrete structures, the technical aspects of correct material selection and use, and the operation, maintenance, and troubleshooting of equipment. Foreman must prove certification and approval of the manufacturer.

B. Superintendent shall have at least 3 years' experience in injection work consisting of a minimum of 5,000 LF of crack injection in the last 3 years.

C. Any technician operating the injection pump shall have at least 1 year's experience consisting of a minimum of 3,000 LF of crack injection.

D. Equipment, material, and training must originate from same source.

E. Qualification of an applicator may be denied, and will be based upon the aforementioned evidence of experience along with any additional investigational information acquired by the ENGINEER.

3.3 PROPORTIONING THE ADHESIVE COMPONENTS

A. Ratio Tolerance: The equipment shall have the capability of maintaining the mix ratio for the injection adhesive prescribed by the manufacturer of the adhesive within a tolerance of $\pm$5 percent by volume at any discharge pressure up to 160 psi.

B. Tests for Proper Ratio:

1. Method:

a. The mixing head of the injection equipment shall be disconnected and the two adhesive components shall be pumped simultaneously through the ratio check device. The ratio check device shall consist of two independent valved nozzles capable of controlling flow rate and back pressure by opening or closing the valve to restrict material flow. There shall be a pressure gauge capable of sensing the back pressure behind each valve. The discharge pressure shall be adjusted to 160 psi for both adhesive components. Both adhesive components shall be simultaneously discharged into separate calibrated containers. The amounts discharged into the calibrated containers simultaneously during the same time period shall be compared to determine the mix ratio.

b. After the test has been completed at a 160 psi discharge pressure, the procedure shall be repeated for 0 psi discharge pressure.

2. Frequency of Test for Proper Ratio: The ratio test shall be run for each injection unit at the beginning of every day, and at the beginning of every work period wherever an hour break has occurred, and at the end of every day that unit is used in the work of crack repair.

3.4 PROOF OF RATIO AND PRESSURE CHECK

A. At all times during the course of the work, the CONTRACTOR must keep complete and accurate records available to the ENGINEER of the ratio check tests.

B. In addition, the ENGINEER at any time without prior notification of the CONTRACTOR, may request the CONTRACTOR to conduct the tests described in the presence of the ENGINEER or the INSPECTOR.

3.5 CRACK REPAIR PROCEDURE

A. Initial Condition (for Sanitary Structures): Each water-holding structure to be repaired will be drained by the plant staff on a schedule to allow the work to proceed in that one structure and at the same time to keep the remainder of the plant in operation. All cleaning and the amount of cleaning shall be the responsibility of the CONTRACTOR.

B. Repair Procedures: Cracks 0.005 inch or wider that are designated by the CITY to be injected shall be cleaned and pressure injected with epoxy as specified. All spalled areas or areas with damaged surface, after being designated by the ENGINEER to be repaired, shall be repaired with epoxy grout as specified herein. Some cracks and damaged areas may be excluded from repair by the ENGINEER. Repair only those specifically identified by the ENGINEER.

C. Crack Preparation:

1. The licensed applicator shall be responsible for crack preparation. All cracks must be free from loose matter such as dirt or laitance and free from oil, grease, salt, or any other contaminants. Cracks shall be cleaned in accordance with the instructions of the injection adhesive manufacturer. The manufacturer's written instructions shall govern.

2. Examine the areas and conditions at the job site under which work of the Section will be performed. Correct conditions detrimental to timely and proper completion of the work. Do not proceed until detrimental conditions are corrected. Coordinate with other trades as required to assure proper and adequate provisions in the work of those trades for interface with the work of this section.

3. Surfaces adjacent to cracks or other areas of application shall be cleaned of dirt, dust, grease, oil, efflorescence, or other foreign matter detrimental to bond of epoxy injection surface seal system. Acids and corrosives shall not be permitted for cleaning, unless neutralized. If necessary, cracks shall receive three-step acid flushing technique.

D. Crack Sealing: A surface seal adhesive as specified shall be applied to the face of the crack to be repaired prior to adhesive injection. The surface seal shall seal the crack and not allow injection adhesive to escape. The seal shall be applied in accordance with the instructions of the surface seal manufacturer.

E. Backfilled Walls: At locations where walls have backfill on one side and where it will not be possible to excavate and seal both crack surfaces, and where cracks extend entirely through the wall, entry ports as specified below shall be spaced closer together in addition to adjusting injecting pressure so that only a minimum amount of injection adhesive is lost to the soil.

F. Entry Ports: Openings in the surface seal shall be established along the crack for the purpose of adhesive entry. The distance between entry ports shall be determined by the adhesive applicator and, in general, shall be spaced approximately equal to the thickness of the concrete member. The spacing of ports may be increased or decreased as required to insure maximum penetration of the injection epoxy. For through cracks, CONTRACTOR shall seal both sides of cracked member. The repair work for each through crack shall be paid for as a single crack. Special consideration to entry port location must be given when cracks occur in a backfilled wall to ensure minimum adhesive is lost to the soil.

G. Injection: The injection of the adhesive into each crack shall begin at the entry port at the lowest port along a radial crack and at the end of a circumferential or horizontal crack. Injection shall continue at the first port until the injection adhesive begins to flow out of the port at the next highest elevation. The first port shall be plugged and injection started at the second port until the adhesive flows from the next port. The entire crack shall be injected with the same sequence. It is required that a manufacturer’s representative or factory trained qualified applicators with past experience be present on the job at all times.

Injection at the last port shall continue for approximately one minute after the rise in gauge pressure. Once injection has been started on a crack, it shall be continued and uninterrupted until the crack has been completely injected.

H. Finishing:

1. After the injection adhesive has cured, the surface seal shall be removed. The face of the crack shall be finished flush with the adjacent concrete. There shall be no indentations or protrusions caused by placement of entry ports.

2. When cracks are completely filled, epoxy adhesive shall be cured for sufficient time to allow removal of surface seal without any draining or runback of epoxy material from cracks.

3. Surface seal material and injection adhesive runs or spills shall be removed from concrete surfaces.

4. Finish Coating: Provide new paint system over concrete surface to match existing adjacent surface and to conform with requirements as specified.

3.6 TESTING OF INJECTION REPAIR

A. Initial Cores: The CONTRACTOR shall obtain three 4-inch diameter initial core samples in the first 100 lineal feet of crack repaired and one core for each 500 lineal feet thereafter. The cores shall be for full crack depth and taken from locations as selected by the ENGINEER. If any reinforcing steel is contacted during the core drilling, the CONTRACTOR shall cease drilling and relocate the core drill to clear the reinforcing steel. Additionally, the CONTRACTOR shall provide, at no additional expense to the CITY the following labor, materials, and services required for core sampling and testing as directed by the ENGINEER including, but not limited to:

1 Preparation, handling, storage, and transportation of epoxy injection concrete core test specimens as directed by the ENGINEER.

2 Providing suitable containers for the storage, curing, and transportation of test specimens.

3 Providing suitable storage for supply of test equipment and other items required for sampling and testing.

B. Initial cores will be tested to determine degree of epoxy penetration and bond strength.

C. Testing of initial core samples will be performed by the ENGINEER at the CITY's expense.

D. Additional cores, called verification cores, required as indicated in G. Evaluation and Acceptance of Tests, specified hereinafter, will be tested by the CITY.

E. Methods of Testing Initial and Verifying Cores:

1 Penetration: Visual examination.

2 Bond Strength/Compression Test: Concrete failure prior to adhesive failure.

F. Test Requirements:

1 Penetration: A minimum of 90 percent of the crack shall be full of epoxy adhesive.

2 Bond Strength: Concrete failure before adhesive failure, or 6,500 psi with no failure of either concrete or adhesive.

G. Evaluation and Acceptance of Tests:

1 If the initial cores pass tests as specified above, epoxy adhesive injection work at the area represented by the cores will be accepted.

2 If initial cores fail either by lack of penetration or bond strength, the work shall not proceed further until the area represented by the cores are reinjected and retested for acceptance.

3 After rework of areas represented by failed initial cores is complete, the CONTRACTOR shall obtain verifying cores, the number and location to be determined by the ENGINEER. Verifying cores shall be tested in accordance with Paragraphs E and F for compliance.

H. Correction of Work As Result of Testing: Upon notification from the ENGINEER, refill initial and verifying core holes in accordance with requirements specified hereinafter.

I. Repair of Core Holes: The CONTRACTOR shall fill the core holes with an epoxy grout tamped and rodded in place to form a dense fill and finish the surface to blend with the adjacent concrete. The

epoxy grout and placement techniques shall be accepted by the ENGINEER and as specified herein.

3.7 CONCRETE SPALL REPAIR

A. The following types of areas are known to require repair:

1. Spalled wall surfaces designated by the ENGINEER.

2. Spalled slab surfaces designated by the ENGINEER.

3. Other specific areas shown on contract drawings.

B. Surface Preparation: The CONTRACTOR shall be responsible for preparing the surfaces of damaged concrete in accordance with the repair adhesive manufacturer's recommendations. The area shall be chipped to remove all loose materials and materials that would prevent bond. The edges shall be left sharp and square with the adjacent concrete surfaces.

C. Application: All concrete spall repair adhesive shall be applied in strict conformance with manufacturer's instructions.

D. Avoid having a joint between new material and old materials right at the planes of the reinforcing steel. Expose the steel completely or at least ¾ inch all around and encase them fully in a new concrete patch.

E. After chipping of the existing concrete has been completed, all reinforcing bars shall be completely exposed or at lease ¾ inch all around, thoroughly cleaned of rust or other deleterious substances by power wire brushing, sandblasting, or other approved means. All remaining fines or dust shall be removed from the chipped surfaces by air jet or vacuum. If an air jet is used, care shall be taken to insure that no oil is in the air system. A suitable oil trap shall be in service during the air cleaning

Before applying the concrete patch/repair mortar; all cracks, exposed damaged or rusted reinforcing steel within the spalled areas shall be cleaned and repaired. All damaged reinforcing steel shall be removed and welded with new. When corrosion has occurred due to presence of chlorides, the reinforcing steel should be high-pressure washed with clean water after mechanical cleaning. Prime all reinforcing steel by using approved anti-corrosion coating per Subsection 2.8.E herein.

The existing concrete surface to be patched must be clean and dry before applying the epoxy bonding agent. The epoxy to be used for bonding the concrete patches shall conform to Subsection 2.8.B herein.

Evaluate moisture content for concrete by determining if moisture will collect at bond lines between existing concrete surface and epoxy bonding agent before epoxy had cured, this may be accomplished by taping a 4’x4’ polyethylene sheet to concrete surface. If moisture collects on underside of polyethylene sheet before epoxy would cure, then allow concrete to dry sufficiently to prevent the possibility of moisture between old concrete and new epoxy.

H. A uniform coat of the epoxy bonding agent and anti-corrosion coating shall be applied to entire chipped areas of the existing concrete and all exposed surfaces of both existing and new reinforcing steel. When the epoxy becomes dry before the concrete patch/repair mortar has been applied, the epoxy shall be completely removed and re-applied.

After the concrete patches/repair mortars have cured for a minimum time of 3 days, the CONTRACTOR shall remove the forms, any irregularities or departures from a plane surface by grinding, rubbing with a carborundum stone or other means approved by the ENGINEER.

I. Color and Finish: The finished surface repair shall have a color that matches best as possible the surrounding concrete. Repaired surface finish shall be roughened to a degree to match surrounding concrete.

END OF SECTION

SECTION 05500
MISCELLANEOUS METALWORK

PART 1 -- GENERAL

1.1 THE REQUIREMENT

The CONTRACTOR shall furnish, fabricate, and install miscellaneous metalwork and appurtenances, complete, in accordance with the requirements of the Contract Documents.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03300 Cast-In-Place Concrete.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with the reference specifications of the GENERAL REQUIREMENTS and the specifications and standards listed below.

B. Federal Specifications:

QQ-F-461 C (1)	Floor Plate, Steel, Rolled.
MIL-6-18015	(Ships) Aluminum Planks. (6063-T6)

C. Commercial Standards:

Aluminum Assn. AA-M32	C22A41.
AASHTO HS-20	Truck Loading.
AISC	Steel Construction Manual
AISI	Standards for Stainless Steel
ASTM A 36	Standard Specification for Carbon Structural Steel.
ASTM A 48	Standard Specification for Gray Iron Castings.
ASTM A 53	Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless.
ASTM A 123	Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
ASTM A 125	Standard Specification for Steel Springs, Helical, Heat Treated.
ASTM A 153	Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

ASTM A 307	Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60,000 psi Tensile.
ASTM A 563	Standard Specification for Carbon and Alloy Steel Nuts.
ASTM A 575	Standard Specifications for Steel Bars, Carbon, Merchant Quality, M-Grades.
ASTM B 98	Standard Specification for Copper-Silicon Alloy Rod, Bar, and Shapes.
ASTM B 438	Standard Specification for Bronze-Base Powder Metallurgy Bearings (Oil-Impregnated).
ANSI/AWS D1.1	Structural Welding Code - Steel.
NFPA 101	Life Safety Code.
NAAMM	Metal Stairs Manual.

1.4 CONTRACTOR SUBMITTALS

A. Shop Drawings: Shop drawings of all miscellaneous metalwork shall be submitted to the ENGINEER for review in accordance with SUBMITTALS of the GENERAL REQUIREMENTS.

B. Delegated-Design Submittal: For stairs and railing include calculation analysis signed and sealed by a Civil or Structural Engineer registered in the State of California.

1. Include plans, elevations, sections, details, and attachment to other Work.

2. Indicate sizes of metal sections, thickness of metals, profiles, holes, and field joints.

3. Include plan at each level

4. Indicate locations of anchors, weld plates, and blocking for attachment of wall-mounted handrails

C. Anchors: Wherever power-driven pins will be utilized for anchorage or support, complete information describing pin capacity, connections, and proposed use locations shall be furnished to the ENGINEER.

PART 2 -- PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Standard: All structural steel shapes, plates, bars, and their products shall conform to the requirements of ASTM A 36.

B. Corrosion Protection: All miscellaneous steel metalwork shall be hot-dip galvanized after fabrication as specified herein.

C. Stainless Steel: Unless otherwise shown, stainless steel metalwork and bolts shall be of Type 316 stainless steel and shall not be galvanized. Where anaerobic conditions are anticipated, Type 304 stainless steel shall be used.

D. Delegated Design: Engage a Civil or Structural Engineer registered in the State of California to design stairs and railings, including attachment to building construction.

E. Structural Performance of Stairs: Metal stairs shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Uniform Load: 100 lbf/sq. ft.

2. Concentrated Load: 300 lbf applied on an area of 4 sq. in.

3. Uniform and concentrated loads need not be assumed to act concurrently.

4. Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.

5. Limit deflection of treads, platforms, and framing members to L/360.

F. Seismic Performance of Stairs: Metal stairs shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. Component Importance Factor: 1.0.

G. Structural Performance of Railings: Railings, including attachment to structure construction, shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Uniform Load: 50 lbf/ft applied in any direction along the top rail.

2. Concentrated Load: 200 lbf applied in any direction on the top rail.

3. Uniform and concentrated loads need not be assumed to act concurrently.

H. Thermal Movements: Allow for movements from ambient and surface temperature changes.

2.2 ALUMINUM RAILINGS

A. General: All aluminum handrails and railings shall be component systems complete with all anchors, attachments, balusters, brackets, caps, fasteners, gates (swing with self-latching hardware or removable), posts, sleeves, trim, and any other related items required or necessary for a complete installation. All gates and removable rail sections shall be complete with all hardware such as self-closing hinges, self-latching latches, hasps, etc. Railings shall conform to the Building Code and OSHA General Industry Occupational Safety and Health Standards (29CFR1910).

B. Materials: All materials for miscellaneous metalwork shall conform to the following requirements:

1. Aluminum: Aluminum shall be U.S. Alloy 6063 T-5 or T-6. Aluminum pipe rail shall not be less than 1-1/2-inch diameter Schedule 40 pipe.

2. Electrolysis Protection: Electrolysis protective material shall be alkali-resistant asphaltum base paint, Koppers "Bitumastic 50," Texaco "Cement 1401," or equal.

3. Sleeves: Sleeves shall be of galvanized steel or PVC.

4. Grout: Grout for hand rail posts shall consist of an inorganic, non-shrink, non-metallic premised grout with a minimum 28-day compressive strength of 4,000 psi.

5. Fasteners: Fasteners, screws, and bolts shall be concealed and shall be of stainless steel or aluminum.

6. Welding Rods: Aluminum welding rods shall be of a type recommended by the aluminum manufacturer for anodized finished products.

C. Finishes: Pipe railing system including handrails, railings, tube caps, and other miscellaneous parts of rails shall be provided with a clear anodized finish, AA-M32 C22A41.

D. Manufacturers or Equal:

1. C-V Pipe Rail, by Crane Veyor Corp..

2.3 METAL GRATING AND FLOOR HATCHES

A. General: Metal grating and floor hatches shall be of the design, sizes and types shown. Aluminum in contact with other metal or concrete shall be shop-painted in accordance with Section 2.5 of this specification.

B. Metal Grating: Metal grating shall be of aluminum or stainless steel as shown. No single piece of grating shall weigh more than 80 lb unless otherwise specified or shown. Aluminum shall be 6061-T6 Alloy Bearing Bars and 6063-T5 Alloy Cross Bars. Stainless steel shall be Type 316. All grating shall be completely banded. Do not notch bearing bars at supports to maintain elevation. For openings 2 inches or greater in diameter or dimension, band grating edges with a bar of same depth and thickness as bearing bars. Weld cut bearing bars or cross bars to banding bar. Provide trench grating with symmetrical cross bar arrangement. Fabricate metal frames and supports for grating of same material as grating, unless otherwise indicated.

Anchor grating to supporting system using saddle clips.

Provide stainless-steel fasteners for fastening aluminum.

C. Floor Hatches: Floor hatches shall be of 1/4" thick diamond-pattern mill-finish aluminum plate with mill finish aluminum angle frames as shown. Hatches shall be either single or double leaf per Contract Drawings, and shall be furnished with adjustable counterbalancing springs, heavy-duty hold-open arm that automatically locks door open at 90 degrees, release handle with vinyl grip that allows for one-handed closure, and recessed lift handle. Hinges shall be heavy-duty butt hinges with stainless steel pins. Latches shall be stainless steel slam latches. Hatches shall be load rated for AASHTO HS-20 concentrated wheel load, with impact.

2.4 SEAT ANGLES, SUPPORTS, AND GUIDES

A. Seat angles for grating shall be aluminum or steel as shown and of a size as shown. Guides for slide gates shall be steel, of a size shown, hot-dip galvanized after fabrication.

2.5 BOLTS AND ANCHORS

A. Standard Service Bolts (Not Buried or Submerged): Except where otherwise shown or specified, all bolts, anchor bolts, and nuts shall be steel, galvanized after fabrication as specified herein. Threads on galvanized bolts and nuts shall be formed with suitable taps and dies such that they retain their normal clearance after hot-dip galvanizing. Except as otherwise specified herein, steel for bolts, anchor bolts and cap screws shall be in accordance with the requirements of ASTM A 307 Grade A or B, or threaded parts of ASTM A 36.

B. Buried or Submerged Bolts: Unless other corrosion-resistant bolts are shown, all bolts, anchor bolts and washers which are buried, submerged, or below the top of the wall inside any hydraulic structure shall be of Type 316 stainless steel, with bronze nuts, or cap screws (where screwed into stainless steel), of copper-silicon alloy, conforming to ASTM B 98, alloy C 65100, designation H04, or alloy C 65500, designation H04. Wherever stainless steel bolts and nuts are specified, it shall refer to the above material combination, unless specifically excluded. Where anaerobic conditions are anticipated, Type 304 stainless steel shall be used.

C. Bolt Requirements:

1. The bolt and nut material shall be free-cutting steel.

2. The nuts shall be capable of developing the full strength of the bolts. Threads shall be Coarse Thread Series conforming to the requirements of the American Standard for Screw Threads. All bolts and cap screws shall have hexagon heads and nuts shall be Heavy Hexagon Series.

3. The length of all bolts shall be such that after joints are made up, each bolt shall extend through the entire nut, but in no case more than 1/2-inch beyond the nut.

D. Adhesive Anchors: Unless otherwise shown or specified, all drilled, concrete or masonry anchors shall be adhesive anchors. No material substitutions will be considered unless accompanied with ICBO report verifying strength and material equivalency.

1. Epoxy adhesive anchors are required for drilled anchors where exposed to weather, in submerged, wet, splash, overhead, and corrosive conditions, and for anchoring handrails, pumps, mechanical equipment, and reinforcing bars. Epoxy systems shall be HILTI HIT-HY 200 or approved equal. Threaded rod shall be stainless steel Type 316.

E. Expanding-Type Anchors: Expanding-type anchors if shown or permitted, shall be steel expansion type HILTI "Kwik-Bolt;" or equal. Lead calking anchors will not be permitted. Size shall be as shown. Expansion type anchors which are to be embedded in grout may be steel. Non-embedded buried or submerged anchors shall be stainless steel.

2.6 COATINGS

A. Primer: Use "10-99 Tnemec Primer" or "Rustoleum Number 5769 Primer.

B. For Repair of Galvanizing: Use a high zinc-dust content paint complying with MIL-P-21035.

C. Galvanizing: Provide a zinc coating for those items shown or specified to be galvanized as follows and as applicable:

1. ASTM A153 for galvanized iron or steel hardware.

2. ASTM A123 for galvanized rolled, pressed or forged steel shapes, plates, bars and strip 1/8-inch thick and heavier.

D. Field Galvanizing:

1. Required: For repair of protective coating of damaged galvanized surfaces resulting from welding or other construction operations in the shop or at the job-site at no added cost to the City.

2. Method: By "galvalloy" methods, in accordance with manufacturer's directions.

E. Shop Painting:

1. Required: On all uncoated ferrous metals; galvanized ferrous metal not to be shop coated.

2. Paint: Specified paint primer.

3. Painting: Full prime coating, completely covering the metal surfaces; at least 1 coat on all surfaces which will be accessible after fabrication and erection; at least 2 coats on all surfaces which will be inaccessible after fabrication and erection.

4. Remove scale, rust and other deleterious materials before application of Shop Coating.

5. Clean off heavy rust and loose mill scale in accordance with SSPC-SP-2 or SSPC-SP-3 before coating.

6. Remove oil, grease and similar contaminants in accordance with SSPC-SP-1.

F. Aluminum Finishes:

1. Anodized Finish: Give an anodic oxide treatment in accordance with AA M31C22A41 where indicated.

2. Mill Finish: Have a cleaned and degreased mill finish on other aluminum items.

2.7 FABRICATION OF FRAMED STAIRS

A. NAAMM Stair Standard: Comply with NAAMM AMP 510, “Metal Stairs Manual,” for Industrial Class, unless more stringent requirements are indicated.

B. Provide Aluminum Stair Framing:

1. Fabricate stringers of channels.

a. Framing Size (Stringers, post, beams, etc): As required to comply with "General Requirements" Article.

b. Provide closures for exposed ends of channel stringers.

c. Aluminum Finish: Anodized

2. Construct platforms and tread supports of channel headers and miscellaneous framing members as required to comply with "Performance Requirements" Article.

    a. Provide closures for exposed ends of channel framing.

3. Weld or bolt stringers to headers; weld or bolt framing members to stringers and headers.

C. Metal Bar-Grating Stairs: Form treads and platforms to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531 Type P-19-4, “Metal Bar Grating Manual.”

1. Fabricate treads and platforms from welded grating with opening in gratings no more than 3/4 inch in least dimension.

    a. Surface: Plain

2. Fabricate grating treads with cast-abrasive nosing and with aluminum angle or plate carrier at each end for stringer connections.

    a. Secure treads to stringers with bolts.

D. Extruded Bars and Shapes: ASTM B 221, alloys as follows:

1. Grating Bearing Bars: 6061-T6 or 6063-T6.

2. Grating Crossbars: 6061-T6.

3. Extruded Shapes: 6061-T6.

4. Aluminum Sheet: ASTM B 209, Alloy 5052-H32.

5. Welding electrode, aluminum: 5356 filler alloy.

E. Risers: Open.

F. General Fabrication Requirements:

1. Provide complete stair assemblies, including metal framing, hangers, railings, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.

    a. Join components by welding unless otherwise indicated.

    b. Use connections that maintain structural value of joined pieces.

2. Assemble stairs and railings in shop to greatest extent possible.

    a. Disassemble units only as necessary for shipping and handling limitations.

    b. Clearly mark units for reassembly and coordinated installation.

3. Cut, drill, and punch metals cleanly and accurately.

    a. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated.

b. Remove sharp or rough areas on exposed surfaces.

4. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

5. Form exposed work with accurate angles and surfaces and straight edges.

6. Weld connections to comply with the following:

   a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

   b. Obtain fusion without undercut or overlap.

   c. Remove welding flux immediately.

   d. Weld exposed corners and seams continuously unless otherwise indicated.

   e. At exposed connections, finish exposed welds to comply with NOMMA's "Voluntary Joint Finish Standards" for Finish # 3 - Partially dressed weld with spatter removed.

7. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible.

   a. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated.

   b. Locate joints where least conspicuous.

   c. Fabricate joints that are exposed to weather in a manner to exclude water.

   d. Provide weep holes where water may accumulate internally.

PART 3 -- EXECUTION

3.1 FABRICATION AND INSTALLATION REQUIREMENTS

A. Fabrication and Erection: Except as otherwise shown, the fabrication and erection of structural steel shall conform to the requirements of the American Institute of Steel Construction "Manual of Steel Construction."

B. Aluminum Railings: Aluminum railing fabrication and installation shall be performed by craftsmen experienced in the fabrication of architectural metalwork. Exposed surfaces shall be free from defects or other surface blemishes. Dimensions and conditions shall be verified in the field. All joints, junctions, miters and butting sections shall be precision fitted with no gaps occurring between sections, and with all surfaces flush and aligned. Electrolysis protection of materials shall be provided.

C. Metal Stairs:

   1. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction.

a. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

2. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

3. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated.

4. Fit exposed connections accurately together to form hairline joints.

a. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.

b. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

c. Comply with requirements for welding in "General Fabrication" Article.

D. Floor Hatches: Unless otherwise shown, the CONTRACTOR shall furnish and install a 1/2-inch drain line to the nearest floor drain for all floor hatches.

E. Power-Driven Pins: Power-driven pins shall be installed by a craftsman who is certified by the manufacturer as being qualified to install the manufacturer's pins. Pins shall be driven in one initial movement by an instantaneous force that has been carefully selected to attain the required penetration. Driven pins shall conform to the following requirements where "D" = Pin's shank diameter:

Material Penetrated by Pin	Material's Minimum Thickness	Pin's Shank Penetration in Supporting Material	Minimum Space From Pin's CL to Edge of Penetrated Material	Minimum Pin Spacing
Concrete	16D	6D minimum	14D	20D
Steel	1/4-inch	Steel thickness	4D	7D

3.2 WELDING

A. Method: All welding shall be by the metal-arc method or gas-shielded arc method as described in the American Welding Society's "Welding Handbook" as supplemented by other pertinent standards of the AWS. Qualification of welders shall be in accordance with the AWS Standards governing same.

B. Quality: In assembly and during welding, the component parts shall be adequately clamped, supported and restrained to minimize distortion and for control of dimensions. Weld reinforcement shall be as specified by the AWS Code. Upon completion of welding, all weld splatter, flux, slag, and burrs left by attachments shall be removed. Welds shall be repaired to produce a workmanlike appearance, with uniform weld contours and dimensions. All sharp corners of material which is to be painted or coated shall be ground to a minimum of 1/32-inch on the flat.

3.3 GALVANIZING

A. All structural steel plates shapes, bars and fabricated assemblies required to be galvanized shall, after the steel has been thoroughly cleaned of rust and scale, be galvanized in accordance with the requirements of ASTM A 123. Any galvanized part that becomes warped during the galvanizing operation shall be straightened. Bolts, anchor bolts, nuts and similar threaded fasteners, after being properly cleaned, shall be galvanized in accordance with the requirements of ASTM A 153. Field repairs to galvanizing shall be made using "Galvinox", or equal.

3.4 DRILLED ANCHORS

A. Drilled anchors and reinforcing bars shall be installed in strict accordance with the manufacturer's instructions. Holes shall be roughened with a brush on a power drill, cleaned and dry. Drilled anchors shall not be installed until the concrete has reached the specified 28-day compressive strength. Adhesive anchors shall not be loaded until the adhesive has reached its specified strength in accordance with the manufacturer's instructions.

END OF SECTION

SECTION 05600

FLOOR ACCESS HATCHES

PART 1 - GENERAL

1.1 SUMMARY

A. Work Included: Provide factory-fabricated floor access doors.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer's product data.

B. Shop Drawings: Submit shop drawings including profiles, accessories, location, adjacent construction interface, and dimensions.

C. Warranty: Submit executed copy of manufacturer's standard warranty.

1.3 QUALITY ASSURANCE

A. Manufacturer: A minimum of 5 years experience manufacturing similar products.

B. Installer: A minimum of 2 years experience installing similar products.

C. Manufacturer's Quality System: Registered to ISO 9001 Quality Standards including in-house engineering for product design activities.

1.4 DELIVERY, STORAGE AND HANDLING

A. Deliver products in manufacturer's original packaging. Store materials in a dry, protected, well-vented area. Inspect product upon receipt and report damaged material immediately to delivering carrier and note such damage on the carrier's freight bill of lading.

1.5 WARRANTY

A. Manufacturer's Warranty: Provide 5 year warranty. Materials shall be free of defects in material and workmanship for a period of five years from the date of purchase. Should a part fail to function in normal use within this period, manufacturer shall furnish a new part at no charge.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Basis-of-Design Manufacturer: Type JAL-H20 Single Leaf Floor Access Door or Type JDAL-H20 Double Leaf by The BILCO Company, P.O. Box 1203, New Haven, CT 06505, 1-800-366-6530, Fax: 1-203-535-1582, Web: www.BILCO.com, or approved equal.

2.2 ACCESS HATCHES

A. Furnish and install where indicated on plans vault access door Type J-AL H20, in sizes shown on the Drawings including hinge locations. The floor access door shall be double leaf and pre-assembled from the manufacturer.

B. Performance characteristics:

1. Covers: Shall be reinforced to support AASHTO HS-20 wheel load with a maximum deflection of 1/150th of the span. Manufacturer to provide structural calculations stamped by a registered professional engineer upon request. (Note: For installation in an off-street location where not subject to high density, fast moving traffic.)
2. Operation of the covers shall be smooth and easy with controlled operation throughout the entire arc of opening and closing.
3. Operation of the covers shall not be affected by temperature.

C. Covers: Shall be 1/4” aluminum cover and extruded aluminum frame.

D. Frame: Channel frame shall be aluminum with full anchor flange around the perimeter.

E. Hinges: Shall be specifically designed for horizontal installation and shall be through bolted to the covers with tamperproof Type 316 stainless steel lock bolts and shall be through bolted to the frame with Type 316 stainless steel bolts and locknuts.

F. Drain Coupling: Provide a 1-1/2” (38mm) drain coupling located in the right front corner of the channel frame (note: can be placed at a different location if specified).

G. Lifting mechanisms: Manufacturer shall provide the required number and size of compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled cover operation throughout the entire arc of opening and to act as a check in retarding downward motion of the covers when closing. The upper tube shall be the outer tube to prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe fastened to a formed 1/4” gusset support plate.

H. A removable exterior turn/lift handle with a spring loaded ball detent shall be provided to open the covers and the latch release shall be protected by a flush, gasketed, removable screw plug.

I. Hardware

1. Hinges: Hinges: Heavy forged Type 316 stainless steel hinges, each having a minimum 1/4” (6mm) diameter Type 316 stainless steel pin, shall be provided and shall pivot so the covers do not protrude into the channel frame.
2. Covers shall be equipped with a hold open arm that automatically locks the cover in the open position.
3. Covers shall be fitted with the required number and size of compression spring operators.
4. A Type 316 stainless steel snap lock with fixed handle shall be mounted on the underside of the cover.
5. All hardware shall be zinc plated and chromate sealed with type 316 stainless steel fasteners. [For installation in highly corrosive environments or when prolonged exposure to hot water or steam is anticipated, specify Type 316 stainless steel hardware.

J. Finishes: Mill finish aluminum with a bituminous coating applied to the exterior of the frame.

2.3 FALL PROTECTION GRATING

A. All hatches both single and double leaf shall have a fall protection grating system meeting OSHA 29 CFR1926.502(c) requirements for fall protection. The grating shall be aluminum with powder coat paint finish that is safety yellow in color. The system is to be factory installed and allow the grating to open to the full 90 degree position.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and openings for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install products in strict accordance with manufacturer's instructions and approved submittals. Locate units level, plumb, and in proper alignment with adjacent work.

1. Test units for proper function and adjust until proper operation is achieved.
2. Repair finishes damaged during installation.
3. Restore finishes so no evidence remains of corrective work.

3.3 ADJUSTING AND CLEANING

A. Clean exposed surfaces using methods acceptable to the manufacturer which will not damage finish.

END OF SECTION

This page intentionally left blank

SECTION 06100
ROUGH CARPENTRY

PART ONE - GENERAL

1.1 DESCRIPTION

*A. All rough carpentry work indicated on the Contract Drawings and as hereinafter specified, including:

1. Blocking and nailers and framing anchors.

2. Miscellaneous wood, nails, screws and other rough hardware indicated on the Drawings and required for complete and proper installation.

*B. Related Sections:

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS and Sections in DIVISION 1 - GENERAL REQUIREMENTS of these Specifications.

2. Concrete Formwork in Section 03100.

3. Finish Carpentry in Section 06200.

4. Architectural Woodwork in Section 06400.

5. Custom Casework in Section 06410.

1.2 QUALITY ASSURANCE

A. Use adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for the proper performance of the work of this Section.

B. Codes and Standards:

1. In addition to complying with the pertinent codes and regulations of the Uniform Building Code with the City of Los Angeles 1992 Amendments, comply with the following:

a. "Product Use Manual" of the Western Wood Products Association for selection and use of products included in that manual;

b. "Plywood Specification and Grade Guide" of the American Plywood Association;

c. "Standard Specifications for Grades of California Redwood Lumber" of the Redwood Inspection Bureau for Redwood, when used.

1.3 GENERAL REQUIREMENTS

A. Verification of Job Conditions: Required and take field measurements as may be required. Report to the City Engineer or Consultant any discrepancies between the Drawings and job-site conditions, for further instructions.

B. Coordination and Cooperation: Do work of this Section in a fully coordinated and cooperative manner with work of other trades to provide complete and proper installation and to expedite the job without delays.

C. Defective Work: All work of this Section that is not set true to line, plane and elevation or is damaged or marred or is not in a condition to receive other trade work will not be accepted. Remedy remove or replace defective work to a first class condition as approved by the City Engineer or Consultant, at no added cost to the City.

D. Clean-Up: During the progress of the work of this Section, conform to provisions of Section 01710 in GENERAL REQUIREMENTS, keep the premises free of debris and waste resulting from the work of this Section. Upon completion, all surplus materials and debris shall be removed from the job-site.

1.4 SUBMITTALS

A. Comply with pertinent provisions of Section 01340 - SUBMITTAL in DIVISION 1 - GENERAL REQUIREMENTS.

B. Contractor shall submit Shop Drawings indicating location of backing, furring, nailers, blocking, etc. to the City Engineer for approval prior to start of Contracted Work. Contractor shall coordinate work of this Section with work of other trades if necessary.

1.5 PRODUCT HANDLING

A. Delivery: Deliver the rough carpentry materials to the job-site and store in a safe area, out of way of traffic and shored up off the ground surface, where directed by the City Engineer.

1. Identify framing lumber as to grades and store each grade separately from other grades.

2. Protect metal items with adequate waterproof outer wrapping and properly identify or label such items.

3. Use extreme care in off loading of lumber to prevent damage, splitting and breaking of materials.

B. Protection: Stack lumber to prevent warping and keep dry.

PART TWO - PRODUCTS

2.1 GRADE STAMPS

A. Identify framing lumber by the grade stamp of the West Coast Lumber Inspection Bureau, or such other grade stamp as is approved in advance by the City Engineer or Consultant.

B. Identify plywood as to species, grade, and glue type by the stamp of the American Plywood Association.

C. Identify other materials of this Section by the appropriate stamp of the agency approved in advance by the City Engineer or Consultant.

D. Conform to the Uniform Building Code with the Los Angeles City 1992 Amendment, Section 2505.

*2.2 MATERIALS (As Applicable)

A. Provide materials in the quantities needed for the work shown on the Drawings and meeting or exceeding the following standards of quality at the time of delivery:

1. Furnish lumber manufactured to comply with PS20 "American Softwood Lumber Standards" and with applicable grading rules of

Inspection Agencies certified by the American Lumber Standards Committee (ALSC) Board of Review.

B. Seasoning:

1. Rough lumber to be air dried and well seasoned to have average moisture content not to exceed 19 percent.

2. Finish lumber to be kiln dried as closely as practicable to have an average moisture content not exceeding 12 percent.

*2.3 PRODUCTS

A. Blocking and Nailers: Douglas Fir, "Construction" grade, pressure treat with chromate zinc chloride.

B. Plywood: Conform to U.S. Product Standard P.S. 1-83 and U.B.C. Standard 25-9. Plywood shall be grade-marked by the American Plywood Association (APA), Pittsburgh Testing Laboratories (PTL) or Timber Engineering Company (TECO). Plywood shall be exterior grade, structural.

C. Nails, Screws, and Lag Screws: Commercial Standard.

D. Bolts and Washers: American Standard and U.B.C. Standard 25-17.

E. Treated Lumber: Cut surfaces in treated lumber shall be given a brush coat of approved type preservative.

F. Fire Retardant: All wood shall be treated with Baxter "Pyresote", Barnard "Bar Flame" or equal.

G. Building Paper: Kraft paper complying with Fed. Spec. UU-B-7902.

H. Joist Hangers: Simpson, Teco or equal as approved by the City Engineer or Architect.

I. Exterior Gypsum Sheathing: Butt edge, 2-inch thick, complying with ASTM C630.

J. Load Bearing Studs: 2-inch x 4-inch, Douglas Fir W.C.L.I.B. No. 1 grade.

K. Beams and Stringers: 5-inch and thicker, width more than 2-inch greater than thickness, Douglas Fire W.C.L.I.B. No. 1 structural beams and stringers.

L. Wall Sills: Treated Douglas Fir of W.C.L.I.B. grade for wall framing or Redwood C.R.A. Foundation grade as market or branded by an approved

agency of the Los Angeles City Department of Building and Safety.

2.4 MINIMUM SURFACING: (As Applicable)

A. General: All faces required to be left exposed; where specifically indicated on the Drawings or specified; where necessary to achieve proper connections to other members.

B. S1E: Blocking, studs, joists, rafters, purlins, bridging and other members in which uniform width must be maintained.

C. S1S1E: Plates, sills and other members in which uniform width and thickness must be maintained.

D. S4S: Exposed wood except where noted to have "Resawn" finish.

*2.5 OTHER MATERIALS

A. Provide other materials not specifically described but required for a complete and proper installation, as selected by the Contractor subject to the approval of the City Engineer or Architect.

1. Glue: As suitable for required joining; water-resistant where subject to moisture conditions.

2. Stock Framing Connectors and Brackets: "Simpson", "Teco" or "Trimfast", galvanized metal of types and sizes indicated or required. Use nails furnished by the connector manufacturer.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until detrimental conditions are corrected.

3.2 COMPLIANCE

A. Do not permit materials not complying with the provisions of this Section to be brought onto or to be stored at the job-site.

B. Promptly remove non-complying materials from the job-site and replace with materials meeting the requirements of this Section.

3.3 WORKMANSHIP

A. Produce joints which are tight, true and well nailed, with members assembled in accordance with the Contract Drawings and with pertinent Codes and Regulations.

B. Selection of Lumber Pieces:

1. Carefully select the members.

2. Select individual pieces to that knots and obvious defects will not interfere with placing bolts or proper nailing, and will allow making of proper connections.

3. Cut out and discard defects which render a piece unable to serve its intended function.

4. Lumber may be rejected by the City Engineer or Consultant, whether or not it has been installed, for excessive warp, twist, bow, crook, mildew, fungus or mold, as well as for improper cutting and fitting.

*3.4 GENERAL FRAMING

A. General: Execute rough carpentry in accordance with the Uniform Building Code wit the Los Angeles City 1992 Amendments, Divisions 25 and 48 as applicable.

1. In addition to framing operations normal to the fabrication and erection indicated on the Drawings, install wood blocking and backing required for the work of other trades.

2. Set horizontal and sloped members with crown up.

3. Do not notch, cut, or bore members for pipes, ducts, or conduits, or for other reasons except as shown on the Drawings or as specifically approved in advance by the Consultant or City Engineer.

4. Make proper allowances for shrinkage where possible.

5. Splicing between bearings not permitted.

6. The contact surfaces of any member coming in contact with an exterior concrete floor slab or footing or masonry wall regardless of height above ground shall be treated wood or shall be painted with two coats of an approved preservative.

B. Bearings:

1. Make bearings full unless otherwise indicated on the Drawings.

2. Finish bearing surfaces on which structural members are to rest as to give sure and even support.

3. Where framing members slope, cut or notch the ends as required to give uniform bearing surface.

C. Wall Sills and/or Ledgers:

1. Set level and in straight alignment.

2. All sills on uneven concrete bases to be set in beds of dry pack mortar as specified in Cast-In-Place Concrete in Section 03300.

3. Anchor to concrete as indicated on the Drawings.

*D. Stud Framing: (As Applicable)

1. Space studs 16-inches on center except where closer spacing is indicated or noted on the Drawings or is necessary at wall corners and openings. Space studs 12-inches on center behind ceramic tile wall surfacing.

2. Double studs at openings with inside studs cut to take headers.

3. Double top plate with joints lapped, at least 4-feet.

4. Place double headers on edge.

5. Lintels to be one piece full thickness of studs.

6. Strap studs together with substantial metal straps where sills or plates are cut to accommodate piping.

7. End studs of partitions adjoining masonry walls to be suitably bolted to masonry, as approved by the City Engineer or the Consultant.

E. Rafters and Ceiling Joists:

1. Space as indicated on the Drawings.

2. Splice only as indicated on the Drawings.

3. Tightly nail joints as indicated or as necessary.

4. Accurately set in place and nail securely to wall framing, beams and to hangers.

5. Level or slope bottom ceiling joists carefully.

6. Properly frame all openings in roof sheathing as indicated on the Drawings.

F. Wood Grounds:

1. Required: Continuous wood grounds for casings, base and other finish and as necessary for attachment of wood finish and millwork specified in Finish Carpentry and Custom Casework Sections.

2. Material: Douglas Fir, S4S.

3. Size: Not less than 1-1/4-inches wide, unless otherwise indicated on the Drawings of proper thickness for exact finish of plaster.

4. Install plumb, level, true to line and grade. Solidly wedged in positions to assure true planes of finished work. Securely nail to framing or to nailers set in masonry, as approved by the City Engineer.

G. Furring and/or Stripping (Where Occur):

1. Material: Douglas Fir Boards, S4S, sizes as noted on the Drawings.

2. Application:

a. Accurate spacing and straight alignment.

b. At right angles to framing or as otherwise indicated on the Drawings.

c. Securely nail to framing at every bearing with suitable box nails to masonry or concrete as indicated on Drawings or other fastening as approved by the City Engineer.

H. Parapet Walls: Construct to uniform height as indicated, make rigid, plumb and straight-line complete with block as necessary to receive sloping framing for eaves. Top surface of top plate shall slope towards flat roof area for drainage and make ready to receive subsequent work.

I. Eave Framing:

1. Size and spacing of joists shall be as indicated on the Drawings.

2. Joists shall be set in place with bottom surfaces carefully leveled and shall be securely anchored to exterior wall framing and to tile roof framing and make ready for lathing and plastering as indicated on the Drawings.

J. Roof Crickets and Saddles:

1. Materials: Douglas Fir Boards S4S for framing; softwood plywood Structural I C-C Exterior DFPA, 2-inch thick for sheathing.

2. Installation: As indicated on the Drawings to the established lines and grades or elevations to assure proper roof drainage. See Roof Plan and "Roof Sheathing" as hereinafter specified.

K. Roof Sheathing:

1. Material: Softwood plywood, Structural I C-C Exterior DFPA, size and of thickness indicated on the Contract Drawings.

2. Installation:

a. As indicated on the Contract Drawings.

b. Nail panels securely to supports in accordance with Nailing Schedule on the Drawings.

c. End Joints: Over and parallel to supports; stagger as indicated on the Drawings.

d. Nailing: As indicated in Nailing Schedule on Drawings. Nail plywood sheets tight and drive nails flush.

e. Cracks and Holes: Cover with sheet metal as necessary for application of roofing and waterproofing.

L. Roof Platforms for Mechanical and/or Electrical Equipment: Construct as indicated on the Drawings on top of the roof sheathing; make top plywood

surface level and ready to receive waterproofing felts, sheet metal covering and mechanical and/or other equipment.

M. Wood Curbs: Construct as detailed on the Drawings; make top of curb level, unless otherwise detailed.

N. First or Second Floor Sheathing: (As Applicable)

1. Material: Softwood plywood Structural I C-D, Interior DFPA (exterior glue).

2. Installation: Securely nail to supports in accordance with nailing schedule indicated on the Drawings. Drive nails tight and flush. Securely butt plywood edges to allow for proper installation of moisture barrier material and lightweight concrete fill.

O. Hose Tower Sheathing (Ladder Rest): (on Fire Department Projects)

1. Material: Softwood plywood, Structural I C-C Exterior DFPA, 3/4-inch thickness.

2. Installation: As indicated on the Drawings.

P. Wood Nailers:

1. Required: For cap of building masonry walls and elsewhere as noted on the Drawings.

2. Materials: Pressure treated lumber, sizes, and shapes as indicated on the Drawings.

3. Installation: In level position, tightly bolt in place with nuts or heads countersunk and make ready for receiving sheet metal copings; as indicated on the Drawings.

Q. Support Beams:

1. Required: As necessary and as indicated for support of steel and other items.

2. Material: Douglas Fir beams, sizes as indicated on the Drawings.

3. Fabrication and Installation: As indicated on the Drawings, securely anchor in place to floor or ceiling framing, and make ready to receive and support steel items.

R. Plywood Backing:

1. Required: For supports for Mechanical and/or Electrical equipment on walls.

2. Material: 3/4-inch plywood "B-D" grade; sizes as noted or indicated on the Drawings.

3. Installation: At location indicated on the Drawings; bolt to structural framing so as to bear weight of equipment; countersink all fasteners.

S. Wall Diaphragm Sheathing:

1. Required on inside surfaces of exterior wall framing and on interior partition framing where indicated on the Structural Drawings for lateral stability of walls.

2. Material: Plywood panels of size and thickness as noted on the Structural Drawings and specified in Paragraph 2.03 of this Section.

3. Installation: Panels shall be applied directly to stud framing with long dimension of panels horizontal and with all edges bearing against wood studs and blocking extending from floor up height as indicated. Panels shall be staggered. Nailing shall be as noted. Where panels contact intermediate studs nail panels thereto with nails at 10" O.C. or as otherwise directed by the City Engineer.

T. Attic Partitions:

1. Shall conform to the Uniform Building Code with the Los Angeles City 1992 Amendments, Section 3201.

2. Frame Partitions with 2-inch x 4-inch studs spaced not over 24-inches on center.

3. Solidly sheath partition, extending from ceiling below to underside of roof sheathing with 2-inch thick plasterboard or plywood, 24-inches on center securely nailed in place, or as otherwise detailed on the Drawings.

4. Each partition to have a self-closing door of the same construction as the partition, top hinged and latched at bottom with a screen door catch. Locate door at center of partition or as otherwise located on the Drawings.

5. Provide continuous catwalks along full length of attic spaces; shall be

two (2) 2-inch x 12-inch boards and secure to ceiling framing.

3.5 BLOCKING AND BRIDGING

A. Install blocking as required to support items of finish and to cut off concealed draft openings, both vertical and horizontal, between ceiling and floor areas.

B. Bridging:

1. Install wood cross bridging (not less than 2" x 3" nominal), metal cross bridging of equal strength, or solid blocking between joists where the span exceeds 8'-0".

2. Provide maximum distance of 8"-0" between a line of bridging and a bearing.
3. Cross bridging may be omitted for roof and ceiling joists where the omission is permitted by code, except where otherwise indicated on the Drawings.

4. Install solid blocking between joists at points of support and wherever sheathing is discontinuous. Blocking may be omitted where joists are supported on metal hangers.

3.6 ALIGNMENT

On framing members to receive a finished surface, align the finish subsurface to vary not more than 1/8" from the plane of surfaces of adjacent furring and framing members.

3.7 INSTALLATION OF PLYWOOD SHEATHING

A. Placement:

1. Place plywood with face grain perpendicular to supports and continuously over at least two supports, except where otherwise shown on the Drawings.

2. Center joints accurately over supports, unless otherwise shown on the Drawings.

B. Protect Plywood from moisture by use of waterproof coverings until the plywood in turn has been covered with the next succeeding component or finish.

3.8 FASTENING

A. General: Comply with provisions of the Uniform Building Code with the Los Angeles City 1992 Amendments, Table 25-Q in Division 25 and Table 48-C in Division 48 as applicable to Rough Carpentry.

B. Nailing:

1. Use only common wire nails or spikes of the dimension shown on the Nailing Schedule, except where otherwise specifically noted on the Drawings. Replacement or sinker nail is not allowed.

2. For conditions not covered in the Nailing Schedule, provide penetration into the piece receiving the point of not less than 2 the length of the nail or spike, provided, however, that 16d nails may be used to connect two pieces of 2" (nominal) thickness.

3. Nail without splitting wood.

4. Prebore as required.

5. Remove split members and replace with members complying with the specified requirements.

C. Bolting:

1. Drill holes 1/16" larger in diameter than the bolts being used.

2. Drill straight and true from one side only.

3. Do not bear bolt threads on wood, but use washers under head and nut where both bear on wood, and use washers under all nuts.

D. Screws:

1. For lag screws and wood screws, prebore holes same diameter as root of threads, enlarging holes to shank diameter for length of shank.

END OF SECTION

This page intentionally left blank

SECTION 07290
WATERPROOFING

PART ONE - GENERAL

1.1 SUMMARY

A. Provide all waterproofing where indicated or noted on the Contract Drawings and specified hereinafter, not limited to the following:

1. Waterproofing exterior concrete block walls below grade (hydrostatic pressure of 6-foot head).

2. Waterproofing exterior concrete block walls below grade (hydrostatic pressure of 12-foot head).

3. Waterproofing exterior building walls below grade (hydrostatic pressure of 6-foot head).

4. Waterproofing site retaining walls.

5. Dampproofing planter boxes at masonry walls below grade.

6. Waterproofing shower and drying room floors over slab on grade.

7. Waterproofing concrete entry canopies.

8. Waterproofing on parking deck.

9. Waterproofing membrane under all toilet rooms, shower stalls and drying rooms, and under mop drain troughs.

10. Waterproofing membrane over wood subfloors of drying and toilet rooms (except shower stalls).

B. Related Sections:

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS and Sections of GENERAL REQUIREMENTS in DIVISION 1 of these Specifications.

2. Moisture Barrier Over Wood Subfloor to Receive Lightweight Concrete Fill in DIVISION 3.

3. Preparation of Concrete Surfaces to Receive Work of this Section in Section 03300.

4. Wood Nailers in Section 06100.

5. Built-up Roofing in DIVISION 7.

6. Above grade Waterproofing Sealer Treatment of Masonry Walls in Section 07210.

7. Sheet Metal Work in Section 07600.

8. Caulking and Sealants in Section 07920.

1.2 QUALITY ASSURANCE

A. Use adequate numbers of skilled applicators who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

B. Use an applicator currently approved in writing by the manufacturer of the waterproofing system.

C. **Technical Services:** Contractor shall notify the manufacturer at least 72 hours prior to start of work to provide required technical services. Equipment used to apply the waterproofing material to be as prescribed by or meeting approval of the material manufacturer.

D. **Manufacturer's Certification:** Prior to start of waterproofing operations of this Section and during work progress, the manufacturer of the waterproofing material shall visit the job-site to inspect and shall certify the following:

1. That the surfaces to which the material was applied were in a condition suitable to receive the waterproofing materials.

2. That materials applied conform to the specified requirements.

3. That materials were applied in accordance with manufacturer's current recommendations.

1.3 SUBMITTALS

A. General: Comply with provisions in SUBMITTALS SECTION 01340 in DIVISION 1 - GENERAL REQUIREMENTS of these Specifications.

B. Certification: Upon completion of the work of this Section and as a condition of its acceptance, deliver to the City Engineer the certification required under the above paragraph 1.2D.

C. Applicator: Submit letter to the City Engineer or Consultant stating that the applicator is approved by the material manufacturer and that the work has been installed or applied in accordance with manufacturer's instructions, as shown or noted on the Contract Drawings and as hereinafter specified.

D. Manufacturer's Recommended Installation Procedures: When approved by the City Engineer, will become the basis for accepting or rejecting actual installation procedures used on the work.

E. Manufacturer's Specifications and other data needed to prove compliance with specified requirements.

F. Materials List of items to be provided under this Section.

1.4 EXTENDED GUARANTEES

A. Guarantee Period: Specified in Section 28 in GENERAL CONDITIONS shall be extended to two (2) years. Obtain written guarantees from each of the several applicators and file five (5) copies of same with the City Engineer or the Consultant as a prerequisite for final acceptance of the work.

1. Guarantee to be prepared by both the material manufacturer and the applicator.

2. Manufacturer shall further guarantee the material to perform as specified and in case of failure to perform within the guarantee period shall agree to furnish sufficient material to correct the failure without added cost to the City.

1.5 INSPECTION

A. Each applicator hereunder, in the company of the City Engineer's representative, before starting work, shall inspect and verify surfaces that are to receive waterproofing materials are in the following condition to receive work of this Section:

1. Concrete to be dry, smooth, free from loose material, rough spots, sharp projections and lumpy places, and that all pits, holes or cracks in concrete surfaces are filled with cement mortar to provide solid surface.

2. Should any deficiency appear, the City Engineer representative shall file a written report of same to the Contractor for correction before such waterproofing work commences.

1.6 PRODUCT HANDLING

A. Delivery and Storage:

1. Deliver waterproofing materials to the job-site in their unopened, sealed and original containers with all labels intact and legible at time of use, with manufacturer's name, brand name and batch number.

2. Store material where directed by the City Engineer in a safe, clean and dry and orderly area free from oily rags, waste and empty containers. Such materials shall be handled and stored in a manner to prevent damage or contamination.

B. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect the work and materials of all other trades.

C. Replacements: In the event of damage or contamination, immediately make all repairs and replacements necessary to the City Engineer's approval, at no added cost to the City.

1.7 CLEANING AND CLEAN-UP

A. Contractor shall not permit applicators to allow waste or debris to accumulate and shall have same removed from the job-site at frequent intervals. Comply with provisions of Section 01710 - CLEANING of the GENERAL REQUIREMENTS in DIVISION 1 of these Specifications.

B. Upon completion of work of this Section, thoroughly clean all non-related surfaces of any material splashed onto adjacent surfaces during work operations of this Section. Use cleaning materials and methods recommended by the waterproofing or damproofing material manufacturer. Remove all waste, debris, surplus materials, equipment, and tools co-incident with the specified work. Leave the premises and the job-site in a clean and

orderly condition.

PART TWO - PRODUCTS

2.1 GENERAL

*** A. Types (As applicable)**

1. Primer: Fed Spec. SS-A-710B, ASTM D41-73 Genstar Roofing Products Co. (Flintkote) No. 810-01 asphalt primer.

2. Waterproofing Asphalt: Fed. Spec. SS-A-666 Class A, temperature range 165 degree Fahrenheit to 175 degree Fahrenheit.

3. Protection Board: Fed. Spec. LLL-I-535A, minimum 2-inch thick, integrally asphalt treated cane fiber board as recommended by the waterproofing material manufacturer.

4. Reinforcement Felts: Fed. Spec. HH-R-595B, Type 15A, Style A, plain, asphalt saturated, 15-lb. weight, Genstar Roofing Products Co. "Saturated Felt".

5. Elastomeric Sheeting: 40 mil thick chlorinated polyethylene (CPE), "Chloraloy 240" manufactured by the Noble Co., Grand Haven, Michigan (local representatives phone (213) 981-8660).

6. Bonding Liquid (for Elastomeric Sheeting): Chlorinated polyethylene (CPE) solvent bonding liquid or Xylen.

7. Reinforcing Fabric: Fed. Spec. HH-C-466B, glass fabric.

8. Waterproofing Asphalt: ASTM D449.

9. Asphalt Emulsion: ASTM D1187-66, marine type asphalt-clay fibered emulsion, Genstar Roofing Products Co. (Flintkote) No. C-113-E.

10. Protective Sheet: 70-lb. similar and equal to Genstar Roofing Products Co. (Flintkote) "New Method Protective Sheet".

11. Reinforcing Paper: Sisalkraft building paper by Sisalkraft Building Paper Co., Chicago, Illinois.

12. Protection Panels: Maximum 2-inch X 4-foot X 8-foot panels of a ductile air blown asphalt fortified with inorganic mineral fibers heat pressure molded to specified thickness manufactured by Asphalt

Products Oil Corp. (A.P.O.C.), Long Beach, California.

a. Primer (A.P.O.C.) hot applied water repelling asphalt.

b. Asphalt (A.P.O.C.) hot applied water repelling asphalt.

13. Nails: 12-gage galvanized steel with 5/8-inch diameter head, length sufficient to penetrate wood minimum 3/4-inch.

2.2 SUMMARIES OF WATERPROOFING ASSEMBLIES

A. For Waterproofing Exterior Concrete Block Yard Walls Below Grade (Hydrostatic Pressure of 6-Foot Head):

1. 1 coat of primer (1 gal.) .....8 lbs./100 sq. ft.

2. First course of waterproofing.....25 lbs./100 sq. ft.

3. 2 layers of felt.....30 lbs./100 sq. ft.

4. Asphalt mopping between layers of felt and on top.....50 lbs./100 sq. ft.

5. Protection board.....57 lbs./100 sq. ft.
   TOTAL: 170 lbs./100 sq. ft.

B. For Waterproofing Exterior Concrete Block Yard Walls and Exterior Building Walls Below Grade (Hydrostatic Pressure of 12-Foot Head):

1. 1 coat of primer (1-1/2-gal.).....15 lbs./100 sq. ft.

2. First course of waterproofing
   (2 coats @ 3 gal. each coat) .....60 lbs./100 sq. ft.

3. 2 layers of reinforcement.....2 lbs./100 sq. ft.

4. Second course of waterproofing
   (2 coats @ 3 gal. each coat) .....60 lbs./100 sq. ft.

5. Protection board.....57 lbs./100 sq. ft.
   TOTAL: 187 lbs./100 sq. ft.

NOTE: Use cold applied method in tight spaces as may be governed by CAL/OSHA.

C. Waterproofing site retaining walls:

1. Asphalt emulsion primer (1-1/2-gallons).....15 lbs./100 sq. ft.

2. Course of emulsion .....40 lbs./100 sq. ft.
   TOTAL: 55 lbs./100 sq. ft.

D. Waterproofing Building Exterior Walls and Yard Walls Below Grade (Hydrostatic Pressure of 6-Foot Head):

Cold Applied Method:

1. Asphalt Emulsion (2 strength) as primer .....15 lbs./100 sq. ft.

2. First course of asphalt emulsion (3 gallons).....30 lbs./100 sq. ft.

3. Layer of reinforcement fabric .....1 lbs./100 sq. ft.

4. Second course of asphalt emulsion (3 gallons).....30 lbs./100 sq. ft.

5. Layer of reinforcement fabric ..... 1 lb./100 sq. ft.

6. Third course of asphalt emulsion (3 gallons)..... 30 lbs./100 sq. ft.
   TOTAL: 107 lbs./100 sq. ft.

Or

Hot Applied Method

1. 1 coat of primer (1-1/2 gal.).....15 lbs./100 sq. ft.

2. First course of waterproofing (3 gallons) .....30 lbs./100 sq. ft.

3. Layer of reinforcement fabric ..... 1 lb./100 sq. ft.

4. Second course of waterproofing (3 gallons).....30 lbs./100 sq. ft.

5. Second Course of Reinforcement Fabric ..... 1 lb./ sq. ft.

6. Third Course of waterproofing (3 gallons) ..... 30 lbs./100 sq. ft.
   TOTAL: 107 lbs./100 sq. ft.

E. Dampproofing Planter Boxes at Masonry or Concrete Walls Below Grade:

1. Asphalt Emulsion Primer.....15 lbs./100 sq. ft.

2. Course of Emulsion..... 40 lbs./100 sq. ft.
55 lbs./100 sq. ft.

F. Waterproofing Membrane Under Toilet Rooms Shower Stalls, Drying Rooms and Under Mop Drain Troughs:

1. One layer of 15-lbs. asphalt saturated felt.

2. Layer of elastomeric sheeting (CPE)

***NOTE**: Use cold applied method in tight spaces as may be governed by CAL/OSHA.

G. Waterproofing Membrane Over Wood Subfloor in Drying and Toilet Rooms (Except in Shower Stalls):

1. Two layers of felt.

2. Asphalt mopping between layer of felt and fabric.

3. Layer of fabric.

4. Asphalt mopping.

5. Layer of reinforcing felt.

PART THREE - EXECUTION

3.1 SURFACE CONDITIONS

A. Examinations Required: All surfaces to receive waterproofing materials by the material applicator, to be clean, free of dirt, foreign materials and surface defects which would impair the proper application of materials. Comply with provisions hereinbefore specified in Subsection 1.5 - INSPECTION of this Section.

B. Preparation of Surfaces: Perform or arrange for all remedial work to be executed prior to start of work of this Section. Start of work of this Section shall imply Contractor's acceptance of surface conditions as meeting requirements for the specified work.

3.2 COORDINATION

A. Required: Work of this Section shall be coordinated with other trades to assure proper and adequate provisions in the work of those trades for interface with work of this Section.

3.3 PROTECTION

A. Required: Below grade waterproof concrete and/or masonry wall surfaces prior to backfilling operations.

B. Material: Install specified protection board against such vertical wall surfaces.

3.4 WATERPROOFING EXTERIOR CONCRETE BLOCK YARD WALLS BELOW GRADE

A. Required: Below finish grade on block surfaces down to concrete foundation against which backfill will be placed.

NOTE: Where working in tight spaces use cold applied method as governed by CAL/OSHA.

* **B. Application:**

1. By an applicator authorized by waterproofing manufacturer, in accordance with manufacturer's specifications.

2. Extend waterproofing from bottom of footing to finish grade; not to be exposed above finish grade.

3. Prime concrete foundation and concrete block wall surfaces with asphalt emulsion primer at rate of 1 2 gallon per 100 square foot of surface; allow to dry thoroughly.

4. Brush apply cold asphalt emulsion to surfaces at rate of three gallons per 100 square foot.

   or

   Hot-mop-prime surfaces with asphalt at temperature of not less than 375 degrees F. or not more than 450 degrees F.

5. On vertical wall angles, angles at footings, and/or offsets embed in

emulsion or hot asphalt 12-inch-wide layer of reinforcing fabric extending 6-inches from the angle or corner.

6. Embed two layers of felt in hot asphalt or cold asphalt emulsion with sheets lapped 19-inches leaving 17-inches exposure, begin at top of footing and extend to within 6-inches of finish grade. Secure top edge of felt to wall with concrete nails through tin discs spaced 6-inches on center.

   NOTE: Where there is a 12 ft. hydrostatic pressure head, apply 3 layers of feet in lieu of 2 layers.

7. Seal perimeter edges of felts with three layers of glass fabric embedded in 1/4-inch thick layers of troweled on flashing compound (roofing cement). Coat the third layer with 1/8-inch thick layer of flashing compound. Extend seal 6-inches onto reinforcing felts and 6-inches out on block wall surfaces, as directed by the waterproofing material manufacturer.

8. Hot-mop-in-place specified protection board with smooth surface against the wall surface, extend the protection board from top of footing up to finish grade, embed in coat of asphalt emulsion. Protection board shall not be exposed above grade.

3.5 WATERPROOFING SITE RETAINING WALLS

A. Required: Where noted on the Contract Drawings.

B. Materials: As hereinbefore specified.

C. Application:

1. Primer: Brush or spray apply asphalt emulsion primer at rate of 1-1/2 gallons per 100 square foot, thinned with not more than 20 percent cool, clean water, and allow to thoroughly dry.

2. Emulsion course: Brush or spray apply emulsion at rate of four gallons per 100 square foot in uniform manner and allow to dry thoroughly before backfill is placed.

3. All applied in accordance with material manufacturer's printed directions.

3.6 DAMPPROOFING PLANTER BOXES AT MASONRY OR CONCRETE WALLS BELOW GRADE

A. Required: Where noted on the Drawings.

B. Materials: As hereinbefore specified.

C. Application: Butt installation method in accordance with manufacturer's instructions.

1. Extend waterproofing from top of footing to finish grade, not to be exposed above finish grade.

2. Prime top of footing and vertical wall surfaces with specified primer at rate of one (1) gallon per 100 to 150 square feet maximum, then hot mop with specified waterproofing asphalt at rate of 20-lbs. per 100 sq. ft. of surface.

3. Prime back side of protection panel and footing angles and while asphalt primer is still hot set footing angles in place followed by an application of protection panel and butt edges squarely up to adjacent footing angles and protection panels edges.

4. Back mop at joints of protection panels and at corners with a minimum 10-inch wide strip of hot asphalt and embed therein 8-inch wide batten strips (protective panels) over all joints and corners.

3.7 WATERPROOFING MEMBRANE UNDER TOILET ROOM, SHOWER STALLS, DRYING ROOMS AND UNDER MOP DRAIN TROUGHS

***NOTE:** This can be used for janitor slop sink construction.

A. Required: Where noted on the Drawings.

B. Materials: Felt, Elastomeric Sheeting and Bonding Liquids as hereinbefore specified.

C. Application: By an applicator authorized by the material manufacturer, in accordance with the manufacturer's specifications.

1. Apply a single layer of 15-lbs. asphalt-saturated felt, shingle method with 4-inch side and end laps and turn up felt 9-inches on vertical surfaces.

2. Install the CPE sheet liner over the felt and turn the sheet 9-inches up on all side walls. Use folded corner on all interior corners and prefab corner on all exterior corners. Secure the liner to the side walls with nails or staples 2-inch from the top edge.

3. Where necessary to nail the elastomeric sheet liner below the water line or in any critical area, cut a 2-inch x 2-inch piece of elastomeric sheeting and weld it to the elastomeric sheeting over the nail head as hereinafter specified for the welding of the seams of the elastomeric sheeting material.

4. Bond lapped joints of elastomeric sheeting material with application of specified liquid bonding material on both surfaces to be joined and press together while bonding material is still moist, lap joints in direction of watershed towards floor drain(s). End and side laps shall be minimum 2-inches.4

5. Fit the floor drain clamping ring in place by pressing on top of the elastomeric sheeting material to indicate the outline of the drain opening. Cut an opening in the membrane materials to expose the drain opening. Bolt the drain opening clamping ring in place firmly over the membrane material to make a waterproof seal.

D. **Test:** Test the completed waterproofing membrane by plugging the drains and filling the shower stall or mop drain trough with water to height of finish floor, shower stall curb, or drain trough curb or finish floor level. There shall be no evidence of leakage during a four hour period with waterproofed areas remaining full of water.

E. **Protection:** Upon completion of the waterproofing membrane, completion of testing, temporarily protect such surfaces with a covering of 15-lb. asphalt saturated felt loosely laid in place until such time subsequent tile work is applied.

***NOTE:** Specified, waterproofing membrane not required for toilet rooms over slabs on grade.

3.8 WATERPROOFING MEMBRANE ON PARKING DECKS

A. **Required:** Between structural parking deck slab and concrete wearing course from line.

B. **Materials:** As hereinbefore specified.

C. Application:

1. Concrete Surface: Smooth and free from rough spots and sharp projections, dry and swept clean.

2. Drains: Properly seal membrane around drains; fill base of ring with plastic cement; install ring over membrane and tighten while asphalt is warm.

3. Reinforcing Strips: Coat the walls and 12-inches out on deck with asphalt primer and allow to dry. Coat the primed area with flashing compound and apply two layers of membrane dampcourse; the first layer shall start 12-inches out on roof surface and 10-inches for second layer extending up full height of recess; apply the membrane assembly over these strips of dampcourse. After membrane is laid, apply two additional strips of membrane dampcourse starting 10-inches out on membrane for first layer, 8-inches for second layer, and extending the full height of recess. Apply each strip in flashing compound 1/8-inch thick. Nail strips 18-inches on centers on upper edge with concrete nails driven through tin discs to wall in recess. Coat the top and bottom of membrane in contact with reinforcing strips with flashing compound and exposed surface of strips 1/8-inches thick.

4. Membrane Assembly: Apply each layer separately over the roof deck surface, roll, and broom into place. Do not allow asphalt to remain on either the outside surfaces of top or bottom layers or the assembly. Mop the membrane solid and even with asphalt between layer starting with two layers of membrane dampcourse, follow with one layer of No. 30 asphalt felt, and two layers of dampcourse. Lap all layers 2-inches on sides and 4-inches on ends, with end laps not less than 2-feet apart; trim all layers flush with vertical surfaces.

5. Protective Sheet: After the finished membrane is approved and accepted, apply the protective sheet dry with mica surfaced side down lapped 4-inches on sides and 8-inches on ends; seal laps only with hot asphalt.

6. Expansion Joints: As indicated on the Drawings.

3.9 WATERPROOFING MEMBRANE OVER WOOD SURFACES

A. Required: Under tile floors in Drying and Toilet Rooms and elsewhere noted (except in shower stalls).

B. Materials: As hereinbefore specified.

C. Application:

1. Clean wood subfloors of dirt, loose and foreign materials and properly set all nail heads.

2. Spot mop and shower nail (at 12-inches on center) first layer of felt, lay shingle fashion with 4-inch side and end laps embedded in hot asphalt.

3. Hot mop in place 2nd layer of felt, lay as above specified, stagger side and end laps in relationship to that of previous layer of felt.

4. Hot mop in place one layer of fabric specified for felts with side and end laps staggered.

5. Hot mopping: Each mopping shall use not less than 25 lbs. of asphalt per 100 sq. ft. of floor and wall area and applied at temperatures between 375 degrees F. and 450 degrees F.

6. Turn up waterproofing onto walls and/or up and over curb surfaces, secure to wood plate at 12-inch centers with nails through tin caps; make corners watertight by folding of felts, fabrics and reinforcing paper.

3.10 WATERPROOFING CONCRETE ENTRY CANOPY

A. Required: Complete waterproofing over the entire roof area of the concrete entry canopy and as indicated on the Drawings, including flashing to the steel support members.

B. Application: By the manufacturer of the product or by an approved applicator authorized by the manufacturer, in accordance with the manufacturer's printed instructions on properly prepared, clean, dry surfaces; 40 mil. thickness minimum. Color shall be white. Make complete application, smooth and even in surface and color.

END OF SECTION

SECTION 07900
JOINT SEALANTS

PART 1 - GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the work as indicated on the Drawings and specified herein.

B. This section covers all joint sealant as specified herein and shown on Drawings.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 03290 Joints in Concrete

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference specifications of the GENERAL REQUIREMENTS.

B. Federal Specifications:

TT-S-001543A	Sealing Compound, Silicone Rubber Base, (Calking, Sealing and Glazing in Buildings and Other Structures).
TT-S-00230C(2)	Sealing Compound, Elastomeric Type, Single Component, (For Calking, Sealing, and Glazing in Buildings and Other Structures).

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. The following submittals and specific information shall be provided.

1. Product Data: Surface preparation and installation instructions.

2. Samples: Material proposed for use showing color range available, and marked with the manufacturer's name and product identification.

3. Quality Control Submittals:

C. Applicator Qualification: Documentation showing minimum of 5 years experience installing sealants in projects of similar scope.

D. Certificates of Compliance: Proposed materials meet Specification requirements.

1. Contract Closeout Submittals: Guarantee.

1.5 QUALITY ASSURANCE (NOT USED)

1.6 PRODUCT HANDLING

A. Deliver sealants to the jobsite in sealed containers, each bearing manufacturer's name and product designation.

B. Store and protect sealant products from damage, deterioration, and contamination in accordance with manufacturer's written recommendations.

1.7 ENVIRONMENTAL CONDITIONS

A. Ambient Temperature: Between 40 and 80 degrees F (4 and 27 degrees C) when sealant is applied.

1.8 GUARANTEE

A. Sealed Joints: Against adhesive and cohesive failure of sealant and for watertightness of sealed joints for a period of 5 years after date of final completion of sealants.

PART 2 -- PRODUCTS

2.1 MATERIALS

A. Like Items of Materials: End products of one manufacturer to achieve standardization for appearance, maintenance, and replacement.

B. CONTRACTOR Option: Immersible sealant may be substituted for nonimmersible sealant of the same material.

C. Characteristics:

1. Uniform, homogeneous.

2. Free from lumps, skins, and coarse particles when mixed.

3. Nonstaining, nonbleeding.

4. Hardness of 15 minimum and 50 maximum, measured by Method ASTM C 661.

2.2 SEALANT MATERIALS

A. Type 1 - Silicone, Nonsag, Not Immersible:

1. Silicone base, single-component, chemical curing; ASTM C 920, Type S, Grade NS, Class 25; Federal Specification TT-S-001543, nonsag type, Class A;

2. Capable of withstanding movement up to 50 percent of joint width.

3. Manufacturer: Dow Corning Corp. No. 790; General Electric Silpruf; or equal.

B. Type 2 - Multi-Part Polyurethane, Self-Leveling, Immersible:

1. Polyurethane base, multi-component, chemical curing; ASTM C 920, Type M, Grade P, Class 25 and Federal Specification TT-S-00227, self-leveling Type I, Class A.

2. Capable of being continuously immersed in water.

3. Manufacturer: Pecora Corp. Urexpan NR-200; Lym Tal Iso-Flex 880GB; or equal.

C. Type 3 - Multi-Part Polyurethane, Nonsag, Immersible:

1. Polyurethane base, multi-component, chemical curing; ASTM C 920, Type M, Grade NS, Class 25 and Federal Specification TT-S-00227, nonsag Type II, Class A.

2. Capable of being continuously immersed in water.

3. Manufacturer: LymTal Iso-Flex 881; or equal.

D. Type 4 - Multi-Part Polyurethane, Nonsag, Not Immersible:

1. Polyurethane base, multi-component, chemical curing; ASTM C 920, Type M, Grade NS, Class 25 and Federal Specification TT-S-00227, nonsag Type II, Class A.

2. Manufacturer: Pecora Corp. Dynatrol II; Tremco Dymeric; LymTal Isoflex 2000; or equal.

E. Type 5 - One-Part Polyurethane, Immersible:

1. Polyurethane base, single-component, chemical curing; Federal Specification TT-S-00230, Type I or II, Class A.

2. Capable of being continuously immersed in water, withstand movement of up to 25 percent of joint width.

3. Manufacturer for Nonsag: Sika Chemical Corp., Sikaflex-1A; equal.

4. Manufacturer for Self-Leveling: Sika Chemical Corp. Sikaflex-1C SL; or equal.

F. Type 6 - One-Part Polyurethane, Not Immersible:

1. Polyurethane base, single-component, chemical curing; ASTM C 920, Type S, Grade NS, Class 25 and Federal Specification TT-S-00230, nonsag Type II, Class A.

2. Manufacturer: Pecora Corp. Dynatrol I; Tremco Dymonic; or equal.

G. Type 7 - Multi-Part Polysulfide, Immersible:

1. Polysulfide base, two-component, chemical curing; ASTM C 920, Type M, Grade P or NS, Class 25 and Federal Specification TT-S-00227, Type I self-leveling, Type II nonsagging, Class A, uniform, homogeneous and free from lumps, skins, and coarse particles when mixed.

2. Capable of being continuously immersed in water.

H. Type 8 - One-Part Polysulfide, Nonsag, Not Immersible:

1. Polysulfide base, single-component, chemical curing; ASTM C 920, Type S, Grade NS, Class 12 1/2; Federal Specification TT-S-00230, Type II nonsag, Class A;

2. Capable of withstanding movement up to 20 percent of joint width.

3. Manufacturer: Sika Chemical Corp. Sikaflex 440; or equal.

I. Type 9 - One-Part Acrylic Terpolymer, Nonsag, Not Immersible:

1. Acrylic base, single-component, solvent curing; Federal Specification TT-S-00230, Type I nonsag, Class B.

2. Capable of withstanding movement up to 7.5 percent of joint width; Shore "A" hardness of 55 maximum.

3. Manufacturer: Tremco Mono; or equal.

2.3 BACKUP MATERIAL

A. Nongassing, extruded, closed-cell round polyethylene foam rod, compatible with sealant used, and as recommended by sealant manufacturer.

B. Size: As shown or as recommended by sealant material manufacturer. Provide for joints greater than 3/16-inch wide.

C. Manufacturer: Haveg Industries Minice; Dow Corning Ethafoam SB; or equal.

2.4 BOND BREAKER

A. Pressure Sensitive Tape: Recommended by sealant manufacturer to suit application.

2.5 JOINT CLEANER

A. Noncorrosive and nonstaining type, recommended by sealant manufacturer; compatible with joint forming materials.

2.6 PRIMER

A. Nonstaining type recommended by sealant manufacturer to suit application.

2.7 SEALANT COLOR

A. Unless specifically noted, match the color of the principal wall material adjoining the area of application.

2.8 TAPE SEALANT

A. Closed cell polyvinyl chloride (PVC) foam coated on both sides with a modified acrylic pressure-sensitive adhesive.

B. Color: Black.

C. Size: 3/4-inch width by length as required by thickness as recommended by manufacturer, for particular application.

D. Properties:

1. Tensile Strength (ASTM D 412, Die C): 80 psi.

2. Elongation (ASTM D 412, Die C): 125 percent.

3. Compression Set (ASTM D 1056): 30 percent max.

4. Compression Deflection (ASTM D 1056) at 25 Percent Deflection: 2.5 psi.

5. Low Temperature Flexibility, 5 Hours at -40 Degrees F: No cracking.

6. Heat Resistance/Maximum Shrinkage, 70 Hours at 212 Degrees F: 1.5 percent.

7. Staining (ASTM D 925) on Most Substrates: None.

8. Water Absorption by Weight at 30 Percent Compression: 24 percent.

9. Density per Cubic Foot (ASTM D 3574): 10 pounds.

10. Thermal Conductivity (k factor): 0.24.

2.9 PREFORMED SEALS

A. Preformed Compressible Joint Seals:

1. Widths Up to 5-Inches: Watson-Bowman Acme, Inc., Buffalo, NY, Wabo-Series; LymTal Isoflex Neoprene Seal, LS-Series, Pontiac, MI; or equal.

2. Other Widths: Series or model recommended by seal manufacturer.

PART 3 -- EXECUTION

3.1 GENERAL

A. Use of more than one material for the same joint is not allowed unless approved by the sealant manufacturer.

B. Install joint sealants in accordance with ASTM C 962.

C. Horizontal and Sloping Joints of 1 Percent Maximum Slope: Use self-leveling (Grade P) joint sealant.

D. Steeper Sloped Joints, Vertical Joints, and Overhead Joints: Use nonsag (Grade NS) joint sealant.

E. Use joint sealant as required for the appropriate application and as follows:

Joint Size	Sealant Type
Less than 1-inch	1,2,3,4,5,6,7,8, or 9
Less than 2-inch	1,2,3,4, or 7
Over 2-inch	As per manufacturer's recommendation

3.2 PREPARATION

A. Verify that joint dimensions and physical and environmental conditions are acceptable to receive sealant.

B. All surfaces to be sealed shall be dry, sound, and free of dust, loose mortar, and other foreign materials.

1. Mask adjacent surfaces where necessary to maintain neat edge.

2. Starting of work will be construed as acceptance of all subsurfaces.

C. Verify that joint shaping materials and release tapes are compatible with sealant.

D. Examine joint dimensions and size materials to achieve required width/depth ratios.

3.3 INSTALLATION

A. Use joint filler to achieve required joint depths, to allow sealants to perform intended function.

1. Install backup material as recommended by sealant manufacturer.

2. Where possible, provide full length sections without splices; minimize number of splices.

B. Use bond breaker where recommended by sealant manufacturer.

C. Apply sealant within environmental conditions stated above.

1. Consult manufacturer when sealant cannot be applied within these temperature ranges.

D. Seal all joints around window, door and louver frames, expansion joints, and elsewhere as indicated.

E. Joint Sealant Materials: Follow manufacturer's recommendation and instructions, filling joint completely from bottom to top, without voids.

F. Joints: Tool slightly concave after sealant is installed.

1. When tooling white or light color sealant, use a water wet tool.

2. Finish joints free of air pockets, foreign embedded matter, ridges, and sags.

G. Tape Sealant: Locate where indicated and install in accordance with manufacturer's instructions.

3.4 PREFORMED SEALS

A. Prepare joint surfaces clean and dry, free from oil, rust, laitance, and other foreign material.

B. Construct joints straight and parallel to each other and at the proper width and depth.

C. Install within environmental conditions stated above.

D. Apply joint sealant manufacturer's approved primer and adhesive in accordance with manufacturer's instructions.

E. Install seal in accordance with manufacturer's instructions.

3.5 CLEANING

A. Clean surfaces next to the sealed joints of smears or other soiling resultant of sealing application.

B. Replace any damaged surfaces resulting from joint sealing or cleaning activities.

C. Clean up and dispose of all waste materials and debris resulting from this operation off the site.

3.6 JOINT SEALANT SCHEDULE

A. This schedule lists the sealant types acceptable for each joint location. Use as few different sealant types as possible to meet the requirements of this project.

Joint Location	Sealant Type(s)
1. Expansion/Contraction and control Joints at:	
Concrete Walls	1,3,4,5,6,7
Concrete Floor Slabs	2,5
2. Other Joints:	
Threshold Sealant Bed	5
Immersed Concrete (Vertical and Sloped)	3,5
Immersed Concrete (Horizontal)	2,5
Concrete Form Snap-Tie Holes	1,4,6

SECTION 07920
CAULKING AND SEALANTS

PART 1 -- GENERAL

1.1 SUMMARY

A. Throughout the Contracted Work furnish all tools, equipment, materials, and supplies and perform all labor to provide a positive barrier against passage of air or moisture from the exterior.

1. Caulk and Seal around entire exposed perimeters of all penetrations and openings through walls and for slabs on grade where any item is installed in the opening or through the penetrations.

2. Caulk and seal the sheet metal flashings and other items penetrating through the roof.

B. Related Sections:

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS and Sections in DIVISION 1 - GENERAL REQUIREMENTS of these Specifications.

1.2 QUALITY ASSURANCE

A. Reference Standards:

1. All materials specified herein shall conform to the requirements of the publications hereinafter listed, to the extent that the requirements therein specified are not in conflict with the provisions of this Section.

2. References to "ANSI Standards" shall mean the American National Standards Institute Publication A116.1-1967 "Two Component Elastomeric Sealing Components for the Building Trade".

B. Qualifications of Manufacturers: Products used in the work of this Section shall be produced by manufacturers regularly engaged in the manufacture of similar items and with a history of successful production acceptable to the City Engineer or the Consultant. Manufacturer shall have been on business

of manufacturing the specified types of Sealants for not less than 10 years.

C. Qualification of Installers:

1. Installers shall be thoroughly trained and experienced in the necessary skills and be thoroughly familiar with the specified requirements and shall have a minimum of 5 years experience installing caulking and sealants.

2. Installers shall be completely familiar with the joint details shown on the Contract Drawings and installation requirement hereinafter specified in this Section.

1.3 SUBMITTALS

A. Manufacturer's Data: Comply with provisions in the SUBMITTALS SECTION 01340 in DIVISION 1-GENERAL REQUIREMENTS of these Specifications.

1. Submit within 45 days after execution of the Contract:

a. A complete materials list showing all items specified to be furnished and installed under this Section.

b. Sufficient data to demonstrate that all materials meet or exceed the specified requirements.

c. Specification, installation instructions and general recommendations from manufacturer showing procedures under which it is proposed that materials will be installed.

d. Upon approval by the City Engineer or the Consultant, the proposed installation procedures will become the basis for inspection and acceptance or rejection of actual installation procedures used on the work.

B. Samples: Submit separate samples for each type of caulking or sealant material, together with manufacturer's data, all as necessary to fully demonstrate functional and service ability characteristics that comply with the specified requirements. Obtain approval prior to delivery of materials to the job-site for material substitutions. Samples of the sealant in concrete construction expansion joints shall be applied between 1-inch thick concrete blocks to the full size and shape of sealant in the joints indicated. Conform to the provisions of MATERIALS, SAMPLING AND TESTING of Section 31 in the GENERAL CONDITIONS of these Specifications.

1.4 GUARANTEE

A. Guarantee: The guarantee period specified in Section 28 of the GENERAL CONDITIONS of these Specifications shall hereby be extended to two (2) years. Contractor shall provide the City Engineer with a written guarantee against any inherent or developed defects in material or in installation and file five (5) copies of same with the City Engineer or the Consultant as a prerequisite for final acceptance of the work.

B. Warranty shall further state that installed sealants are warranted against the following:

1. Water leakage through sealed joints.

2. Adhesive or co-adhesive failure of sealant.

3. Staining of adjacent surfaces caused by migration of sealant or primer.

4. Chalking or visible color changes of the cured sealant.

1.5 DEFECTIVE WORK

A. Work will be adjudged defective by the City Engineer or the Consultant if leakage results from failure of sealant or caulking to bond to adjacent work or if it hardens, cracks, shrinks, or runs or stains adjacent work.

B. Remove defective work, clean joints and install new caulking and/or sealant materials as approved by the City Engineer or the Consultant at no added cost to the City.

1.6 PRODUCT HANDLING

A. Delivery and Storage: Deliver all materials of this Section to the job-site in their original unopened or unbroken containers with all labels intact and legible at time of use. Store only under conditions recommended by the manufacturer concerning shelf life, temperature humidity, ensuring the fitness of the material when installed. Do not retain on the job-site any material which has exceeded the manufacturer's recommended shelf life.

B. Protection: Use all means necessary to protect the materials of this Section before, during and after installation and to protect work and materials of other trades.

C. Replacements: In the event of damage, immediately make all repairs and replacements necessary to the approval of the City Engineer or the Consultant, at no added cost to the City.

PART TWO - PRODUCTS

2.1 SEALANTS

A. Type of Sealants:

1. Asphalt Sealant shall conform to Federal Specifications SS-S-1614 (1), EDOCO Technical Product No. 3060 or Burke's No. 400 Sealing Compound.

2. Elastomeric Joint Sealant: Federal Specification TT-S-00227E (3) for 2-part rubber base sealant or Federal Specification TT-S-230A for 1-part synthetic rubber base sealant.

a. Use "Class A" sealant for non-traffic bearing horizontal surfaces.

b. Use "Class B" sealant for vertical surfaces.

B. Sealant Colors:

1. Colors for each sealant installation will be selected by the City Engineer or the Consultant from standards colors normally available from the manufacturer. Should such standard color is not available from the approved manufacturer except at additional charge, provide all such colors at no additional cost to the City.

2. In concealed installations and in partially or full exposed installations, where so approved by the City Engineer or the Consultant, use standard gray or black sealant.

2.2 CAULKING MATERIALS

A. Caulking Compound: W.R. Grace & Co. "Hornflex Standard Gun Grade" or "Thiokol" approved polysulfide sealant for all other joints including miscellaneous vertical joints, exterior door, window and louver frames, etc.

B. Caulking Stop: Polyurethane for open joints of size 1-1/2 times the joint width opening and depth no more than 3/8 inch for sealant bite.

C. Oakum: Untarred, picked (loose), fine hemp fibers.

*2.3 BACKUP MATERIALS FOR SEALANTS

A. Primers and Bond Breakers: As recommended by the sealant manufacturer in their published instructions.

B. Backer Rods and Other Backing Materials: Type as recommended by the Sealant manufacturer.

1. Closed-cell resilient urethane or polyvinyl chloride foam;

2. Closed-cell polyethylene foam;

3. Closed-cell sponge of vinyl or rubber;

4. Polychoroprene tubes or beads;

5. Polyisobuthlene extrusion;

6. Oil-less dry jute.

C. Filler for Use with Asphalt Sealant: Asphalt impregnated, as per ASTM D 1715.

D. Filler of Use with Elastomeric Sealer: Plain type as per ASTM D 1752 Type II or Type III.

E. Surface Covers: (Where Simple bond-prevention is necessary).

1. Polyethelene Tape, pressure-sensitive adhesive, required only to hold tape to the construction material.

2. Aluminum foil conforming to MIL-SPEC-MIL-A-148E

3. Heavy wax paper conforming to Fed. Spec. UU-P-270

F. Other Materials: All other materials, not specifically described but required for complete and proper caulking and installation of sealants, shall be first quality of their respective kinds as selected by the Contractor subject to the approval of the City Engineer or the Consultant.

PART THREE - EXECUTION

*3.1 INSPECTION AND INSTRUCTIONS

A. Manufacturer's Inspection: Just prior to start of application of each type sealant, provide initial instructions at start of work in order to verify if physical conditions are proper in order to properly instruct applicators and that supervision provided is by qualified personnel handling such materials.

B. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to the proper and timely completion of the work. Do not proceed until detrimental conditions have been corrected.

C. Contractor to notify the manufacturer at least 72 hours prior to time inspection is required.

D. Failure or refusal of manufacturer to provide inspection and supervision shall constitute grounds for non-acceptability of materials manufactured, even though specified hereinafter in this Section.

E. Applicator shall report to the Contractor any detrimental conditions impairing the proper installation of such materials. Contractor shall correct all such detrimental conditions to the full satisfaction of the City Engineer or the Consultant or the Inspector at no added cost to the City.

3.2 WORKMANSHIP

A. Application: In strict accordance with ASTM C-962 and ASTM C-1193 and manufacturer's instructions and supervised by the manufacturer's approved applicator. Manufacturer to provide field assistance to insure proper mixing of sealants, cleaning of surfaces, and application of materials.

B. Cleaning: Immediately remove caulking and/or sealant materials from adjacent surfaces not specified to receive sealant, and/or caulking materials. Leave work in a condition satisfactory to the City Engineer or the Consultant.

C. Protection: Carefully protect adjoining surfaces from staining. Carefully provide necessary strippable masking where required to limit extent of caulking and sealant material application.

3.3 PREPARATION (As Applicable)

A. Joint Cleaning: Joints shall be free of foreign materials full depth of joint. Joint

surfaces to be clean, dry and free from grease, oil, wax or other foreign matter, which would tend to destroy or impair adhesion. Clean surfaces in accordance with manufacturer's instructions.

B. Priming: Joint surfaces to be primed in accordance with sealant manufacturer's instructions.

C. Steel Surfaces:

1. Steel surfaces in contact with sealant shall be sandblasted or scraped or wire-brushed to remove mill scale.

2. Use solvent to remove oil and grease, wiping the surfaces with clean rags.

3. Remove protective coatings on steel by sandblasting or by a solvent that leaves no residue.

*D. Aluminum Surfaces:

1. Surfaces in contact with sealant shall be cleaned of temporary protective coatings, dirt, oil and grease.

2. When masking tape is used as a protective cover, remove tape just prior to application of sealant.

3. Use only such solvents to remove protective coatings as recommended for that purpose by the aluminum manufacturer, and which are non-staining.

*E. Concrete and Ceramic Tile Surfaces:

1. All contact surfaces shall be dry, sound, well brushed and wiped free from dust.

2. Use solvent to remove oil and grease, wiping the surfaces with clean rags.

3. Treated surfaces shall have the surface treatment removed by sandblasting or wire brushing.

4. Remove all laitance and mortar from the joint cavity.

5. Where backstop is required, insert an approved backup material into the joint cavity to required depth.

3.4 INSTALLATION OF BACKUP MATERIAL

Use only the backup materials recommended by the Sealant manufacturer and approved by the City Engineer or the Consultant for the particular installation, compressing the backup material 25% to 50% to secure a positive and secure fit. When using backup of tube or rod stock, avoid lengthwise stretching of material. Do not twist or braid hose or rod backup stock.

1. Sealant bite 1/8" to 2" but never more than 2 to 1/4 of joint width.

2. Use foam backup rod or bond breaker tape to minimize joint configuration.

3.5 PRIMING

Use only the primer recommended by the Sealant Manufacturer and approved by the City Engineer or the Consultant for the particular installation. Apply primer in strict accordance with manufacturer's recommendations as approved by the City Engineer or the Consultant.

3.6 SCHEDULE

A. Elastomeric Caulking Joint Compound: Use in expansion and contraction joints where limited movement is anticipated and areas where general caulking is required.

B. Multi-Part Sealant: Use in expansion and construction joints and all joints in all concrete walking surfaces where indicated or noted on the Contract Drawings and/or specified in the Specifications.

3.7 INSTALLATION SEALANTS

A. General: Prior to start of installation in each joint, verify the joint type according to Contract Drawing Details and that the required proportion of width to depth of joint has been secured.

B. Equipment: Apply sealants under pressure with hand or power actuated gun or other appropriate means. Guns shall have nozzle of proper size and shall provide sufficient pressure to completely fill joints as designed.

*C. Application:

1. Caulking performed under other Sections of these Specifications shall

comply with all of the following requirements unless specific changes are specified in those other Specification Sections.

2. Fill all joints where no backing exists partially with filler material (that is compatible with specified caulking or sealant material).

   a. Metal to Metal Joints: Minimum joint width of 1/4-inch.

   b. All Other Joints: Maximum 3/4-inch, unless otherwise detailed.

   c. Minimum joint depth shall be 1/4-inch, for metal joints; 2-inch for concrete, masonry, and plaster work joints.

3. Apply sealants under sufficient pressure to completely fill all voids.

4. Apply non-sagging type sealants in vertical joints.

5. Apply self-leveling type sealants in horizontal joints.

6. Apply non-tracking sealants, having a shore hardness range of 40 to 55, to concrete, masonry or tile expansion joints, subject to foot or vehicular traffic.

7. Finish all exposed joints smooth, flush with surfaces, or recessed as shown.

8. Provide strippable masking for factory applied sealing materials to prevent dirt contamination until parts are assembled.

9. Tool all joints to the profile shown on the Contract Drawing Details.

10. Caulk and seal open joints left between openings and both sides of frames on the exterior of building and all other joints between building units or materials where Contract Drawings call for caulking and/or sealants, interior and exterior or where necessary to completely seal off joints against passage of water, air or dust.

D. Cleaning Up:

1. Remove masking tape immediately after joints have been tooled.

2. Clean adjacent surfaces free from sealants as the installation progresses. Use solvent or cleaning agent as recommended by the sealant manufacturer.

3. Remove excess caulking and sealants from adjacent surfaces of joints, leaving the work in a neat and clean condition.

E. Concrete Expansion and/or Contraction Joints: Construct such joints as indicated on the Contract Drawings and specified in DIVISION 3 - CONCRETE.

END OF SECTION

SECTION 09800
PROTECTIVE COATING

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The Contractor shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the protective coating of all specified surfaces not specifically included under the requirements of Section [09905] "Architectural Paint Finishes," including all surface preparation, pretreatment, coating application, touch-up of factory-coated surfaces, protection of surfaces not to be coated, cleanup, and appurtenant work, all in accordance with the requirements of the Contract Documents.

B. The following surfaces shall not be protective coated hereunder unless shown or specified herein, or elsewhere in the Contract Documents.

1. Concrete.

2. Stainless steel.

3. Machined surfaces.

4. Grease fittings.

5. Glass.

6. Equipment nameplates.

7. Maintenance hole frames and covers.

8. Platform gratings, stair treads, door thresholds, and other walk surfaces.

C. The coating system schedules summarize the surfaces to be coated, the required surface preparation, and the coating systems to be applied. Coating notes on the drawings are used to show exceptions to the schedules, to show or extend the limits of coating systems, or to clarify or show details for application of the coating systems.

1.2 RELATED WORK SPECIFIED ELSEWHERE (Not Used)

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. References herein to "SSPC Specifications" or "SSPC" shall mean the published standards of the Steel Structures Painting Council, 4400 Fifth Avenue, Pittsburgh, PA 15213.

B. References herein to "NACE" shall mean the published standards of the National Association of Corrosion Engineers, P.O. Box 986, Katy, TX 77450.

C. Comply with the reference specifications of the GENERAL REQUIREMENTS.

D. Comply with the current provisions of the following Codes and Standards.

1. Commercial Standards:

ANSI A13.	Scheme for Identification of Piping Systems.
ANSI/AWWA C105	Polyethylene Encasement for Ductile Iron Piping for Water and Other Liquids.

ANSI/AWWA C203	Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape-Hot-Applied.
ANSI/AWWA D102	Painting Steel Water-Storage Tanks

2. Federal Specifications:

TT-P-28F	Paint, Aluminum, Heat Resisting (1200F)

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. Samples: The Contractor shall submit samples of all paint, finishes, and other coating materials specified herein, in accordance with the GENERAL REQUIREMENTS. Paint or coating samples shall be submitted on 8-1/2-inch by 11-inch sheet metal. Each sample shall be completely coated over its entire surface with one protective coating material, type, and color.

C. Coating Materials List: The Contractor shall provide 8 copies of a coating materials list which indicates the manufacturer and the coating number, keyed to the coating systems herein, prior to or at the time of submittal of samples.

D. Paint Manufacturer's Information: For each paint system to be used the Contractor shall submit the following listed data at least 30 days prior to painting.

1. Paint manufacturer's data sheet for each product used, including statements on the suitability of the material for the intended use.

2. Paint manufacturer's instructions and recommendations on surface preparation and application.

3. Colors available for each product (where applicable).

4. Compatibility of shop and field applied coatings (where applicable).

5. Material safety data sheet for each product used.

6. Two sets of color samples to match each color selected by the Engineer from the manufacturer's standard color sheets. If custom mixed colors are required by this Section, the color samples shall be made using color formulations prepared to match the color samples furnished by the Engineer. The color formula shall be shown on the back of each color sample.

E. Manufacturer's Certification: For submerged and severe service coating systems, the Contractor shall require the paint manufacturer to certify to the following:

1. The manufacturer's representative has provided at least 6 hours of on-site instruction in the proper surface preparation, use, mixing, application, and curing of the coating systems.

2. The manufacturer's representative has personally observed the start of surface preparation, mixing, and application of the coating materials.

F. The Contractor shall submit all such certificates to the Engineer within 7 days of completion of each paint system.

G. Applicator's Certificate and Report: For submerged and severe service coating systems, the Contractor shall require the applicator of the protective paint coatings to certify to the following:

1. Immediately before painting, surfaces conformed to the specified preparation; they were in

the specified condition; and were clean, dry, and free of dust, rust, and mill scale.

2. Surface preparation and coating use, mixing, application, and curing were done in accordance with the current printed instructions and recommendations of the protective coating manufacturer, and these Specifications.

3. The products specified were used and a listing of the names of the products and their manufacturer.

4. The products were used within the shelf-life dates, stating the shelf-life dates of each container of each product used.

5. The specified dry film thickness of coatings are on the items.

6. The quantities of each product used with copies of paint manufacturer's invoice.

7. Compatible paints were used where shop or field applied coatings are applied over previously-applied coatings.

8. The applicator's certificate shall list the dates and locations that the coating work was completed for the various surfaces coated and shall also list the dry film thickness obtained for each coat. The Contractor shall submit said paint applicator's certificates to the Engineer within 7 days after completion of each paint system.

1.5 QUALITY ASSURANCE

A. General: The Contractor shall give the Engineer a minimum of 3 days advance notice of the start of any field surface preparation work of coating application work, and a minimum of 7 days advance notice of the start of any shop surface preparation work.

B. All such work shall be performed only in the presence of the Engineer, unless the Engineer has granted prior approval to perform such work in its absence.

C. Inspection by the Engineer, or the waiver of inspection of any particular portion of the work, shall not relieve the Contractor of its responsibility to perform the work in accordance with these Specifications.

D. Where protective coatings are to be performed by a subcontractor, said subcontractor [must possess a valid state license as required for performance of the painting and coating work called for in this specification and] must provide 5 references which show that the painting subcontractor has previous successful experience with the specified or comparable coating systems. Include the name, address, and the telephone number for the owner of each installation for which the painting subcontractor provided the protective coating.

E. Scaffolding shall be erected and moved to locations where requested by the Engineer to facilitate inspection. Additional illumination shall be provided to cover all areas to be inspected.

F. Inspection Devices: The Contractor shall furnish, until final acceptance of such coatings, inspection devices in good working condition for the detection of holidays and measurement of dry-film thicknesses of protective coatings. Dry-film thickness gages shall be made available for the Engineer's use at all times while coating is being done, until final acceptance of such coatings. The Contractor shall provide the services of a trained operator of the holiday detection devices until the final acceptance of such coatings. Holiday detection devices shall be operated only in the presence of the Engineer.

G. Holiday Testing: The Contractor shall holiday test all coated ferrous surfaces inside a steel reservoir, or other surfaces which will be submerged in water or other liquids, or surfaces which are enclosed in a vapor space in such structures and surfaces coated with any of the submerged and severe service coating systems. Areas which contain holidays shall be marked and repaired

or recoated in accordance with the coating manufacturer's printed instructions and then retested.

1. Coatings With Thickness Exceeding 20 Mils: For surfaces having a total dry film coating thickness exceeding 20 mils: pulse-type holiday detector such as [Tinker & Rasor Model AP-W], [D.E. Stearns Co. Model 14/20], or equal shall be used. The unit shall be adjusted to operate at the voltage required to cause a spark jump across an air gap equal to twice the specified coating thickness.

2. Coatings With Thickness of 20 Mils or Less: For surfaces having a total dry film coating thickness of 20 mils or less: [Tinker & Rasor Model M1 non-destructive type holiday detector], [K-D Bird Dog], or equal shall be used. The unit shall operate at less than 75 volts. For thicknesses between 10 and 20 mils, a non-sudsing type wetting agent, such as [Kodak Photo-Flo], or equal, shall be added to the water prior to wetting the detector sponge.

H. Film Thickness Testing: On ferrous metals, the dry film coating thickness shall be measured in accordance with the SSPC "Paint Application Specification No. 2" using a magnetic-type dry film thickness gage such as Mikrotest model FM, Elcometer model 111/1EZ, or equal. Each coat shall be tested for the correct thickness. No measurements shall be made until at least 8 hours after application of the coating. On non-ferrous metals and other substrates, the coating thicknesses shall be measured at the time of application using a wet film gage.

I. Surface Preparation: Evaluation of blast cleaned surface preparation work will be based upon comparison of the blasted surfaces with the standard samples available from the NACE, using NACE standard TM-01-70.

1.6 MANUFACTURER REPRESENTATIVE

A. The Contractor shall require the protective coating manufacturer to furnish a qualified technical representative to visit the project site for technical support as specified in the paragraph entitled "Manufacturer's Certification", herein, and as may be necessary to resolve field problems attributable or associated with the manufacturer's products furnished under this Contract or the application thereof.

1.7 MAINTENANCE

A. Warranty Inspection: A warranty inspection may be conducted during the eleventh month following completion of all coating and painting work. The Contractor and a representative of the coating material manufacturer shall attend this inspection. All defective work shall be repaired in accordance with these specifications and to the satisfaction of the City. The City may, by written notice to the Contractor, reschedule the warranty inspection, or may cancel the warranty inspection altogether. If a warranty inspection is not held the Contractor is not relieved of its responsibilities under the Contract Documents.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Definitions: The term "paint", "coatings", or "finishes" as used herein, shall include surface treatments, emulsions, enamels, paints, epoxy resins, and all other protective coatings, excepting galvanizing or anodizing, whether used as a pretreatment, primer, intermediate coat, or finish coat. The term "DFT" means minimum dry film thickness.

B. General: Coating materials shall be sealed in containers that plainly show the designated name, formula or specification number, batch number, color, date of manufacture, manufacturer's directions, and name of manufacturer, all of which shall be plainly legible at the time of use.

C. The Contractor shall use coating materials suitable for the intended use and recommended by their manufacturer for the intended service.

D. Compatibility: In any coating system only compatible materials from a single manufacturer shall be used in the work. Particular attention shall be directed to compatibility of primers and finish coats. If necessary, subject to the approval of the Engineer, a barrier coat shall be applied between existing prime coat and subsequent field coats to ensure compatibility.

E. Colors: All colors and shades of colors of all coats of paint shall be as selected or specified by the Engineer. Each coat shall be of a slightly different shade, to facilitate inspection of surface coverage of each coat. [Finish colors shall be as selected from the manufacturer's standard color samples by the Engineer.] [Finish colors shall be custom mixed to match color samples furnished by the Engineer.]

F. Protective Coating Materials: Products shall be standard products produced by recognized manufacturers who are regularly engaged in production of such materials for essentially identical service conditions. Where requested, the Contractor shall provide the Engineer with the names of not less than 10 successful applications of the proposed manufacturer's products demonstrating compliance with this specification requirement.

G. Substitute or "Or-Equal" Submittals: Unless otherwise specified, materials are from the catalogs of the companies listed herein. Materials by other manufacturers are acceptable provided that they are established as being compatible with and of equal quality to the coatings of the companies listed. The Contractor shall provide satisfactory documentation from the firm manufacturing the proposed substitute or "or-equal" material that said material meets the specified requirements and is equivalent or better than the listed materials in the following properties:

1. Quality
2. Durability
3. Resistance to abrasion and physical damage
4. Life expectancy
5. Ability to recoat in future
6. Solids content by volume
7. Dry film thickness per coat
8. Compatibility with other coatings
9. Suitability for the intended service
10. Resistance to chemical attack
11. Temperature limitations in service and during application
12. Type and quality of recommended undercoats and topcoats
13. Ease of application
14. Ease of repairing damaged areas
15. Stability of colors

H. The cost of all testing and analyzing of the proposed substitute materials that may be required by the Engineer shall be paid by the Contractor. If the proposed substitution requires changes in the contract work, the Contractor shall bear all such costs involved and the costs of allied trades

affected by the substitution.

2.2 INDUSTRIAL COATING SYSTEMS

A. Material Sources: Each of the following manufacturers is capable of supplying many of the industrial coating materials specified herein. Where manufacturers and paint numbers are listed, it is to show the type and quality of coatings that are required. Proposed substitute materials must be shown to satisfy the material descriptions and to equal or exceed the properties of the listed materials as required in the paragraph entitled "Substitute or `Or-Equal' Submittals" herein.

1. Carboline Coatings Company

2. PPG Paints, Ameron

3. Sherwin Williams Company

4. Tnemec Company

B. System 1 – Not Used

C. System 2 - Not Used

D. System 3 – Not Used

E. System 4 - Aliphatic Polyurethane: Two component aliphatic acrylic or polyester polyurethane coating material shall provide superior color and gloss retention, resistance to splash from acid and alkaline chemicals, resistance to chemical fumes and severe weathering and with a minimum solids content of 58 percent by volume. Primer shall be a rust inhibitive two component epoxy coating with a minimum solids content of 70 percent by volume.
If this coating system is to be used on Galvanized Ferrous Metal; provide surface treatment (or approved equal) for the prime coat as per the Coating Manufacturers product data sheet.

1. Prime coat (Min DFT = 4 mils), Amerlock 400, Carboguard 890, SW Macropoxy 646-100, [Tnemec L69 Epoxoline], or equal.

2. Finish coat (one or more, Min DFT = 3 mils), Amershield, Carboline 133 MC, SW Sherloxane 800, Tnemec 740 EverThane, or equal.

3. Total system Min DFT = 7 mils.

4. More than one finish coat shall be applied as necessary to produce a finish with uniform color and texture.

F. System 5 - Inorganic Zinc/Epoxy/Polyurethane: The inorganic zinc primer shall be a water or solvent based, self-curing, zinc silicate 2-component inorganic coating which contains at least 85 percent of metallic zinc by weight in the dried film,and is recommended by the coating manufacturer as a primer for this system. The intermediate coat shall be a high-build two component epoxy with a solids content of at least 70 percent by volume. Finish coats shall be a 2-component aliphatic acrylic or polyester polyurethane coating material that provides superior color and gloss retention, resistance to chemical fumes and severe weathering, and a minimum solids content of 58 percent by volume.

1. Prime coat (Min DFT = 2 mil), Dimetcote 21-5/4A, Carbo Zinc 11 WB, SW Corothane Galvapac 2k 100, Tnemec 94H2O Hydro- Zinc, or equal.

2. Intermediate coat (Min DFT = 4 mils), Amerlock 400, Carboline 890, SW Macropoxy 646-100, Tnemec L69 Epoxoline, or equal.

3. Finish coats (one or more, Min DFT = 3 mils), Amershield, Carboline 133 MC, SW

Sherloxane 800, Tnemec 740 EverThane, or equal.

4. Total system DFT = 9 mils.

5. Intermediate coat shall be applied in excess of 4 mils DFT or in more than one coat as necessary to completely cover the inorganic zinc primer and prevent application bubbling of the polyurethane finish coat.

6. More than one finish coat shall be applied as necessary to produce a finish with uniform color and texture.

G. System 6 - Inorganic Zinc, Water Based: Water based, self-curing, ethyl silicate shall be a two-component inorganic coating material that contains at least 85 percent of metallic zinc by weight in the dried film.

1. Prime coat and finish coat (one, Min DFT = 3 mils), Dimetcote 21- 5/4 A, Carbozinc 11 WB, SW Zinc Clad XI, or equal.

2. Total system DFT = 3 mils.

H. System 7 – Acrylic Enamel: Single component, water based acrylic coating with a fungicide additive shall have a minimum solids content of 35 percent by volume. Prime coat shall be as recommended by manufacturer. The coating material shall be available in the ANSI safety colors.

1. Prime coat (Min DFT = 2 mils), as recommended by manufacturer.

2. Finish coats (2 or more, Min DFT = 6 mils), Amercoat 2104, Carboline 3359 MC, SW Pro Industrial Acrylic, Tnemec 1028 Enduratone, or equal.

3. Total system DFT = 8 mils.

I. System 8 - Not Used

J. System 9 - Not Used

K. System 10 – Acrylic Enamel, Concrete: High molecular weight acrylic coating material shall have a minimum solids content of 35 percent by volume. Prime coat shall be an acrylic filler and sealer for concrete surfaces.

1. Prime coat (Filler/sealer)(Min DFT = 12 mils), Tnemec 180 Tneme-Crete, Sanitile 100, SW Heavy Duty Block Filler, or equal.

2. Finish coats (2 or more, Min DFT = 4 mils), Tnemec 180 Tneme- Crete, Carbocrylic 3359 MC, SW Pro Industrial Acrylic (DFT = 6 mils) or equal.

L. System 11 - Aliphatic Polyurethane, Concrete: Two component aliphatic polyester polyurethane coating material shall provide superior color and gloss retention, resistance to splash from acid and alkaline chemicals, and resistance to chemical fumes and severe weathering, and with a minimum solids content of 58 percent by volume. Filler-sealer compound shall be a two component epoxy material used to provide a smooth surface for the epoxy intermediate coat. The filler-surfacer is applied to the entire concrete surface and worked into the concrete surface with a wide blade putty knife or squeegee. The intermediate coat shall be a high-build polyamide epoxy coating with a minimum solids content of 70 percent by volume.

1. Prime coat (Filler-sealer), [NU-Klad 114A, Carboguard 501. SW Steel Seam FT 910, Tnemec 215 Surfacing Epoxy, or equal.

2. Intermediate coat (Min DFT = 4 mils), Amerlock 400, Carboguard 60, Macropoxy 646-100,

Tnemec L69 Epoxoline, or equal.

3. Finish coats (1 or more, Min DFT = 3 mils), Amershield, Carbothane 133 MC, SW Sherloxane 800, Tnemec 740 Everthane, or equal.

M. System 12 - Aliphatic Polyurethane, Fiberglass: Two-component aliphatic polyurethane coating material shall provide superior color and gloss retention, resistance to splash from acid and alkaline chemicals, and resistance to chemical fumes and severe weathering. A primer, tie coat, or mist coat shall be used as recommended by the manufacturer.

1. Prime coat (Tie coat) (Min DFT= 2 mils), Sanitile 120, SW Macropoxy 646-100, Tnemec P69 Epoxoline, or equal.

2. Finish coats (1 or more, Min DFT = 3 mils), Amershield, Carbothane 133 MC, SW Sherloxane 800, Tnemec 740 Everthane, or equal.

N. Max VOC levels per SCQAMD noted in Section 2.5

2.3 SUBMERGED AND SEVERE SERVICE COATING SYSTEMS

A. Materials Sources: The manufacturers' products listed in this paragraph are materials which satisfy the material descriptions of this paragraph and have a documented successful record for long term submerged or severe service conditions. If proposed materials are not listed below, the requirements of the paragraph entitled "Substitute or `Or-Equal' Submittals" apply. In addition, the Contractor shall submit for consideration a list of at least 10 installations with similar service conditions for which the proposed substitute or "or-equal" products have shown satisfactory performance for at least several years including the name, address, and phone number of the owner of each installation.

B. System 100 - Amine Cured Epoxy Lining: High build, amine cured, straight epoxy resin shall have a solids content of at least 80 percent by volume, manufactured in accordance with ANSI 61 Standards as test by NSF, and shall be suitable for long-term immersion service in potable water, raw water, and non-potable water. The material shall conform to Food and Drug Administration regulations for food additives.

1. Prime coat and finish coats (1 or more, Minimum DFT = 20 mils), Phenoline 341, Amercoat 133, SW Duraplate UHS, Sherplate PW, Tnemec 22 Pota-Pox, or equal.

C. System 101 – Epoxy: High-build, amine or polyamide cured, epoxy resin shall have a solids content of at least 70 percent by volume, comply with local VOC regulations, and shall be suitable for exposures to chlorine vapors, fumes, and incidental splash or spill of chemicals. Total thickness 8- 12 mills DFT.

1. Prime Coat (DFT= 4-6 mils) Carboguard 890, SW Macropoxy 646-100, Tnemec L140F Pota-Pox, or equal.

2. Topcoat (DFT = 4-6 mils) Carboguard 890, SW Macropoxy 646-100, Tnemec l140F Pota-Pox, or equal.

D. System 102 – Epoxy Mortar: High-build, 3-component amine cured epoxy mortar, shall have a solids content of 100 percent by volume, suitable for long-term immersion and atmospheric exposure to wastewater. Filler-resurfacing compound shall be a 3-component epoxy cementitious thin overlay material used to fill voids and rough areas and must feather-edge capable. Epoxy Glaze (finish) coat shall bea 100 percent solids epoxy suitable for long-term immersion and atmospheric exposure to wastewater.

1. Filler / Resurfacing Overlay (Thickness = minimum 1/16”), SW Duraplate 2300, Tnemec 218 MortarClad, or equal.

2. Epoxy Mortar (Minimum DFT = 125 mils) SW Duraplate 6100, Tnemec 434 Perma-Shield, or equal.

3. Finish coat (DFT = 15-20 mils), SW Duraplate 6100, Tnemec 435 Perma-Glaze, or equal.

E. System 103 - Coal Tar Epoxy: High build, 2-component amine cured coal tar epoxy shall have a solids content of at least 68 percent by volume, suitable for coating of buried surfaces, and conforming to DOD-P-23236, Class 2, or to SSPC Paint 16. Prime coats are for use as a shop primer only. Prime coat shall be omitted when both surface preparation and coating are to be performed in the field.

1. Prime coat (Min DFT = 1.5 mils).

2. Finish coats (2 or more, Min DFT = 16 mils), SW Targuard CTE 100, Carboguard 888 or 330M, or equal

3. Total system DFT = 17.5 mils.

F. System 104 - Coal Tar Epoxy Substitute, Concrete: High build, 2-component amine cured epoxy, shall have a solids content of at least 80 percent by volume, suitable for long term immersion for coating of buried surfaces. Product performance shall be equivalent to DOD-P-23236, Class 2, or to SSPC Paint 16. Filler-surfacin compound shall be a 2-component epoxy material used to fill voids and rough areas. The seal coat provides a smooth surface for the application of the amine cured epoxy. The seal coat is a two-component epoxy material with 100 percent solids and is applied to the entire concrete surface and worked into the concrete surface with a wide blade putty knife or a squeegee.

1. Seal coat, Carboguard 501, SW Steel Seam FT910, Tnemec Series 215, or equal.

2. Finish coats (1 or more, Min DFT = 25 mils) Phenoline 341 or Plascite 4500, Amercoat 133, SW Duraplate UHS, Tnemec Series 22 or equal.

G. System 105 - Inorganic Zinc/Epoxy:

1. Inorganic Zinc Primer: Water or solvent based, self-curing 2-component inorganic coating shall contain a minimum of 85 percent metallic zinc by weight in the dried film and is recommended by the coating manufacturer as a primer for the epoxy material.

2. Polyamide Cured Epoxy: High build polyamide cured epoxy coating shall have a solids content of at least 70 percent by volume and a finish coat color of white. The material shall be capable of achieving at least 4 mils dry film thickness per coat.

3. Amine Cured Epoxy: High build amine cured epoxy coating shall have a solids content of at least 80 percent by volume and with a finish coat color of white or ivory. The material shall be capable of achieving at least 5 mils dry film thickness per coat.

4. The epoxy coating material shall be a straight epoxy resin and shall be either a polyamide-cured epoxy or an amine-cured epoxy suitable for long-term immersion service in potable water. The material shall conform to Food and Drug Administration regulations for food additives and state and local health regulations and policies for service in potable water reservoirs. The Contractor shall submit a written certification that the proposed materials meet the above regulatory agency standards and policies. The material shall be applied with a primer if recommended by the coating manufacturer.

5. Part A: Products shall be as listed, or equal:

a. Pre-coating, prior to erection. (DFT = 3 mils) See Note (1) under Paragraph f.	Dimetcote 9, Carboline Zinc, SW

			Corothane Galvapac, Tnemec 94-H2O Hydro-Zinc
	Touch up, following erection. (DFT = 3 mils) See Note (2) under Paragraph f		SW Corothane Galvapac, Tnemec 94-H2O Hydro-Zinc
b.	Difficult-to-coat areas, following erection. See Note (3) underline Paragraph f .		Amercoat 395, Macropoxy 5500LT, Carbo-859, Tnemec L140F Pota-Pox.
c.	Finish Coats (2 or more)	(DFT = 8 mils)	Amercoat 395, Macropoxy 5500LT, Carbo-859 Tnemec L140F Pota-Pox.

d. Total system DFT = 7 mils

e. Notes:

(1) All lap roof plate edges are to be pre-coated. If necessary, zinc primer exposed on exterior of roof may be removed prior to welding.

(2) Touch-up coating shall be done for areas damaged during erection, or areas not pre-coated. The Contractor shall spot sandblast to SSPC-SP-5 before application of coating. Material used for touch-up shall be a compatible solvent based inorganic or organic zinc primer recommended by the manufacturer.

(3) All edges, nuts, bolts, lap joints, weld seams and the roof rim angle shall receive one brush-applied coat prior to the application of the complete spray coat.

6. Part B: Products shall be as listed, or equal:

a.	Difficult-to-coat areas. See Note (1) under Paragraph d.		Amercoat 395, Phenoline 341, SW Macropoxy 5500LT, Tnemec L140F Pota-Pox.
b.	Finish coats (2 or more). See Note (1) under Paragraph d.	(DFT = 12 mils)	Amercoat 395, Phenoline 341, SW Macropoxy 5500LT, Tnemec L140F Pota-Pox.

c. Total system DFT = 12 mils

d. Notes:

(1) All edges, nuts, bolts, lap joints, and weld seams shall receive one brush-applied coat prior to the application of the first complete spray coat.

7. Curing Period: Prior to immersion, the completed system shall be subjected to at least 240 hours of curing time with the metal temperature at a minimum of 70 degrees F, or 480 hours at a minimum of 60 degrees F, both conditions at a maximum relative humidity of 50 percent and under the forced ventilation conditions required by the paragraph entitled "Curing of Coatings, herein. More curing time or a higher temperature shall be provided if recommended by the epoxy coating manufacturer. If the environmental conditions do not provide the necessary minimum temperature, use heated air to provide the necessary heat for curing. Other combinations of curing time and temperature may be used if the coating manufacturer presents satisfactory documentation and test results to substantiate that the degree of curing is equal or greater than curing for 240 hours at 70 degrees F.

8. Volatile Organic Compound Testing: The completed interior reservoir coating system shall be tested for volatile organic compounds as specified herein.

H. System 106 - Fusion Bonded Epoxy: The coating material shall be a 100 percent powder epoxy applied in accordance with the ANSI/AWWA C213 "AWWA Standard for Fusion-Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines", except that the surface preparation shall be as specified in the coating system schedule of this Section. The coating shall be applied using the fluidized bed process.

1. Liquid Epoxy: For field repairs or where, as confirmed by the Engineer, it would be impossible to use the powder epoxy method without causing damage to the item, the use of a liquid epoxy will be permitted, applied in not less than 3 coats to provide a DFT of 15 mils. The liquid epoxy shall be a 100 percent solids epoxy recommended by the powder epoxy manufacturer.

2. Coating (Min DFT = 16 mils), Scotchkote 206N, SW Pipeclad 2000, or equal.

3. Total system DFT = 16 mils.

I. System 107 – Not Used

J. System 108 - Not Used

K. System 109 – Epoxy - Amine, Epoxy-amine cured resin with a solids content of at least 100 percent by volume, and suitable for long-term immersion in wastewater and exposure to the effects of hydrogen sulfide gas where there is the probability of sulfuric acid formation on the surfaces

1. Prime coat and finish coats (1 or more, Minimum DFT 20 mils), Tnemec 435 Perma-Glaze, SW Duraplate 6100, or equal

L. System 110 - Epoxy - Amine, Concrete: Epoxy- amine cured resin with a solids content of at least 55 percent by volume, and suitable for long-term immersion in wastewater and exposure to the effects of hydrogen sulfide gas where there is the probability of sulfuric acid formation on the surfaces. The filler-sealer shall be a 100 percent solids amine cured epoxy material with silica and inert fillers. A 100 percent solids epoxy surfacer shall be used to fill holes and patch the concrete surfaces after abrasive blasting.

1. Prime coat (filler-sealer)(1 or more, applied to the entire surface using a squeegee to achieve a smooth, void-free surface), Carboguard 501, Nu-Klad 114A, SW Steel Seam FT910, Tnemec 218 MortarClad, or equal.

2. Finish coats, manholes, (1 or more, Minimum DFT = 120 mils), Plasite 4500-S, Sigma Novoguard 840, SW Duraplate 6100, Tnemec 435 PermaGlaze or equal.

3. Finish coats, wastewater, (1 or more, Minimum DFT = 30 mils), Plasite 4500-S, Sigma Novoguard 840, SW Duraplate 6100, Tnemec 435 PermaGlaze or equal.

4. Finish coats, stairways and walkways, (2 or more, Minimum DFT = 15 mils per coat)(provide aluminum oxide, non-skid broadcast between coats), Plasite 4500-S, Sigma Novoguard 840, Plascite 4500-S, SW Duraplate 6100, Tnemec 435 Permaglaze, or equal.

M. System 111 – Not Used

N. System 112 - Vinyl Ester-Concrete: Vinyl ester resin coating material with an inert flake pigment suitable for immersion service in hydrochloric acid and sulfuric acid solutions. The filler-sealer shall be a 100 percent solids amine-cured epoxy or vinyl ester material with silica and inert fillers. The filler-sealer is applied to the entire concrete surface. A 100 percent solids epoxy or vinyl ester surfacer shall be used to fill holes and patch the concrete surface after abrasive blasting.

1. Prime coat (filler-sealer), applied to achieve a smooth void-free surface.

2. Finish coats (two or more, Minimum DFT = 40 mils), SW Cor Cote VEN, Tnemec 120 Vinester, or equal.

O. Max VOC levels per SCQAMD noted in Section 2.5

2.4 SPECIAL COATING SYSTEMS

A. System 200 - PVC Tape: Prior to wrapping the pipe with PVC tape, the pipe and fittings first shall be primed using a primer recommended by the PVC tape manufacturer. After being primed, the pipe shall be wrapped with a 20-mil adhesive PVC tape, half-lapped, to a total thickness of 40 mils.

B. System 201 - Rich Portland Cement Mortar: Rich portland cement mortar coating shall have a minimum thickness of 1/8-inch, followed by enclosure in an 8-mil thick polyethylene sheet with all joints and edges lapped and sealed with tape.

C. System 203 - Epoxy Surfacing: Two-component epoxy floor surfacing mortar shall be formulated to resist many acids, alkalies, and solvents. Novolac finish material shall be resistant to liquid alum, sodium hydroxide, and 50 percent sulphuric acid. Finish coats shall be a minimum 20 mils dry film thickness over mortar surfacing. Products shall be as follows, or equal:

1. Ameron Alternative: Prime coat Amerlock Sealer; finish coat Nu-Klad 110A, (1/4-inch thick).

2. SW Alternative: Prime coat TPM 115; finish coat GP 3741 Novoflo (1/4-inch thick).

3. Carboline Alternative: Prime coat Carboguard 501, finish coat Semstone 140 (¼ inch thick, 250 mils DFT).

4. Tnemec Alternative: Prime coat Tnemec 237 Power- Tread; finish Tnemec 282 Tneme-Glaze (1/4-inch thick).

D. System 204 - Waterproofing: Two coats of a clear, non-staining, silane-modified-siloxane masonry waterproofing material. The waterproofing system 204 after application shall be provided with not less than a five-year warranty on the performance of the product.

1. Where EPA Allows Solvents: Chemstop, "WB Heavy Duty "; Rainguard, "XS", Chemprobe / Prime a Pell H2O; or equal.

2. Where EPA Prohibits Solvents: Chemstop, "WB Regular / Heavy Duty"; Rainguard's "Blok-Lok"; Rainproof's "Chem-Trete #45", Chemprobe / Prime A Pell H2O; or equal.

Surfaces shall be cleaned with a chemical (approved by waterproofing manufacturer) cleaner and power wash. Surfaces shall be clean and dry before application of waterproofing. Method and rate of application shall be in accordance with manufacturer's published instructions. A manufacturer's representative shall be present during applications if necessary for warranty.

E. System 205 - Polyethylene Encasement: Application of polyethylene encasement shall be in accordance with ANSI/AWWA C105 using Method C.

F. System 206 - Cement Mortar Coating: A 1-1/2-inch minimum thickness mortar coating reinforced with 3/4-inch galvanized welded wire fabric shall be provided. The cement mortar shall contain no less than one part Type V cement to 3 parts sand. The cement mortar shall be cured by a curing compound meeting the requirements of "Liquid Membrane-Forming Compounds for Curing Concrete" ASTM C 309-81, Type II, white pigmented, or by enclosure in an 8-mil thick polyethylene sheet with all joints and edges lapped by at least 6-inches.

G. System 207 - Non-Slip Surfacing: Coating shall have one coat of Semstone 140 W/ aluminum

oxide additive, AS 150 as manufactured by Amstep Products or one coat of Ameron Nu-Klad 100A with Amercoat 886 additive, or one coat SW Fastop TC with AO, or one coat Tnemec 280 Tneme-Glaze with Series 211 additive or equal. The coating shall be gray in color. Application shall be by means of a roller and not more than 60 sq ft per gallon of non-slip coating shall be applied. Primer shall be as recommended by the coating manufacturer.

H. System 208 - Aluminum Metal Isolation: A wash primer (0.5 mils) shall be applied, followed by one coat of heavy bodied bituminous paint, such as SW Macropoxy 646-100, Tnemec L69 Epoxoline, or equal (8 mils). Total thickness of system (8.5 mils).

I. Max VOC levels per SCQAMD noted in Section 2.5

PART 3 -- EXECUTION

3.1 STORAGE, MIXING, AND THINNING OF MATERIALS

A. Manufacturer's Recommendations: Unless otherwise specified herein, the coating manufacturer's printed recommendations and instructions for thinning, mixing, handling, applying, and protecting its coating materials, for preparation of surfaces for coating, and for all other procedures relative to coating shall be strictly observed. The Contractor shall supply the Engineer with copies of each manufacturer's instructions in accordance with the GENERAL REQUIREMENTS.

B. All protective coating materials shall be used within the manufacturer's recommended shelf life.

C. Storage and Mixing: Coating materials shall be protected from exposure to cold weather, and shall be thoroughly stirred, strained, and kept at a uniform consistency during application. Coatings of different manufacturers shall not be mixed together.

3.2 PREPARATION FOR COATING

A. General: All surfaces to receive protective coatings shall be cleaned as specified herein prior to application of said coatings. The Contractor shall examine all surfaces to be coated and shall correct all surface defects before application of any coating material. All marred or abraded spots on shop-primed and on factory-finished surfaces shall receive touch-up restoration prior to any coating application.

B. Protection of Surfaces Not to be Coated: Surfaces which are not to receive protective coatings shall be protected during surface preparation, cleaning, and coating operations.

C. All hardware, lighting fixtures, switch plates, machined surfaces, couplings, shafts, bearings, nameplates on machinery, and other surfaces not to be painted shall be removed, masked or otherwise protected. Drop cloths shall be provided to prevent coating materials from falling on or marring adjacent surfaces. The working parts of all mechanical and electrical equipment shall be protected from damage during surface preparation and coating operations. Openings in motors shall be masked to prevent entry of coating or other materials.

D. Care shall be exercised not to damage adjacent work during blast cleaning operations. Spray painting shall be conducted under carefully controlled conditions. The Contractor shall be fully responsible for and shall promptly repair any and all damage to adjacent work or adjoining property occurring from blast cleaning or coating operations.

E. Protection of Painted Surfaces: Cleaning and coating shall be so programmed that dust and other contaminants from the cleaning process will not fall on wet, newly-coated surfaces.

3.3 SURFACE PREPARATION STANDARDS

A. The following referenced surface preparation specifications of the Steel Structures Painting Council shall form a part of this specification:

1. Solvent Cleaning (SSPC-SP1): Removal of oil, grease, dirt, soil, salts, and contaminants by cleaning with solvent, vapor, alkali, emulsion, or steam.

2. Hand Tool Cleaning (SSPC-SP2): Removal of loose rust, loose mill scale, and loose paint to degree specified, by hand chipping, scraping, sanding, and wire brushing.

3. Power Tool Cleaning (SSPC-SP3): Removal of loose rust, loose mill scale, and loose paint to degree specified by power tool chipping, descaling, sanding, wire brushing, and grinding.

4. White Metal Blast Cleaning (SSPC-SP5/NACE1): Removal of all visible rust, mill scale, paint, and foreign matter by blast cleaning by wheel or nozzle (dry or wet) using sand, grit,

or shot.

5. Commercial Blast Cleaning (SSPC-SP6/NACE3): Blast cleaning until at least two-thirds of each element of surface area is free of all visible residues.

6. Brush-Off Blast Cleaning (SSPC-SP7/NACE4): Blast cleaning of all except tightly adhering residues of mill scale, rust, and coatings, exposing numerous evenly distributed flecks of underlying metal.

B. The other surface preparation standards shall be the most recent versions published by the SSPC and NACE.

3.4 METAL SURFACE PREPARATION (UNGALVANIZED)

A. The minimum abrasive blasting surface preparation shall be as specified in the coating system schedules included at the end of this Section. Where there is a conflict between these specifications and the coating manufacturer's printed recommendations for the intended service, the higher degree of cleaning shall apply.

B. Workmanship for metal surface preparation shall be in conformance with the current SSPC Standards and this Section. Blast cleaned surfaces shall match the standard samples available from the National Association of Corrosion Engineers, NACE Standard TM-01-70.

C. All oil, grease, welding fluxes and other surface contaminants shall be removed by solvent cleaning per SSPC-SP1 prior to blast cleaning.

D. All sharp edges shall be rounded or chamfered and all burrs, and surface defects and weld splatter shall be ground smooth prior to blast cleaning.

E. The type and size of abrasive shall be selected to produce a surface profile that meets the coating manufacturer's recommendation for the particular coating and service conditions.

F. The abrasive shall not be reused unless otherwise approved by the Engineer. For automated shop blasting systems, clean oil-free abrasives shall be maintained.

G. The Contractor shall comply with the applicable federal, state, and local air pollution control regulations for blast cleaning.

H. Compressed air for air blast cleaning shall be supplied at adequate pressure from well maintained compressors equipped with oil/moisture separators which remove at least 95 percent of the contaminants.

I. Surfaces shall be cleaned of all dust and residual particles of the cleaning operation by dry air blast cleaning, vacuuming or another approved method prior to painting.

J. Enclosed areas and other areas where dust settling is a problem shall be vacuum cleaned and wiped with a tack cloth.

K. Damaged or defective coating shall be removed by the specified blast cleaning to meet the clean surface requirements before recoating.

L. If the specified abrasive blast cleaning will damage adjacent work, the area to be cleaned is less than 100 square feet, and the coated surface will not be submerged in service, then SSPC-SP2, hand tool cleaning or SSPC-SP3, power tool cleaning, may be used.

M. Shop applied coatings of unknown composition shall be completely removed before the specified coatings are applied. Valves, castings, ductile or cast iron pipe, and fabricated pipe or equipment shall be examined for the presence of shop-applied temporary coatings. Temporary coatings shall be completely removed by solvent cleaning per SSPC-SP1 before the abrasive blast

cleaning work has been started.

N. Shop primed equipment shall be solvent cleaned in the field before finish coats are applied.

O. Ferrous metal surfaces in severe or immersion service shall conform to the following.

1. Solvent Cleaning (SSPC-SP1) shall be performed over all surfaces prior to abrasive blast cleaning. : Removal of oil, grease, dirt, soil, salts, and contaminants by cleaning with solvent, vapor, alkali, emulsion, or steam as required.

2. All ferrous metal and non ferrous metal surfaces to be cleaned in accordance with SSPC-SP5/NACE 1. White Metal Blast Clean with a 3.0 mil minimum anchor profile.

3. Where the coating is specified to be terminated, the Contractor shall prepare and apply materials as outlined in coating manufacturer recommendations.

4. Where the coating is specified to be terminated at a metal embedment, the Contractor shall prepare and apply materials as outlined or as recommended by the manufacturer.

5. The Contractor shall notify the Engineer should jobsite conditions prevent the above operations and/or applications

3.5 SURFACE PREPARATION FOR GALVANIZED FERROUS METAL

A. Galvanized ferrous metal shall be alkaline cleaned per SSPC-SP1 to remove oil, grease, and other contaminants detrimental to adhesion of the protective coating system to be used.

B. Abrasive brush blasting or uniform scarification of cleaned surfaces is required. Perform surface preparation according to SSPC-SP16, Brush of Blast Cleaning of Coated and Uncoated Galvanized steel, Stainless Steel, and Non-Ferrous Metals.

C. Abrasive brush blasting is required for all non-ferrous metals in severe or immersion service.

D. Pretreatment coatings, white rust staining, passivation treatments such as chromating shall be completely removed. Perform successful test to confirm removal of passivating treatments according to SSPC-Sp16 prior to the application of any coatings.

3.6 SURFACE PREPARATION OF FERROUS SURFACES WITH EXISTING COATINGS

A. General: All grease, oil, heavy chalk, dirt, or other contaminants shall be removed by solvent or detergent cleaning prior to abrasive blast cleaning. The generic type of the existing coatings shall be determined by laboratory testing.

B. Abrasive Blast Cleaning: The Contractor shall provide the degree of cleaning specified in the coating system schedule for the entire surface to be coated. If the degree of cleaning is not specified in the schedule, deteriorated coatings shall be removed by abrasive blast cleaning to SSPC-SP6, Commercial Blast Cleaning. Areas of tightly adhering coatings shall be cleaned to SSPC-SP7, Brush-off Blast Cleaning, with the remaining thickness of existing coating not to exceed 3 mils.

C. Incompatible Coatings: If coatings to be applied are not compatible with existing coatings the Contractor shall apply intermediate coatings per the paint manufacturer's recommendation for the specified coating system or shall completely remove the existing coating prior to abrasive blast cleaning. A small trial application shall be conducted for compatibility prior to painting large areas.

D. Unknown Coatings: Coatings of unknown composition shall be completely removed prior to application of new coatings.

E. Water Abrasive or Wet Abrasive Blast Cleaning: Where specified or where job site conditions do not permit dry abrasive blasting for industrial coating systems due to dust or air pollution considerations, water abrasive blasting or wet abrasive blasting may be used. In both methods, paint-compatible corrosion inhibitors shall be used, and coating application shall begin as soon as the surfaces are dry. Water abrasive blasting shall be done using high pressure water with sand injection. In both methods, the equipment used shall be commercially produced equipment with a successful service record. Wet blasting methods shall not be used for submerged and severe service coating systems unless specified.

3.7 CONCRETE AND CONCRETE BLOCK MASONRY SURFACE PREPARATION

A. Surface preparation shall not begin until at least 30 days after the concrete or masonry has been placed.

B. All oil, grease, and form release and curing compounds shall be removed by detergent cleaning per SSPC-SP1 before abrasive blast cleaning.

C. Concrete, concrete block masonry surfaces and deteriorated concrete surfaces to be coated shall be abrasive blast cleaned to remove existing coatings, laitance, deteriorated concrete, and to roughen the surface equivalent to the surface of the No. 80 grit flint sandpaper.

D. If acid etching is required by the coating application instructions the treatment shall be made after abrasive blasting. After etching, rinse surfaces with water and test the pH. The pH shall be between neutral and 8.

E. Surfaces shall be clean and as recommended by the coating manufacturer before coating is started.

F. Unless required for proper adhesion, surfaces shall be dry prior to coating. The presence of moisture shall be determined with a moisture detection device such as [Delmhorst Model DB], or equal.

G. Concrete, Concrete Masonry Unit surfaces in sever or immersion service shall conform to the following.

1. Remove all release agents, curing compounds, efflorescence, chalk, grease, and foreign material from the surface. Surfaces shall be decontaminated to remove all microorganisms, acid constituents, grease, oil, and other contaminants prior to commencement of surface preparation (Reference ASTM D4258, SSPC-SP13/NACE No. 6).

2. Verify that the pH of the cleaned and prepared concrete surfaces to be coated is within the range of to 9 to 11. Application of coating materials outside this range will not be permitted without written approval from the Engineer. ASTM D 4262 should be used to determine pH.

3. Allow new concrete to cure for a minimum of 28 days or shall be prepared and treated according to the coating manufacturer’s recommendations.

4. Test concrete for moisture following the 28 day curing period in accordance with ASTM D4263 and/or F1869. Test results shall be reviewed by the coating manufacturer’s technical representative to determine if any special treatments are required prior to the application of coating.

5. Concrete surfaces shall be prepared in accordance with SSPC-SP13/NACE No. 6, Severe Service, and shall produce a minimum surface profile of a CSP-5 as noted in ICRI Technical Guideline No. 310.2 and ASTM D4259, SSPC-SP13/NACE No. 6.

6. Fill all bug holes, honeycombs, cracks, and surface imperfections with surface fillers to the specified thickness in a uniform and consistent fashion. .

7. Where the coating is specified to be terminated, the contractor shall prepare and apply materials as outlined by the coating manufacturer. Detailed drawings shall provided for

review with contractor submittals.

8. Repair of spalling, corroded concrete, exposed rebar shall be performed according to the specified process and manufacturer's recommendation.

3.8 PLASTIC, FIBERGLASS AND NONFERROUS METALS SURFACE PREPARATION

A. Plastic and fiberglass surfaces shall be sanded or brush off blast cleaned prior to solvent cleaning with a chemical compatible with the coating system primer.

B. Non-ferrous metal surfaces shall be solvent-cleaned SSPC-SP1 followed by sanding or brush-off blast cleaning SSPC-SP7/NACE4.

C. All surfaces shall be clean and dry prior to coating application.

3.9 ARCHITECTURAL CONCRETE BLOCK MASONRY SURFACE PREPARATION

A. The mortar surfaces shall be cured at least 14 days before surface preparation work is started.

B. Dust, dirt, grease, and other foreign matter shall be removed prior to abrasive blasting.

C. The masonry surfaces shall be prepared in accordance with the material manufacturer's printed instructions.

3.10 WORKMANSHIP

A. Skilled craftsmen and experienced supervision shall be used on all work.

B. Clean drop cloths shall be used. All damage to surfaces resulting from the work hereunder shall be cleaned, repaired, and refinished to their original condition.

C. All coatings shall be applied under dry and dust-free conditions. Coating shall be done in a workmanlike manner so as to produce an even film of uniform thickness. Edges, corners, crevices, and joints shall receive special attention to insure that they have been thoroughly cleaned and that they receive an adequate thickness of coating material. The finished surfaces shall be free from runs, drops, ridges, waves, laps, brush marks, and variations in color, texture, and finish. The hiding shall be so complete that the addition of another coat would not increase the hiding. Special attention shall be given to insure that edges, corners, crevices, welds, and similar areas receive a film thickness equivalent to adjacent areas, and installations shall be protected by the use of drop cloths or other approved precautionary measures.

3.11 SHOP COATING REQUIREMENTS

A. All items of equipment, or parts of equipment which are not submerged in service, shall be shop primed and then finish coated in the field after installation with the specified or approved color. The methods, materials, application equipment and all other details of shop painting shall comply with this section. If the shop primer requires topcoating within a specified period of time, the equipment shall be finish coated in the shop and then touch-up painted after installation.

B. All items of equipment, or parts and surfaces of equipment which are submerged or inside an enclosed hydraulic structure when in service, with the exception of pumps and valves, shall have all surface preparation and coating work performed in the field.

C. The interior surfaces of steel reservoirs shall have all surface preparation and coating work performed in the field.

D. For certain pieces of equipment it may be undesirable or impractical to apply finish coatings in the field. Such equipment may include engine generator sets, equipment such as electrical control panels, switchgear or main control boards, submerged parts of pumps, ferrous metal passages in

valves, or other items where it is not possible to obtain the specified quality in the field. Such equipment shall be shop primed and finish coated and touched up in the field with the identical material after installation. The Contractor shall require the manufacturer of each such piece of equipment to certify as part of its shop drawings that the surface preparation is in accordance with these specifications. The coating material data sheet shall be submitted with the shop drawings for the equipment.

E. For certain small pieces of equipment the manufacturer may have a standard coating system which is suitable for the intended service conditions. In such cases, the final determination of suitability will be made during review of the shop drawing submittals. Equipment of this type generally includes only indoor equipment such as instruments, small compressors, and chemical metering pumps.

F. Shop painted surfaces shall be protected during shipment and handling by suitable provisions including padding, blocking, and the use of canvas or nylon slings. Primed surfaces shall not be exposed to the weather for more than 6 months before topcoated, or less time if recommended by the coating manufacturer.

G. Damage to shop-applied coatings shall be repaired in accordance with this Section and the coating manufacturers printed instructions.

H. The Contractor shall make certain that the shop primers and field topcoats are compatible and meet the requirements of this Section. Copies of applicable coating manufacturer's data sheets shall be submitted with equipment shop drawings.

3.12 APPLICATION OF COATINGS

A. The application of protective coatings to steel substrates shall be in accordance with "Paint Specification No. 1, (SSPC-A-1)", Steel Structures Painting Council.

B. Cleaned surfaces and all coats shall be inspected prior to each succeeding coat. The Contractor shall schedule such inspection with the Engineer in advance.

C. Blast cleaned ferrous metal surfaces shall be painted before any rusting or other deterioration of the surface occurs. Blast cleaning shall be limited to only those surfaces that can be coated in the same working day.

D. Coatings shall be applied in accordance with the manufacturer's instructions and recommendations, and this Section, whichever has the most stringent requirements.

E. Special attention shall be given to edges, angles, weld seams, flanges, nuts and bolts, and other places where insufficient film thicknesses are likely to be present. Use stripe painting for these areas.

F. Special attention shall be given to materials which will be joined so closely that proper surface preparation and application are not possible. Such contact surfaces shall be coated prior to assembly or installation.

G. Finish coats, including touch-up and damage repair coats shall be applied in a manner which will present a uniform texture and color matched appearance.

H. Coatings shall not be applied under the following conditions:

1. Temperature exceeding the manufacturer's recommended maximum and minimum allowable.

2. Dust or smoke laden atmosphere.

3. Damp or humid weather.

4. When the substrate or air temperature is less than 5 degrees F above dewpoint.

5. When air temperature is expected to drop below 40 degrees F or less than 5 degrees F above the dewpoint within 8 hours after application of coating.

I. Dewpoint shall be determined by use of a sling psychrometer in conjunction with U.S. Dept. of Commerce, Weather Bureau psychrometric tables.

J. Steel piping shall be abrasive blast cleaned and primed before installation.

K. The finish coat on all work shall be applied after all concrete, masonry, and equipment installation is complete and the work areas are clean and dust free.

3.13 CURING OF COATINGS

A. The Contractor shall provide curing conditions in accordance with the conditions recommended by the coating material manufacturer or by this Section, whichever is the highest requirement, prior to placing the completed coating system into service.

B. In the case of enclosed areas, forced air ventilation, using heated air if necessary, may be required until the coatings have fully cured.

C. Forced Air Ventilation of Steel Reservoirs and Enclosed Hydraulic Structures: Forced air ventilation is required for the application and curing of coatings on the interior surfaces of steel reservoirs and enclosed hydraulic structures. During curing periods continuously exhaust air from a maintenance hole in the lowest shell ring, or in the case of an enclosed hydraulic structure, from the lowest level of the structure using portable ducting. After all interior coating operations have been completed provide a final curing period for a minimum of 10 days, during which the forced ventilation system shall operate continuously. For additional requirements, refer to the specific coating system being used in the paragraph entitled "Submerged and Severe Service Coating Systems" herein.

3.14 TESTING FOR VOLATILE ORGANIC COMPOUNDS IN POTABLE WATER RESERVOIRS

A. General: The Contractor shall provide the following services to ensure that the interior reservoir coatings or linings do not convey volatile organic compounds to the potable water.

B. Selection of Coating or Lining Material: The Contractor shall provide a coating or lining system that has a successful record in meeting the national, regional, and local regulations and policies pertaining to leaching of volatile organic compounds into potable water.

C. Before the coating or lining materials are used, the Contractor shall by letter notify the regulatory agency having jurisdiction. The letter shall describe the proposed materials, including brand names, catalog numbers, catalog technical data, application and curing instructions, and material safety data sheets.

D. The Contractor shall provide curing time, temperature and ventilations as specified by the manufacturer or this Section, whichever is the highest requirement. In some cases, the Contractor may find it necessary to extend the curing time or ventilation time beyond the requirements in order to comply with the regulatory agency requirements or to reduce the leached organic compounds to the required levels. All costs in connection with any extended curing times shall be borne by the Contractor.

E. Following the curing or ventilation period, the Contractor shall clean, disinfect and fill the reservoir as specified.

F. A 7-day soaking period shall follow initial filling to determine the presence of any leached organics. Before the tank is placed into service, samples of the water in the tank will be taken by

the Engineer and analyzed by a laboratory approved by the State or the EPA. Analyses will be for volatile organic compounds by EPA Method 624 or equivalent (this test includes TCE, PCE, xylenes, toluene, ketones, carbon tetrachloride, and similar compounds).

G. If the tests results are above either (1) 0.005 mg/l for TCE, 0.004 mg/l for PCE, 0.62 mg/l for xylenes, 0.10 mg/l for toluene, 0.75 mg/l for methyl-ethyl ketone (to be used as representative for all ketone compounds), 0.005 mg/l for carbon tetrachloride, or (2) the regulatory agency's recommended Action Level Limits, whichever is less, the Contractor shall drain the water from the tank and flush, refill, and retest at no additional cost to the City. The Contractor shall provide as many curing, soaking, and flushing cycles as necessary to reduce the leached volatile organic compounds to levels below the requirements.

3.15 IDENTIFICATION OF PIPING

A. Identification of piping shall be in accordance with Section [15780] "Treatment Plant Piping Identification Systems."

B. Every valve or connection, where it may be possible for a worker to be exposed to a hazardous substance, shall be labeled per [General Industry Safety Orders, Article 112] OSHA Occupational Safety and Health Standards 29CFR1910.

C. [All unburied pipe in structures and in chemical pipe trenches shall be color-code painted. Colors shall be as specified in Section [15780] "Treatment Plant Piping Identification Systems," as selected by the Engineer, or as shown.]

D. [All unburied chemical pipes, including chemical pipes in structures and chemical pipe trenches shall be color-code painted. Colors shall be as specified in Section [15780] "Treatment Plant Piping Identification Systems," as selected by the Engineer, or as shown.]

3.16 COATING SYSTEM SCHEDULES - FERROUS METALS

A. Coating System Schedule, Ferrous Metal - Not Galvanized:

	Item	Surface Prep.	System No.
[FM-1	All exposed surfaces indoors and outdoors, except those included below.	Commercial blast cleaning SSPC-SP6/NACE3	(7) acrylic enamel
[FM-1	All exposed surfaces indoors and outdoors, except those included below.	Commercial blast cleaning SSPC-SP6/NACE3	(4) aliphatic polyurethane
[FM-1	All exposed surfaces indoors and outdoors, except those included below.	White metal blast cleaning SSPC-SP5/NACE1	(5) zinc-rich / polyurethane
FM-2	Surfaces in chlorination room, chlorine storage room.	Commercial blast cleaning SSPC-SP6/NACE3	(101) epoxy
FM-3	Surfaces of equipment and ferrous surfaces submerged or intermittently submerged in potable water or utility water, including all surfaces lower than 2-feet above high water level and all surfaces inside enclosed hydraulic structures and vents (excluding shop-coated	White metal blast cleaning SSPC-SP5/NACE1	(100) amine cured epoxy

	valves, couplings, pumps).		
FM-4	Surfaces of equipment and ferrous surfaces submerged or intermittently submerged in wastewater, including all surfaces lower than 2-feet above high water level and all surfaces inside enclosed hydraulic structures (excluding shop-coated valves, couplings, pumps).	White metal blast cleaning SSPC-SP5/NACE1	(109) epoxy amine
FM-5	Surfaces exposed to high temperature (between 150 and 600 degrees F).	White metal blast cleaning SSPC-SP10/NACE1	(6) inorganic zinc,water-based
FM-6	Surfaces exposed to high temperature (between 600 and 1000 degrees F).	white metal blast cleaning SSPC-SP5/NACE1	(3) aluminum silicone resin
FM-7	Buried small steel pipe.	Removal of dirt, grease, oil	(200) PVC tape
FM-8	Buried pipe couplings, valves, and flanged joints (where piping is plastic).	Removal of dirt, grease, oil	(201) rich portland cement mortar
FM-9	Buried pipe couplings, valves, and flanged joints (where piping is not plastic, or tape-coated, or mortar-coated steel), including epoxy-coated surfaces.	As specified by reference specification	(205) polyethylene encasement
FM-10	Buried pipe couplings, valves, and flanged joints (where piping is mortar-coated steel or reinforced concrete), including epoxy-coated surfaces.	Removal of dirt, grease, oil	(206) cement-mortar coating
[FM-11	Ferrous surfaces in water passagaes of all valves 4-inch size and larger, exterior surfaces of submerged valves.	White metal blast cleaning SSPC-SP5/NACE1	(100) amine-cured epoxy
[FM-12	Where shown or specified, ferrous surfaces in water passages and submerged surfaces of all pumps which have discharge size of 4-inches or larger.	White metal blast cleaning SSPC-SP5/NACE1	(100) amine-cured epoxy

[FM-12	Where shown or specified, ferrous surfaces in water passages and submerged surfaces of all pumps which have discharge size of 4-inches or larger.	White metal blast cleaning SSPC-SP5/NACE1	(106) fusion-bonded epoxy]
FM-13	Ferrous surfaces of sleeve-couplings	White metal blast cleaning SSPC-SP5/NACE1	(100) amine-cured epoxy
[FM-14	All ferrous surfaces of sluice gates, flap gates, and shear gates, including wall thimbles.	White metal blast cleaning SSPC-SP5/NACE1	(106) fusion-bonded epoxy
FM-15	Buried surfaces that are not specified to be coated	White metal blast cleaning SSPC-SP5/NACE1	(103) coal tar epoxy
FM-16	Indoor sheet metal, flashings, exposed ducts.	Commercial blast cleaning SSPC-SP6/NACE3	(7) acrylic enamel
FM-17	Interior surfaces of all chemical tanks, except caustic soda tanks, including tank nozzles, manholes, nozzle necks, flange faces.	White metal blast cleaning SSPC-SP5/NACE1	(107) chemical-resistant sheet lining
FM-18	Surfaces of indoor equipment.	[Specifier enter]	[Specifier enter]
FM-19	[Specifier list of existing ferrous equipment or surfaces which are required to be re-coated as part of this work.]	[Specifier enter]	[Specifier enter]

B. Coating System Schedule, Ferrous Metal - Galvanized: Pretreatment coatings, barrier coatings, or washes shall be applied as recommended by the coating manufacturer. [All galvanized surfaces shall be coated] [All galvanized surfaces except for the following items shall be coated unless coating is required by other Sections: (1) Floor gratings and frames, (2) Handrails, (3) Stair treads, (4) Chain link fencing and appurtenances, (5) Specifier selected items].

	Item	Surface Prep.	System No.
[FMG-1	All exposed surfaces indoors and outdoors, except those included below.	Galvanized Metal	(3) acrylic enamel]
[FMG-1	All exposed surfaces indoors and outdoors, except those below.	Galvanized Metal	(4) aliphatic polyurethane
FMG-2	Surfaces in chlorinator room, chlorine storage room.	Galvanized Metal	(101) amine-cured epoxy
FMG-3	Buried small steel pipe.	Galvanized Metal	(200) PVC tape
FMG-4	Surfaces buried or submerged in wastewater.	Galvanized Metal	(109) epoxy-amine
FMG-5	Buried miscellaneous surfaces, couplings, valves, and flanged joints.	Galvanized Metal	(201) rich portland cement mortar
FMG-6	Indoor sheet metal flashings, exposed ducts.	Galvanized Metal	(3) acrylic enamel
FMG-7	[Specifier list of existing galvanized equipment or surfaces which are required to be recoated as part of this work.]	[Specifier enter]	[specifier enter]

C. Coating System Schedule, Steel Reservoir Interior: For steel reservoir exterior coating system, see "Coating System Schedule, Ferrous Metal-Not Galvanized". The interior surfaces of steel reservoirs shall have all surface preparation and coating work performed in the field.

	Item	Surface Prep.	System No.
SR-1	All interior surfaces beginning one foot above high water level, including all plates, roof structural members, fittings, and vents.	White metal blast cleaning SSPC-SP5/NACE1	(105) Part A, inorganic zinc/epoxy
SR-2	Underside of column bases, floor under column bases before columns set in place, submerged contact surfaces that are not accessible after erection.	White metal blast cleaning SSPC-SP5/NACE1	(105) Part B, inorganic zinc/epoxy
SR-3	Interior surfaces exclusive of surfaces in SR-1 and SR-2 above, including overflow, drain and other piping out to the first valve or coupling.	White metal blast cleaning SSPC-SP5/NACE1	(105) Part B, inorganic zinc/ epoxy]

D. Coating System Schedule, Steel Digester Floating Covers and Digester Gasholders:

	Item	Surface Prep.	System No.
SD-1	All ferrous surfaces submerged in water or sludge, including rim plate.	White metal blast cleaning SSPC-SP5/NACE1	(109) epoxy amine
SD-2	All ferrous surfaces exposed to digester gas.	White metal blast cleaning SSPC-SP5/NACE1	(109) epoxy amine
SD-3	All interior ferrous surfaces of gasholder shell, including top angle.	White metal blast cleaning SSPC-SP5/NACE1	(109) epoxy amine
SD-4	All ungalvanized interior surfaces inside digester roof, between and including the ceiling plate and the roof deck.	White metal blast cleaning SSPC-SP5/NACE1	(109) epoxy amine
SD-5	Exposed, outdoors.	Commercial blast cleaning SSPC-SP6/NACE3	(5) Zinc rich, aliphatic polyurethane

3.17 COATING SYSTEM SCHEDULE, NON-FERROUS METAL, PLASTIC, FIBERGLASS

A. Where isolated non-ferrous parts are associated with equipment or piping, the Contractor shall use the coating system for the adjacent connected surfaces. Do not coat handrails, gratings, frames or hatches. Only primers recommended by the coating manufacturer shall be used.

	Item	Surface Prep.	System No.
NFM-1	All exposed surfaces, indoors and outdoors, except those included below.	Solvent cleaned SSPC-P1	(3) acrylic enamel
NFM-1	All exposed surfaces, indoors and outdoors, except those included below.	Solvent cleaned SSPC-P1	(4) aliphatic polyurethane
NFM-2	Chlorination room, chlorine storage room.	Solvent cleaned SSPC-SP1	(101) amine-cured epoxy
NFM-3	Aluminum surfaces in contact with concrete, or with any other metal except galvanized ferrous metal.	Solvent cleaned SSPC-SP1	(208) aluminum metal isolation
NFM-4	Polyvinyl chloride plastic piping, indoors and outdoors, or in structures, not submerged.	Solvent cleaned SSPC-SP1	(7) acrylic enamel
NFM-5	Fiber glass surfaces.	Per Paragraph [3.8]	(12) aliphatic polyurethane fiberglass
NFM-6	Buried non-ferrous metal pipe.	Removal of dirt, grease, oil	(200) PVC tape
NFM-7	[Specifier list of existing equipment or surfaces which are required to be recoated as part of this work.]	[Specifier enter]	[Specifier enter]

3.18 COATING SYSTEM SCHEDULE-CONCRETE

	Item	Surface Prep.	System No.
C-1	Exposed indoors and outdoors, as shown.	Per Paragraph [3.7]	(10) acrylic, concrete
C-2	Submerged in wastewater including surfaces up to 2-feet above high water line and down to 2-feet below low water line and all surfaces in an enclosed structure, as shown.	Per Paragraph [3.7]	New surface:(110) epoxy amine, concrete Existing surface: (102) epoxy mortar
C-2	Submerged in wastewater including surfaces up to 2-feet above high water line and down to 2-feet below low water line and all surfaces in an enclosed structure, as shown.	Per Paragraph [3.7]	(110) epoxy amine, concrete
C-3	Floor slab, exposure to chemicals, as shown.	Per Paragraph [3.7]	(203) epoxy surfacing
C-4	Floor slab, non-slip surface, as shown.	Per Paragraph [3.7]	(207) non-slip surfacing
C-5	Interior surfaces of sewer manholes, including sidewalls, bottom, and metal appurtenances, for manholes shown.	Per Paragraph [3.7]	New surface:(110) epoxy amine, concrete Existing surface: (102) epoxy mortar
C-5	Interior surfaces of sewer manholes, including sidewalls, bottom, and metal appurtenances, for manholes shown.	Per Paragraph [3.7]	New surface:(110) epoxy amine, concrete Existing surface: (102) epoxy mortar
C-6	Walls, exposure to chemical splash, washdown, as shown.	Per Paragraph [3.7]	(11) aliphatic polyurethane, concrete
C-7	[Specifier list of existing concrete surfaces which are required to be recoated as part of this work and as shown.]	[Specifier enter]	[Specifier enter]

3.19 COATING SYSTEM SCHEDULE-CONCRETE BLOCK MASONRY

	Item	Surface Prep.	System No.
CBM-1	Exposed, indoors and outdoors, as shown.	Per Paragraph [3.9]	(10) acrylic, concrete
CBM-2	Submerged in wastewater, including all vertical masonry surfaces above waterline as shown.	Per Paragraph [3.9]	New surface:(110) epoxy amine, concrete Existing surface: (102) epoxy mortar
CBM-2	Submerged in wastewater, including all vertical masonry surfaces above waterline as shown.	Per Paragraph [3.9]	New surface:(110) epoxy amine, concrete Existing surface: (102) epoxy mortar
CBM-3	Exterior surfaces, above grade.	Per Paragraph [3.9]	(204) waterproofing
CBM-4	[Specifier list of existing masonry surfaces which are required to be recoated as part of this work, and as shown.]	[Specifier enter]	[Specifier enter]

END OF SECTION

SECTION 10443

DISABLED ACCESSIBILITY PARKING SIGNAGE

PART ONE - GENERAL

*1.1 DESCRIPTION

A. Furnish and install disabled accessibility signage as indicated on the drawings and specified herein.

B. Related Work Sections:

1. Documents affecting work of this Section include, but are not necessarily limited to the GENERAL CONDITIONS, SUPPLEMENTARY CONDITIONS, GENERAL REQUIREMENTS in Division 1 and other Section of the Project Manual.

2. Earthwork in Section 02310.

3. Porous Paving in Section 02731.

4. Concrete Work in Section 03300.

1.2 QUALITY ASSURANCE

A. Labor: Use adequate number laborer's who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for the proper performance of the work of this section.

B. Codes and Regulations: In accordance with the following documents:

1. American National Standards Institute (ANSI), ANSI A117.1, latest edition - Providing Accessibility and Usability for Physically Disabled People.

2. State of California, Code of Regulations, Title 24, Chapter 11B – Accessibility to Public Buildings, Public Accommodations, Commercial Buildings and Publicly Funded Housing, Section 1129B.5 – Identification of Parking Spaces for Off-Street Parking Facilities.

3. Los Angeles City Building Code and Amendment.

1.3 SUBMITTALS

A. Comply with pertinent provisions of Section 01340 – SUBMITTALS of Division 1 GENERAL REQUIREMENTS of the Project Manual.

B. Product Data: Within 35 calendar days after the Contractor has received the City's Notice-To-Proceed, submit list of material, product data of items proposed to be provided under this Section.

C. Shop Drawings: Submit drawings including elevations of each type of sign; dimensions, details, and methods of mounting; shape and thickness of materials; and details of construction.

1.4 PRODUCT HANDLING

A. Protection: Protect the concrete footing, the posts and signs before, during and after installation. Protect from the paving operations.

B. Delivery: Deliver all items to be built into concrete footing in time so as not to delay construction and installation operations.

C. Storage: Properly store all material until time for installation.

PART TWO - PRODUCTS

*2.1 STANDARD PRODUCTS

A. Signs shall be as manufactured by Western Highway Products Inc., Stanton, CA. (714-761-4811) or equal.

B. Signs shall be complete with lettering, framing, and related components for a complete installation. Materials and equipment shall be the standard product of a manufacturer regularly engaged in the manufacture of the products. Items of equipment shall essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening.

*2.2 MATERIAL AND FABRICATION

A. Posts: Provide two-piece, 2 inches x 2 inches x 1/9 inch thick x9 feet high galvanized steel tabular post and sleeve. Post shall be designed to accept panel framing system and shall be designed to permit attachment of panel

framing system without exposed fasteners. Caps shall be provided for each post.

B. Panel Framing System: Panel framing consisting of galvanized steel sections and interlocking track components shall be designed to interlock with posts with concealed fasteners. Top and bottom framing members shall be removable to permit panel removal.

C. Panels: Modular message panels shall be provided in sizes, [not less than 18 inches wide x 27 inches high], [as shown on contract drawings]. Constructed of reflective sheeting laminated to 18-gage heavy duty sheet steel and silk screened in transparent blue with “Disabled Symbol” and the appropriate message in white. Panels shall be designed to be interchangeable. Panels with metal return sheeting shall have welded corners, ground smooth.

2.3 FINISHES

A. Post finish shall be semi-gloss baked enamel or two-component acrylic polyurethane.

B. Metal panel framing system finish shall be baked enamel or two-component acrylic polyurethane, as standard with the sign manufacturer.

*2.4 GRAPHICS

A. Graphics and message shall be applied to panel using the silkscreen process. Silkscreened images shall be executed with photo screens prepared from original art. No handcut screens will be accepted. Original art shall be defined as artwork that is a first generation stencil of the original specified art. Edges and corners shall be clean. Rounded corners, cut or ragged edges, edge buildup, bleeding or surfaces pinholes will not be accepted.

At least one parking sign with “Disabled Symbol” plus the message “Van Accessible” shall be provided. Other accessible parking signs shall be provided with “Disabled Symbol”.

An additional sign shall also be posted in a conspicuous place at the entrance and it shall state the following:

> “Unauthorized vehicles parked in designated handicapped space not displaying distinguishing placards or license plates issued for physically disabled persons may be towed away at owner’s expense. Towed vehicles may be reclaimed at (address) or by telephone (number)”.

The blank spaces are to be filled in with appropriate information as a permanent part of the sign by the Contractor.

B. Graphics, message, and colors shall be in accordance with ANSI A117.1. The type face shall be Helvetica medium. All lettering shall not less than one (1) inch in height.

*3.1 INSTALLATION

A. Signs shall be installed at locations shown on the drawings, plumb and true. Bottom of the sign shall be 80 inches above the finish grade of the parking lot or floor.

B. Permanent mounting shall be provided by fastening to 12 inch post sleeve embedded in concrete foundations. Foundations shall be not less than 12 inches in diameter and 24 inches deep with the top one inch above the paving. The top of the foundation shall be shaped/sloped to drain water away from the post. Concrete shall have a minimum compressive strength of 2500 psi at 28 days. Metal sleeve shall be installed 2 inches in the concrete foundation above about the top of concrete and secured with the post; all subgrade, base course and paving shall be compacted and placed around the foundation.

3.2 PROTECTION AND CLEANING

A. The work shall be protected against damage during construction. Keep the signage clean until final acceptance of the work.

END OF SECTION

SECTION 11815
SLIDE/STOP GATES

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish and install slide/stop gates in the sizes and locations shown, complete and operable, including manual and electric operators, bracing, frame, mountings, etc., as specified herein, in accordance with the requirements of the Contract Documents.

1.2 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the applicable reference specifications as specified in the GENERAL REQUIREMENTS.

B. Comply with the current provisions of the following Codes and Standards.

ASTM A193A	Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service.
ASTM A194A	Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure and High-Temperature Service.
ASTM A240	Chromium and Chromium-Nickel Stainless Steel.
ASTM A283	Low and Intermediate Tensile Strength Carbon Steel Plates.
ASTM A380	Standard Practice for Cleaning, De-scaling and Passivation of Stainless Steel Parts, Equipment and Systems.
ASTM D638	Test Method for Tensile Properties of Plastics.
ASTM D790	Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
ASTM D2240	Test Method for Rubber Property-Durometer Hardness.
ASTM E 84-91A	Surface Burning Characteristics
ASTM D3982-92	Standard Specifications for Contact Molded “Fiberglass” Glass Fiber Reinforced Thermosetting Resin Duct and Hoods.
ASTM C582	Standard Specifications for Contact Molded Reinforced Thermosetting Plastic (RTP).
ASTM D5241-93	Standard Specifications for Contact Molded Glass-Fiber-Reinforced Thermosetting Resin Flanges.
ASTH D4024-00	Standard Specifications for Reinforced Thermosetting Resin (RTR) Flanges.
NBS PS 15-69	Custom Contact-Molded Reinforced-Polyester Chemical-Resistant Process Equipment.
UL 181	Standard for Factory Made Air Ducts and Air Connectors.

* When two or more of the above regulations are applicable, the more stringent requirement shall be met.

1.3 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the GENERAL REQUIREMENTS.

B. Shop Drawings: The CONTRACTOR shall submit complete shop drawings of all gates, frames, slides, and operators, as well as design load calculations for deflection at the maximum expected head, and calculations for the lifting force required to lift the gate with 40 pounds effort on the handwheel or crank.

1.4 QUALITY ASSURANCE

A. Comply with Section 11000 "Equipment General Provisions."

B. The leakage allowance for slide gates shall not exceed 0.1 gpm/ft of seating perimeter under 20 ft of seating head, and 0.2 gpm/ft under 20 ft of unseating head, to meet ANSI/AWWA C-501.

PART 2 -- PRODUCTS

2.1 GENERAL REQUIREMENTS

A. All plastic and fiberglass items shall be manufactured with the "matched die-molded method," of material suitable for potable water, and shall be certified for such use on the shop drawings. Bolts, anchor bolts, nuts, washers, and supports shall be provided for all plastic and fiberglass items in accordance with the requirements of the manufacturers of the plastic and fiberglass items. All bolts, anchor bolts, washers, and supports required in connection with the plastic or fiberglass items shall be of Type 316 stainless steel.

B. All gates shall be new and of current manufacture, and adequately braced to prevent warpage and bending under the intended use. Where designated, gates shall be furnished with electric operators provided by the gate manufacturer. All operators of a given type shall be furnished by the same manufacturer.

C. All gates shall be furnished with a handwheel, crank-operated or electrically operated floor stand, having a 2:1 gear ratio, or 2-inch square operating nut, as shown on drawings, and shall conform to ANSI/AWWA C501, except as otherwise specified herein.

D. Operating Mechanism: Operators shall be weatherproof, equipped with stem covers, and shall be mounted on cast-iron or fabricated steel pedestals. Actuator shall be placed in an adjacent dry vault as shown on the drawings. The pedestal shall have an ample base or bracket area to evenly distribute the load to the supporting structure. The center line of the manual operator shall be approximately 3-feet above the base of the pedestal. The unit shall be designed so that a maximum of 40 pounds effort on the crank will operate the gate. Clockwise movement of the handwheel shall close the gate. The operating crank shall be easily removable to facilitate the use of a portable power operator.

E. Coating: Each gate and all accessories shall be epoxy-coated as specified in Section 09800 Protective Coating. Care shall be exercised to protect all machined surfaces during sandblasting and coating.

1. Cleaning and Finishing stainless steel welded fabrication:

a. Cleaning of weld joints and weld joint areas both before and after welding, shall conform to ASTM A380. Use only stainless steel brushes or stainless steel wool.

b. Finishing: All weld areas following fabrication shall be pickled to remove all mill scale, weld inclusions, and color, and passivated in conformance to ASTM A380.

c. Contractor shall submit the cleaning and passivation procedure in compliance with the above requirements for ENGINEER's review and approval.

F. Stems: Stems shall be of Type 316 stainless steel and shall be provided with Type 316 stainless steel adjustable bushed stem guides to ensure that the L/R ratio of the stem does not exceed 200.

2.2 ALUMINUM SLIDE GATES

A. Construction: Aluminum slide gates shall be self-contained, or as shown, crank or handwheel-operated, with Type 316 stainless steel operating stem. Aluminum gates in liquids with a pH lower than 5, or higher than 9, shall be anodized. The gates shall have stiffeners, extruded aluminum frames with bearing bars of ultra high molecular weight polymer, resilient P-seals, and fully lubricated stems and operators.

B. Manufacturers:

1. Waterman

2. Fontaine Aquanoz Water Control Products

3. Whipps

4. Or equal.

PART 3 -- EXECUTION

3.1 INSTALLATION

A. Slide gates shall be installed in strict accordance with the manufacturer's printed recommendations and the requirements herein. Operators shall be located to avoid interference with handrails and structural members.

B. All damage to surface coatings incurred during shipment and/or installation shall be repaired to the satisfaction of the ENGINEER prior to installation.

END OF SECTION

This page intentionally left blank

SECTION 13200
MODULAR BURIED STORMWATER INFILTRATION AND DESILTING BASIN SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the performance criteria, materials, design, production, and installation for precast concrete, modular, buried, stormwater desilting basins and infiltration units that together form the stormwater infiltration system. The Work performed under this Section includes all labor, materials, equipment, related services, and supervision required for the supply, installation and commissioning of the precast concrete, modular, buried, stormwater storage and infiltration units and accessories formed into the infiltration system.

1.3 RELATED SPECIFICATIONS

A. All precast concrete for this Section shall comply with the requirements of Section 03400 Precast Concrete.

1.4 SUBMITTALS

A. Submittals shall conform to Section 01330 Shop Drawings/Submittals.

B. Action Submittals

1. Shop Drawings and Calculations

a. Stormwater Infiltration system layout drawings indicating each separate unit type and location, system dimensions, access locations and types, floor infiltration openings vent locations, and other information needed to provide an understanding of the complete system to be supplied.
b. Detail fabrication and installation of structural precast concrete units including joint interface at member ends and to each adjoining member.
c. Indicate locations, plan views, elevations, dimensions, shapes, and cross sections of each unit, openings, inlet and outlet pipe openings, vents, and level sensors, and other equipment openings, support conditions and types of reinforcement, including special reinforcement.
d. Detail loose and embedded hardware, lifting and erection inserts, connections, and interface surfaces.
e. Indicate location and details of joint treatment for sealing of joints.

f. Submit signed and sealed reinforcing drawings for all precast units by a Structural Engineer registered in the State of California.
g. Submit structural calculations and design for cast-in-place modules for approval in accordance with Section 01330 Shop Drawings/Submittals. This also applies to modules that do not fit the 6'x8' access hatch requirements.

C. Concrete Design Mixtures

1. Include a submittal for each concrete design mixture including both 7-day and 28-day compressive strength. Submit Concrete Mix Design signed and sealed by a Structural Engineer registered in the State of California.
2. Water Storage Sizing:

a. Include supporting data to confirm the stormwater infiltration system is sized with sufficient water storage capacity per the Drawings.
b. Alternative stormwater infiltration systems to any Specified system shall include a continuous simulation hydrologic model that supports how the system is sized with sufficient water storage capacity, conforms to the required draw-down time, and conforms to the release rates and other pertinent design parameters as detailed on the Plans and in the Specifications. The continuous simulation hydraulic model and results shall be reviewed and will require Approval by the Engineer or the Owner's authorized representative prior to acceptance of an alternative system.

D. Informational Submittals

1. Material Test Reports:

a. Aggregates: Material test reports shall be from an accredited agency indicating and interpreting test results for compliance with Reference Standards and Specifications as detailed herein.
b. Compressive Strength: Concrete compressive strength test results shall be supplied for 25% of the batches of concrete utilized in the production of the precast concrete, modular, buried, infiltration system.

2. Material Certifications: Material certifications shall be signed by the Manufacturers certifying that each of the following items comply with the Reference Standards and Specifications as detailed herein.

a. Cementitious materials.
b. Reinforcing materials.
c. Admixtures.
d. Bearing pads.
e. Sealants.
f. Gaskets.

3. Operations and Maintenance Manual.

a. Contractor Provided Installation Verification: The installation of the subsurface stormwater infiltration system shall be verified by a California Licensed Professional Engineer and a certification provided indicating that the system has

been constructed and is in substantial conformance with the Shop Drawings, Project Drawings and Specifications.

b. Provide an operations and maintenance manual that includes recommended maintenance schedule and tasks, personnel, access requirements, health and safety, equipment, and standard operating procedures.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver all precast concrete members in such quantities and at such times to assure compliance with the agreed upon Project schedule and setting sequence to ensure continuity of installation.

B. Transport and handle members in a manner that will avoid excessive stresses that could cause cracking or other damage.

C. Store individual precast members with adequate dunnage and bracing, and protect units to prevent contact with soil, staining, and to control cracking, distortion, warping or other physical damage.

D. Store individual precast members with dunnage across the full width of each bearing point unless otherwise Specified or shown on the Shop Drawings.

E. Place stored members so that identification marks are clearly visible and units can be inspected.

F. Place dunnage of even thickness between each member.

G. Precast members shall be stacked according to the manufacturer's recommendation.

H. Lift and support precast members as per manufacturer's recommendations only at designated points indicated on the Shop Drawings. Do not drag, slide or push members.

I. Accessories:

1. Accessory components shall be delivered in the manufacturer's original, unopened packaging and/or containers with labels that clearly identify the make, model, date of fabrication, and manufacturer.
2. Accessory components shall be stored in a clean, dry area out of direct sunlight.

PART 2 - PRODUCTS

2.1 MODULAR BURIED STORMWATER DESILTING BASIN AND INFILTRATION UNITS

A. Manufacturers: Subject to compliance with requirements, provide products manufactured by one of the following:

1. Bio Clean Environmental, 5796 Armada Drive, Suite 250, Carlsbad, CA 92008; Phone: (855) 566-3938, www.biocleanenvironmental.com, Contact: Michael Frasco (310) 595-4583 (Los Angeles, CA)

2. Jensen Precast, 14221 San Bernardino Ave., Fontana, CA 92335, Phone: (909) 350-4111, www.jensenprecast.com, Contact: Matthew Blaylock (909) 429-3174.
3. OldCastle Infrastructure, 10650 Hemlock Ave., Fontana, CA 92337, Phone: (909) 428-3700, oldcastleinfrastructure.com, Contact: Xiaoyu Zhang, (323) 430-3138 (Los Angeles).
4. Precon Products, 240 W. Los Angelese Ave., Simi Valley, CA 93065; Phone: (805) 527-0841, www.pre-conproducts.com; Contact: Dan Zarraonandia, (805) 306-2494.
5. StormTrap, 1287 Windham Parkway, Romeoville, IL 60446; Phone: (815) 941-4549 stormtrap.com; Contact: Charlie Carter, (760) 212-5628.
6. Approved equal.

B. Design and Performance Requirements:

1. Water Storage Capacity: Underground stormwater infiltration system with minimum water storage capacities as indicated on the Drawings and Specifications. The storage volume to reflect any necessary freeboard.
2. System Footprint: Underground infiltration system footprint to be within the site limit restrictions shown on the Drawings. Design system to prevent hydraulic blockage in the longitudinal, lateral or diagonal directions with the exception of areas designated as sedimentation basins. Sedimentation basins shall be designed to the dimensions, locations, etc. as shown on the Drawings without deviation.
3. System Configuration:

    a. Underground stormwater infiltration system to meet one of the following two layout requirements:

        1) Total area of infiltration openings in the concrete base of the infiltration units to meet the minimum required area identified on the drawings. Provide easily removable and replaceable filter fabric units to prevent sediment from entering and clogging the crushed rock voids of the bedding below the infiltration system. Filter fabric to cover all infiltration openings to filter all stormwater that passes through these openings and to not restrict the hydraulic characteristics of the infiltration system if 90% clogged by sediment. Filter fabric shall meet the requirements of Section 02660 Geotextile Filter Fabrics.
        2) Total area of infiltration openings at the concrete base of the infiltration units to be a minimum of 40% of the total area of the infiltration system.

4. Maintenance Access:

    a. Access to be provided for maintenance staff entry into the underground infiltration system. Access locations, sizes and types to be provided at the site locations shown on the Drawings.
    b. Maintenance access for mechanized equipment to be provided that allows access to all locations within the infiltration system through continuous forward motion of the equipment with a turning radius of 2.5 feet without the need for three-point turn arounds.
    c. The stormwater infiltration system shall be designed with no internal ledges, steps, slopes, or walls that would impede the maintenance vehicle pathway.

5. Ventilation: Vents to be provided in locations as shown on the drawings.
6. Structural Performance: Underground stormwater infiltration units capable of withstanding design loads as indicated on the Drawings and Specifications and as detailed herein:

    a. Dead Loads:

        1) Soil load based on minimum and maximum depth of burial as indicated on the Drawings using a minimum of 120 pcf soil density.
        2) Lateral soil pressures based on a minimum "At Rest Earth Pressure" of 60 pcf.
        3) Other dead loads as indicated on the Drawings.

    b. Live Loads:

        1) Able to sustain HS20 loading requirements without damage to the structure; ACI 350 and ACI 318 based on minimum and maximum depths of burial as indicated on the Drawings.
        2) For burial depths less than two feet including at manned access locations a concentrated point load shall be utilized for the calculated live load.

    c. Interior Water Load:

        1) A minimum of 62.4 pcf water density at the maximum water storage depth as indicated on the Drawings. Evaluation of loads on infiltration units to be based on both the maximum water storage volume depth and dry infiltration unit conditions.

    d. Seismic Loads to be based on project Geotechnical Report in the Appendix.
    e. Other Loads (if any) to be determined using the following:

        1) As detailed on the Drawings of otherwise listed in the specifications.

7. Materials and Concrete Thicknesses: Structural precast concrete, modular, buried, stormwater desilting basin and infiltration units to be designed in accordance with ACI 350, ACI 350.3, and ACI 318 latest edition and the details listed herein;

    a. Cement: Type II/V Portland cement; ASTM C150.
    b. Aggregate: ASTM C33, except for gradation requirement
    c. Reinforcement to consist of steel bar conforming to ASTM A615, Grade 60/80, glass fiber reinforced polymer bars conforming to ASTM D7957, or mesh conforming to ASTM A1064, Grade 60/80.
    d. All desilting and stormwater infiltration units to be cured by an approved method. Do not ship until concrete has attained full design compressive strength as determined by a California Licensed Professional Engineer (and in no case less than 2,000 psi compressive strength).
    e. Wall thickness, and top slab thickness of the desilting basin and infiltration units to conform to ACI 350 and ACI 318 and shall be no less than the minimum thickness necessary to sustain soil loading plus HS20 loading requirements as determined by a Licensed Professional Engineer in the State of California.

f. Wall thickness, top slab thickness and bottom slab thickness of the desilting and infiltration units to be no less than the minimum thickness necessary to sustain the expected soil loading based on a minimum of 120 pcf for soil density at the required burial depths as determined by a Licensed Professional Engineer in the State of California.

g. Wet mix concrete or self-consolidating concrete (SCC) with a water/cement ratio of no greater than 0.40 to be utilized for all precast elements and any field cast elements. Dry cast concrete is not to be used in order to maintain dimensional tolerances and to ensure adequate consolidation around heavy reinforcement.

h. The interior assembled floor of the infiltration units is to be flat to within ½" and not sloped greater than 1%. The top of concrete at the floor of the desilting basin units is to be within ½" and not sloped greater than 1% more or less than the slope indicated on the drawings.

i. All vertical load bearing elements to contain transverse reinforcement per ACI 350 and ACI 318 to provide confinement and ensure that spalling of the shell concrete does not result in a loss of axial load strength.

j. Minimize horizontal structural irregularities in interior space to prevent unpredictable movement during a design seismic event.

8. Openings and Risers:

a. Pipe Openings: ASTM C595 or ASTM C1107. Sized to accept pipes of the specified size(s) and material(s) as indicated on the Drawings and shall be sealed by the Contractor with hydraulic cement.

b. Access Risers: ASTM A478 for round access risers and ASTM C857 and ASTM C858 for square/rectangular access risers and provide for an access opening with a minimum dimension of 48-inches.

c. Leveling: Brick or masonry used to level the manhole frames and covers to finished grade; ASTM C32 or ASTM C139 and to be installed in conformance with all local requirements.

9. Warranty Period – Material supplier shall provide a minimum 5-year materials warranty.

C. Accessories:

1. Spacer/Backer (for use between concrete members): 1/2-inch thick x 4-inch wide closed-cell polypropylene foam; ASTM D8139, ASTM D1751, and ASTM D545.
2. Joint Filler (for use between concrete member floors): Non-shrink hydraulic cement; ASTM C595 or C1107.
3. Joint Sealer (for use between concrete member floors): Cold-applied, water proof membrane; ASTM C836.
4. Joint Sealer (for use between concrete member walls): Rapid-cure, elastomeric sealant; ASTM C920.
5. Joint Sealer (to span between concrete member roofs): Polyolefin backed exterior joint wrap; ASTM C877.

2.2 EXCAVATION, BACKFILL AND SOIL MATERIALS

A. Excavation, backfill, soil and bedding materials are specified in Section 02310 Earthwork.

2.3 CAST-IN-PLACE CONCRETE

A. Cast-in-Place Concrete is specified in Division 3.

2.4 ACCESS HATCHES AND MANHOLE FRAMES AND COVERS

A. Manhole frames and covers, and access hatches are specified in Section 02585 Maintenance Hole and Precast Vault Construction.

2.5 FILTER FABRICS

A. Filter fabric to be installed in the filter units in the base of the infiltration gallery to:

1. Filters shall meet the following requirements:

    a. Filters particles to 50 microns in size,
    b. Removes a minimum of 99% of total suspended solids (TSS);
    c. Removed oil and grease to be non detectable;
    d. Flow rate of 100 gpm per sq-ft; and
    e. Minimum gross solids removal of 90%.

2. Product to be Absorb-it Catch Basin Filter Basket, or approved equal.

B. Filter fabric to be installed around the Infiltration Gallery structure to be:

1. EX Description: Fabric of PP or polyester fibers or combination of both, with flow rate range from 110 to 330 gpm/sq. ft. (4480 to 13 440 L/min. per sq. m) when tested according to ASTM D4491.
2. Structure Type: Nonwoven, needle-punched continuous filament. Class 2 in first subparagraph below is the default class recommended by AASHTO. Survivability to meet AASHTO M 288 Class 2; with styles flat and sock.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine all surfaces and areas for suitable conditions beneath the modular buried stormwater infiltration system and desilting basins and to a limit of 2 feet outside each structure where crushed stone will be placed for infiltration. Notify Engineer if existing soil area is not acceptable for infiltration.

B. If subsurface drainage is required for landscaping, locate and mark existing utilities, underground structures, and aboveground obstructions before beginning installation and avoid disruption and damage of services.

C. Verify that drainage panels installed as part of foundation wall waterproofing are properly positioned to drain into subsurface drainage system.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Section 02310 Earthwork.

3.3 STORMWATER INFILTRATION SYSTEM INSTALLATION

A. General Locations and Arrangements: As indicated on Shop Drawings.

B. Install per ASTM C891. Follow manufacturer's written instructions where specific installation procedures are not indicated.

C. Inspect all precast concrete members for defects and cracks before being lowered into the excavation. Remove and replace defective, damaged or unsound structures or products whose grade is disturbed after laying. Ensure interior of treatment system is free from dirt, excess water and foreign materials as installation progresses; leave in a clean condition at completion of the installation.

3.4 EXCAVATION

A. Excavate pit to ensure side slopes will be stable under working conditions. Slope trench walls or provide shoring or bracing in conformance with federal, state, and local safety standards. Excavate only as much as can be safely maintained by available equipment.

B. Where excavation walls are stable or supported, provide width sufficient, but no greater than necessary, to ensure working room to properly and safely place and compact embedment materials. Provide space between infiltration system and excavation wall that is wider than compaction equipment used in compaction area.

C. Dewatering:

Do not lay or embed any precast concrete member in standing or running water. Prevent surface runoff from entering excavation at all times.

1. When water is present in work area, dewater to maintain stability of in-situ and imported materials. Maintain water level below infiltration system bedding and foundation to provide a stable excavation bottom. Use, as appropriate, sump pumps, well points, deep wells, geofabrics, perforated underdrains, or stone blankets of sufficient thickness to remove and control water in all excavations. When excavating while depressing ground water, ensure that ground water is kept below bottom of cut at all times to prevent washout from behind sheeting or sloughing of exposed excavation walls. Maintain control of water in excavation before, during, and after stormwater infiltration system

installation and until covering embedment is installed and sufficient backfill has been placed to prevent flotation of system, attached piping, or accessory drainage structures.

D. Removal of Unstable Material:

1. Where wet or otherwise unstable soil incapable of properly supporting the infiltration system, as determined by Engineer, is encountered in bottom of an excavation, remove the material to at least 24 inches below the bottom of the system and replace to proper grade with select granular material, compacted as directed by Engineer. Removal of unstable material created due to fault or neglect of Contractor while performing shoring and sheeting, water removal, or other specified requirements, shall be performed at no additional cost to Owner.

3.5 PLACING PRECAST CONCRETE MEMBERS

A. Examine each precast concrete member for defects before placement; do not use defective or damaged members. Place precast concrete members within ± ¾-inch of elevations as indicated on Drawings. Provide proper equipment for lowering and setting precast concrete members into the excavation. Do not lay precast concrete members in water, and do not lay members when trench conditions or weather are unsuitable for such work. Provide diversion of drainage or dewatering of excavations as directed by Engineer and as indicated in Section 3.4 C.

B. Place a ½" thick x 4" wide closed-cell polypropylene foam gasket conforming to ASTM D8139, ASTM D1751, and ASTM D545 on all sides of precast concrete members that will abut an adjacent member. Keep foam gasket members in place to ensure proper alignment and act as backer material for subsequent sealing.

C. Place and align precast concrete members to within ½-inch of each other horizontally and vertically.

D. Use a random-oriented fiber bearing pad conforming to ASTM D4014 and ASTM D5992 between members with a minimum bearing surface area of 18 square-inches for precast members transferring vertical loads to other members or slabs.

1. Minor misalignment of upper sections on slab or upper sections on other members may be adjusted through shimming using random oriented fiber pads conforming to the ASTM D4014 and ASTM D5992, provided the minimum bearing surface area is maintained.

3.6 JOINTING/SEALING

A. Seal joints on exterior top and side surface using a polyolefin backed exterior joint wrap conforming to ASTM C877. Span joint wrap by a minimum of 6-inches on either side of the joint.

B. Protect sealed joints from damage during placement of additional members and during final backfill. Re-seal joints damaged during construction.

3.7 BACKFILLING

A. General:

1. Backfill placement and compaction shall be constructed in accordance with the Specifications herein and the product manufacturer's published installation guides.

B. Backfilling Stormwater Infiltration System in Excavation:

1. After precast concrete member and accessory drainage connections have been properly bedded, select material from excavation or borrow, at a moisture content that will facilitate compaction as described on the project geotechnical report, shall be placed along all sides of the system in layer depths to ensure minimum compaction density is obtained evenly throughout the backfill material. Bring backfill up evenly on all sides of structure. Compact each layer with mechanical tampers or rammers. The lift thickness for fill soils will depend on the type of compaction equipment used, but generally should not exceed 8 inches in loose thickness. Tests for density as necessary to ensure conformance to compaction requirements as Specified in Geotechnical Evaluation Report. Where necessary, in the opinion of the Engineer, that sheeting or portions of bracing used to be left in place, the contract will be adjusted accordingly. Do not leave untreated wood sheeting or shoring in place beneath structures or pavements.

C. Movement of Construction Machinery:

1. Movement of construction machinery over the stormwater infiltration system at any stage of construction shall be at the Contractor's risk. Remove and replace any damaged precast member. Do not load equipment used during construction greater than H20 per AASHTO. Do not permit equipment to operate over top of the stormwater infiltration system with less than 12-inches of structural cover.

3.8 CONNECTIONS

A. Comply with requirements for piping specified in Section 02545 Storm Drain System. Drawings indicate general arrangement of piping, fittings, and specialties.

3.9 FIELD QUALITY CONTROL

A. Inspect all precast concrete members, accessories, and aggregate material used during installation prior to installation and replace defective, damaged or non-conforming material.

B. Precast Concrete Members: Reject units:

1. With a fracture or continuous crack greater than 12 inches in length or 0.01 inch in width.
2. That have not reached required design strength based on laboratory test results.
3. With indications of imperfections in mixing and/or molding, honeycombed, or open textured surface.
4. With indications of substantial patches or repairs.
5. With exposed reinforcing steel.

C. Accessories: Free from defects and damage.

D. Tests and Inspections:

1. After installing drainage course to top of piping, test drain piping with water to ensure free flow before backfilling.
2. Remove obstructions, replace damaged components, and repeat test until results are satisfactory.

E. Drain piping will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

3.10 CLEANING

A. Clear interior of installed piping and structures of dirt and other superfluous material as work progresses. Maintain swab or drag in piping and pull past each joint as it is completed. Place temporary plugs in ends of uncompleted pipe at end of each day or when work stops.

END OF SECTION

This page intentionally left blank

SECTION 15270
MECHANICAL SYSTEMS COMMISSIONING

PART 1 – GENERAL

1.01 DESCRIPTION

A. The purpose of this section is to specify Division 15 responsibilities in the commissioning process.

B. The systems to be commissioned are listed in Section 01810.

C. Commissioning requires the participation of Division 15 to ensure that all systems are operating in a manner consistent with the Contract Documents. The general commissioning requirements and coordination are detailed in Division 01, Section 01810. Division 15 shall be familiar with all parts of Division 01, Section 01810 and the commissioning plan issued by the CA and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

1.02 RESPONSIBILITIES

A. Mechanical, Controls and TAB Contractors. The commissioning responsibilities applicable to each of the mechanical, controls and TAB contractors of Division 15 are as follows (all references apply to commissioned equipment only):

1. Construction and Acceptance Phases

a. Include and itemize the cost of commissioning in the contract price.
b. In each purchase order or subcontract written, include requirements for submittal data, commissioning documentation, O&M data and training.
c. Attend a commissioning kickoff meeting and other meetings necessary to facilitate the commissioning process.
d. Contractors shall provide the CA with normal cut sheets and shop drawing submittals of commissioned equipment.
e. Provide additional requested documentation, prior to normal O&M manual submittals, to the CA for development of start-up and functional testing procedures.

(1) Typically this will include detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, full details of any owner-contracted tests, fan and pump curves, full factory testing reports, if any, and full warranty information, including all responsibilities of the Owner to keep the warranty in force clearly identified. In addition, the installation, start-up and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Commissioning Agent.
(2) The Commissioning Agent may request further documentation necessary for the commissioning process.
(3) This data request may be made prior to normal submittals.

f. Provide a copy of the O&M manuals and submittals of commissioned equipment, through normal channels, to the CA for review and approval.
g. Contractors shall assist (along with the design engineers) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures.
h. Provide limited assistance to the CA in preparing the specific functional performance test procedures as specified in Section 15997. Subs shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests.
i. Develop a full start-up and initial checkout plan using manufacturer's start-up procedures and the prefunctional checklists from the CA for all commissioned equipment. Submit to CA for review and approval prior to startup. Refer to Section 01810 for further details on start-up plan preparation.
j. During the startup and initial checkout process, execute the mechanical-related portions of the prefunctional checklists for all commissioned equipment.
k. Perform and clearly document all completed startup and system operational checkout procedures, providing a copy to the CA.
l. Address current A/E punch list items before functional testing. Air and water TAB shall be completed with discrepancies and problems remedied before functional testing of the respective air- or water-related systems.
m. Provide skilled technicians to execute starting of equipment and to execute the functional performance tests. Ensure that they are available and present during the agreed upon schedules and for sufficient duration to complete the necessary tests, adjustments and problem solving.
n. Provide skilled technicians to perform functional performance testing under the direction of the CA for specified equipment in Section 15997 and 01810. Assist the CA in interpreting the monitoring data, as necessary.
o. Correct deficiencies (differences between specified and observed performance) as interpreted by the CA, CM and A/E and retest the equipment.
p. Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built conditions.
q. During construction, maintain as-built red-line drawings for all drawings and final CAD as-builts for contractor-generated coordination drawings. Update after completion of commissioning (excluding deferred testing).
r. Provide training of the Owner's operating staff using expert qualified personnel, as specified.
s. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

2. Warranty Period

a. Execute seasonal or deferred functional performance testing, witnessed by the CA, according to the specifications.
b. Correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

B. Mechanical Contractor. The responsibilities of the HVAC mechanical contractor, during construction and acceptance phases in addition to those listed in (A) are:

1. Provide startup for all HVAC equipment, except for the building automation control system, if any.
2. Assist and cooperate with the TAB contractor and CA by:

    a. Putting all HVAC equipment and systems into operation and continuing the operation during each working day of TAB and commissioning, as required.
    b. Including cost of sheaves and belts that may be required by TAB.
    c. Providing test holes in ducts and plenums where directed by TAB to allow air measurements and air balancing. Providing an approved plug.
    d. Providing temperature and pressure taps according to the Construction Documents for TAB and commissioning testing.
    e. Install a P/T plug at each water sensor, which is an input point to the control system.
    f. List and clearly identify on the as-built drawings the locations of all air-flow stations.
    g. Prepare a preliminary schedule for Division 15 pipe and duct system testing, flushing and cleaning, equipment start-up and TAB start and completion for use by the CA. Update the schedule as appropriate.
    h. Notify the GC, CM or CA depending on protocol, when pipe and duct system testing, flushing, cleaning, startup of each piece of equipment and TAB will occur. Be responsible to notify the GC, CM or CA, ahead of time, when commissioning activities not yet performed or not yet scheduled will delay construction. Be proactive in seeing that commissioning processes are executed and that the CA has the scheduling information needed to efficiently execute the commissioning process.

C. Controls Contractor. The commissioning responsibilities of the controls contractor, during construction and acceptance phases in addition to those listed in (A) are:

1. Sequences of Operation Submittals. The Controls Contractor's submittals of control drawings shall include complete detailed sequences of operation for each piece of equipment, regardless of the completeness and clarity of the sequences in the specifications. They shall include:

    a. An overview narrative of the system (1 or 2 paragraphs) generally describing its purpose, components, and function.
    b. All interactions and interlocks with other systems.
    c. Detailed delineation of control between any packaged controls and the temperature control system, listing what points the temperature control system monitors only and what points are control points and are adjustable.
    d. Written sequences of control for packaged controlled equipment. (Equipment manufacturers' stock sequences may be included, but will generally require additional narrative).
    e. Start-up sequences.
    f. Warm-up mode sequences.
    g. Normal operating mode sequences.

h. Unoccupied mode sequences.
i. Shutdown sequences.
j. Capacity control sequences and equipment staging.
k. Temperature and pressure control: setbacks, setups, resets, etc.
l. Detailed sequences for all control strategies, e.g., economizer control, optimum start/stop, staging, optimization, demand limiting, etc.
m. Effects of power or equipment failure with all standby component functions.
n. Sequences for all alarms and emergency shut downs.
o. Seasonal operational differences and recommendations.
p. Initial and recommended values for all adjustable settings, setpoints and parameters that are typically set or adjusted by operating staff; and any other control settings or fixed values, delays, etc. that will be useful during testing and operating the equipment.
q. Schedules, if known.
r. To facilitate referencing in testing procedures, all sequences shall be written in small statements, each with a number for reference. For a given system, numbers will not repeat for different sequence sections, unless the sections are numbered.

2. Control Drawings Submittal

a. The control drawings shall have a key to all abbreviations.
b. The control drawings shall contain graphic schematic depictions of the systems and each component.
c. The schematics will include the system and component layout of any equipment that the control system monitors, enables or controls, even if the equipment is primarily controlled by packaged or integral controls.
d. Provide a full points list with at least the following included for each point:

(1) Controlled system
(2) Point abbreviation
(3) Point description (DB temp, airflow, etc.)
(4) Display unit
(5) Control point or setpoint (Point that controls equipment and can have its setpoint changed, e.g. OSA, SAT, etc.)
(6) Monitoring point (Point that does not control or contribute to the control of equipment, but is used for operation, maintenance, or performance verification)
(7) Intermediate point (Point whose value is used to make a calculation which then controls equipment, e.g. space temperatures that are averaged to a virtual point to control reset)
(8) Calculated point (“Virtual” point generated from calculations of other point values)

e. The Controls Contractor shall keep the CA informed of all changes to this list during programming and setup.

3. An updated as-built version of the control drawings and sequences of operation shall be included in the final controls O&M manual submittal.
4. Assist and cooperate with the TAB contractor in the following manner:

a. For a given area, have all required prefunctional checklists, calibrations, startup and selected functional tests of the system completed and

approved by the CA prior to TAB.

b. Provide a qualified technician to operate the controls to assist the TAB contractor in performing TAB, or provide sufficient training for TAB to operate the system without assistance.

5. Assist and cooperate with the CA in the following manner:

   a. Using a skilled technician who is familiar with this building, execute the functional testing of the controls system as specified for the controls contractor in Section 15997. Assist in the functional testing of all equipment specified in Section 15997.
   b. Execute all control system trend logs specified in Section 15997.

6. The controls contractor shall prepare a written plan indicating in a step-by-step manner, the procedures that will be followed to test, checkout and adjust the control system prior to functional performance testing, according to the process in Section 01810. At minimum, the plan shall include for each type of equipment controlled by the automatic controls:

   a. System name.
   b. List of devices.
   c. Step-by-step procedures for testing each controller after installation, including:

      (1) Process of verifying proper hardware and wiring installation.
      (2) Process of downloading programs to local controllers and verifying that they are addressed correctly.
      (3) Process of performing operational checks of each controlled component.
      (4) Plan and process for calibrating valve and damper actuators and all sensors.
      (5) A description of the expected field adjustments for transmitters, controllers and control actuators should control responses fall outside of expected values.

   d. A copy of the log and field checkout sheets that will document the process. This log must include a place for initial and final read values during calibration of each point and clearly indicate when a sensor or controller has “passed” and is operating within the contract parameters.
   e. A description of the instrumentation required for testing.
   f. Indicate what tests on what systems should be completed prior to TAB using the control system for TAB work. Coordinate with the CA and TAB contractor for this determination.

7. Provide a signed and dated certification to the CA and CM upon completion of the checkout of each controlled device, equipment and system prior to functional testing for each piece of equipment or system, that all system programming is complete as to all respects of the Contract Documents, except functional testing requirements.
8. Beyond the control points necessary to execute all documented control sequences, provide monitoring, control and virtual points as specified in Division 15.
9. List and clearly identify on the as-built duct and piping drawings the locations of all static and differential pressure sensors (air, water and building pressure).

D. TAB Contractor. The duties of the TAB contractor, in addition to those listed in (A) are:

1. Six weeks prior to starting TAB, submit to the CM the qualifications of the site technician for the project, including the name of the contractors and facility managers of recent projects the technician on which was lead. The Owner will approve the site technician's qualifications for this project.
2. Submit the outline of the TAB plan and approach for each system and component to the CA, CM and the controls contractor six weeks prior to starting the TAB. This plan will be developed after the TAB has some familiarity with the control system.
3. The submitted plan will include:

    a. Certification that the TAB contractor has reviewed the construction documents and the systems with the design engineers and contractors to sufficiently understand the design intent for each system.
    b. An explanation of the intended use of the temperature control system. The controls contractor will comment on feasibility of the plan.
    c. All field checkout sheets and logs to be used that list each piece of equipment to be tested, adjusted and balanced with the data cells to be gathered for each.
    d. Discussion of what notations and markings will be made on the duct and piping drawings during the process.
    e. Final test report forms to be used.
    f. Detailed step-by-step procedures for TAB work for each system and issue: flow calibration , diffuser proportioning, branch / submain proportioning, total flow calculations, rechecking, diversity issues, expected problems and solutions, etc. Criteria for using air flow straighteners or relocating flow stations and sensors will be discussed. Provide the analogous explanations for the water side, as applicable.
    g. List of all air flow, water flow, sound level, system capacity and efficiency measurements to be performed and a description of specific test procedures, parameters, formulas to be used.
    h. Details of how *total* flow will be determined (Air: via hood readings of all outlets, supply (SA) and return air (RA) pitot traverse, SA or RA flow stations, etc.).
    i. The identification and types of measurement instruments to be used and their most recent calibration date.
    j. Specific procedures that will ensure that both air and water side are operating at the lowest possible pressures and provide methods to verify this.
    k. Confirmation that TAB understands the outside air ventilation criteria under all conditions.
    l. Details of whether and how minimum outside air cfm will be verified and set, and for what level (total building, zone, etc.).
    m. Details of how building static and exhaust fan / relief damper capacity will be checked.
    n. Proposed selection points for sound measurements and sound measurement methods.
    o. Details of methods for making any specified coil or other system plant capacity measurements.
    p. Details of any TAB work to be done in phases (by floor, etc.), or of areas to be built out later.
    q. Details regarding specified deferred or seasonal TAB work.

r. Details of any specified false loading of systems to complete TAB work.
s. Details of all exhaust fan balancing and capacity verifications, including any required room pressure differentials.

4. A running log of events and issues shall be kept by the TAB field technicians. Submit hand-written reports of discrepancies, deficient or uncompleted work by others, contract interpretation requests and lists of completed tests to the CA and CM at least twice a week.
5. Communicate in writing to the controls contractor all setpoint and parameter changes made or problems and discrepancies identified during TAB which affect the control system setup and operation.
6. Provide a draft TAB report within two weeks of completion. A copy will be provided to the CA. The report will contain a full explanation of the methodology, assumptions and the results in a clear format with designations of all uncommon abbreviations and column headings. The report should follow the latest and most rigorous reporting recommendations by AABC.
7. Provide the CA with any requested data, gathered, but not shown on the draft reports.
8. Provide a final TAB report for the CA with details, as in the draft.
9. Conduct functional performance tests and checks on the original TAB as specified for TAB in Section 15997.

1.03 RELATED WORK

A. Refer to Section 01810 Part 1.12 for systems to be commissioned and Section 01810 Part 3.05 and Section 15997 for functional testing requirements.

PART 2 – PRODUCTS

2.01 TEST EQUIPMENT

A. Division 15 shall provide all test equipment necessary to fulfill the testing requirements of this Division.

B. Refer to Section 01810 Part 2.01 for additional Division 15 requirements.

PART 3 – EXECUTION

3.01 SUBMITTALS

A. Division 15 shall provide submittal documentation relative to commissioning to the CA as requested by the CA. Refer to Section 01810, Part 3.03 for additional Division 15 requirements.

3.02 STARTUP

A. The HVAC mechanical and controls contractors shall follow the start-up and initial checkout procedures listed in the Responsibilities list in this section and in Section 01810. Division 15 has start-up responsibility and is required to complete systems and sub-systems so they are fully functional, meeting the design objectives of the Contract Documents. The commissioning procedures and functional testing do not relieve or

lessen this responsibility or shift that responsibility partially to the commissioning agent or Owner.

B. Functional testing is intended to begin upon completion of a system. Functional testing may proceed prior to the completion of systems or sub-systems at the discretion of the CA and CM. Beginning system testing before full completion does not relieve the Contractor from fully completing the system, including all prefunctional checklists as soon as possible.

3.03 TAB

A. Refer to the TAB responsibilities in Part 1.02 above.

3.04 FUNCTIONAL PERFORMANCE TESTS

A. Refer to Section 01810 Part 1.12 for a list of systems to be commissioned and to Part 3.05 for a description of the process and to Section 15997 for specific details on the required functional performance tests.

3.05 TESTING DOCUMENTATION, NON-CONFORMANCE AND APPROVALS

A. Refer to Section 01810 Part 3.06 for specific details on non-conformance issues relating to prefunctional checklists and tests.

B. Refer to Section 01810 Part 3.05 for issues relating to functional performance tests.

3.06 OPERATION AND MAINTENANCE (O&M) MANUALS

A. The following O&M manual requirements do not replace O&M manual documentation requirements elsewhere in these specifications.

B. Division 15 shall compile and prepare documentation for all equipment and systems covered in Division 15 and deliver this documentation to the GC for inclusion in the O&M manuals, according to this section and Section 01810, prior to the training of owner personnel.

C. The CA shall receive a copy of the O&M manuals for review.

D. Special Control System O&M Manual Requirements. In addition to documentation that may be specified elsewhere, the controls contractor shall compile and organize at minimum the following data on the control system in labeled 3-ring binders with indexed tabs.

1. Three copies of the controls training manuals in a separate manual from the O&M manuals.
2. Operation and Maintenance Manuals containing:

    a. Specific instructions on how to perform and apply all functions, features, modes, etc. mentioned in the controls training sections of this specification and other features of this system. These instructions shall be step-by-step. Indexes and clear tables of contents shall be included. The detailed technical manual for programming and customizing control loops and algorithms shall be included.

b. Full as-built set of control drawings (refer to Submittal section above for details).
c. Full as-built sequence of operations for each piece of equipment.
d. Full points list. In addition to the updated points list required in the original submittals (Part 1 of this section), a listing of all rooms shall be provided with the following information for each room:

(1) Floor
(2) Room number
(3) Room name
(4) Air handler unit ID
(5) Reference drawing number
(6) Heating and/or cooling valve tag ID
(7) Minimum cfm
(8) Maximum cfm

e. Full print out of all schedules and set points after testing and acceptance of the system.
f. Full as-built print out of any software program.
g. Electronic copy on disk or CDRom of the entire program for this facility.
h. Marking of all system sensors and thermostats on the as-built floor plan and mechanical drawings with their control system designations.
i. Maintenance instructions, including sensor calibration requirements and methods by sensor type, etc.
j. Control equipment component submittals, parts lists, etc.
k. Warranty requirements.
l. Copies of all checkout tests and calibrations performed by the Contractor (not commissioning tests).

3. The manual shall be organized and subdivided with permanently labeled tabs for each of the following data in the given order:

a. Sequences of operation
b. Control drawings
c. Points lists
d. Controller / module data
e. Thermostats and timers
f. Sensors and DP switches
g. Valves and valve actuators
h. Dampers and damper actuators
i. Program setups (software program printouts)

4. Field checkout sheets and trend logs should be provided to the CA for inclusion in the Commissioning Record Book.

E. Special TAB Documentation Requirements. The TAB will compile and submit the following with other documentation that may be specified elsewhere in the *Specifications.*

1. Final report containing an explanation of the methodology, assumptions, test conditions and the results in a clear format with designations of all uncommon abbreviations and column headings.
2. The TAB shall mark on the drawings where all traverse and other critical measurements were taken and cross reference the location in the TAB report.

F. Review and Approvals. Review of the commissioning related sections of the O&M manuals shall be made by the A/E and by the CA. Refer to Section 01810, Part 3.07 for details.

3.07 TRAINING OF OWNER PERSONNEL

A. The GC shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed. Refer to Section 01810 for additional details.

B. The CA shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment. Refer to Section 01810 for additional details.

C. Mechanical Contractor. The mechanical contractor shall have the following training responsibilities:

1. Provide the CA with a training plan two weeks before the planned training according to the outline described in Section 01810, Part 3.08.
2. Provide designated Owner personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of HVAC equipment including, but not limited to air conditioning units, air handling units, fans, and controls, etc.
3. Training shall normally start with classroom sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.
4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer’s representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.
6. The controls contractor shall attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
7. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.
8. Training shall include:

    a. Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
    b. A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed, and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.
    c. Discussion of relevant health and safety issues and concerns.
    d. Discussion of warranties and guarantees.
    e. Common troubleshooting problems and solutions.
    f. Explanatory information included in the O&M manuals and the location of all plans and manuals in the facility.

g. Discussion of any peculiarities of equipment installation or operation.
h. The format and training agenda in *The HVAC Commissioning Process, ASHRAE Guideline 1-1989R*, 1996 is a recommended reference.
i. Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate.

9. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.
10. The mechanical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not *controlled* by the central control system.
11. Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.
12. Duration of Training. The mechanical contractor shall provide training on each piece of equipment according to the following schedule.

Hours	System
2	Air Handling Units
1	Variable Speed Drives
2	Split System AC or Heat Pumps
1	Specialty Exhaust Fans
2	Controls

D. Controls Contractor. The controls contractor shall have the following training responsibilities:

1. Provide the CA with a training plan four weeks before the planned training according to the outline described in Section 01810, Part 3.08.
2. The controls contractor shall provide designated Owner personnel training on the control system in this facility. The intent is to clearly and completely instruct the Owner on all the capabilities of the control system.
3. Training manuals. The standard operating manual for the system and any special training manuals will be provided for each trainee, with three extra copies left for the O&M manuals. In addition, copies of the system technical manual will be demonstrated during training and three copies submitted with the O&M manuals. Manuals shall include detailed description of the subject matter for each session. The manuals will cover all control sequences and have a definitions section that fully describes all relevant words used in the manuals *and* in all software displays. Manuals will be approved by the CA. Copies of audiovisuals shall be delivered to the Owner.
4. The trainings will be tailored to the needs and skill-level of the trainees.
5. The trainers will be knowledgeable on the system and its use in buildings. For the on-site sessions, the most qualified trainer(s) will be used. The Owner shall approve the instructor prior to scheduling the training.
6. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
7. The controls contractor shall attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.
8. There shall be a training session, which shall consist of a total of 8 hours of actual training. Upon completion, each student, using appropriate documentation, should be able to perform elementary operations and describe

general hardware architecture and functionality of the systems.

a. This training shall be held on-site for a period of 8 hours. The portions of actual hands-on training shall take place after the completion of system commissioning. The session shall include instruction on:
   (1) Controls training. Upon completion, each student, using appropriate documentation, should be able to perform elementary operations and describe general hardware architecture and functionality of the system.
   (2) Specific hardware configuration of installed systems in this building and specific instruction for operating the installed system, including HVAC systems, lighting controls and any interface with security and communication systems.
   (3) Security levels, alarms, system start-up, shut-down, power outage and restart routines, changing setpoints and alarms and other typical changed parameters, overrides, freeze protection, manual operation of equipment, optional control strategies that can be considered, energy savings strategies and set points that if changed will adversely affect energy consumption, energy accounting, procedures for obtaining vendor assistance, etc.
   (4) All trending and monitoring features (values, change of state, totalization, etc.), including setting up, executing, downloading, viewing both tabular and graphically and printing trends. Trainees will actually set-up trends in the presence of the trainer.
   (5) Every screen shall be completely discussed, allowing time for questions.
   (6) Use of keypad or plug-in laptop computer at the zone level, if applicable.
   (7) Use of remote access to the system via phone lines or networks.
   (8) Graphics generation.
   (9) Point database entry and modifications.
   (10) Understanding DDC field panel operating programming (when applicable).

E. TAB The TAB contractor shall have the following training responsibilities:

1. TAB shall meet for 4 hours with facility staff after completion of TAB and instruct them on the following:

   a. Go over the final TAB report, explaining the layout and meanings of each data type.
   b. Discuss any outstanding deficient items in control, ducting or design that may affect the proper delivery of air or water.
   c. Identify and discuss any duct runs, diffusers, coils, and fans that are close to or are not meeting their design capacity.
   d. Discuss any temporary settings and steps to finalize them for any areas that are not finished.
   e. Other salient information that may be useful for facility operations, relative to TAB.

3.08 DEFERRED TESTING

A. Refer to Section 01810, Part 3.09 for requirements of deferred testing.

3.09 WRITTEN WORK PRODUCTS

A. Written work products of Contractors will consist of the start-up and initial checkout plan described in Section 01810 and the filled out start-up, initial checkout and prefunctional checklists.

END OF SECTION

This page intentionally left blank

SECTION 15280
MECHANICAL TESTING REQUIREMENTS

PART 1 – GENERAL

1.01 INCLUDED SYSTEMS AND EQUIPMENT

A. The following is a list of the equipment and system test requirements included in this section:

1. Packaged air handling units – including fans, power exhausters, economizers, dampers, UVC lights, variable speed drives, heaters, humidifiers, CO2 sensors, and controls.
2. Temperature Control System
3. Exhaust fans
4. Split system heat pump – including fans, dampers, UVC lights, variable speed drives, heaters, humidifiers, CO2 sensors, and controls.
5. Test and balance (TAB) work

1.02 DESCRIPTION

A. This section specifies the functional testing requirements for Division 15 systems and equipment. From these requirements, the Commissioning Authority (CA) shall develop step-by-step procedures to be executed by the Subs or the Commissioning Authority. The general functional testing process, requirements and test method definitions are described in Section 01810. The test requirements for each piece of equipment or system contain the following:

1. The contractors responsible to execute the tests, under the direction of the CA.
2. A list of the integral components being tested.
3. Prefunctional checklists associated with the components.
4. Functions and modes to be tested.
5. Required conditions of the test for each mode.
6. Special procedures.
7. Required methods of testing.
8. Required monitoring.
9. Acceptance criteria.
10. Sampling strategies allowed.

1.03 PREREQUISITES

The following applicable generic prerequisite checklist items shall be listed on each written functional test form and be completed prior to functional testing.

1. All related equipment has been started up and start-up reports and prefunctional checklists submitted and approved ready for functional testing. Sample prefunctional checklists can be found in Section 01813. These are samples and for reference only. Final prefunctional checklists will be provided as part of the Construction Phase Commissioning Plan.
2. All control system functions for this and all interlocking systems are programmed and operable per contract documents, including final setpoints and schedules with debugging, loop tuning and sensor calibrations completed.

_____ _____
Controls Contractor Signature or Verbal Date

3. Piping system flushing complete and required report approved.
4. Test and balance (TAB) complete and approved for the hydronic system.
5. All A/E punchlist items for this equipment corrected.
6. These functional test procedures reviewed and approved by installing contractor.
7. Safeties and operating ranges reviewed by the CA.
8. Test requirements and sequences of operation attached.
9. Schedules and setpoints attached.
10. False loading equipment, system and procedures ready.
11. Sufficient clearance around equipment for servicing.
12. Record of all values for pre-test setpoints changed to accommodate testing has been made and a check box provided to verify return to original values (control parameters, limits, delays, lockouts, schedules, etc.).
13. Other miscellaneous checks of the prefunctinal checklist and start-up reports completed successfully.

1.04 TEST METHODS

A. MANUAL

1. Manual testing involves using hand-held instruments, immediate control system readouts or direct observation to verify performance of a system.

B. MONITORING

1. Monitoring is a method of testing as a stand-alone method or to augment manual testing.
2. All points listed in the required monitoring section of the test requirements which are control system monitored points shall be trended by the controls contractor. At the option of the CA, some control system monitoring may be replaced with datalogger monitoring. At the CA's request, the controls contractor shall trend up to 20% more points than listed herein at no extra charge.
3. Hard copies of monitored data must be in columnar format with time down the left column and at least 5 columns of point values on the same page.
4. Graphical output is desirable, and will be required for all output, if the system can produce it.

PART 2 – PRODUCTS

NOT LISTED

PART 3 – EXECUTION

3.01 TEMPERATURE CONTROL SYSTEM

A. Parties Responsible to Execute Functional Test

1. Controls contractor: operate the controls to activate the equipment.
2. CA: to witness, direct and document testing, Mechanical Contractor assist in testing sequences.

B. Integral Components or Related Equipment Being Tested

1. Building Automation System, if any
2. All prefunctional checklists of controlled equipment

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 15997 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the prefunctional checklists previously completed by the installer, before the beginning of functional testing.

D. A significant part of the temperature control system functional testing requirements is the successful completion of the functional tests of equipment the temperature control system controls or interlocks with. Uncompleted equipment functional tests or outstanding deficiencies in those tests lend the required temperature control system functional testing incomplete.

E. Integral or stand-alone controls are functionally tested with the equipment they are attached to, including any interlocks with other equipment or systems and thus are not covered under the temperature control system testing requirements, except for any integrated functions or interlocks listed below.

F. The following testing requirements are in addition to and do not replace any testing requirements elsewhere in the specifications.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISC. FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable	Verbal discussion of features
2. Power failure and battery backup and power-up restart functions	Demonstration
3. Specified trending and graphing features demonstration	See equipment trends
4. Global commands features	Demonstration
5. Security and access codes	Demonstration
6. Occupant over-rides (manual, telephone, key, keypad, etc.)	Demonstration
7. O&M schedules and alarms	Demonstration
8. Scheduling features fully functional and setup, including weekends and holidays	Observation in terminal screens or printouts
9. Date and time setting in central computer and verify field panels read the same time	Demonstration
10. Included features not specified to be setup are installed (list)	Demonstration
11. Demonstrate functionality of field panels using local operator keypads and local ports (plug-ins)	Demonstration of 100% of panels and 10% of ports
12. All graphic screens and value readouts completed	Demonstration
13. Setpoint changing features and functions	Done during equipment testing
14. Communications to remote sites	Demonstration
15. Sensor calibrations	Sampled during equipment tests
16. “After hours” use tracking and billing	
17. Final as-builts or redlines (per spec) control drawings, final points list, program code, setpoints, schedules, warranties, etc. per specs, submitted for O&Ms.	Observation
18. Verify that points that are monitored only, having no control function, are checked for proper reporting.	Observation
INTEGRATED TESTS	

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
19. Fire alarm interlocks and response	Demonstration
20. Duty cycling (if specified)	Monitoring
21. Demand limiting (including over-ride of limiting)	Monitoring
22. Sequential staging ON of equipment	Either
23. Optimum start-stop functions	Monitoring
24. All control strategies and sequences not tested during controlled equipment testing	Either

G. Additional Required Monitoring

1. Besides the trending and monitoring required with the functional testing of equipment, all points listed below which are control system monitored points shall be trended by the controls contractor. Refer to the Monitoring section at the beginning of Section 15997 for additional monitoring details.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)	Function Being Tested
Misc. equipment current or status for duty cycling and demand limiting	5	5 days incl. weekend	Y	Y	20, 21
Equipment or building kW or current for demand limiting	5	5 days incl. weekend	Y	Y	20, 21
Optimum start/stop equip.	5	5 days incl. weekend	Y	Y	23

H. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

I. Sampling Strategy for Identical Units

1. Sample 10% of the field panels for procedure 9, and 10% of the local ports for procedure 11. If 10% fail, test another 10%. If 10% of those fail, test all remaining units at the contractor's expense.

3.02 EXHAUST FANS

A. Parties Responsible to Execute Functional Test

1. Controls contractor: operate the controls to activate the equipment, if BAS controlled.
2. CA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested

1. Exhaust fans

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 15997 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the prefunctional checklists previously completed by the installer, before the beginning of functional testing.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements

1. The following testing requirements are in addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual, Monitoring, Either or Both	Required Seasonal Test
General 1. Test each sequence in the sequence of operations, and other significant modes and sequences not mentioned; including startup, shutdown, unoccupied & manual modes and power failure. Test functionality of this piece of equipment or system in all control strategies or interlocks that it is associated with.	Manual	
In addition to, or as part of (1) above, the following modes or tests are required:		
2. Verify schedules and setpoints to be reasonable and appropriate		
3. Function at fire alarm (off, depressurization, etc.)	Manual	
4. Interlocks to building pressurization control	Manual	
5. Speed controls	Either	
6. Check TAB report record of sound power level tests and space pressures and compare to specifications	Review	
7. Sensor calibration checks on any controlling temperature or pressure sensor	Manual	

E. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the fans, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

F. Sampling Strategy for Identical

1. No sampling, test all.

3.03 PACKAGED DX AIR CONDITIONING OR HEAT PUMP UNITS

A. Parties Responsible to Execute Functional Test

1. Controls contractor: operate the controls to activate the equipment.
2. CA: to witness, direct and document testing. Mechanical contractor or equipment vendor to assist in testing sequence as needed.

B. Integral Components or Related Equipment Being Tested

1. Unit (fans, coils, condenser, compressors).
2. Power exhausters
3. Economizers

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 15997 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the prefunctional checklists previously completed by the installer, before the beginning of functional testing.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements

1. The following testing requirements are in addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual, Monitoring, Either or Both[3]	Required Seasonal Test[1]
General 1. Test each sequence in the sequence of operations, and other significant modes and sequences not mentioned; including startup, shutdown, unoccupied & manual modes and power failure. Test functionality of this piece of equipment or system in all control strategies or interlocks that it is associated with.	Manual	
In addition to, or as part of (1) above, the following modes or tests are required:		
2. Supply air, and reset temp. control functions	Both	
3. Compressor unloading & condenser fan staging for head pressure control	Both	
4. Demand limiting control (if applicable)	Monitoring	Cooling
5. Duct static pressure (SP) control	Both	
6. Return or exhaust fan tracking and building SP	Monitoring	
7. Damper interlocks and correct modulation in all modes, including fire and smoke dampers	Manual	
8. Verification of minimum OSA quantity	Either	[2]
9. Verification of Economizer and Power Exhauster operation	Either	[2]
10. Verify TAB reported SF cfm with control system reading	Manual	[2]
11. All alarms (low limits, high static, freezes at, etc.)	Manual	
12. Sensor and actuator calibration checks on: duct static pressure sensor on units >10 tons, SAT, MAT, OSAT, economizer and RA dampers and other random checks (EMS readout against hand-held calibrated instrument must be within 0.5°F for temps. or within a tolerance equal to 10% of static pressure setpoint, with an inclined manometer)	Manual	
13. Verify control strategies, schedules and setpoints to be reasonable and appropriate		

[1]Cooling season, Heating season or Both. “Design” means within 5°of season design (ASHRAE 2 1/2%), or 95% of loading design. A blank cell denotes no special seasonal test is required and that test can be executed during any season, if condition simulation is appropriate.

[2]Seasonal test not required if seasonal conditions can be adequately simulated.

E. Special Procedures (other equipment to test with, etc.; reference to function ID)

1. Reduced Testing for Smaller Units. For standard application AHU's less than 15 tons, the following modifications to the testing requirements apply: 1) either Manual or Monitoring will satisfy the verification requirement--where Both is listed, choose one. 2) Testing Modes 6, 8, 11, 13 and 16 is not required.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)	Function Being Tested
For each Unit being tested:					
RAT	5	5 days incl. weekend	Y	Y	1-3, 11
SAT	5	5 days incl. weekend	Y	Y	1-3
CC LAT	5	5 days incl. weekend	Y	Y	1-3
MAT	5	5 days incl. weekend	Y	Y	1, 3, 11
SF speed	5	5 days incl. weekend	Y	Y	1, 3-6
Duct SP	5	5 days incl. weekend	Y	Y	5, 6
OSAT	5	5 days incl. weekend	Y	Y	All
Indoor dry-bulb all zones	5	5 days incl. weekend	Y	Y	All
Compressor amps or stage	5	5 days incl. weekend	Y	Y	3
Condenser fan amps or stage	5	5 days incl. weekend	Y	Y	3

F. Acceptance Criteria

1. For the conditions, sequences and modes tested, the system, integral components and related equipment respond to varying loads and changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.
2. RTU shall be able to maintain the SA temperature within 1.0F either side of the deadband of the current setpoint without excessive hunting.
3. RTU and controls shall control the duct static pressure so that it does not drift more than an amount equal to 10% of the setpoint value either side of the deadband without excessive hunting.

G. Sampling Strategy for Identical Units

1. No sampling, test all.

3.04 TEST AND BALANCE WORK (TAB)

A. Parties Responsible to Execute Functional Test

1. TAB contractor: perform checks using test instruments.
2. Controls contractor: operate the controls to activate the equipment.
3. CA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested

1. TAB air-side

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 15997 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the prefunctional checklists previously completed by the installer, before the beginning of functional testing.

D. Purpose. The purpose of this test is to spot check the TAB work to verify that it was done in accordance with the contract documents and acceptable practice and that the TAB report is accurate.

E. The following tests and checks will be conducted. The following testing requirements are in addition to and do not replace any testing requirements elsewhere in this Division.

Test or Check	Test Method	Required Seasonal Test[3]
1. A random sample of up to 50 % the TAB report data shall be selected for verification (air velocity, air or water flow rate, pressure differential, electrical or sound measurement, etc.). The original TAB contractor will execute the checks, witnessed by the commissioning authority. The TAB contractor will use the same test instruments as used in the original TAB work. A failure[1] of more than 10% of the selected items of a given system[2] shall result in the failure of acceptance of the system TAB report and the TAB contractor shall be responsible to rebalance the system, provide a new system TAB report and repeat random verifications of the new TAB report. The random testing will include the verification of minimum outdoor air intake flows at minimum, maximum and intermediate total airflow rates for all of the air handlers. Other selected data to be verified will be made known upon day of testing.	Demonstration	
2. Verify that final settings of all valves, splitters, dampers and other adjustment devices have been permanently marked by the TAB Contractor.	Demonstration	
3. Verification that the air system is being controlled to the lowest possible static pressure while still meeting design loads, less diversity. This shall include a review of TAB methods, control setpoints established by TAB and a physical verification of at least one leg from fan to diffuser having all balancing dampers wide open and that during full cooling of all TUs taking off downstream of the static pressure sensor, the TU on the critical leg has its damper 90% or more open.	Demonstration	
4. Verification that the water system is being controlled to the lowest possible pressure while still meeting design loads, less diversity. This shall include a review of TAB methods, control setpoints established by TAB and a physical verification of at least one leg from the pump to the coil having all balancing valves wide open and that during full cooling the cooling coil valve of that leg is 90% or more open.	Demonstration	

[1]Failure of an item is defined as follows:
For air flow of supply and return: a deviation of more than 10% of instrument reading
For minimum outside air flow: 20% of instrument reading (30% for reading at intermediate

supply low for inlet vane or VFD OSA compensation system using linear proportional control)

For temperatures: a deviation of more than 1°F

For air and water pressures: a deviation of more than 10% of full scale of test instrument reading

For sound pressures: a deviation of more than 3 decibels. (Variations in background noise must be considered)

[2]Examples of a "system" are: the air distribution system served by one air handler or the hydronic chilled water supply system served by a chiller or the condenser water system. Systems can be defined smaller if inaccuracies in TAB work within the smaller defined system will have little or no impact on connected systems.

[3]Cooling season, Heating season or Both. "Design" means within 5°of season design (ASHRAE 2 1/2%), or 95% of loading design. A blank cell denotes no special seasonal test is required and that test can be executed during any season, if condition simulation is appropriate.

F. Special Procedures

1. None.

G. Required Monitoring

1. None.

H. Acceptance Criteria

1. Provided in footnote to test table above.

I. Sampling Strategy for Identical Units

1. Described in test table above.

SECTION 15320
ELECTRICAL REQUIREMENTS FOR MECHANICAL EQUIPMENT

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Provisions and Division 1A General Requirements, apply to work of this section.

B. Related Sections: Separate electrical components and materials required for field installation and electrical connections are specified in Division 16.

1.2 SUMMARY

A. This section specifies the basic requirements for electrical components which are an integral part of packaged mechanical equipment. These components include, but are not limited to factory installed motors, starters, and disconnect switches furnished as an integral part of packaged mechanical equipment.

B. Specific electrical requirements (i.e. horsepower and electrical characteristics) for mechanical equipment are scheduled on the Drawings.

1.3 REFERENCES

A. NEMA Standards MG 1: Motors and Generators

B. NEMA Standards ICS 2: Industrial Control Devices, Controllers, and Assemblies.

C. NEMA Standard 250: Enclosures for Electrical Equipment

D. NEMA Standard KS 1: Enclosed Switches

E. National Electrical Code (NFPA 70).

1.4 SUBMITTALS

A. No separate submittal is required. Submit product data for motors, starters, and other electrical components with submittal data required for the equipment for which it serves, as required by the individual equipment specification sections.

1.5 QUALITY ASSURANCE

A. Electrical components and materials shall be UL labeled.

PART 2 – PRODUCTS

2.1 MOTORS

A. The following are basic requirements for simple or common motors. For special motors, more detailed and specific requirements are specified in the individual equipment specifications.

1. Torque characteristics shall be sufficient to satisfactorily accelerate the driven loads.

2. Motor sizes shall be large enough so that the driven load will not require the motor to operate in the service factor range.

3. Temperature Rating: Rated for 40 deg. C environment with maximum 50 deg. C temperature rise for continuous duty at full load (Class A Insulation).

4. Starting capability: frequency of starts as indicated by automatic control system, and not less than 5 evenly time spaced starts per hour for manually controlled motors.

5. Service Factor: L15 for poly-phase motors and 1.35 for single phase motors.

6. Motor construction: NEMA Standard MG 1, general purpose, continuous duty, Design "B", except "C" where required for high starting torque.
   a. Frames: NEMA Standard No. 48 or 54; use driven equipment manufacturer’s standards to suit specific application.
   b. Bearing:
      1) ball or roller bearings with inner and outer shaft seals;
      2) re-greaseable, except permanently sealed where motor is normally inaccessible for regular maintenance;
      3) designed to resist thrust loading where belt drives or other drives produce lateral or axial thrust in motor;
      4) for fractional horsepower, light duty motors, sleeve type bearings are permitted.
   c. Enclosure Type:
      1) open drip-proof motors for indoor use where satisfactorily housed or remotely located during operation;
      2) guarded drip-proof motors where exposed to contact by employees or building occupants;
      3) weather protected Type 1 for outdoor use, Type II where not housed;
   d. Overload protection: built-in thermal overload protection and, where indicated, internal sensing device suitable for signaling and stopping motor at starter.
   e. Noise rating: "Quiet" rating on motors located in occupied spaces of building.
   f. Nameplate: indicate the full identification of manufacturer, ratings, characteristics, construction, special features and similar information.

2.2 STARTERS, ELECTRICAL DEVICES, AND WIRING

A. Motor Starter Characteristics:

1. Enclosures: NEMA 1, general purpose enclosures with padlock ears, except in wet locations shall be NEMA 3R with conduit hubs, or units in hazardous locations which shall have NEC proper class and division.

2. Type and size of starter shall be as recommended by motor manufacturer and the driven equipment manufacturer for applicable protection and start-up condition.

B. Manual switches shall have:

1. Pilot lights and extra positions for multi-speed motors.

2. Overload protection: melting alloy type thermal overload relays.

C. Magnetic Starters:

1. Maintained contact push buttons and pilot lights, properly arranged for single speed or multi-speed operation as indicated.

2. Trip-free thermal overload relays, each phase.

3. Interlocks and similar devices as required for coordination with control requirements of Division-15 Controls sections.

4. Built-in 120 volts control circuit transformer, fused from line side, where service exceeds 240 volts.

5. Externally operated manual reset.

6. Under-voltage release or protection.

D. Motor connections:

1. Flexible conduit, except where plug-in electrical cords are specifically indicated.

2.3 CAPACITORS

A. Features:

1. Individual unit cells

2. All welded steel housing

3. Each capacitor internally fused

4. Non-flammable synthetic liquid impregnant

5. Craft tissue insulation

6. Aluminum foil electrodes

7. KVAR size shall be as required to correct motor power factor to 90 percent or better and shall be installed on all motors 1 horsepower and larger, that have an uncorrected power factor of less than 85 percent at rated load.

B. Disconnect Switches:

1. Fusible switches: fused, each phase; general duty; horsepower rated; non-teasible quick-make, quick-break mechanism; dead front line side shield; solderless lugs suitable for copper or aluminum conductors; spring reinforced fuse clips; electro silver plated current carrying parts; hinged doors; operating lever arranged for locking in the "OPEN" position; arc quenchers; capacity and characteristics as indicated.

2. Non-fusible switches: for equipment 2 horsepower and smaller, shall be horsepower rated; toggle switch type; quantity of poles and voltage rating as indicated. For equipment larger than 2 horsepower, switches shall be the same as fusible type.

PART 3 – EXECUTION (NOT APPLICABLE)

END OF SECTION

SECTION 16020
MUNICIPAL FACILITIES GENERAL ELECTRICAL REQUIREMENTS

PART 1- - GENERAL

1.1 DESCRIPTION:

A. Related Work:

1. 01810 Commissioning Requirements

2. 01813 Prefunctional Checklists

3. 16560 Municipal Facilities Electrical Systems Commissioning

4. 16570 Municipal Facilities Electrical Testing Requirements

B. Electrical subcontractor shall attend the Commissioning pre-construction meeting and other required meetings to facilitate coordination and execution of the commissioning scope.

C. Provide pre-functional checklists and complete functional testing under the supervision of the commissioning authority, including preparation of data in form templates. Provide qualifying calibrated instrumentation needed for the prescribed testing procedures.

D. Provide the services of specialized technicians for testing and validation. Technicians may be supplied by the equipment suppliers or from qualified independent testing services.

E. Systems that shall be commissioned are:

1. Lighting system and controls.

2. Storm water diversion and infiltration facilities.

F. Detailed descriptions of electrical commissioning requirements are provided in Section 01810.

G. Comply with all provisions of the General Conditions, Supplementary Conditions and General Requirements as applicable to work of all Sections of Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc.

H. Examine all Technical Sections for work required to be included in work in Sections of Division 16 - Electrical Work.

I. All work of this Division shall be coordinated with work of other trades.

1.2 SCOPE

A. Required: Provide all labor, materials, equipment, tools and appliances required to furnish and install all electrical work shown on the Contract Drawing and herein specified in the Sections of Division 16 complete and operable but not limited to the following:

1. All construction power and lighting and power for testing equipment and systems through final acceptance of test.

2. Power and lighting service raceway(s) underground from the property line to an on-site pad-mount transformer, and from the transformer to the main service switchboard.

3. Complete lighting and power system(s) including branch circuits, fixtures, outlets, lamps, switches, controllers, and auxiliary equipment.

4. Complete distribution system(s) including switchboards, panelboards, transformers, feeders, and auxiliary equipment.

5. Complete system of exterior (vandal resistant) lighting.

6. Complete Grounding System.

7. Control wiring and devices for equipment specified in Sections of Division 16 and other Technical Sections, except where specifically indicated or noted otherwise on the Contract Drawings or in the Specifications.

8. Connection and testing of electrical equipment and controls specified in Division 16 and other technical sections, except where specifically indicated or noted elsewhere on the Contract Drawing or in the Specifications.

9. Applicable excavating, trenching and backfilling.

1.3 WORK NOT INCLUDED

A. Furnishing all electrical or partially electrically devices related uniquely to mechanical equipment and only as specified in the Mechanical Division 15.

B. Furnishing and installing of all motors.

1.4 RELATED WORK

A. Preparation of Soils Reports, refer to Section 02200 EARTHWORK.

B. Painting of exposed raceways and equipment in DIVISION 9.

C. Commissioning requirements in DIVISION 1.

D. Municipal Facilities Electrical Commissioning Requirements in DIVISION 16.

E. Municipal Facilities Electrical Testing Requirements in DIVISION 16.

1.5 LEGAL REQUIREMENTS AND STANDARDS

A. Required: Comply with the latest, as applicable and effective, during the progress of Contracted Work.

1. Latest Los Angeles City Electrical, Fire and Building Codes and U.B.C. Supplement.

2. California State Administrative Code, Title 24, State Building Standard.

3. (CAL/OSHA) California State Occupational Safety and Health Act.

4. California State Fire Marshal Standards.

5. Los Angeles City Department of Water and Power.

6. U.L. - Underwriters Laboratories Inc.

7. NEC - National Electric Code.

8. ASTM - American Society of Testing and Materials.

9. Current publications of the National Fire Protection Association.

10. National and American Standards Association.

B. General Compliance as Applicable

1. Drawings and specification requirements shall govern where they exceed Code requirements.

2. Where requirements between governing Codes and Regulations vary, the more restrictive provision shall apply.

3. Nothing contained in Contract Documents shall be construed as authority or permission to disregard or violate legal requirements.

1.6 GENERAL REQUIREMENTS

A. Permits and Inspections:

1. Apply and pay for all required electrical work (construction and installation) prescribed by legally constituted public authorities.

2. Arrange and pay for all required inspections or examinations and shall deliver "certifications" of such inspections to the City Engineer prior to acceptance of the electrical work. Obtain approved plans from the Los Angeles City Department of Building and Safety.

B. Site Inspections:

1. Carefully examine the job-site and existing facilities and compare the Contract Drawings for work coordination.

2. By act of submitting bid, it will be deemed the Contractor has made required inspections and has accepted such job-site conditions and has made allowances thereof in the preparation of "Bid" figures.

C. Verification of Dimensions: All dimensions (scaled, figured or noted) are approximate, given for estimating purposes. Before proceeding with work Contractor shall carefully check and verify all

dimensions, sizes, etc. and shall assume full responsibility for proper fitting in and attachment of all materials and equipment to other equipment and to the structure.

D. Examination of the Contract Drawings:

1. Carefully study Contract Drawings and Specifications to verify if any work as laid out or indicated is contrary to or in conflict with applicable Codes and Standards. Report to the City Engineer such data prior to submittal of Bid(s).

2. The City Engineer will then instruct the Contractor on how to proceed.

3. By the act of submitting a "Bid" or "Proposal" Contractor is deemed to have made such study and has accepted all job-site conditions.

E. Substitutions:

1. Items, articles or products named on the Contract Drawings and in the Specifications are intended to establish a standard of quality and required functional performance.

2. If the Contractor desires to propose a substitution or alternate, submit a complete list with detailed specifications and manufacturer's data which differ from those specified within thirty-five (35) days after award of Contract for approval or rejection by the City Engineer.

3. If such submittals are not approved, use specified materials and equipment throughout the Electrical Work.

F. Interpretations:

1. Make all requests for interpretations of the Contract Drawings and/or Specifications to the Contractor through the Architect or City Engineer.

2. Manufacturer's or Supplier's requests for interpretations will be referred to the Contractor.

G. Submittals: Conform to applicable provisions of Section 01330 of the General Requirements and as hereinafter specified.

1. Prepare, review and coordinate schedule of submittals, determining necessary lead time for preparation, submitting, checking, and ordering and delivering materials and equipment to the job-site for timely arrival and conformance with the overall Construction schedule.

2. All submittals will be checked for general compliance with Specifications only. Contractor will be responsible for deviations from the Drawings or Specifications and for errors or omissions of any sort in the Submittals.

3. Shop drawings shall be submitted in completed groups of materials (i.e., all lighting fixtures or all switchgear, etc.). The Contractor shall add and sign the following paragraph on all equipment and materials submitted for review.

a. "It is hereby certified that the (equipment) (material) shown and marked in this submittal is that proposed to be incorporated into the project; is in compliance with the Contract Drawings and Specifications and can be installed in the allocated spaces".

b. Failure to add the above written statement for compliance will result in return of submittals to be reviewed.

4. All required submittals on electrical items and equipment shall include complete catalog information such as construction ratings, insulation systems, including manufacturer's certification that items or equipment meet or exceed U.L. and Trade Standards, and the Specifications.

5. Equipment Floor Plans: Submit after approval of material and/or equipment is secured. Prepare for each electrical equipment room drawn to 1/2" = 1'0" scale. Layout drawing shall be to exact scale.

6. Materials list of items and equipment proposed to be provided for the work of this Division 16 and shall include the following as applicable:

   a. Service and distribution switchgear.

   b. Motor control centers.

   c. Lighting control systems, including user interface programs, system configuration, control switches, etc. including wiring diagrams and sequence of operation.

   d. Lighting panelboards.

   e. Dry type transformers.

   f. Conduits.

   g. Conductors.

   h. Electrical equipment layout at 1/2" = 1'-0" scale indicating exact dimensions of equipment, clearances, housekeeping pads.

   i. Disconnect switches, pull boxes and fuses.

   j. Lighting fixtures.

   k. Fire alarm and detection system.

   l. Control devices, standard and special receptacles, switches and finish device plates.

   m. Wiring for storm water diversion and infiltration PLC based control system specified in Division 17.

   n. Grounding systems.

   o. All fabricated equipment.

H. Special Submissions:

1. Test Reports for the Following:

a. Ground fault devices.

b. Megger Readings: Ground system, motors, feeders and switchgear.

c. Voltage Readings: Distribution, service and motors.

d. Fire alarm system.

2. Maintenance service and operating manuals for all equipment.

3. Items as outlined in other Sections.

I. "No Exceptions Taken": Be responsible for equipment ordered and/or installed prior to receipt of shop drawings returned from the City Engineer bearing the Electrical Engineer's stamp of "No Exceptions Taken". Corrections or modifications to equipment as noted on shop drawings shall be performed or equipment removed from the job site at request of City Engineer without additional compensation.

J. Disapprovals: Any article or equipment supplied by the Contractor disapproved by the Architect or City Engineer as not conforming to the Specifications or not of proper quality or grade or suitability shall be deleted and suitable article or equipment be provided in lieu thereof in conformance with the Specifications at no added cost to the City.

K. Terminology: Generally speaking throughout this Division 16 of the Specifications when the words "or equal" or other words of similar intent and meaning are used implying judgment or decision is to be exercised, it is understood that it is the judgment, discretion, or decision of the City Engineer to which reference is made.

Note: Specifier should name at least two manufacturers plus the words "or equal".

L. Modification of Contract Drawings: In each case where proposed substitute material or equipment will require changes to the design of the Project as indicated on the drawings, for proper installation or operation, appropriate proposed revision drawings prepared and signed by a licensed Engineer shall be furnished by the Contractor for approval by the City Engineer. Make such drawings sufficiently complete for the proper installation and operation of the proposed substitute materials or equipment, and for construction by all of the involved trades of the proposed revisions. The cost of the drawings and the proposed revised construction shall be borne by the Contractor.

M. Record Drawings: Provide in strict accordance with applicable provisions of Section 30 in the GENERAL CONDITIONS of these Specifications concerning accurate locations of raceways, cable runs, outlets and equipment. See also applicable provisions of Section 01783-RECORD (as-built) Drawings of the GENERAL REQUIREMENTS of these Specifications.

N. Operation and Maintenance Manuals: Prior to final acceptance of Contracted Work by the City, furnish 4 bound copies of operation and maintenance manuals for all electrical equipment, as required in this Section. The contents shall include description of equipment, names of manufacturers, parts lists, model numbers, maintenance schedules, location of nearest facility for replacement parts or service, wiring and connection diagrams, internal schematic drawings, and other electrical/mechanical data necessary for operation and maintenance.

1.7 QUALITY ASSURANCE

A. General:

1. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture.

2. Supply all equipment and accessories new, free from defects and listed by Underwriters' Laboratories, Inc. or bearing its label. Special or custom equipment must bear the label of laboratory recognized by the City of Los Angeles Department of Building and Safety.

3. Supply all equipment and accessories in compliance with the applicable standards listed in Article 1. 5 of this Section and with all applicable National, State and Local codes.

4. All items of a given type shall be the product of the same manufacturer.

B. Labor: Use adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and completely familiar with specifications, requirements and methods needed for proper performance of the work of Electrical Division 16.

C. Superintendence: Provide an experienced Superintendent to be in charge of erection and/or installation of electrical work together with journeymen helpers to properly unload, erect, connect, adjust, operate and test the work involved to provide a neat, workmanlike and operable installation.

1.8 LOCATION

A. The location of apparatus and equipment indicated on the Contract Drawings are approximate only and shall be changed to meet site conditions as required.

B. Any change in work which has not been installed shall be made by the Contractor without additional compensation, except changes which are caused by Architectural changes which increase or decrease the size of apparatus or materials specified or indicated on the drawings. The Contractor shall submit a detailed breakdown cost estimate of, or credit for, such changes and shall proceed only upon the written authority of the Architect and Engineer.

C. All apparatus and equipment shall be furnished and installed in a manner and in locations avoiding all obstructions, preserving head room, and keeping openings and passageways clear. Changes shall be made in locations of equipment and materials which may be necessary in order to accomplish this.

D. The drawings are essentially diagrammatic to the extent that many offsets, bends, special fittings, and exact locations are not indicated. The Contractor shall carefully study the Contract Drawings and premises in order to determine the best methods, exact location, routes, and building obstructions, etc., and shall install all apparatus and equipment in the available location.

1.9 CUTTING AND PATCHING

A. Conform to provisions of the General Requirements.

B. The Contractor shall do all drilling, cutting and patching of the general construction work existing or new, rough finish and trim, which may be required for the installation of electrical equipment. All patching shall be of the same materials, workmanship and finish as the original work, and shall accurately match all surrounding work.

C. All cutting and patching shall be as approved by the City or City's authorized representative.

1.10 PROTECTION OF WORK

A. The Contractor shall protect all work, material and equipment from damage from any cause whatsoever, and shall provide adequate and proper storage facilities during the progress of the Work. Contractor shall provide for the safety and good condition of all work until final acceptance of the work by the City, and replace all damaged or defective work, materials and equipment before requesting final acceptance.

B. The Contractor shall be held responsible for the protection and correction of the work of all trades from smears, splashes, stain or damages that might occur in the progress of the work.

1.11 WORK COORDINATION

A. The Contractor shall so order electrical work that progress will harmonize with that of other trades so that all work may proceed as expeditiously as possible.

B. So far as possible, the work has been indicated on the Contract Drawings in such positions as to suit and accommodate the work of the other trades, but the work as indicated is largely diagrammatic, and the correct finish position of all equipment and materials cannot always be indicated. Therefore, the Contractor is hereby made directly responsible for the correct placing of electrical work and the proper location and connection of electrical work in relation to the work of other trades.

1.12 JOB SAFETY

A. The Contractor shall be solely and completely responsible for the condition of the premises on which the work is performed and for the safety of all persons and property on the site during performance of the Contract. These requirements shall not be limited to normal working hours, but shall apply continuously.

B. Contractor shall conform to all governing safety regulations.

PART 2 -- PRODUCTS

2.1 MATERIALS

A. All materials, items and equipment furnished under this Contract shall be new, recently manufactured and available locally.

B. All materials shall comply with applicable legal requirements and standards hereinbefore specified in this Section 16020.

C. The label of listing by UL shall appear on all materials and equipment for which standards have been established by that agency.

D. Where local or other authorities having jurisdiction have established label or approval requirements, furnish all materials and equipment with either the required labels affixed or the necessary written approval.

E. Examine the Drawings and Specifications and determine the work to be performed by the electrical and other trades. Provide the type and quantity of electrical materials and equipment necessary to complete this work and all systems in proper operation, tested and ready for use.

F. Provide and install all incidental items not indicated on the Drawings nor mentioned in the Specifications that belong to the work described or are required for complete systems.

2.2 MATERIALS LISTING

A. Required: See Subsection 1. 6 G 6 of this Section 16020.

PART 3 - - EXECUTION

3.1 UTILITY SERVICES (AS APPLICABLE)

A. Every effort has been made to determine as accurately as possible the requirements of the electrical services. However, before submitting bid, the Contractor shall verify the locations shown on the plans and shall include sufficient funds for material, labor and utility fees for installation of an approved utility service.

B. Before any work is performed on these facilities, verify all electrical, civil, architectural and structural, dimensional and other requirements related to these facilities with the serving utility companies.

C. Should any major changes to the work indicated be necessary to complete the power systems, notify the City Engineer at once and cease all work affected until approval for required modifications has been obtained from the City Engineer.

3.2 WORK RESPONSIBILITIES

A. The drawings indicate diagrammatically the desired locations or arrangement of conduit runs, outlets, equipment, etc., and are to be followed as closely as possible. Proper judgment must be exercised in executing the work so as to secure the best possible installation in the available space and to overcome local difficulties due to space limitations or interference with structural conditions. The Contractor is responsible for the correct placement and coordination of electrical work in relation to the work of other trades. Advise appropriate trade as to locations of access panels.

B. Locations shown on architectural plans and elevations shall take precedence over electrical plan locations, but where a major conflict is evident; notify the Architect or City Engineer for instructions.

C. In the event changes in the indicated locations or arrangement are necessary due to developed conditions in the building construction or rearrangement of furnishings or equipment, such changes shall be made without extra cost, providing the change is ordered before the conduit runs, etc., and work directly connected to same are installed and no extra materials are required.

D. Where equipment is furnished by others, verify dimensions and the correct location of this equipment before proceeding with the roughing in of connections.

E. All scaled and figured dimensions are approximate of typical equipment of the class indicated. Before proceeding with any work, carefully check and verify all dimensions, sizes, etc., with the drawings to see that the equipment will fit into the spaces provided without violation of applicable codes.

F. Should any changes to the work indicated on the Drawings or described in the Specifications be necessary in order to comply with the above requirements, notify the City Engineer immediately and cease work for all parts of the Contract Work which are affected until approval for any required modifications to the construction has been obtained from the City Engineer.

G. Be responsible for any cooperative work which must be altered due to lack of proper supervision or failure to make proper provisions in time. Such changes shall be under the direction of the City Engineer and shall be made to their satisfaction.

H. Perform all work with competent and skilled personnel. Conform to provisions of Subsection 1. 7B of this Section.

I. All work, including aesthetic as well as electrical and mechanical aspects of the work, shall be of the highest quality consistent with the best practices of the trade.

J. Replace or repair, without additional compensation, any work which, in the opinion of the City Engineer does not comply with these requirements.

3.3 GENERAL INSTALLATION (AS APPLICABLE)

A. Unless otherwise specified elsewhere in the Specifications, do all excavating necessary for the proper installation of the electrical work in accordance with the "Earthwork" Section 02220.

B. Locations of Openings: Obtain approval for all chases, shafts and openings required for the installation of the electrical work. Cutting or drilling in any structural member is prohibited without written approval of the Architect or City Engineer. Furnish access panels as required.

C. Finish Around Sleeves: Rough edges shall be finished smooth. Space between conduit and sleeves where conduit passes through exterior walls shall be sealed to permit movement of conduit but prevent entrance of water. Space between conduit and sleeves where conduit passes through fire rated interior walls and slabs shall be sealed with approved materials to provide a fire barrier conforming to the requirements of the governing authorities having jurisdiction, use Dow Corning 3-6548 RTV silicone foam or equal by General Electric if so approved by the applicable authorities having jurisdiction at the job site.

D. Wherever conduit extends through roof, furnish and install flashings in accordance with City Engineer's directions.

E. Be responsible for all cutting and patching which may be required for the proper installation of the electrical work. Work shall be performed by the trade originally installing same and paid for under this Section of the work.

F. Protect all work, materials and equipment from damage from any cause whatever and provide adequate and proper storage facilities during the progress of the work. Storage outdoors shall be

weather protected and shall include space heaters to prevent condensation. Provide for the safety and good condition of all work until final acceptance of the work by the City Engineer and replace all damaged or defective work, materials and equipment before requesting final acceptance at no added cost to the City.

G. Conduit and Equipment to be installed: Clean thoroughly to remove plaster, spattered paint, cement and dirt on both exterior and interior.

H. Conduit and Equipment to be painted: Clean all conduits exposed to view in completed structure by removing plaster and dirt. Remove grease, oil and similar material from conduit and equipment by wiping with clean rags and suitable solvents in preparation for paint.

I. All Items with Factory Finish: Remove cement, plaster, grease and oil, and leave all surfaces, including cracks and corners, clean and polished. Touch up any scratched or bare spots to match finish. Factory finish may be approved as prime coat by the Architect (see "Painting" Section).

J. Site Cleaning: Remove from site all packing cartons, scrap materials and other rubbish relating to electrical installation.

K. Electrical equipment and materials exposed to public and in finished areas shall be finish-painted after installation to coordinate with surrounding walls. Surfaces shall be thoroughly cleaned for receiving painting. Paint color coordination shall be as directed by the Architect or City Engineer. Paint shall be identical to that on adjacent surfaces to insure proper matching of quality and color with surrounding areas.

3.4 EXCAVATION, CUTTING AND PATCHING

A. All excavating, trenching and backfilling required for the work of this Division shall conform to the applicable requirements of the "Earthwork" Section 02220 in the Project Specifications. All excavating and backfilling connected with electrical work, repaving all cuts and providing and maintaining all protective measures for the electrical work excavation required by the governing authorities having jurisdiction shall be performed as a part of the work of this Division.

B. At a time in advance of the work, verify all openings indicated on the Drawings. Should the work of this division require it, furnish new instruction as to requirements for these openings, subject to the Architect's approval. All cutting, patching and reinforcement of the building (subject to the City Engineer's approval) shall be performed under the Section of the Specifications under which the work was originally performed, but the coat shall be an obligation of the Contractor.

3.5 TESTS

A. Conduct resistance to ground tests by qualified personnel to measure resistance to ground at all grounding electrodes. Make tests before slabs of affected areas are poured in order that corrective measures, if requested, may be taken. Submit to the City Engineer a report showing the results of these measurements. If the resistances exceed values specified elsewhere, perform all corrective measures as directed by the City Engineer at no additional cost to City.

B. Prior to energizing any motors, measure the service voltage for phase balance and report immediately to the City Engineer if unbalance exceeds 1% from means.

C. Measure the three-phase voltage at no load and at maximum load conditions and submit to the City Engineer a report showing the results of these measurements.

D. Upon completion of the work and adjustment of all equipment, conduct an operating test for

approval at such time as the Architect directs. Conduct the test in the presence of an authorized representative of the State. Demonstrate all systems and equipment to operate in accordance with all requirements of the Contract documents and to be free from all electrical and mechanical defects. Provide all systems free from short circuits and grounds and show an insulation resistance between phase conductors and ground not less than the requirements of the governing electric code. Test all circuits for proper neutral connections.

E. Complete all tests prior to final inspection of project, including corrective work based on the results of the tests.

F. Perform special tests on systems and equipment as specified herein in other sections of this division, using personnel qualified to perform such tests.

G. Measure voltage on secondary side of all transformers with full load connected and adjust taps to provide rated secondary voltage.

H. Submit to the City Engineer a report showing test voltage of L-N on the secondary's of all transformers.

3.6 PROTECTION

A. Besides the provisions of Subsection 1.10 of this Section comply with the following:

1. Protect all finish parts of the materials and equipment against damage during the progress of the work and until final completion and acceptance. Cover all materials and equipment in storage and during construction in such a manner that no finished surfaces will be damaged or marred. Keep all moving parts clean, dry and lubricated.

3.7 PRELIMINARY OPERATIONS

A. Required**:** Should the City require that any portion of the systems or equipment be operated prior to the final scheduled dates for completion and acceptance of the work, the Contractor shall consent. Such operation shall be under the direct supervision of, and at the expense of the Contractor, and shall not be construed as an acceptance of any of the work by the City.

3.8 CLEANING UP

A. Conform to applicable provisions of Section 01740 of the General Requirements and the following as applicable.

B. Upon completion of the work and at various times during the progress of the work, remove from the building all surplus materials, rubbish and debris resulting from the work of this division and leave the involved portions of the job-site in a neat, clean and acceptable conditions.

C. Thoroughly clean all switchgear, apparatus, exposed conduit, metal work and accessories for the work of this Division of cement, plaster and other deleterious materials; remove all grease and oil spots with cleaning solvent; carefully wipe all surfaces and scrape all cracks and corners clean.

D. Thoroughly polish all chromium and all plated work. Remove all dirt and stains from lighting fixtures.

E. Leave the entire installation in a neat, clean and usable condition.

3.9 COMPLETION

A. The work will not be reviewed for final acceptance until operating and maintenance data, manufacturer's literature, panel directories and nameplates specified herein have been approved and properly posted or installed and final cleaning of equipment and premises has been completed.

B. When the installation is complete and all adjustments have been made, operate the systems for a period of one week, during which time demonstrate to the City Engineer that the systems are completed and operating in conformance with the Specifications.

3.10 GUARANTEE

A. Conform to applicable provisions of the GENERAL CONDITIONS of these Specifications.

B. Required: Except as may be specified under other sections in the Specifications, guarantee all equipment furnished under the specifications for a period of one year from date of acceptance against defective workmanship and material, and improper installation. Upon notification of failure, correct deficiency immediately and without cost to the City.

C. Standard warranty of manufacturer shall apply for replacement of parts after expiration of the above period. Manufacturer shall furnish replacement parts to the City or his service agency as directed. Furnish to the City Engineer printed manufacturer's warranties complete with material included and expiration dates, upon completion of project.

3.11 OPERATING AND MAINTENANCE DATA

A. Required: Submit to the City Engineer, complete and at one time, prior to acceptance of the installation, 10 copies of manufacturer's instructions for operation and maintenance of electrical equipment, including replacement parts lists. Each set to be bound in an indexed loose leaf ring binder with permanent cover and permanent identification on back.

3.12 RECORD DRAWINGS

A. Required: Conform to the provisions of Subsection 1. 6 M of this Section and as noted hereinafter as applicable.

B. Provide and maintain in good order at the field office a complete set of electrical contract prints. All changes to the contract shall be clearly recorded on this set of prints and initialed by the Contractor on a weekly basis. At the end of the project transfer all changes, using same symbols, to one set of Mylar transparencies. Obtain Mylar transparencies from the Engineer at Contractor's cost.

C. Accurately indicate and dimension all underground conduit runs and conduit stub-outs and all pullboxes from building walls on all Record Drawings.

D. Upon completion of the work and as a prerequisite to issuance of certificate for final payment, deliver one complete set of final prints of the mylars and the Mylar originals themselves.

E. Initial and identify name and telephone number of installing Contractor on all sheets as being a correct and accurate record of the installation. This also includes, but is not limited to, fire alarm and control systems.

3.13 INSPECTION AND ACCEPTANCE PROCEDURES

A. The City Engineer will submit observation reports periodically during the construction phase detailing Contract deficiencies. The Contractor is responsible for making all corrections immediately to avoid delaying other trades. Final acceptances of the project will not be made until all items have been corrected.

3.14 FINAL ACCEPTANCE OF ELECTRICAL SYSTEMS

A. Prior to Final Acceptance of operating electrical systems Contractor shall do the following, as applicable:

1. Provide materials of the type and quality specified and as necessary for proper operation, tested and ready for use.

2. Deliver to the City Engineer the "as-built" transparency and set of prints as "Record Drawings".

3. Furnish the required operating and maintenance data/manuals.

4. Clean-up of the project pertaining to this Division of the work, as hereinbefore noted in Subsection 3. 8 of this Division.

5. After installation has been completed and adjustments made, operate the system for a period of one week, during which time, demonstrate to the City Engineer that all systems are complete and operating in conformance with Contract documents.

6. Conduct all tests required and as specified in Sections of this Division and submit test reports and corrective actions taken.

7. Submission of all warranties and guarantees.

B. Final Acceptance of Electrical Work Shall Be Contingent On The Following:

1. Contractor replacing defective materials and workmanship.

2. Upon completion of work and adjustments made, Contractor shall conduct an operating test for each system for approval at such time as City Engineer directs. Conduct test in presence of authorized representative of the City Engineer demonstrate that systems and equipment do operate in accordance with requirements of the Contract documents and are free from electrical and mechanical defects.

3. Contractor shall provide the necessary training programs and instructions to the City's representative.

4. Submit copies of manufacturer's instructions and maintenance of electrical equipment including replacement parts lists. Each set shall include one set of shop drawings of

equipment installed.

3.15 SUBMITTALS FOR CHANGE ORDERS

A. General: When changes are made during the construction phase, deletions and additions shall be presented in a manner that will indicate the cost of each item of material and corresponding labor. Overhead and profit makeup shall be then added in accordance with the requirements of the GENERAL CONDITIONS.

1. Unit costs shall apply in event of changes, additions and deletions to the contract, as follows:

2. Submit with Bid Costs a unit cost, covering one hour of labor, including all applicable supervision, nonproductive labor, burdens, benefits, insurance, taxes, direct and indirect job expenses including drawings, engineering, temporary power, warehouse, tools, equipment, clean-up, bonds, overhead and profit, charged for labor. Unit cost of labor shall be applicable for duration through completion of the project.

3. Material unit costs shall be based on the latest edition of "Electrical Trade Book", published by Trade Service Publications, Inc. Unit cost shall be taken from extreme right-hand column.

4. Labor unit quantities, for specific items required, shall be those listed in the third column from the National Electrical Contractors' Association, Inc., "NECA Manual of Labor Units".

END OF SECTION

This page intentionally left blank

SECTION 16100
BASIC MATERIALS AND METHODS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the work as indicated on the Drawings and specified herein.

B. This section covers the work necessary to furnish and install the materials specified hereinafter.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The following Sections and Divisions applies to the WORK of this Section. Other Sections and Divisions, not referenced below, shall apply to the extent required for proper performance of this WORK.

1. Division 02 Site Work.

2. Division 03 Concrete.

3. Division 09 Finishes.

4. Division 11 Equipment.

5. Division 17 Instrumentation and Control.

6. Work Specified Under Other Divisions

a. All concrete work required for encasement, installation, or construction of the work specified in the various Sections of Division 16 is included as a part of the work hereunder, and shall be 2500-psi concrete conforming to the applicable requirements of Section 03300, "Cast-in-Place Concrete"; provided, that the following exceptions and supplementary requirements shall apply:

1. Consolidation of encasement concrete around duct banks shall be by hand puddling. No mechanical vibration shall be used.

2. A workability admixture shall be used in encasement concrete, which shall be a hydroxylated carboxylic acid type in liquid form. Admixtures containing calcium chloride shall not be used.

3. Concrete for encasement of conduit or duct banks shall contain an integral red-oxide coloring pigment in the proportion of 8 pounds per cubic yard of concrete.

1.3 REFERENCE CODES AND STANDARDS

A. All work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these specifications.

1. Codes and Standards:

LAEC	City of Los Angeles Electrical Code, latest adopted edition.

2. Government Standards:

FS W-C-596H/GEN	Connector, Plug, Receptacle and Cable Outlet, Electrical Power.
FS W-S-896G	Switches, Toggle (Toggle and Lode), Flush Mounted (ac).

3. Commercial Standards:

ANSI B16.5	Pipe Flanges and Flanged Fittings, Steel, Nickel Alloy, and Other Special Alloys.
ANSI C80.1	Electrical Rigid Steel Conduit (ERSC)
ANSI Z55.1	Gray Finishes for Industrial Apparatus and Equipment.
ANSI/UL 467	Grounding and Bonding Equipment, Safety Standard For.
NEMA WD-1-1.10	General Requirements for Wiring Devices.
NEMA PB-1	Panelboards.
NEMA KS-1	Enclosed Switches.
NEMA VE-1	Ventilated Cable Tray.
ICEA S-61-402	Thermoplastic - Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
ICEA S-19	Rubber - Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
ICEA S-95-658/WC70	Power Cables Rated 2000 Volts or Less.
ICEA S-96-659/WC71	Nonshielded Cables Rated 2,001-5,000 V.
ICEA S-93-639/WC74	5-46 kV Shielded Power Cable.
UL 6	Electrical Rigid Metal Conduit - Steel
UL 489	Molded Case Circuit Breakers.
UL 943	Ground Fault Circuit Interrupters.

B. All equipment furnished by the CONTRACTOR shall be listed by and shall bear the label of Underwriters' Laboratories, Incorporated, (UL) or of an independent testing laboratory acceptable to the CITY's Department of Building and Safety.

C. The construction and installation of all electrical equipment and materials shall comply with all applicable provisions of the Cal/ OSHA Safety Orders (Title 8, CCR), State Building Standards, and applicable local codes and regulations.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the requirements of Section 16020 Municipal Facilities General Electrical Requirements.

1.5 QUALITY ASSURANCE

A. Quality assurance shall be in accordance with all applicable requirements of Section 16020 Municipal Facilities General Electrical Requirements.

PART 2 -- PRODUCTS

2.1 SERVICE ENTRANCE

A. Provide labor and furnish equipment as required by the electric utility which will provide service to the facility. All such materials and work shall meet the requirements of the utility company.

B. Provide temporary service for construction.

2.2 OUTLET AND DEVICE BOXES

A. General: Provide boxes not less than 2-inches deep, unless shallower boxes are required by structural conditions and are specifically accepted by the ENGINEER. Do not use box extensions to provide wiring space required by the NEC. For hollow masonry construction, provide boxes of sufficient depth so that conduit knockouts or hubs are in the masonry void space.

B. Sheet Steel (SS) Boxes: Provide zinc- or cadmium-plated boxes of the one-piece drawn type. Install 4-inch minimum octagonal boxes for ceiling outlets, except where smaller boxes are required for the particular fixture being installed. Use concrete type boxes in poured concrete slabs. Provide 2-inch by 4-inch minimum boxes for switches and receptacles. Provide plaster rings where required.

C. Cast Steel (CS) Boxes: Provide boxes of cast ferrous metal with gasketed, watertight, cast ferrous metal covers and stainless steel screws. Provide boxes with threaded conduit hubs and cast mounting lugs where lugs are required. Use Crouse-Hinds or Appleton Type FS or FD boxes, or equal.

D. Cast Aluminum (CA) Boxes: Provide boxes of cast, copper-free aluminum with gasketed, watertight, cast copper-free aluminum covers and stainless steel screws. Provide boxes with threaded conduit hubs and cast mounting lugs where lugs are required. Use Crouse-Hinds or Appleton Type FS or FD boxes, or equal.

E. Nonmetallic (NM) Boxes: Provide fiberglass boxes with gasketed, watertight covers and stainless steel screws. Provide boxes with conduit hubs and any required mounting lugs. Use Crouse-Hinds, Stahlin, or equal.

F. Provide a box suitable for the conditions encountered at each outlet in the wiring or raceway system and sized in accordance with the LAEC. Use the listed types unless otherwise indicated or accepted.

1. Types to be provided, Steel Raceway System:

Locations	Box Type
Exterior Locations, with:	
Exposed Raceways	316 Stainless steel (NEMA 4X)
Concealed Raceways	316 Stainless steel (NEMA 4X)
Concrete Encased Raceways	316 Stainless steel (NEMA 4X)
Interior Dry Locations, with:	
Exposed Rigid Conduit	Sheet metal
Exposed EMT	Sheet steel
Concealed Raceways	Sheet steel
Concrete Encased Raceways	Cast steel
Lighting Circuits, Ceiling Portion	Sheet steel
Interior Wet Locations, with:	
Exposed Raceways	316 Stainless steel (NEMA 4X)
Concealed Raceways	Cast steel
Concrete Encased Raceways	Cast steel
Lighting Circuits, Ceiling Portion	Sheet steel

2. Types to be Provided, Nonmetallic Raceway System:

Locations	Box Type
Concealed Raceways	Nonmetallic
Concrete Encased Raceways	Precast concrete

G. Device Plates:

1. Types to be Provided:

Locations	Plate Type
All Interior	Plastic

WP Designation	Weatherproof
Flush Mounted Boxes	Plastic
Surface Mounted Cast Metal Boxes	Plastic
Surface Mounted Sheet Metal Boxes	Plastic

2.3 JUNCTION AND PULL BOXES

A. Utilize NEMA 4X 316 stainless steel or fiberglass UV-rated watertight enclosures for outdoor or wet and corrosive locations and where subscript WP is indicated at the box location on the Drawings. Fiberglass enclosures may be used only with the approval of the ENGINEER.

B. Where outlet boxes are used as junction or pull boxes, use materials as specified under article 2.2, OUTLET AND DEVICE BOXES.

C. Where larger sheet steel boxes are required, utilize boxes of code-gauge, galvanized steel with full-access screw covers mounted with corrosion-resistant stainless steel machine screws.

D. Where larger cast metal boxes are required, use neoprene gasketed, watertight boxes with hinged, cast metal full-access covers, stainless steel cover hardware, and drilled and tapped conduit entrances. Use Crouse-Hinds Series W, O.Z./Gedney Series Y boxes, or equal. For below grade conduit, use Crouse-Hinds Type WJBF, O.Z./Gedney Series YR, or equal, minimum size 8-inches by 8-inches by 6-inches. For hazardous areas, use boxes applicable for the location and hazardous atmosphere present.

E. Where larger nonmetallic boxes are required, they shall be gasketed, watertight, corrosive resistant, and have a hinged, full-access screw cover. The hinge and machine screws shall be stainless steel. The box and cover shall be of high impact strength fiberglass-reinforced polyester material with stability to high heat. The boxes shall have conduit hubs and any required mounting lugs. The minimum size shall be 7-inches by 10-inches by 6-1/2-inches deep. Use Crouse-Hinds, or equal, Type NJB boxes.

F. Use concrete boxes of reinforced, precast concrete, 10-inches by 17-inches minimum inside dimensions, Brooks Products, Inc., No. 3-1/2T, Jensen Precast HT1017, or equal. Mark cast iron cover as per CITY standards. Boxes shall be inspected and approved by the CITY prior to site delivery.

G. Use special boxes where indicated on the Drawings.

2.4 TERMINAL JUNCTION BOXES (TJB)

A. Provide hinged-cover terminal junction boxes of the required type and size where indicated. Utilize NEMA 12 enclosures for indoor dry locations. Utilize NEMA 4X 316 stainless steel watertight enclosures, as described under article 2.4, JUNCTION AND PULL BOXES, for outdoor or wet locations and where subscript WP is indicated at the box location on the Drawings. Provide terminal blocks with a separate connection point for each conductor entering or leaving the box. Provide 25 percent spare terminal points for CITY use following completion of installation. Paint interior surfaces with white enamel or lacquer.

2.5 WIRING DEVICES

A. Switches:

1. General Use Switches: Provide specification grade, totally-enclosed, ac type, quiet tumbler switches meeting NEMA WD 1 performance standards and Federal Specification W-S-896G, and capable of control of lamp loads. Use switches rated at 20 amps, 120/277 volts. Provide operating handles colored white. Switches shall have screw terminals.

2. Weatherproof Switches: Use switches mounted in a cast metal box with gasketed, weatherproof device plate.

B. Receptacles:

1. Single and Duplex: Provide specification grade receptacles meeting NEMA WD 1 performance standards and Federal Specification W-C-596H, and having a contact arrangement such that contact is made on two sides of each inserted blade without detent. Use two-pole, three-wire grounding type receptacles rated 15 amps, 125 volts, NEMA Configuration 5-15R.

   Acceptable Manufacturers:

   1. Crouse-Hinds;

   2. Hubbell;

   3. Pass & Seymour;

   4. Or equal.

2. Weatherproof Receptacles: Receptacles installed in wet or damp locations shall be listed weather-resistant type and mounted in an enclosure that is weatherproof whether or not the attachment plug cap is inserted. An outlet box hood shall be UL listed and identified as extra-duty.

3. Ground Fault Interrupter (GFI) Receptacles: Provide duplex specification grade GFI receptacles tripping at 5 milliamps; rated 15 amps, 120 volts, NEMA Configuration 5-15Rand capable of interrupting 1,000 amps without damage. Use units meeting NEMA WD 1, fitting standard sized outlet boxes, having No. 12 AWG copper TW insulated pigtails, having provision for testing, and white in color.

   Use standard model where ground fault protection is needed at an individual location. Use feed-thru model where ground fault protection is specified for "downstream" conventional receptacles. Provide receptacles accepting standard device plates.

   Acceptable Manufacturers:

   1. Crouse-Hinds;

   2. Hubbell;

   3. Pass & Seymour;

Or equal.

4. Special Purpose Receptacles: Provide receptacles of the type, rating, and number of poles indicated or required for the anticipated purpose.

C. Device Plates:

1. General:

a. Provide plates fitting closely and tightly to the box on which they are to be installed. On surface mounted boxes, provide plates which do not extend beyond the sides of the box unless the plates do not have sharp corners or edges.

b. Use plate material compatible with the box material so that galvanic corrosion of the plate and/or box does not occur.

2. Plastic (P) Plates: Provide specification grade device plates manufactured of 0.10-inch minimum thickness, noncombustible, thermosetting material. Provide white one-piece with oval-head metal mounting screws of a color matching that of the plate.

3. Metal (M) Plates: Provide specification grade, one-piece, 0.040-inch nominal minimal thickness, No. 430 satin finish stainless steel device plates with oval-head, matching mounting screws.

4. Engraved Plates: Where device titles are indicated, provide device plates engraved with the designated titles. Provide engraved letters, numbers, or characters 1/8-inch high with filler of black color.

5. Cast Metal (CM) Plates: Provide cast metal device plates of copper-free aluminum with gaskets and stainless steel screws with oval heads.

6. Weatherproof (WP) Plates:

a. Where weatherproof receptacles are designated, the receptacle shall be installed in the specified box with a gasketed, weatherproof, cast metal or stainless steel cover plate with individual cap over each receptacle opening and stainless steel mounting screws. Utilize plates with caps held tightly closed with stainless steel springs when receptacle is not in use.

Acceptable Manufacturers:

1. Crouse-Hinds;

2. Hubbell;

3. Pass & Seymour;

4. Or equal.

b. Where weatherproof switches are designated, the switch shall be installed in the specified box with a gasketed, weatherproof, cast metal cover plate incorporating an external operator for the internal switch and with stainless steel mounting screws.

Acceptable Manufacturers:

1. Crouse-Hinds;
2. Hubbell;
3. Pass & Seymour;
4. Or equal.

7. Raised Sheet Metal (SM) Plates: Provide 1/2-inch high zinc or cadmium-plated steel device plates designed for one-piece drawn type sheet steel boxes.

2.6 LIGHTING AND POWER DISTRIBUTION PANELBOARDS

A. General: Provide circuit breaker panelboards meeting standards established by UL, NEMA PB 1, and the NEC. Where used as service entrance equipment, provide panels UL labeled for that use. Furnish panels with fully rated short circuit current equipment rating. Series connected equipment ratings are not acceptable.

Provide panels rated for connection to an electric system having an available amperes rms symmetrical short circuit current as indicated on drawings or as required by electrical studies. Provide panelboards and circuit breakers suitable for use with 75 degrees C wire at full LAEC 75 degrees C ampacity.

B. Cabinets: Furnish boxes large enough to provide a minimum wiring gutter space on both sides and top and bottom of 4-inches by 4-inches minimum. Provide flush or surface mounted boxes as indicated manufactured with reinforced steel frame and code-gauge, hot-dip galvanized sheet steel. Utilize front trim the same size as the box for surface mounted panelboards and 3/4-inch larger all around than the box for flush mounted panelboards. Panel covers shall be installed with direct screw connections. Adjustable clamps shall not be used. Utilize fronts having doors with concealed hinges and flush type lock and catch device. Provide multipoint locking devices for all doors over 30-inches in height. Key all locks alike, and furnish two milled type keys with each lock. Furnish on door interior a metal directory frame with transparent plastic face and enclosed directory card. Furnish an engraved, laminated plastic nameplate screwed (no adhesives) to the cabinet exterior face indicating the panelboard designation, service voltage, and phases. Nameplates shall be white, engraved to a black core. Letter height shall be 1/4 inch.

C. Interiors:

1. Furnished factory assembled panelboard interiors complete with circuit breakers as shown. In addition, space for future circuit breakers shall be provided with easily removable front cover. Utilize panelboards with interiors designed so that circuit breakers can be replaced without disturbing adjacent circuit breakers or without removing the main bus.

2. Provide copper bus bars full sized throughout their length. Make complete provisions for mounting future circuit breakers throughout the full length of the bus. Provide all machining, drilling, or tapping required to add or change circuit breakers in the future. Bolt together and rigidly support bus bars and connection straps on molded insulators.

3. Furnish an insulated neutral bus bar rated the same as the phase bus bars and having at least one terminal screw for each branch circuit. Furnish a copper ground bus bar installed

on the panelboard frame, bonded to the box, and containing at least one terminal screw for each circuit. Provide solderless main lugs for main, neutral, and ground bus bars. Provide sub-feed or thru-feed lugs where indicated. Provide lugs and connection points on phase, neutral, and ground buses suitable for copper conductors.

D. Circuit Breakers:

1. Furnish indicating type molded circuit breakers providing ON/OFF and TRIPPED positions of the operating handle. Furnish thermal magnetic, quick-make, quick-break circuit breakers which are non-interchangeable in accordance with the LAEC. Do not use tandem or dual circuit breakers in normal single-pole spaces. Do not use single-pole circuit breakers with handle ties where multiple circuit breakers are indicated. Utilize multi-pole circuit breakers designed so that an overload on one pole automatically causes all poles to open. Provide circuit breakers meeting requirements of UL 489. Install bolt-on circuit breakers in all panelboards. Provide circuit breaker handle padlocking provisions where indicated or required.

2. Where ground fault interrupter (GFI) circuit breakers are indicated or required by the LAEC, provide a unit containing a conventional thermal magnetic trip and a ground fault sensor rated to trip the circuit breaker in approximately 0.025 second for a 5-milliampere ground fault (UL Class A sensitivity). Utilize a ground fault sensor having the same rating as the circuit breaker and having a push-to-test button.

E. Acceptable Manufacturers:

1. Eaton;

2. Schneider Electric;

3. Siemens;

4. Or equal.

2.7 CIRCUIT BREAKERS, INDIVIDUAL, 600 VOLTS AND LESS

A. Mount individual circuit breakers in NEMA 12, industrial use enclosure unless otherwise indicated. Provide NEMA 4X, 316 stainless steel raintight enclosure for circuit breakers mounted outdoors and wherever the subscript WP is indicated on the Drawings. Provide circuit breakers with handles that can be locked in the OFF position. Interlock enclosure and circuit breaker to prevent opening the cover with the circuit breaker in the ON position. Provide quick-make, quick-break, thermal magnetic circuit breakers of the indicating type showing ON/OFF and TRIPPED positions of the operating handle. Do not use single-pole circuit breakers with handle ties where multi-pole circuit breakers are indicated. Utilize multi-pole circuit breakers designed so that an overload on one pole automatically causes all poles to open. Provide circuit breakers meeting the requirements of UL 489 and having a minimum interrupting rating as indicated. Where circuit breakers are used as service entrance equipment, provide units UL labeled for that use. Provide circuit breakers with terminals suitable for use with 75 degrees C wire at full LAEC 75 degrees C ampacity.

2.8 FUSED SWITCHES, INDIVIDUAL, 600 VOLTS AND LESS

A. Mount individual fused switches in NEMA 12, industrial use enclosures unless otherwise indicated Provide fused switches that can be locked in the OFF position. Interlock enclosure and switch to

prevent opening the cover with the switch in the ON position. Provide fused switches which are quick-make, quick-break, motor rated, load-break, heavy-duty (HD) type having external marking clearly indicating ON and OFF positions. Provide fuses of the current ratings indicated and types specified herein. Utilize fuse mountings that reject Class H fuses and will accept only the current--limiting fuses specified. Provide fused switches meeting the requirements of NEMA KS 1 and UL listed for application to a system having an available short circuit current as indicated. Where fused switches are used as service entrance equipment, provide units UL labeled for that use. Provide switches suitable for use with 75 degrees C wire at full LAEC 75 degrees C ampacity.

2.9 NONFUSED SWITCHES, INDIVIDUAL, 600 VOLTS AND LESS

A. Mount individual switches in NEMA 12, industrial use enclosure unless otherwise indicated. Provide NEMA 4X, 316 stainless steel raintight enclosure for switches mounted outdoors and wherever the subscript WP is indicated on the Drawings. Provide switches that can be locked in the OFF position. Interlock enclosure and switches to prevent opening the cover with the switch in the ON position. Provide switches which are quick-make, quick-break, motor rated, load-break, heavy-duty (HD) type having external marking clearly indicating ON and OFF positions. Furnish switches meeting the requirements of NEMA KS 1. Provide switches with terminals suitable for use with 75 degrees C wire at full LAEC 75 degrees C ampacity.

2.10 FUSES, 600 VOLTS AND LESS

A. Provide a complete set of current-limiting fuses wherever fuses are indicated. Supply a set of six spare fuses of each type and each current rating installed. Utilize fuses that fit mountings specified with switches and which provide features rejecting Class H fuses. Provide the following types:

1. For motor and transformer circuits, 600 volts and less, 0 to 600 amps, UL Class RK-1 with time delay, Bussmann Type LPS-RK, Shawmut Type A6D-R, or equal.

2. For motor and transformer circuits, 250 volts and less, 0 to 600 amps, UL Class RK-1 with time delay, Bussmann Type LPN-RK, Shawmut Type A2D-R, or equal.

3. For feeder and service circuits, 600 volts and less, 0 to 600 amps, UL Class RK-1, Bussmann Type KTS-R, Shawmut Type A6K-R, or equal.

4. For feeder and service circuits, 250 volts and less, 0 to 600 amps, UL Class RK-1, Bussmann Type KTN-R, Shawmut Type A2K-R, or equal.

5. For feeder and service circuits, 600 volts and less, 601 to 6,000 amps, UL Class L, Bussmann Type KRP-C, Shawmut Type A4BY, or equal.

2.11 PUSHBUTTONS, INDICATING LIGHTS, AND SELECTOR SWITCHES

A. For non-hazardous, indoor, dry locations, including motor control centers, control panels, and individual stations, provide heavy-duty, oil tight type pushbuttons, LED indicating lights, selector switches, and stations for these devices.

B. For non-hazardous, outdoor, or normally wet locations, or where otherwise indicated, provide heavy-duty corrosion-resistant, watertight type pushbuttons, indicating lights, or selector switches mounted in NEMA 4X 316 stainless steel watertight enclosures. Provide special gasketing required to make complete station watertight.

C. Provide devices meeting the requirements of NEMA ICS 2, and having individual, extra large nameplates indicating their specific function. Provide pushbutton stations with laminated plastic nameplates indicating the drive they control. Provide contacts with NEMA designation rating A600. Install provisions for locking pushbuttons and selector switches in the OFF position wherever lockout provisions are indicated.

D. Utilize selector switches having standard operating levers. Make all LED indicating lights push-to-test type. Provide ON or START pushbuttons colored green. Provide OFF or STOP pushbuttons colored red**.**

2.12 TERMINAL BLOCKS 600 VOLTS AND LESS

A. Provide 600-volts terminal blocks for termination of all control circuits entering or leaving equipment, panels, or boxes. Provide screw clamp compression, dead front barrier type terminal blocks with current bar providing direct contact with wire between the compression screw and yoke. Provide yoke, current bar, and clamping screw constructed of high strength and high conductivity metal. Utilize yoke that guides all strands of wire into the terminal. Utilize current bar providing dependable vibration-proof connection. Supply terminals constructed to allow connection of wire without any special preparation other than stripping. Rail mount individual terminals to create a complete assembly and provide terminals constructed such that jumpers can be installed with no loss of space on terminal or rail.

B. Size all terminal block components to allow insertion of all necessary wire sizes and types. Supply terminal blocks with marking system allowing the use of preprinted or field-marked tags. Supply UL approved terminal blocks manufactured by Weidmuller, Ideal, or equal. Provide terminal blocks with 25 percent spare termination points for CITY use following completion of installation.

2.13 CONTROL RELAYS

A. Provide industrial control relays, NEMA Class A300 for 300 volts, or A600 for 600 volts, with field convertible contacts, and meeting the requirements of NEMA ICS 2.

B. Where time delay relays are specified or required, unless otherwise noted, provide industrial control relays with a timer attachment adjustable over the range specified on the Drawings.

C. Where latching (mechanically held) relays or motor thermal detector relays are specified, provide industrial control relays with mechanical latch attachment with unlatching coil and coil clearing contacts. Utilize an attachment allowing easy manual latching and unlatching.

2.14 RESET TIMERS

A. Provide synchronous-motor-driven reset timers with a solenoid-operated clutch and suitable for semi-flush, panel mounting. Utilize timers with time range indicated and 10-amp, 120-volts contacts. Provide Eagle Signal Reset timers, Automatic Timing and Controls Reset timers, or equal.

2.15 ELAPSED TIME METERS

A. Provide synchronous-motor-driven, elapsed time meters, 0 to 99,999.9 hours range, non-reset type, suitable for semi-flush, panel mounting. Provide Type 240, 2-1/2-inch Big Look unit, Eagle

Signal Elapsed Time unit, or equal.

2.16 MAGNETIC CONTACTORS

A. Provide contactors of the NEMA sizes indicated. Mount contactors in NEMA 12, dust-tight, drip-tight, industrial use enclosures unless otherwise indicated. Utilize contactors manufactured and rated in accordance with NEMA ICS 2.

2.17 MAGNETIC LIGHTING CONTACTORS

A. Provide mechanically held lighting contactors of the current ratings indicated. Mount contactors in NEMA 12, dust-tight, drip-tight, industrial use enclosures unless otherwise indicated. Provide coil-clearing contacts on mechanically-held units. Utilize contactors manufactured and rated in accordance with NEMA ICS 2.

2.18 DRY TYPE SMALL POWER TRANSFORMERS (600-VOLTS AND LESS PRIMARY)

Provide self-cooled, two-winding, dry type transformers of the ratings indicated and built in accordance with the latest IEEE, ANSI, and NEMA standards. Utilize units with manufacturer's standard insulation class and standard temperature rise. For ratings 3 to 25 kVA single-phase and 3 to 15 kVA 3-phase, provide units with core and coils completely enclosed in a non-ventilated, NEMA 3R weatherproof enclosure. Utilize encapsulated windings on single-phase units 0 to 25 kVA. On all transformers 15 kVA and larger provide units with at least four, 2-1/2 percent, full capacity voltage taps; two above and two below normal voltage rating.

A. Supply units where sound levels determined by tests in accordance with NEMA and ANSI standards do not exceed:

1. 40 decibels for 0 to 9 kVA.

2. 45 decibels for 10 to 50 kVA.

3. 50 decibels for 51 to 150 kVA.

4. 55 decibels for 151 to 300 kVA.

5. 60 decibels for 301 to 500 kVA.

B. For transformers 30 kVA and larger, equip units with integral vibration isolators completely isolating the core and coil assembly from the transformer enclosure. For smaller transformers, provide integral vibration isolators or install external vibration isolators which isolate the entire unit from the structure on which it is mounted.

Utilize only integral or external vibration isolators which are rated for the weight of the transformer and provide 99 percent isolation efficiency at the fundamental frequency of sound emitted by the transformer.

C. Acceptable Manufacturers:

1. Eaton;

2. Hammond Power Solutions;

3. Schneider Electric;

4. Or equal.

2.19 DRY TYPE, SHIELDED, ISOLATION TRANSFORMERS (600-VOLTS AND LESS PRIMARY)

A. General: Supply dry type transformers providing electrical isolation and noise suppression between the electrical supply system and the critical load. Supply transformers of the ratings and connections indicated, built in accordance with current IEEE, ANSI, NEMA, and UL standards in a general purpose indoor enclosure. Provide units having six 2-1/2 percent full capacity primary winding taps, three above and three below rated voltage. Provide units with a minimum 80 degrees C and maximum 150 degrees C temperature rise above ambient.

B. Isolation and Noise Suppression:

1. Provide units including core and coils having two foil type electrostatic shields, one located between the primary and secondary windings, and the other located between the core and the secondary winding. Provide a ground lead from each shield out into the unit enclosure.

2. Supply isolation transformers with electrical noise attenuation and other characteristics as follows:

Common mode attenuation	120 dB
Transverse mode attenuation	20 dB
Impedance	4.3
Reactance	Minimum 3 percent; Maximum 4.2
Regulation, no-load to percent full-load	1.2
Output distortion	None added3.

Provide primary surge protection as follows:

Peak transient current	40,000 amps
10-microsecond rise time volts	2.9 kV

C. Additional Features Required:

1. Magnetic field strength around transformer less than 0.1-gauss at 1-1/2-feet.

2. Two thermal switches located in the center cove "hot spot" to provide two-stage (high and high-high alarm) thermal sensing. Each switch rated 5 amps, 120 volts, and having one

normally open and one normally closed contact.

D. Acceptable Manufacturers:

1. Eaton;

2. Hammond Power Solutions;

3. Schneider Electric;

4. Or equal.

2.20 LOW VOLTAGE SURGE PROTECTIVE EQUIPMENT

A. Provide secondary surge protective equipment consisting of a surge capacitor and surge arrestor combination located where indicated on the Drawings. Utilize components for all surge protective equipment covered by this Specification, designed and tested in accordance with ANSI/IEEE C62.11.

B. Provide a surge capacitor impregnated with non-pcb biodegradable dielectric fluid. Include an integral discharge resistor which will drain the residual voltage to 50 volts crest in less than 5 minutes after the unit has been disconnected from the circuit.

C. Provide an arrestor consisting of an assembly of high strength metal oxide valve elements enclosed in a high strength, corrosion-resistant, molded resin housing.

D. Provide a capacitor and arrestor having a mounting nipple, flat washer, and nut suitable for knockout mounting. Install capacitors and arrestors in NEMA 4X (stainless steel) enclosures.

2.21 PENETRATION SEALING SYSTEMS (FIRE STOPS) (NOT USED)

2.22 ELECTRIC VEHICAL PEDESTAL CHARGING STATION – Not Used

A General: Electrical vehicle (EV) standard single 40A, Level 2, and 75A Level 3 pedestal charging stations in NEMA 3R rated cabinet, designed for outdoor use.

B. Charging stations to provide the following:

1. Output cable: Single output cable extending to 18 feet, with cable organizer integral with pedestal. Standard EV connector complying with SAEJ1772.

2.. Pedestal Electrical supply: 240 VAC, 40A, 60 Hz (Level 2) or 480 VAC, 75A, 60 Hz (Level 3).

3. Charging power output: 208 to 240VAC, 30A -- DC, or 60 A DC.

4. Ground fault protection: Internal with auto reclosure.

5. Auto restart after ground fault or mains loss.

6. Authentication using RFID card.

7. Simple user interface: Front panel indicators or display showing power status, charge indicator, system fault indicator, general fault indicator.

8. Ambient operating temperature range: -20 deg F to 120 deg F.

9. Manufacturers: Level 2; General Electric EVSRN3, Schneider Electric EVLinkEV 230PSRR, or equal; Level 3: EFACEC Model QC45, Schneider Electric Level 3, or equal.

2.23 ENCLOSURE PAINT AND FINISH

A. All metallic enclosures shall be finished with a prime coat of rust inhibitor and painted as per ANSI No. 61 or as per the ENGINEER's instructions.

PART 3 -- EXECUTION

3.1 JUNCTION AND PULL BOXES

A. Where indicated on the Drawings, and where necessary to terminate, tap-off, or redirect multiple conduit runs, provide and install appropriately designed junction boxes. Furnish and install pull boxes where necessary in the raceway system to facilitate conductor installation. Provide pull boxes to limit conduit runs to less than 150-feet and to contain no more than the equivalent of three right-angle bends unless accepted by the ENGINEER.

1. Installation:

a. Make all boxes accessible. Do not install boxes in finished areas unless accepted by the ENGINEER. Mount all boxes plumb and level. Use flush mounted boxes with concealed conduits. Make edges of boxes flush with the final surface.

b. Mount boxes in a secure, substantial manner, supported independently of conduit by attachment to the building structure or a structural member. Fasten boxes with bolts and expansion shields on concrete or brick, toggle bolts on hollow masonry units, and machine screws or welded threaded studs on steelwork. Threaded studs driven in by a powder charge and provided with lock washers and nuts are acceptable in lieu of expansion shields. Boxes embedded in concrete or masonry need not be additionally supported. Utilize galvanized mounting hardware in industrial areas.

c. Install boxes for conduits under grade flush with finished grade in locations outside of paved areas, roadways, or walkways.

d. If adjacent structure is available, the box may be mounted on the structure surface just above finished grade in accessible but unobtrusive location. If it is found desirable to locate boxes in paved areas, roadways, or walkways, obtain ENGINEER's written approval and utilize boxes and covers suitable for the weights to which they may be subjected.

3.2 TERMINAL JUNCTION BOXES (TJB)

A. Install in accordance with all the requirements detailed under article 3.2, JUNCTION AND PULL BOXES above. Label each block and terminal with a permanently attached, non-destructible tag.

3.3 WIRING DEVICES

A. Switches: Mount switches at the heights indicated under article 3.1, OUTLET AND DEVICE BOXES. Mount switches for switch operation in the vertical position.

B. Device Plates:

1. Installation: Securely fasten device plates to switch or receptacle boxes or the wiring device contained therein. Install device plates used with flush mounted boxes with all four edges in continuous contact with the finished wall surfaces without the use of mats or similar materials. Plaster fillings will not be acceptable. Install device plates vertically or horizontally with an alignment tolerance of 1/16-inch. Do not use sectional type device plates.

3.4 LIGHTING AND DISTRIBUTION PANELBOARDS

A. Mount panelboards securely where indicated, plumb, in-line, and square with walls. Unless otherwise indicated, mount panelboard with top of its cabinet approximately 6-feet above the floor. Provide a typewritten circuit directory under a metal-framed transparent plastic cover inside each panelboard. Provide an engraved, laminated plastic nameplate on the outside of the panelboard showing the panelboard designation, voltage, and phases.

3.5 DRY TYPE TRANSFORMERS (600-VOLTS AND LESS PRIMARY)

A. Mount transformers approximately where indicated. Load any vibration isolators external to the unit properly and provide complete isolation with no direct transformer unit metal in contact with the mounting surface. Connect electrical circuits to transformers by means of moisture proof, flexible conduit in a manner that prevents transformer vibrations from being transmitted to the building or other equipment.

B. Ground neutrals and enclosures of all transformers and all moisture proof flexible conduit in accordance with applicable codes and as otherwise may be indicated. Connect voltage taps on all transformers to give as close as possible to rated output voltage under normal plant load conditions.

3.6 DRY TYPE, SHIELDED, ISOLATION TRANSFORMERS (600-VOLTS AND LESS PRIMARY)

A. Follow instructions for DRY TYPE TRANSFORMERS (600-VOLTS AND LESS PRIMARY) above. In addition, ground isolation shields to the unit enclosure with a conductor of the same material, and at least as big, as the shield ground lead provided with the unit.

END OF SECTION

SECTION 16110
RACEWAYS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, materials, and supplies and shall perform all labor required to complete the work as indicated on the Drawings and specified herein.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The following Divisions and Sections applies to the WORK of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this WORK.

1. Division 02 Site Work.

2. Division 03 Concrete.

3. Division 09 Finishes.

4. Division 11 Equipment.

5. Division 15 Mechanical.

6. Division 17 Instrumentation and Control.

B. Materials and equipment furnished and installed under Divisions 11 and 15 with raceway and electrical conductors furnished, installed, and connected under Division 16, Electrical.

1.3 REFERENCE CODES AND STANDARDS

A. All work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these specifications.

B. Comply with the current provisions of the following Codes and Standards.

1. Codes and Standards:

LAEC	City of Los Angeles Electrical Code, latest adopted edition.

2. Commercial Standards:

ANSI C80.1	Electrical Rigid Steel Conduit (ERSC).
ANSI/NEMA FB 1	Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit
ANSI/UL 467	Grounding and Bonding Equipment, Safety Standard For.
NEMA TC 2	Electrical Polyvinyl Chloride (PVC) Conduit

NEMA TC 3	Polyvinyl Chloride (PVC) Fittings
NEMA VE-1	Metal Cable Tray Systems.
UL 6	Electrical Rigid Metal Conduit - Steel

C. All equipment furnished by the CONTRACTOR shall be listed by and shall bear the label of Underwriters' Laboratories, Incorporated (UL), or of an independent testing laboratory acceptable to the Building and Safety Department of the City of Los Angeles.

D. The construction and installation of all electrical equipment and materials shall comply with all provisions of the CAL OSHA Safety orders Title 8 CCR, as applicable, State Building Standards, and applicable local codes and regulations.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the requirements of Section 16020 Municipal Facilities General Electrical Requirements.

B. The following submittals and specific information shall be provided.

1. Catalog cuts, bulletins, or brochures shall be submitted for mass produced non-custom material.

2. The CONTRACTOR shall furnish copies of the manufacturer’s certified test reports for the material being supplied to establish compliance with NEMA RN-1.

1.5 QUALITY ASSURANCE

A. Quality Assurance shall be in accordance with Section 16010 Municipal Facilities General Electrical Requirements.

PART 2 -- PRODUCTS

2.1 RIGID GALVANIZED STEEL CONDUIT

A. Use rigid steel conduit, including bushings, couplings, elbows, nipples, and other fittings,

galvanized by hot-dipping, and meeting the requirements of ANSI C80.1, ANSI/NEMA FB 1, UL, and the LAEC. Do not use setscrew type couplings, bushings, bends, nipples, and other fittings, unless approved by the ENGINEER or the INSPECTOR. Factory bends are not permitted unless approved by the ENGINEER or the INSPECTOR. Conduit bending radius shall not be less than the minimum cable bending radius of the cable to be installed. See NEC Section 300.34 for conductor bending radius.

2.2 PVC SCHEDULE 40 CONDUIT

A. Use rigid PVC Schedule 40 conduit, UL listed for concrete-encased, underground direct burial, concealed and direct sunlight exposed use, and UL listed and marked for use with conductors having 90 degrees C insulation. Use conduits, couplings, bushings, elbows, nipples, and other fittings meeting the requirements of NEMA TC 2 and TC 3, UL, NEC, and ASTM specified tests for the intended use. Use only conduit with a factory formed bell on one end. Conduit that requires the use of couplings for straight runs will not be acceptable.

2.3 PVC SCHEDULE 80 CONDUIT

A. Use rigid PVC conduit, Schedule 80, extra heavy wall, UL listed for concrete-encased, underground direct burial, and UL listed and marked for use with conductors having 90 degrees C insulation. Use conduit, couplings, bushings, elbows, nipples, and other fittings meeting the requirements of NEMA TC 2 and TC 3, UL, and LAEC. CONTRACTOR shall account for conduit wall thickness in determining appropriate conduit size. Schedule 80 conduit shall be used as indicated on the drawings. In general, this conduit is used in concrete encased or direct burial locations exposed to vehicular traffic.

2.4 PVC COATED RIGID GALVANIZED STEEL CONDUIT

A. Use PVC coated rigid steel conduit, galvanized inside and out. Prior to coating, the galvanized conduits and fittings shall be UL listed. The galvanized conduit shall have an exterior PVC coating of 40 mils nominal (+10 mils / -5 mils) bonded to the metal. The interior shall be coated with a urethane coating no more than 7 mils thick. Use PVC coated fittings with the same interior and exterior coating requirements. PVC coated fittings and sleeves shall be completely watertight to prevent moisture from penetrating the interior of the conduits and fittings. The PVC coating shall be resistant to ultra-violet rays when installed outdoors. The conduit and fittings shall meet all the requirements of NEMA RN-1.

2.5 FLEXIBLE METAL CONDUIT, LIQUID-TIGHT

A. Use UL listed liquid-tight flexible metal conduit consisting of galvanized steel flexible conduit covered with an extruded PVC jacket and terminated with nylon bushings or bushings with steel or malleable iron body and insulated throat and sealing O-ring. Provide external grounding connector and appropriately sized grounding conductor to assure ground continuity.

2.6 RACEWAY FITTINGS

A. Fittings for Rigid Steel.

1. Use insulated throat bushings of metal with integral plastic bushings rated for 105 degrees C.

2. For insulated throat bushings for rigid steel conduit, use Thomas & Betts Nylon Insulated Metallic Bushings, or O.Z. Gedney Type B, or equal.

3. Use Myers Scru-Tite, or equal hubs for rigid steel conduit.

4. Use conduit bodies for rigid steel conduit of metal and sized as required by the NEC. Use Appleton Form 35 threaded Unilets; Crouse-Hinds Mark 9 or Form 7 threaded condulets; Killark Series O Electrolets; or equal, for normal conduit bodies for rigid steel conduit. Where conduit bodies for rigid steel conduit are required to be approved for hazardous (classified) locations, use conduit bodies manufactured by Appleton, Crouse-Hinds, Killark, or equal.

5. Use only couplings for rigid steel conduit supplied by the conduit manufacturer.

6. Use Appleton Type EYF, EYM, or ESU; Crouse-Hinds Type EYS or EZS; Killark Type EY or EYS; or equal, 40% fill sealing fittings for rigid steel conduit. Where condensate may collect on top of a seal, provide a drain by using Appleton Type SF Crouse-Hinds Type EYD or EZD, or equal Drain Seal.

7. Use Appleton Type ECDB, Crouse-Hinds ECD, or equal drain fittings for rigid steel conduit.

8. Fittings for Liquid-Tight Flexible Metal Conduit: Use insulated throat connectors for liquid-

tight flexible metal conduit of metal with an integral plastic bushing rated for 105 degrees C, and of the long design type extending outside of the box or other device at least 2-inches. Use Thomas & Betts Super-Tite Nylon Insulated Connectors or equal.

9. Fittings in Hazardous Areas: In hazardous areas, use only fittings approved for the atmosphere involved.

10. Use cable sealing fittings forming a watertight nonslip connection to pass cords and cables into conduit. Size cable sealing fitting for the conductor OD. For conductors with OD's of 1/2-inch or less, provide a neoprene bushing where the conductor enters the connector. Use Crouse-Hinds CGBS, Appleton CG Series, or equal, cable 40% fill sealing fittings.

11. Coating thickness of PVC coated fittings shall be the same as that for PVC coated conduits.

2.7 PRECAST MAINTENANCE HOLES AND HANDHOLES

A. Install maintenance holes and handholes precast with 28-day, 3,000 psi minimum compressive strength concrete and designed for AASHTO H-20 loading. Minimum dimensions for maintenance holes and handholes are shown on the Drawings. Increase these as required by use of extension sections to accommodate the several raceway entrances at their required elevations.

B. Provide raceway entrances on all 4 sides. For raceways installed under this Contract, knockout panels or precast individual raceway openings may be used. On sides where no raceways are installed under this Contract, provide knockout panels for future raceway installation.

C. Utilize heavy-duty type frames and covers made of cast iron, as per CITY of Los Angeles standards, suitable for H-20 loading, and having machined bearing surfaces. Provide indented type covers, solid top design, with two drop handles each. On the upper side of each cover, cast or burned by welder, in integral letters not less than 2-inches high appropriate titles, ELECTRIC HV (for above 600 volts), ELECTRIC LV (for 600 volts and below), or TELEPHONE. Field stamp covers with manhole or handhole numbers indicated on the Drawings.

D. Provide heavy weight cable racks with adjustable arms and acceptable insulators for all cables in each maintenance hole. Set adjustable inserts in the concrete walls for the attachment of racks. Do not use bolts or studs embedded in concrete for attaching racks. Set racks and inserts on not greater than 3-foot centers around the entire inside perimeter of the maintenance hole, arranged so that all spare conduit ends are clear for future cable installation. Provide racks with a sufficient number of arms and insulators to accommodate cables for each conduit entering or leaving the maintenance hole, including spares.

E. Provide a pulling iron embedded in the concrete wall opposite each raceway entrance and one in the floor vertically below the center of the manhole or handhole cover. Utilize 3/4-inch round stock securely fastened to the overall steel reinforcement before concrete is poured.

F. Utilize maintenance hole and handhole hardware of steel, hot-dip galvanized after fabrication.

G. Acceptable Manufacturers:

1. Brooks Products;

2. Jensen Precast;

3. Oldcastle Precast;

4. Or equal.

H. All prefabricated maintenance holes shall be shop inspected before delivery to the site.

2.8 RACEWAY TAGS

A. Provide permanent, stainless steel markers with raceway designations, minimum 1/4-inch high lettering, pressure stamped, embossed, or engraved onto the tag. Tags relying on adhesives or taped-on markers are not acceptable. Attach tags to raceways with stainless steel wire.

2.9 WARNING TAPE

A. Provide heavy-gauge, yellow plastic tape of 6 -inch minimum width for use in trenches containing electric circuits. Utilize tape made of material resistant to corrosive soil. Use tape with printed warning that an electric circuit is located below the tape.

Acceptable Manufacturers:

1. Brady;

2. Marking Services Inc.;

3. Seton;

4. Or equal.

PART 3 -- EXECUTION

3.1 GENERAL

A. Provide raceway systems meeting or exceeding the requirements of the NEC.

3.2 PROTECTION DURING CONSTRUCTION

A. In addition to the provisions of the GENERAL REQUIREMENTS, and Section 16020 "Municipal Facilities General Electrical Requirements," prior to installation, store all products specified in this section in a dry location. Following installation, protect products from the effects of moisture, corrosion, and physical damage during construction. Keep openings in conduit and tubing capped with manufactured seals during construction.

3.3 MINIMUM RACEWAY SIZE

A. Use no circular raceway less than 3/4-inch.

3.4 REQUIRED RACEWAY TYPE FOR LOCATION AND INSTALLATION METHOD

A. Exterior, Exposed:

1. PVC coated rigid galvanized steel conduit.

B. Interior, Exposed:

1. Rigid galvanized steel conduit.

2. EMT for above-ceiling application.

C. Interior, Concealed (Not Embedded in Concrete):

1. Rigid galvanized steel conduit.

2. PVC Schedule 40 conduit.

D. Embedded in Concrete Walls or Floors:

1. PVC Schedule 40 conduit.

E. Underground, Direct Earth Burial:

1. PVC Schedule 40 conduit.

2. PVC Schedule 80 conduit. (For vehicular traffic areas)

F. Concrete Encased Raceways:

1. Rigid galvanized steel conduit.

2. PVC Schedule 40 conduit.

G. Under Concrete Floor Slabs:

1. PVC Schedule 40 conduit.

H. Final Connection to Certain Equipment:

1. Make final connection to motors, wall or ceiling mounted fans and unit heaters, dry type transformers, valves, local instrumentation, and other equipment where flexible connection is required to minimize vibration or where required to facilitate removal or adjustment of equipment, with 36-inch maximum length liquid-tight, PVC-jacketed, flexible steel conduit.

2. The flexible conduit shall be long enough to allow the item to which it is connected to be withdrawn or moved off its base. Use liquid-tight flexible metal conduit in outside areas, process areas exposed to moisture, and areas required to be oil free and dust-tight.

I. Special Locations:

1. Use PVC coated rigid galvanized steel conduit:

a. Where conduit changes from underground and/or concrete embedded to exposed.

b. Under equipment mounting pads.

c. In exterior light pole foundations.

J. Communication and Instrumentation Conduits:

1. Communication and instrumentation conduits shall be PVC coated rigid galvanized steel.

3.5 GENERAL INSTALLATION REQUIREMENTS FOR RACEWAYS

A. Location, Routing, and Grouping:

1. Conceal or expose raceways as indicated. Group raceways in same area together. Locate raceways at least 12-inches away from parallel runs of heated piping for other utility systems.

2. Run exposed raceways parallel or perpendicular to walls, structural members, or intersections of vertical planes to provide a neat appearance. Follow surface contours as much as possible.

3. Avoid obstruction of passageways. Run concealed raceways with a minimum of bends in the shortest practical distance considering the building construction and other systems.

4. In block walls, do not run raceways in the same horizontal course with reinforcing steel.

5. In outdoor, underground, or wet locations, use watertight couplings and connections in raceways. Install and equip boxes and fittings so as to prevent water from entering the raceway.

6. Paint all threads of galvanized conduits with UL approved zinc-rich paint or liquid galvanizing compound before assembling. Touch up after assembly to cover nicks or scars.

7. Do not notch or penetrate structural members for passage of raceways except with prior approval of the ENGINEER or the INSPECTOR.

8. Do not run raceways in equipment base foundations.

9. Locate above ground raceways concealed in poured concrete so that the minimum concrete covering is not less than 1-1/2-inches.

10. Except at raceway crossings, separate raceways in slabs not less than six times the raceway outside diameter.

11. Raceways installed under slab floors shall lie completely under the slab with no part of the horizontal run of the raceway embedded within the slab.

12. Install concealed, embedded, and buried raceways so that they emerge at right angles to the surface. Provide support during pouring of concrete to ensure that raceways remain in position.

13. Allow a minimum headroom of 7 feet for conduit passing over walkways.

14. Communication and instrumentation conduits crossing power circuits shall be separated from such circuits by the minimum distance stipulated by the IEEE standards.

B. Support:

1. Support raceways at intervals not exceeding LAEC requirements unless otherwise indicated. Support multiple raceways adjacent to each other by ceiling trapeze. Support individual raceways by wall brackets, strap hangers, or ceiling trapeze, fastened by toggle bolts on hollow masonry units, expansion shields on concrete or brick, and machine screws or welded thread studs on steelwork.

2. Threaded studs driven in by a powder charge shall not be accepted.

3. Support all raceways from building structural members only.

4. Do not use nails anywhere or wooden plugs inserted in concrete or masonry as a base for raceway or box fastenings. Do not weld raceways or pipe straps to steel structures. Do not use wire in lieu of straps or hangers.

C. Bends:

1. Make changes in direction of runs with symmetrical bends. Make bends and offsets of the longest practical radius. Do not heat metal raceways to facilitate bending.

2. Make bends in parallel or banked runs of raceways from the same center or centerline so that bends are parallel and of neat appearance. Make field bends in parallel runs.

3. For PVC conduits, use factory made elbows for all bends 30 degrees or larger. Use rigid steel elbows on all 90-degree bends in PVC conduits. Use acceptable heating methods for forming smaller bends.

4. Make no bends in flexible conduit that exceed 90 degrees or allowable bending radius of the cable to be installed or that significantly restricts the conduits flexibility.

D. Bushing and Insulating Sleeves:

1. Where metallic conduit enters metal equipment enclosures through conduit openings, install a bonding bushing on the end of each conduit. Install a bonding jumper from the bushing to any equipment ground bus or ground pad.

2. If neither exists, connect the jumper to a threaded bolt connection to the metallic enclosure.

3. Use manufacturer's standard insulating sleeves in all metallic conduits or insulated bushings terminating at an enclosure.

E. Expansion Joints: Provide suitable expansion fittings for raceways crossing expansion joints in structures or concrete slabs or provide other suitable means to compensate for expansion and contraction. Provide for the high rate of thermal expansion and contraction of PVC conduit by providing PVC expansion joints as recommended by the manufacturer and as required.

F. PVC Conduit: Solvent weld PVC conduit joints with solvent recommended by the conduit manufacturer. Follow manufacturer's solvent welding instructions and provide watertight joints. Use acceptable PVC terminal adapters when joining PVC conduit to metallic fittings. Use acceptable PVC female adapters when joining PVC conduit to rigid metal conduit.

G. PVC Coated Rigid Steel Conduit: Install in strict accordance with the manufacturer's instructions. Touch up any damage to the coating with conduit manufacturer acceptable patching compound. PVC boot shall cover all threads. Where belled conduits are used, bevel the unbelled end of the joint before joining. Leave no metallic threads uncovered.

H. Penetrations:

1. Seal the interior of all raceways entering structures at the first box or outlet with oakum or suitable plastic expandable compound to prevent the entrance into the structure of gases, liquids, or rodents.

2. Dry pack with nonshrink grout around raceways that penetrate concrete walls, floors, or ceilings aboveground, or use one of the methods specified for underground penetrations.

3. Where an underground conduit enters a structure through a concrete roof or a membrane waterproofed wall or floor, provide an acceptable, malleable iron, watertight, entrance

sealing device. Provide a device having a gland type sealing assembly at each end with pressure bushings which may be tightened at any time when there is no raceway concrete encasement specified or indicated. When there is raceway concrete encasement specified or indicated, provide such a device with a gland type sealing assembly on the accessible side. Securely anchor all such devices into the masonry construction with one or more integral flanges. Secure membrane waterproofing to such devices in a permanently watertight manner.

4. Where an underground raceway without concrete encasement enters a structure through a nonwaterproofed wall or floor, install a sleeve made of Schedule 40 galvanized pipe.

   Fill the space between the conduit and sleeve with a suitable plastic expandable compound, or oakum and lead joint, on each side of the wall or floor in such a manner as to prevent entrance of moisture. A watertight entrance sealing device as specified may be used in lieu of the sleeve.

5. Where raceways penetrate fire-rated walls, floors, or ceilings, fire stop openings around electrical penetrations to maintain the fire-resistance rating.

6. Raceways passing through roofs shall be flashed.

7. Provide conduit seals where required by Article 500 of the LAEC.

3.6 INSTALLATION REQUIREMENTS FOR UNDERGROUND DIRECT BURIAL CONCRETE-ENCASED RACEWAYS

A. General:

1. Coordinate installation of underground raceways with other outside and building construction work. Maintain existing outside utilities in operation unless otherwise authorized by the ENGINEER.

2. Remove entirely and properly reinstall all raceway installations not in compliance with these requirements.

3. Do not use union type fittings underground.

4. Provide a minimum cover per NEC Table 300.5 for all underground raceways unless otherwise indicated. Warning tape as specified in Part 2 shall be placed no less than 12 inches above conduit and duct bank.

5. Where a concrete-encased duct bank is installed over an extensive area of disturbed earth such as that within the periphery of a building, provide a separate concrete base under the duct bank to ensure stability of raceways during installation. Allow this base to set before the duct bank is installed.

6. Do not backfill underground direct burial and concrete-encased raceways until they have been inspected by the ENGINEER and the INSPECTOR.

7. Warning Tapes: Bury warning tapes approximately 8-inches below grade and above all underground conduit runs or duct banks. Align parallel to and within 12-inches of the centerline of runs.

B. Separation and Support:

1. Separate parallel runs of two or more raceways in a single trench with preformed, nonmetallic spacers designed for the purpose. Install spacers at intervals not greater than

that specified in the LAEC for support of the type raceways used, and in no case greater than 10-feet.

2. Support raceways installed in fill areas to prevent accidental bending until backfilling is complete. Tie raceways to supports, and raceways and supports to the ground, so that raceways will not be displaced when concrete encasement or earth backfill is placed.

C. Arrangement and Routing:

Arrange multiple conduit runs substantially in accordance with any details shown on the Drawings. Locate underground conduits where indicated on the Drawings.

1. Make minor changes in location or cross-section as necessary to avoid obstructions or conflicts. Where raceway runs cannot be installed substantially as shown because of conditions not discoverable prior to digging of trenches, refer the condition to the ENGINEER for instructions before further work is done.

2. Where other utility piping systems are encountered or being installed along a raceway route, maintain a 12-inch minimum vertical separation between raceways and other systems at crossings. Maintain a 12-inch minimum separation between raceways and other systems in parallel runs. Do not place raceways over valves or couplings in other piping systems. Refer conflicts with these requirements to the ENGINEER for instructions before further work is done.

3. Provide insulated grounding bushings on all metallic raceways entering manholes. Provide bell-ends flush with manhole walls on all nonmetallic raceways entering manholes.

4. In multiple conduit runs, stagger raceway coupling locations so that couplings in adjacent raceways are not in the same transverse line.

5. Provide markers at grade to indicate the direction of underground conduits provided under this Contract. Provide markers consisting of double-ended arrows, straight for straight runs and bent at locations where runs change direction. Provide markers at all bends and at intervals not exceeding 100-feet in straight runs. Use markers made of sheet bronze not less than 1/4-inch thick embedded in and secured to the top of concrete posts. Use markers not less than 10-inches long and 3/4-inch wide and marked ELECTRIC CABLES in letters 1/4-inch high incised into the bronze to a depth of 3/32-inch.

6. All conduits shall enter maintenance holes and structures at right angles.

D. Provide expandable grommets for concrete encased raceway passing through wall to the earth.

E. Raceway Coating: At couplings and joints, coat metallic underground direct-burial conduits with Bitumastic No. 50 or equal, or wrap with Scotchrap No. 51, or equal plastic tape with 1/2-inch overlap.

1. Direct Earth Burial Conduit Zone Backfill Installation:

2. Backfill material for the conduit zone of direct burial conduit trenches may be selected from the excavated material if it is free from roots, foreign material, and oversized particles. Use material with 3/4-inch maximum particle size and suitable gradation for satisfactory compaction. Remove material if necessary to meet these requirements.

3. Imported 3/4-inch minus gravel or sand may be used in lieu of material from the excavation.

4. After conduits have been properly installed, backfill the trench with specified material placed around the conduits and carefully tamped around and over them with hand tampers.

Final, tamped conduit cover shall be 4-inches minimum.

F. Concrete Encasement:

1. Where indicated, encase conduits in a red concrete envelope sized as indicated and located at the elevation shown. Use 2,500 psi concrete as specified in Section 03300 CAST-IN-PLACE CONCRETE.

2. Maintain a grade of at least 4-inches per 100-feet, either from one maintenance hole or pull box to the next, or from a high point between them, depending on the surface contour.

3. Hold conduits for concrete-encased raceways securely in place by acceptable window type spacer supports. Where, in the opinion of the ENGINEER, ground conditions are such as to require concrete forms, install forms constructed of materials and in a manner acceptable to the ENGINEER. No variations greater than 1/2-inch in 50-feet will be permitted from a straight line.

4. Envelopes may be poured directly against the sides of trenches if the cut is clean, even, and free of loose material. Remove loose material from trenches before and during pouring of concrete to ensure sound envelopes. Carefully spade concrete during pouring to eliminate all voids under and between raceways and honeycombing of the exterior surface.

5. Do not use power-driven tampers unless they are specifically designed for the application, in order to ensure that the watertight integrity of the raceways is maintained.

6. Generally, pour an entire concrete envelope in one continuous pour. Where more than one pour is necessary, terminate each pour in a sloped plane, and insert 3/4-inch reinforcing rod dowels extending into the concrete 18-inches minimum on each side of the joint. Obtain Engineers' approval for the number and location of dowels.

7. Provide reinforcement shown where envelopes connect to manholes or building structures to prevent shearing of joints.

3.7 MAINTENANCE HOLES AND HANDHOLES

A. Install maintenance holes and handholes where shown on the Drawings. Provide excavation, shoring, bracing, backfilling, grading, etc., in accordance with requirements specified elsewhere in these Contract Documents.

B. Do not install maintenance holes or handholes until final conduit grading, including field changes necessitated by underground interferences, has been determined. Set frames to final grades as required.

C. Make installation so that raceways enter maintenance holes or handholes at nearly right angles and as near as possible to one end of a wall, unless otherwise indicated.

D. Install one ground rod in each maintenance hole and handhole. Connect all noncurrent-carrying metal parts in the maintenance holes and any metallic raceway grounding bushings to this ground rod with No. 6 AWG (minimum) copper conductor.

E. CONTRACTOR shall clean and remove all debris from maintenance holes and handholes whether new or existing.

3.8 WIREWAYS

A. Mount wireways securely in accordance with the LAEC and manufacturer's instructions. Locate

removable cover or hinged cover on accessible vertical face of wireway unless otherwise indicated.

3.9 PREPARATION FOR PULLING IN CONDUCTORS

A. Do not install crushed or deformed raceways. Avoid traps in raceways where possible. Take care to prevent the lodging of plaster, concrete, dirt, or trash in raceways, boxes, fittings, and equipment during the course of construction. Make raceways entirely free of obstructions or replace them. Ream all raceways, remove burrs, and clean raceway interior before introducing conductors or pull wires.

B. Immediately after installation, plug or cap all raceway ends with watertight and dust-tight seals until the time for pulling in conductors.

C. For concrete-encased raceways, after the concrete envelope has set, pull a mandrel of a diameter approximately 1/4-inch less than the raceway inside diameter, through each raceway. Then pull a bristle brush through each raceway to remove debris.

3.10 EMPTY RACEWAYS

A. Certain raceways will have no conductors pulled in as part of this Contract. Identify with tags at each end and at any intermediate pull point the origin and destination of each such empty raceway. Where a raceway has been identified with a name (number) in the Raceway Schedule, use that name on the tag in lieu of origin and destination. Provide a removable permanent cap over each end of each empty raceway. Mandrel and provide a nylon pull cord in each empty raceway.

3.11 PAINTING

A. Paint raceway systems in accordance with and as specified in Section 09800 "Protective Coating."

END OF SECTION

SECTION 16160
CONDUCTORS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish all tools, equipment, material, and supplies and shall perform all labor required to complete the work as indicated on the Drawings and specified herein.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The following Sections or Divisions applies to the WORK of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this WORK.

1. Division 11 Equipment.

2. Division 17 Instrumentation and Control.

B. Materials and equipment furnished and installed under other divisions with raceway and electrical conductors furnished, installed, and connected under Division 16, Electrical.

1.3 REFERENCE CODES AND STANDARDS

A. All work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these specifications.

B. Comply with the current provisions of the following Codes and Standards.

1. Codes and Standards:

LAEC	City of Los Angeles Electrical Code, latest adopted edition.

2. Commercial Standards:

ANSI/UL 467	Grounding and Bonding Equipment, Safety Standard For.
ICEA S-95-658/WC70	Power Cables Rated 2000 Volts or Less.
ICEA S-96-659/WC71	Nonshielded Cables Rated 2,001-5,000 V.
ICEA S-93-639/WC74	5-46 kV Shielded Power Cable.
ANSI/UL 62	Flexible Cord and Fixture Wire.
ANSI/UL 510	Insulating Tape.
ANSI/UL 1277	Electric Power and Control Tray Cables with Optional Optical Fiber Members.
ASTM B8	Standard Specifications from Concentric Lay Standard Copper Conductors, Hard, Medium-Hard or Soft.

IEEE 48	Standard Test Procedures and Requirements for High Voltage Alternating Current Cable Terminations.
NEMA WC-57	Control, Thermocouple Extension, and Instrumentation Cable.

C. All Conductors furnished by the CONTRACTOR shall be listed by and shall bear the label of Underwriters' Laboratories, Incorporated, (UL).

D. The construction and installation of all electrical equipment and materials shall comply with all provisions of the CAL OSHA Safety Orders Title 8 CCR, as applicable, State Building Standards, and applicable local codes and regulations.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the Section 16010 Wastewater Facilities General Electrical Requirements.

B. CONTRACTOR shall submit the following items.

1. Catalog cut sheets and other brochures depicting conductor characteristics.

2. Manufacturer’s certified test records and factory test procedures.

3. Manufacturer’s recommended splicing, testing, and installation procedures and practices.

4. Certified test reports of HI-POT and Megger test results for medium and high voltage cables.

1.5 QUALITY ASSURANCE

A. Conductor Identification System:

1. Provide complete power, control and signal conductor identification system so that after installation, circuits can be easily traced from origin to final destination.

2. Identify power, control and signal conductors at each termination and in all accessible locations such as maintenance holes, handholes, panels, switchboards, pull boxes, terminal boxes, etc. For identification, use type of tags specified herein.

3. Tag conductors using a three-segment conductor numbering scheme which defines the origin of the conductor, the function of the conductor, and the destination of the conductor.

   Example: MCCA-P-MCCB where MCCA is the origin, P is the function identification (P = power, C = control, S = signal, etc.), and MCCB is the destination.

4. For conductors with one point of origin and two or more destinations, expand the function identification number, e.g., PA, PB, etc.

5. Make the origin and destination identification the specific names for the equipment used in the Contract Documents. Make the instrumentation and control identification names exactly as designated, i.e., FT-S-121.

B. Conductor Color Coding:

1. Color coding of multiconductor control and instrumentation cable is specified in the individual cable type specification.

2. For power conductors, provide all single conductors and individual conductors of multiconductor power cables with integral insulation pigmentation of the designated colors, except conductors larger than No. 6 AWG may be provided with color coding by applying a heat shrink tube of the appropriate color.

3. Phase A, B, C implies the direction of positive phase rotation.

4. Use the following colors:

System	Conductor	Color
All Systems	Equipment Grounding	Green
240/120 Volts	Grounded Neutral	White
1-Phase, 3-Wire	One Hot Leg	Black
	Other Hot Leg	Red
208Y/120 Volts	Grounded Neutral	White
3-Phase, 4-Wire	Phase A	Black
	Phase B	Red
	Phase C	Blue
240/120 Volts	Grounded Neutral	White
3-Phase, 4-Wire	Phase A	Black
Delta, Center Tap "High"	(wild) Leg	Orange
Ground on 1-Phase	Phase C	Blue
480Y/277 Volts	Grounded Neutral	White
3-Phase, 4-Wire	Tracer	
	Phase A	Brown
	Phase B	Orange
	Phase C	Yellow
4,160 Volt	Grounded Neutral	White
4,800 Volt	Phase A	Yellow
13,800 Volt	Phase B	Red
34,500 Volt	Phase C	Blue

C. For all high voltage cable and all 600 volt cable sized AWG #2 and larger, CONTRACTOR shall furnish cable manufactured no more than one year prior to installation. Provide documentation from the supplier.

PART 2 -- PRODUCTS

2.1 GENERAL

A. The use of a manufacturer's name and model or catalog number is for the purpose of establishing the standard of quality and general configuration desired only. Products of other manufacturers will be considered in accordance with the GENERAL REQUIREMENTS.

2.2 CONDUCTORS

A. Conductors 600 Volts and Below:

1. Unless otherwise indicated, provide stranded conductors, except provide solid conductors where No. 10 AWG and No. 12 AWG are designated for branch circuit power wiring in lighting and receptacle circuits.

2. Provide conductors with Type THW or Type THHN/THWN, except for sizes No. 6 and larger, provide conductors with XHHW, XHHW-2 insulation.

3. Use only copper conductors.

4. For all direct burial and aerial conductors and cables, provide conductors with UL labeling "TYPE USE" and RHW insulation with heavy-duty, black, neoprene sheath meeting the physical requirements and minimum thickness requirements of ICEA S-95-658 NEMA WC70.

5. Where flexible cords and cables are specified, provide Type SO, 600-volt, with the number and size of copper conductors indicated.

6. Conductors for applications of 600 volts and below shall be rated for 600 volts unless otherwise specified.

7. The name of the manufacturer, insulation type, voltage rating and wire size shall be clearly and permanently imprinted throughout the length of each conductor. All conductors and cables supplied shall bear the UL label.

B. Conductors Above 600 Volts:

1. 5 kV Conductors

a. Unless indicated otherwise, provide minimum 19 strand soft annealed uncoated copper conductors with crosslinked polyethylene (XLPE) insulation, extruded semiconducting strand and insulation shields, and a polyvinyl chloride jacket.

b. Provide shielded single conductors with 100 percent insulation level, that meet applicable portions of ICEA S-93-639/NEMA WC74, Ionization Level Requirements. Provide conductors UL listed 1072 Type MV-90.

c. Cable marking shall include manufacturer’s name, insulating material, Conductor size, voltage class and UL mark.

C. Multi-Conductor Cable:

1. Provide cable that is UL listed Type TC and conforms to the requirements of UL 1277 and NEC Article 336, or UL listed Power Limited Circuit Cable that conforms to the requirements of Article 725 of the LAEC. Provide cables permanently and legibly marked with the manufacturer's name, the maximum working voltage for which the cable was designed, the type of cable, and labeled UL (or submit evidence of UL listing).

2. Provide cables as specified under the type number in this section (Type 1, Type 2, etc.). Conduits shown on the Drawings and in the Circuit/Raceway Schedule have been sized to accommodate the outside diameter for each type. For this reason, use cable diameters equal to or less than the diameters specified.

a. Type 1 (600-Volt Multi-Conductor Control Cable, Type TC):

(1) General: Multi-conductor control circuit interconnection cable with ground. Suitable for installation in open air, in cable trays, conduit, or other approved raceways. Maximum cable temperature rating 90 degrees C dry locations, 75 degrees C wet locations. Passes vertical tray flame test.

(2) Individual Conductors: No. 14 AWG, strand copper.

(3) Insulation and Jackets: Provide conductors having 15-mil PVC insulation with 4-mil nylon jacket, and UL listed as Type THHN/THWN. Color code the conductor group in accordance with ICEA S-95-658/WC70. Include one full size green equipment grounding conductor. Bind conductor group with a spiral wrap of barrier tape. Provide cable with overall outer PVC jacket which is flame-retardant, sunlight- and oil-resistant, and has a nominal thickness as shown in the table below.

(4) Use only2,3, 4, 5, 7, 9, 12,19, 25, 30,and 37 -conductor cables. The green grounding conductor is included in the number of conductors shown in the table below.

No. of Conductors	Max. Outside Diameter (inches)	Jacket Thickness (mils)
5	0.45	45
7	0.48	45
12	0.65	60
19	0.76	60
25	0.93	60
37	1.04	80

(5) Acceptable Manufacturers:

1. Belden;
2. General Cable;
3. Southwire;
4. Or equal.

b. Type 2 (600-Volt Multi-Conductor Power Cable, Type TC):

(1) General: 3 or 4-conductor, with ground and overall jacket. Suitable for installation in open air, in cable trays, conduit, or other approved raceways. Maximum cable temperature rating 90 degrees C dry locations, 75 degrees C wet locations.

(2) Individual Conductors: Class B stranded, coated, or uncoated copper.

(3) Insulation and Jacket: Provide conductors insulated with chemically cross-linked polyethylene or ethylene-propylene, UL rated VW-1. Provide sunlight- and oil-resistant PVC outer jacket with nominal thickness as shown in the following table. Provide phase conductors color-coded black, red, and blue. Provide neutral conductor color-coded white with black tracer.

Conductor Size	No. of Conductors	Ground Wire Size	Max. OD (inches)	Thickness (mils)
12	3	-	0.45	45
	4	-	0.49	45
10	3	-	0.50	45
	4	-	0.58	60
8	3	10	0.66	60
	4	10	0.72	60
6	3	8	0.74	60
	4	8	0.81	60
4	3	8	0.88	60
	4	8	0.97	80
2	3	6	1.01	80
	4	6	1.11	80
1	3	6	1.14	80
	4	6	1.25	80
1/0	3	6	1.22	80
	4	6	1.35	80
2/0	3	6	1.32	80
	4	6	1.46	80
3/0	3	4	1.42	80
	4	4	1.58	80
4/0	3	4	1.56	80
	4	4	1.78	110

(4) Acceptable Manufacturers:

1. General Cable;
2. Okonite;
3. Southwire;
4. Or equal.

c. Type 3 (600-Volt No. 16 AWG Twisted, Shielded Pair Instrumentation Cable, Type TC) (UL 62 & 1277):

(1) General: Single pair instrumentation cable designed for noise rejection for process control, computer, or data log applications. Suitable for installation in cable trays, conduit, or other approved raceways. Maximum cable temperature rating shall be 90 degrees C dry locations, 75 degrees C wet locations.

(2) Individual Conductors: Bare soft annealed copper, Class B, 7-strand concentric per ASTM B 8; 20 AWG, 7-strand tinned copper drain wire.

(3) Insulation and Jacket: Each conductor 15-mil nominal PVC and 4-mil nylon insulation. Pair conductors pigmented black and red. Jacket flame-retardant and sunlight- and oil-resistant PVC with 45 mils nominal thickness. Shield 1.35-mil aluminum/mylar overlapped to provide 100 percent coverage.

(4) Dimension: 0.31 inch nominal OD.

(5) Acceptable Manufacturers:

1. Belden;

2. General Cable;

3. Okonite;

4. Or equal.

d. Type 4 (600-Volt No. 16 Twisted, Shielded Triad Instrumentation Cable, Type TC) (UL 62 & 1277):

(1) General: Single triad instrumentation cable designed for noise rejection for process control, computer, or data log applications. Suitable for installation in cable tray, conduit, or other approved raceways. Maximum cable temperature rating shall be 90 degrees C dry locations, 75 degrees C wet locations.

(2) Conductors: Bare soft annealed copper, Class B, 7-strand concentric per ASTM B 8; 20 AWG, 7-strand, tinned copper drain wire.

(3) Insulation and Jacket: Each conductor, 15-mil nominal PVC and 4-mil nylon insulation. Triad conductors pigmented black, red, and blue. Jacket flame-retardant and sunlight- and oil-resistant PVC with 45 mils nominal thickness. Shield 1.35-mil aluminum/mylar, overlapped to provide 100 percent coverage.

(4) Dimension: 0.32 inch nominal OD.

(5) Acceptable Manufacturers:

1. Belden;

2. General Cable;

3. Okonite;

4. Or equal.

e. Type 5 (600-Volt No. 18 AWG, Multi-twisted Shielded Pairs with a Common Overall Shield Instrumentation Cable, Type TC)(UL 62 & 1277):

(1) General: Twisted, shielded pairs of instrument cables, grouped in a single cable, designed for use as instrumentation, process control, and computer cable. Suitable for installation in cable tray, conduit, or other approved raceways. Maximum cable temperature rating shall be 90 degrees C dry locations, 75 degrees C wet locations.

(2) Conductors: Bare soft annealed copper, Class B, 7-strand, concentric per ASTM B 8. Tinned copper drain wires. Pair drain wire size AWG 20, group drain wire size AWG 18.

(3) Insulation and Jacket: Each conductor 15-mil PVC and 4-mil nylon insulation. Pair conductors pigmented black and red with red conductor numerically printed for group identification. Outer jacket flame-retardant and sunlight- and oil-resistant PVC with nominal thickness as shown in table. Individual pair shield 1.35-mil aluminum/mylar. Group shield 2.35-mil aluminum/mylar, overlapped for 100 percent coverage.

(4) Dimensions as noted in table below:

Number of Pairs	Maximum Outside Dimension (inches)	Nominal Jacket Thickness (mils)
4	0.50	45
8	0.68	60
12	0.82	60
16	0.95	80
20	1.05	80
24	1.16	80
36	1.33	80
50	1.56	80

(5) Acceptable Manufacturers:

1. Belden;
2. General Cable;
3. Okonite;
4. Or equal.

D. Conductor and Cable Tags:

1. Tags relying on adhesives or taped-on markers are not acceptable.
2. Provide conductor tags for conductors No. 12 AWG and below with legible permanent sleeve of yellow or white PVC with machine printed black marking.
3. Provide tags for cables, and for conductors No. 10 AWG and larger, consisting of permanent nylon marker plates with legible designations hot stamped on the plate. Attach these marker plates to conductors and cables with nylon tie cord.

E. Equipment Grounding Conductors:

1. Provide soft-drawn copper conductors, not smaller than AWG12 and as indicated or as required by NEC, for equipment grounding.
2. Provide conductors with green insulation of the same type as all other circuit wires.

F. Direct Buried Grounding Conductors:

1. Provide bare stranded copper conductors, size as indicated, for the ground system grid at transformers, switchgear, and where indicated.

2.3 MANUFACTURED WIRING SYSTEMS

A. Provide a flexible, coordinated means of distributing lighting branch circuit and control wiring.

B. Provide a system rated at 20 amperes load-carrying capacity per phase with final assemblies consisting of a maximum of three, phase conductors. Provide a system manufactured of Type MC

cable with 90 degrees C insulation and stranded copper conductors.

C. Provide three, single-phase, five-wire circuit cable configuration with standard color wire coding as per Article 1.5 B. of this Section.

D. Provide a system having a latch/strike locking mechanism with voltage clearly marked on latch. Provide a system UL listed for use in air handling plenums, listed to connect or disconnect under load, and manufactured in accordance with Article No. 604 of the NEC.

PART 3 -- EXECUTION

3.1 GENERAL

A. Do not exceed cable manufacturer's recommendations for maximum pulling tensions and minimum bending radii. Where pulling compound is used, use only UL listed compound compatible with the cable outer jacket and with the raceway involved. contractor shall perform and submit pulling calculation per manufacturers' recommendation to ascertain that there is no overstrain to the cable. The calculation shall be submitted to the ENGINEER for approval."

B. Tighten all screws and terminal bolts using torque type wrenches and/or drivers to tighten to the inch-pound requirements of the NEC and UL.

C. Single conductors and cables in maintenance holes, handholes, vaults, cable trays, and other indicated locations shall be wrapped together by arc and fireproofing tapes, and shall be bundled throughout their exposed length with nylon, self-locking, releasable, cable ties placed at intervals not exceeding **18** inches on centers.

D. Wires and cables in each voltage classification shall be installed in separate raceways and shall be completely isolated at the cable and wire terminations.

E. No vehicles shall be used to pull conductors. Only cable pulling machines shall be used.

F. A means of monitoring cable tension shall be provided at all pulls. (I.e. dynamometer)

3.2 CONDUCTOR 600 VOLTS AND BELOW

A. Provide conductor sizes indicated on Drawings.

B. Wire nuts may be used on solid conductors of 120-volt and 277-volt lighting and 120-volt receptacle circuits only. Place no more than one conductor in any single-barrel pressure connection. Use crimp connectors with tools by same manufacturer and/or UL listed for connectors of all stranded conductors.

C. Soldered mechanical joints insulated with tape will not be acceptable.

D. Vinyl plastic insulating tape for wire and cable splices and terminations shall be flame retardant, 7-mil thick minimum, rated for 90 degrees C minimum meeting the requirements of UL 510.

E. Provide terminals and connectors acceptable for the type of material used.

F. Arrange wiring in cabinets, panels, and motor control centers neatly cut to proper length, remove surplus wire, and bridle and secure in an acceptable manner. Identify all circuits entering motor control centers or other control cabinets in accordance with the conductor identification system specified herein**.**

G. Terminate control and instrumentation wiring with methods consistent with terminals provided, and

in accordance with terminal manufacturer's instructions. Where terminals provided will accept such lugs, terminate all control and instrumentation wiring (except solid thermocouple leads) with insulated, locking-fork compression lugs, Thomas & Betts Sta-Kon, or equal.

H. For terminals designed to accept only bare wire compression terminations, use only stranded wire, and terminate only one wire per terminal. Tighten all terminal screws with torque screwdriver to recommended torque values.

I. Attach compression lugs with a tool specifically designed for that purpose which provides a complete, controlled crimp where the tool will not release until the crimp is complete. Use of plier type crimpers is not acceptable.

J. Cap spare conductors and conductors not terminated with UL listed end caps.

K. Where conductors pass through holes or over edges in sheet metal, remove all burrs, chamfer all edges, and install bushings and protective strips of insulating material to protect the conductors.

L. For conductors that will be connected by others, provide at least 6 feet spare conductor in freestanding panels and at least 2 feet spare in other assemblies. Provide appropriate length of spare conductor in any particular assembly where it is obvious that greater spare conductor length will be needed to reach the termination point.

3.3 CONDUCTORS ABOVE 600 VOLTS

A. Splices will not be permitted unless specifically indicated or approved by the ENGINEER.

B. Make all joints and terminations with high voltage splice and termination kits specified herein and in accordance with splice or termination manufacturer's instructions. Once started, install splices or terminations as a continuous operation.

C. Identify all circuits in accordance with the conductor identification system specified at load centers, maintenance holes, splices, terminations, etc.

D. Provide terminals or connectors acceptable for the type of conductor material used.

E. Give 2 working days' notice to the ENGINEER and the INSPECTOR prior to the making of joints or terminations.

F. Cable splices shall be made by qualified cable splicers in accordance with the recommendations of the manufacturer. CONTRACTOR shall furnish documentation detailing the qualifications of each cable splicer to be working on the job.

3.4 CABLES

A. Do not splice without permission of the ENGINEER or the INSPECTOR. Locate splices, when permitted, only in readily accessible cabinets or junction boxes using locknut terminal strips. Splices will not be permitted unless deemed necessary by approved pulling tension calculations.

B. Where connections of cables installed under this section are to be made under Division Instrumentation and Controls, leave pigtails of adequate length for neat bundled type connections.

C. Instrumentation, computer, and control cables run under infinite access floors in control rooms may be installed under the floor without protection. Run individual wires, pairs, or triads in flex conduit under the floor or grouped into bundles at least 3/4 inch in diameter.

D. Maintaining the integrity of shielding of instrumentation cables is essential to the operation of the control systems. Take special care in cable installation to ensure that grounds do not occur

because of damage to the jacket over the shield.

E. Cables entering maintenance holes, handholes or vaults shall be sealed at the entrance and exit using an expanding fireproof foam product approved for the purpose.

3.5 CONDUCTOR ARC AND FIREPROOFING TAPES

A. Use arc and fireproofing tapes on all 600-volt single conductors and cables except those rated Type TC at splices in all maintenance holes, handholes, vaults, cable trays, and other indicated locations.

B. Use arc and fireproofing tapes on all 5 Kv at splices in all maintenance holes , handholes, vaults, cable trays, and other indicated locations.

C. Wrap together as a single cable all conductors entering from each conduit.

D. Follow tape manufacturer's installation instructions. Secure the arc and fireproofing tape at frequent intervals with bands of the specified glass cloth electrical tape. Make each band of at least two wraps of tape directly over each other.

E. Wrap together as far as possible, conductors carrying phases A, B, and C of the same feeder. Do not wrap together conductors carrying only two of the three phases.

F. The cables shall be placed as closely as possible to their final positions.

G. The cables shall be cleaned of all oil, grease, and cable pulling compounds using suitable solvents and cleaners non-injurious to cable and then wiped completely dry.

H. Any projecting surfaces such as fittings, ground connectors or bonding connections shall be covered with an insulating compound to present a smooth continuous surface for taping.

I. Fireproofing tapes shall be submitted as shop drawings for approval. Tapes shall be 3-inch width half-lapped and extend a minimum of 6-inches into the raceway. Use ¾” glass tape at three foot intervals to hold tape in place.

3.6 UNDERGROUND DIRECT BURIAL CABLE

A. Comply with requirements for Installation of Underground Direct Burial Raceways in Section 16110, "Raceway", including warning tapes above the cables.

3.7 FIELD TESTS

A. Field test shall be performed on conductors in accordance with Section 16020 Municipal Facilities Electrical Testing Requirements.

END OF SECTION

This page intentionally left blank

SECTION 16170
CABINETS AND RACKS

PART 1 - GENERAL

1.1 GENERAL CONDITIONS:

A. See the Conditions of the Contract (General, Supplementary and Special Conditions) and the General Requirements (Division 1).

1.2 WORK INCLUDED:

A. This section covers all equipment cabinets, enclosures and racks as shown on the drawings or as required to house the specified devices and equipment. The work under this section consists of furnishing materials and equipment, performing labor and services necessary for the installation of the cabinets and racks required for a complete system.

1.3 RELATED WORK SPECIFIED ELSEWHERE:

A. Refer to all other Division 16 specification sections and drawings, and to the specifications and drawings under the General Construction Contract to ascertain the extent of work included.

1.4 REFERENCED SPECIFICATIONS, MATERIALS AND/OR CODES:

A. City of Los Angeles Electrical Code, latest adopted edition

B. Electronic Industries Alliance (EIA) Standards. EIA/ECA-310-E

1.5 COOPERATION WITH OTHER TRADES:

A. The Contractor shall coordinate the work of the section with that of other sections as required to ensure that the entire work of this Project will be carried out in an orderly, complete and coordinated fashion.

1.6 SUBMITTALS:

A. General: Submittals shall be made in accordance with the General Provisions (Section 16000) of these specifications.

B. Provide thermal calculations for cabinets. Include sizing calculations for air conditioner or forced ventilation fans. Account for solar gain for outside cabinets.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Cabinets - All equipment cabinets installed indoors shall be NEMA 12 enclosures. All equipment cabinets installed outside or exposed to weather shall be NEMA 3R or 4X enclosures.

1. Cabinets shall be constructed of 14 gauge rolled steel.

2. Cabinet doors shall be furnished with key lockable doors with all cabinets under Division 16 keyed alike.

3. All cabinets shall be furnished with removable steel back panels for mounting equipment.

4. Cabinets shall be furnished with appropriate size and quantity of knock-outs for conduit entry.

5. Cabinets shall be grounded as specified in Section 16290.

6. Cabinets shall be provided with adequate vents.

7. All cabinets shall be furnished with black on white laminated plastic name plates identifying each cabinet as noted on the drawings. Lettering shall be minimum 3/16” high.

8. Cabinet finish shall be ANSI 61 gray inside and out.

9. Cabinets shall be sized in strict accordance with the EIA/ECA-310-E.

10. Cabinet back panels shall be furnished with a ground buss bar.

11. Door size shall be selected to allow a minimum door swing of 90 degrees within the dimensional constraints of the equipment room.

12. Cabinets shall be equipped with index card holders and cards mounted behind heavy plastic on inside of cabinet doors.

13. Affix nameplates to cabinet doors with a minimum of two stainless steel escutcheon pins or screws.

B. Vertical Cabinet - Floor Mounted:

1. All vertical cabinets shall be free-standing floor mounted type having features and/or characteristics as follows:

a. Panel Width - 19"

b. Panel Height - 78-3/4"

c. Overall Height - 87" Nominal

d. Overall Depth - 25" Nominal

e. Rear Door - Vented, except as otherwise specified.

f. Front door with vents at top and bottom, except as otherwise specified.

g. Plain top panel

h. Frame- 14 ga. Cold rolled sheet steel

i. Side panels - 18 ga.

j. Styled frames with trim

k. 19" EIA adjustable mounting rails for front and rear equipment mounting

l. Locks - all cabinets to be keyed alike

m. Units shall be pre-assembled type

n. Color - to be selected by Architect

2. Cabinets grouped side-by-side shall have side panels on each section.

3. Furnish and install blank 19" panels of color to match cabinet for all unused vertical mounting units on front mounting rails. Maximum height of each filler panel shall be 10.5".

C. Power Strips:

1. Furnish and install plug-in or hardwired outlet strips as required to support the installed equipment.

2. Power strips shall have a metallic case.

3. Plug-in power strips shall be equipped with a locking plug and shall only be used with a compatible locking-type receptacle.

D. Pedestals:

1. Pedestals shall be weather-tight, seam welded, constructed of 14 gauge galvanized steel. Where indicated on the drawings construction shall be stainless steel.

2. Pedestals shall be furnished with gasketed panel for access to equipment contained within. Panel shall be secured with security screws.

3. Pedestal shall be painted to withstand environmental conditions and the final color shall be as specified by the Architect.

4. Pedestal shall be pre-drilled for mounting of intercom stations, loop detectors, and other equipment as specified herein.

5. Pedestal dimensions shall be as shown on the drawings.

PART 3 - EXECUTION

3.1 EXECUTION:

A. Cabinets:

1. Provide cabinets as necessary for proper installation of the equipment specified and in compliance with all codes and regulations.

2. Secure all cabinets in place with anchors and lag bolts to ensure compliance with seismic requirements.

3. Unused openings in cabinets shall be closed to afford protection equivalent to that of the wall of the cabinet.

B. Ventilation:

1. Furnish and install ventilation fans, vents, and filters for all cabinets where forced air cooling is required to maintain interior cabinet temperature at or below 95°F.

2. For cabinets with forced ventilation, doors and side panels shall be solid with no louvers.

3. Division 17 Subcontractor shall select vented vs. forced air cabinets based on the environment's conditions of the equipment room and equipment to be installed in each cabinet.

C. Pedestals:

1. Provide pedestals at all locations shown on the drawings.

2. Secure pedestals to concrete base with anchors to ensure compliance with seismic requirements. Anchors shall be located such that they are only accessible from inside the enclosure.

3. Coordinate installation of required conduit such that all conduit is stubbed up inside pedestal.

4. Cabinets shall be large enough and equipment spaced in cabinets to provide adequate spacing for airflow and maintenance.

5. Locate all heat producing equipment, such as power supplies and amplifiers, at top of equipment cabinets.

3.2 COMPLETION:

A. General:

1. Upon completion of the work, remove excess debris, materials, equipment, apparatus, tools and the like and leave the premises clean, neat and orderly.

2. All cables shall be dressed neatly in each cabinet and rack. Excess cable shall be trimmed and disposed of. Any unused cables shall be identified with stainless steel tags showing the origination and marked as “spare”.

END OF SECTION

SECTION 16180
WIRING DEVICES

PART 1- GENERAL

1.1 SCOPE

A. Required: Provide and install wiring devices as indicated on the Contract Drawing and herein specified.

B. Comply with the General Conditions, General Requirements and Section 16020 of this Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

1.2 SUBMITTALS

A. Submit under the provision of Section 01330.

B. Product Data: For each product specified.

C Maintenance Data: For materials and products to include in maintenance manuals specified in Division 1.

PART 2 - PRODUCTS

2.1 GENERAL

A. All wiring devices shall be specification grade, UL listed and labeled, conform to NEMA standards and meet the requirements of Federal specifications.

2.2 BOXES

A. Types:

1. Provide galvanized steel knockout type outlet boxes with suitable plaster rings of similar material, for interior concealed wiring in dry, non-hazardous (classified) locations.

2. Provide cast metal boxes for floor outlets, and where installed in walls direct contact with the earth. Floor outlet boxes shall be Walker box 880 series or equal.

3. Provide weatherproof cast metal outlet boxes for surface wiring, or in wet or damp locations, or where indicated on the Drawings, unless otherwise directed by the City Engineer. Boxes shall be Crouse-Hinds FS, FD, GRF, GS, or VXF series.

4. Provide sheet steel type with screw cover for pull and junction boxes over 100 cubic inches, in dry non-hazardous (classified) locations.

B. Sizes: In accordance with Code for the number and size of conductors, but not less than indicated on the drawings nor less than 4 inch square trade size, except for cast metal type, or multigang masonry type embedded in concrete or masonry walls.

C. Accessories:

1. Plaster rings, fixture studs, covers, plates, dividers, etc., as required.

2. Weatherproof covers, plates, and other accessories in wet or damp locations.

2.3 SWITCHES

A. All switches shall be specification grade and meet Federal Spec. W-S-896E.

B. Provide screw type; push-in type connections not acceptable.

C. Switches shall be self-grounding, color coded, silent or quiet type, and rated 120-277 Volts AC, 20 ampere rating, totally enclosed, where installed in AC systems Bakelite or composition base with "T" rating for AC loads, standard toggle handle, side wired only and binding screw terminals with screwdriver slot.

D. Where pilot lights are specified for switches, they shall be the neon type 1/25 W. mounted under the same plate as the switch. Lighted toggles are not acceptable.

E. Momentary contact switches shall be three position toggle, 20 Ampere rating at 120 Volts AC.

F. Single pole switches shall be equal to Bryant 1121-I; two pole switches Bryant 1122-I; three way switches Bryant 1123-I; four way switches Bryant 1124-I.

G. Approved Manufacturers:

1. Hubbell/Bryant;

2. General Electric;

3. Or equal.

2.4 PLATES AND COVERS

A. Required: For all switches, receptacles, junction boxes, telephone and other outlets.

B. Finishes of Plates and Devices:

Location	Plate	Device
General interior finished areas	White	White
Interior finished areas over wood panels	Black	Black
On exterior with spring loaded cover	Corrosion resistant	Brown
In equipment rooms or other generally unfinished areas	Galvanized	Brown
Janitor and utility	Stainless	Gray

rooms	steel	
Toilet rooms	Stainless steel	Ivory

C. Provide the Following: Unless otherwise directed by the City Engineer, provide telephone, TV, and communication outlet plates with a bushed hole.

D. Provide engraved or etched plates for all lock switches, pilot switches, switches from which the equipment or circuit controlled cannot be readily seen, three or more switches under a common plate and for switches as indicated.

E. Stainless steel plates, type 302 non-magnetic with beveled edges, 0.040" thick with satin finish. Leviton 84000-40 series or approved equal.

F. Galvanized steel plates shall be square or rectangular and hot dipped galvanized or sherardized beveled edges and 0.040" thick.

G. Provide weatherproof receptacles with spring-loaded, corrosion resistant covers with gasket for mounting on outdoor type or flush wall boxes. Leviton 6196-V or approved equal.

H. Provide plates equipped with close fitting openings for the exact device to be used. Provide plates for telephone outlets equipped with bushed openings. Synthetic plates shall be smooth finish as manufactured by Pass & Seymour, Sierra, Leviton, or approved equal.

I. Provide brass covers for floor receptacles with duplex flap opening flush with floor
See also Section 16115, sub-section 2.2, paragraph E..

J. Provide brass covers for data and communications floor outlets with 2-1/8 x 1 inch combination threaded opening.

K. Engraved plates and covers for equipment and controls, motors, for switches out of sight of the equipment controlled, for receptacles rated other than 125 volts, and for ganged switches (except no more than two switches controlling lights in the same room). Engraving shall provide positive identification acceptable to the City Engineer.

2.5 RECEPTACLES

A. Types:

1. All receptacles shall be specification grade and meet Federal Spec. WC 596 E.

2. Provide screw terminal type receptacles. Push-in type connections are not acceptable.

3. Straight blade 125 volt, 15 and 20 ampere duplex type shall be equal to Bryant 5262-I or 5263-I; single type shall be Bryant 5661-I or 5461-I.

4. Straight blade 250 volt, 15 and 20 ampere duplex type shall be equal to Bryant 5662-I or 5462-I; single type shall be Bryant 5661-I or 5461-I.

5. Combination duplex receptacles, straight blade 125/250 volt, 15 and 20 amperes, shall be equal to Bryant 5292-I or 5492-I.

6. Clock hanger receptacles shall be Bryant 2828-GS or equal.

7. Special outlets of other types shall be as indicated on the Contract Drawings.

2.6 OCCUPANCY SENSORS:

A. Wall-mounted, passive infrared sensors, as specified on the contract drawings or approved equal.

B. Ceiling mounted combination, passive infrared and ultra sonic, as approved on the contract drawings or approved equal.

2.7 CONTROLS

A. Required: For all equipment furnished in this and other divisions, as required by Code, and as indicated on the Contract Drawings and in the specifications. All devices shall be listed by U.L. or another approved testing laboratory.

B. Types:

1. Circuit Breakers: Thermal-magnetic with interrupting and trip ratings as indicated on the drawings. Equip each breaker with a device for individual padlocking. Circuit breakers shall meet Federal Specifications W-C-375B.

2. Enclosed Safety Switches: Shall be externally operable, heavy duty "tease-proof", fusible and nonfusible with number of poles and ratings as indicated on the Contract Drawings. Provide suitable rejection type fuse holders for Class R fuses. Switches shall meet Federal Spec. W-S-865C. Switches shall be as manufactured by Square D Co. or equal.

3. Fuses: All fuses shall meet U.L. Standard 198. Provide a label within each fuse enclosure indicating fuse replacement type and ratings. Provide one complete set of each type and rating of fuses and limiters, as spares. Fuses shall be one of the following types:

   a. Current-limiting Class L; Bussman KRP-C or KTU.

   b. Current-limiting Class J; Bussman JKS or JHC.

   c. Dual element Class RK-1; Bussman KTS-R or KTN-R.

   d. Dual element Class RK-5; Bussman FRS-R or FRN-R.

   e. Low Peak dual element Class RK-5; Bussman LPS-R or LPN-R.

   f. For secondary protection of control transformers rated 500 V.A. and 50 volts, or less; Bussman FNQ fuses with HPS-D or HPL-B fuse holder or equal.

   g. Fuses for direct-current circuits shall be identified for the use.

   h. Other required fuses, if not specified, shall be standard nonrenewable type; Bussman FRN or FRS for circuits where available fault current is 10,000 amperes or less.

4. Terminal connection blocks shall be provided in switch and circuit breaker enclosures in which grounded (neutral) conductors are installed.

5. Magnetic Motor Starters: Shall be across-the-line start type with overload and low voltage protection; Square D. Co. Class 8536. Combination starters shall be fusible or

nonfusible disconnect switch type; Square D. Co. Class 8538, or motor circuit protector type (instantaneous trip only); Square D. Co. Class 8539. Reversing starters shall be Square D. Co. Class 8736 or 8739 or equal. Ratings shall be as indicated on the Drawings. Equip each circuit breaker with a device for individual padlocking.

6. Manual Motor Starters: Pushbutton type with overloads; Square D. Co. Class 2510 Type M. Toggle type with overloads; Square D. Co. Class 2510 Type F. Toggle type without overloads; Square D. Co. Class 2510 Type K or equal. Each device shall have provision for padlocking.

7. General Purpose Contactors: Shall be ASCO 1000 Series or equal with number of poles and ratings as indicated on the drawings. Provide suitable hinged door enclosures.

8. Lighting Contactors: Electrically operated, mechanically held, with coil clearing contacts; ASCO Remote Control (RC) Switches or equal with number of poles and ratings as indicated on the Drawings. Provide suitable hinged door enclosures.

9. Pushbutton and Other Control Devices: Shall be Square D.Co. Class 9001 Type K or equal, in suitable enclosures with legend plates.

10. Pilot Lights: Shall be Square D. Co. Class 9001 Type K, transformer type or equal. Shall have push-to-test feature where installed in switchboards or motor control centers.

11. Control Relays: Shall be Square D. Co. Class 8501 Types D, H, or L. or equal. Install relays in suitable enclosures.

12. Time Switches: Provide types with minimum 10-hour spring driven automatic rewind reserve power. For control of mechanical systems or equipment provide 7 day dial type with features permitting daily control or omission; Paragon 7000 Series. For control of mechanically-held lighting contactors provide astronomic type with day omitting device and momentary contact single pole double-throw switching; Paragon 47216-OSZ or equal. Number of poles and voltages for time switches shall be as indicated on the Drawings.

13. Emergency Control Switches: Shall be ASCO equal to #124 Series break-glass devices for mechanical or data processing rooms or similar applications.

14. Three-Position Selector Switches: Shall be equal to Bryant 4922-I for maintained contact type; Bryant 4921-I for momentary contact type.

15. Manual Timers: Spring-wound timers shall be equal to M.R. Rhoades Inc. "Mark-Time" 125 V. 20 A.

16. Identification: Identify all control and disconnecting devices by engraved laminated plastic nameplates designating the equipment controlled, except where device plates are engraved.

    a. Motors and other equipment shall be suitably and durably identified to correspond to the control or disconnecting device. Nameplate lettering shall be white on black finish and 1/8 inch high minimum.

    b. Marking shall be as indicated on the drawings or as approved by the City Engineer. Nameplates shall be affixed with a minimum of two escutcheon pins or screws.

PART 3 - EXECUTION

3.1 GENERAL

Each class of device shall be furnished by one manufacturer for the total project. Mixing of devices by different suppliers will not be permitted.

3.2 BOX INSTALLATION

A. Install boxes where indicated on the Contract Drawings and coordinate locations with structural and architectural features for proper installation. Boxes shall be accessible.

B. Install boxes for wall mounted local switches at 4 feet to center above floor or standing surface unless otherwise directed by the City Engineer. The maximum height in handicapped areas shall be 48 inches.

C. Install boxes for wall mounted receptacles, signal and communication outlets at 15 inches to center above floor or standing surface except where located above counter tops, or used for clock outlets, or as otherwise indicated on the Drawings or directed by the City Engineer.

3.3 RECEPTACLE AND SNAP SWITCH INSTALLATION

A. General:

1. Install receptacles and switches square, level, secure, and connected to a single set of circuit conductors at each outlet. Plaster ears of receptacles and switches installed in flush boxes shall be seated against the finish surface.

2. Install closely adjacent snap switches in a single multi-gang type box, unless otherwise directed by the City Engineer.

3. Install permanent barriers between switches where the voltage between switches exceed 300 volts.

4. Connect all devices by wrapping conductor around binding screw terminals.

5. Provide GFCI type receptacles in toilet, kitchen counters and for all outdoor locations where required by code.

3.4 OUTLET PLATES AND COVER INSTALLATIONS

A. General:

1. Install square, level and secure. Plates installed at flush outlets shall be seated against the finish.

2. Properly identify plates and covers as required and noted in Subsections 2. 5 D and K of this Section as applicable.

3. Provide jumbo size plates for outlets installed in masonry walls.

4. Properly align and plumb all devices and plates. Fit plates flat against walls and tights against surfaces of devices without strain on the plate.

5. Code sized (#12 minimum) bonding jumper shall connect grounded outlet box to receptacle grounding terminal on all flush mounted units.

END OF SECTION

SECTION 16190
ELECTRICAL IDENTIFICATION

PART 1 -- GENERAL

1.1 SCOPE

A. Required: Furnish and install nameplates and warning sign where indicated on the Contract Drawings or herein specified.

B. Comply with the General Conditions, General Requirements and Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

C. Work includes but is not necessarily limited to the following:

1. Nameplates and warning signs permanently installed on all electrical equipment and devices including, but not limited to, the following items:

a. Transformers, switchboards, motor control centers, panelboards, variable frequency drives, pullboxes, cabinets and motors.

b. Enclosures for all separately enclosed devices including, but not limited to, disconnect switches, circuit breakers, contactors, time switches control stations and relays, fire alarm panels and lighting control panel.

c. Wall switches not within sight of outlet controlled.

d. Special systems such as, but not limited to, telephone, fire alarm, warning and signal systems. Identification shall be at each equipment rack, terminal cabinet, control panel, annunciator and pullbox.

e. Devices mounted within and part of equipment including circuit breakers, switches, control devices, control transformers, relays, indication devices and instruments.

PART 2 -- PRODUCTS

2.1 NAMEPLATE DESIGNATIONS SHALL CLEARLY STATE

A. Manufacturer's nameplate including equipment design rating of current, voltage, KVA, HP, bus bracing rating or as applicable.

B. Equipment nameplates designating system usage and purpose, system nominal voltage, equipment rating in KVA, amperes, HP and RPM as applicable. Designation data per drawings shall be supplied with Shop Drawings approval.

C. Panelboard nameplates showing panel designation, voltage, phase and source.

2.2 MANUFACTURERS DEVICE NAMEPLATES

Device usage, purpose, or circuit number; manufacturer and electrical characteristic ratings including the following:

A. Circuit Breakers: Voltage, continuous current, maximum interrupting current and trip current.

B. Switches: Voltage, continuous current, horsepower or maximum current switching. If fused, include nameplate stating, "Fuses must be replaced with current limiting type of identical characteristics".

C. Contactors: Voltage, continuous current, horsepower or interrupting current, and whether "mechanically held" or "electrically held".

D. Motors: Rated voltage, full load amperes, frequency, phases, speed, horsepower, code letter rating, time rating, type of winding, class and temperature.

E. Controllers: Voltage, current, horsepower and trip setting of motor running overcurrent protection.

F. Motor Control Centers: Horizontal and vertical bus ratings.

2.3 MATERIALS

A. For Nameplates**:** Three layer laminated plastic or Micarta with engraved black letters over white background.

B. For Emergency Equipment: Use engraved white letters over red background.

C. For Warning Signs: Minimum 18 gauge steel with red lettering on white porcelain enamel finish.

PART 3 -- EXECUTION

3.1 MOUNTING

Nameplates shall be mounted by self-tapping, threaded stainless steel screws and bolts, or by rivets. Adhesive types are not acceptable.

3.2 MINIMUM LETTER HEIGHTS ON NAMEPLATES (AS APPLICABLE)

A. Panelboards, Switchboards and Motor Control Centers and Special Systems Enclosures: 1/4 inch identifies equipment designation; 3/16 inch identifies voltage rating and source.

B. Individual Circuit Breakers, Switches, and Motor Starters in Panelboards, Switchboards, and Motor Control Centers: 1/4 inch identifies circuit and load served, including location.

C. Individual Circuit Breakers, Enclosed Switches, and Motor Starters: 1/4 inch identify load served.

D. Transformers: 1/4 inch identifies equipment designation; 3/16 inch identifies primary and secondary voltages, primary source and secondary load. Include location of primary source or secondary load if remote from transformer.

3.3 WARNING SIGNS

A. Warning signs shall be permanently mounted with stainless steel screws or nickel-plated brass bolts.

B. Warning signs to read "DANGER - HIGH VOLTAGE", with letters 1-1/2 inch high, 1/4 inch stroke minimum.

C. Provide warning sign on all doors or immediately next to door for equipment rooms or closets containing equipment energized above 150 volts to ground.

END OF SECTION

SECTION 16200
MOTOR CONTROL CENTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Related Sections: The following sections contain requirements that relate to this section:

1.2 SUMMARY

A. This Section includes motor-control centers for use on AC circuits rated 600 V and less.

B. Related Sections include the following:

1. Section 16190, "Electrical Identification" for labeling materials.

2. Section 16210, “Switches, Disconnect and Safety”.

1.3 SUBMITTALS

A. Submit under the provisions of Section 01330.

B. Product Data: For products specified in this Section. Include dimensions, ratings, short-circuit rating, and data on features and components.

C. Shop Drawings: For each motor-control center specified in this Section. Include dimensioned plans, elevations, and component lists. Show ratings, including short-time and short-circuit ratings, and horizontal and vertical bus ampacities.

1. Schedule of features, characteristics, ratings, and factory settings of individual motor-control center units.

2. Wiring Diagrams: Interconnecting wiring diagrams pertinent to class and type specified for motor-control center. Schematic diagram of each type of controller unit indicated.

D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

E. Maintenance Data: For products to include in the maintenance manuals specified in Division 1. Include operating instructions required per 3.4.B.

F. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.

G. Qualification Data for Field Testing Agency: Certificates, signed by Contractor, certifying that agency complies with requirements specified in "Quality Assurance" Article below.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Maintain, within 100 miles of Project site, a service center capable of providing training, parts, and emergency maintenance and repairs.

B. Field Testing Agency Qualifications: An independent testing agency with experience and capability to satisfactorily conduct testing indicated without delaying the Work. Evaluation criteria shall be according to ASTM E 699.

C. Source Limitations: Obtain similar motor-control devices through one source from a single manufacturer.

D. Comply with NFPA 70 NEMA, IEEE, UL & ANSI Standards.

E. Listing and Labeling: Provide motor-control centers and components specified in this Section that are listed and labeled.

1. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.

2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

F. Product Selection for Restricted Space: Drawings indicate maximum dimensions for motor-control centers, including clearances between motor-control centers and adjacent surfaces and items, and are based on types and models indicated. Other manufacturers' motor-control centers with equal performance characteristics and complying with indicated maximum dimensions may be considered. Refer to Section 01330, “Shop Drawings/Submittals."

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver in shipping splits of lengths that can be moved past obstructions in delivery path as indicated.

B. Store so condensation will not occur on or in motor-control centers. Provide temporary heaters as required to prevent condensation.

C. Handle motor-control centers according to NEMA ICS 2.3, "Instructions for the Handling, Installation, Operation, and Maintenance of Motor Control Centers." Use factory-installed lifting provisions.

1.6 COORDINATION

A. Coordinate features of controllers and accessory devices with pilot devices and control circuits to which they connect.

B. Coordinate features, accessories, and functions of each motor controller with the ratings and characteristics of the supply circuit, the motor, the required control sequence, and the duty cycle of the motor and load.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

   1. Spare Indicating Lights: Furnish 6 of each type required.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

   1. Eaton;

   2. Tesco Controls;

   3. Or equal.

2.2 MOTOR-CONTROL CENTERS

A. Wiring: NEMA ICS 3, Class I, Type B.

B. Enclosures: Free-standing structure as indicated. U.L.listed, NEMA 250, Type 2, unless otherwise indicated to meet environmental conditions at installed location.

   1. Outdoor Locations: NEMA 250, Type 3R.

   2. Compartments: Modular; individual doors have concealed hinges and quick-captive screw fasteners. Interlocks on combination controller units require disconnect means in off position before door can be opened or closed, except by consciously operating a permissive release device.

   3. Interchangeability: Compartments are constructed to remove units without opening adjacent doors, disconnecting adjacent compartments, or disturbing the operation of other units in control center. Units requiring the same size compartment are interchangeable, and compartments are constructed to permit ready rearrangement of units, such as replacing 3 single units with one unit requiring 3 spaces, without cutting or welding.

   4. Wiring Spaces: Each vertical section of structure with horizontal and vertical wiring has spaces for wiring to each unit compartment in each section, with supports holding wiring in place.

   5. Controls: As specified elsewhere herein and as indicated on the Drawings. Each magnetic starter shall be provided with a hand-off-auto selector switch and a red "on" pilot light. Control power shall be 120 volts from integral transformer(s) unless indicated otherwise on the Drawings. Control transformer insulation shall be Class H. Provide suitable primary and secondary over current protection, and ground the secondary of control transformers. The secondary grounded conductor shall be identified with continuous white insulation.

Where external control circuits are used a disconnecting means shall be provided in the control center and identified with a red laminated plastic nameplate marked "120 volt external control". Provide each motor control unit with a wiring diagram and overload heater chart affixed to the inside of the unit door or cover. Overload heaters shall be installed only after verification of actual motor FLA ratings.

C. Short-Circuit Current Rating for Each Section: Minimum 42,000 amps symmetrical RMS or as specified on the drawings.

2.3 BUSES

A. Material: Plated copper.

B. Ampacity Ratings: As indicated for horizontal and vertical main buses.

C. Equipment Ground Bus: Noninsulated, horizontal copper bus 2 by 1/4 inch, minimum.

D. Horizontal Bus Arrangement: Main phase, and ground buses extended with same capacity the entire length of motor-control center, with provision for future extension at both ends by bolt holes and captive bus splice sections or approved equivalent.

E. Short-Circuit Withstand Rating: Minimum 42,000 amps symmetrical rms Or as specified on the drawings.

2.4 FUNCTIONAL FEATURES

A. Description: Modular arrangement of motor controllers, control devices, overcurrent protective devices, transformers, panelboards, instruments, indicating panels, blank panels, and other items mounted in compartments of motor-control center as indicated.

B. Motor-Controller Units: Combination controller units of types and with features, ratings, and circuit assignments indicated.

1. Units with full-voltage, across-the-line, magnetic controllers up to and including Size 3 are installed on drawout mountings with connectors that automatically line up and connect with vertical-section buses while being racked into their normal, energized positions.

2. Units have short-circuit current ratings equal to or greater than short-circuit current rating of motor-control center section.

3. Units in motor-control centers with Type B wiring shall be equipped with pull-apart terminal strips or drawout terminal boards for external control connections.

C. Overcurrent Protective Devices: Types of devices with features, ratings, and circuit assignments indicated. Individual feeder-tap units through 225-A rating shall be installed on drawout mountings with connectors that automatically line up and connect with vertical-section buses while being racked into their normal, energized positions.

D. Spaces and Blank Units: Compartments fully bused and equipped with guide rails or equivalent, ready for insertion of drawout units. Provide bus barrier and compartment door.

E. Spare Units: Type, sizes, and ratings as indicated, and installed in compartments indicated "spare."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces to receive motor control centers for compliance with installation tolerances and other conditions affecting performance of motor control centers installation. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Select features of each motor controller to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; duty cycle of motor, drive, and load; and configuration of pilot device and control circuit affecting controller functions.

B. Select horsepower rating of controllers to suit motor controlled.

C. Push-Button Stations: In covers of magnetic controllers for manually started motors where indicated, start contact connected in parallel with sealing auxiliary contact for low-voltage protection.

D. Hand-Off-Automatic Selector Switches: In covers of manual and magnetic controllers of motors started and stopped by automatic controls or interlocks with other equipment.

3.3 INSTALLATION

A. Install motor-control centers according to NEMA ICS 2.3 and manufacturer's written instructions.

B. Anchor each motor-control center assembly to steel-channel sills arranged and sized according to manufacturer's written instructions. Attach by tack welding or bolting. Level and grout sills flush with motor-control center mounting surface.

C. Install motor-control centers on concrete housekeeping bases conforming to Section 03300, "Cast-in-Place Concrete".

D. Fuses: Install fuses in each fusible switch as indicated, oriented for label readability.

3.4 IDENTIFICATION

A. Identify field-installed wiring and components and provide warning signs according to Section 16190, "Electrical Identification".

B. Operating Instructions: Frame printed operating instructions for motor-control centers, including control sequences, and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of motor-control centers.

3.5 CONTROL WIRING INSTALLATION

A. Install wiring between motor-control devices according to Section 16180, “Wiring Devices".

B. Bundle, train, and support wiring in enclosures.

C. Connect hand-off-automatic switch and other automatic control devices according to an indicated wiring diagram or one that is manufacturer approved, where available.

   1. Connect selector switches to bypass only the manual and automatic control devices that have no safety functions when switch is in the hand position.

   2. Connect selector switches with motor-control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor-overload protectors.

3.6 CONNECTIONS

A. Tighten motor-control center bus joint, electrical connector, and terminal bolts according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.7 FIELD QUALITY CONTROL

A. Testing Agency: Provide services of a qualified independent testing agency to perform specified testing.

B. Testing: After installing motor-control center and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

   1. Procedures: Perform each visual and mechanical inspection and electrical test stated in NETA ATS, Sections 7.5, 7.6, and 7.16. Certify compliance with test parameters.

   2. Remove and replace malfunctioning units with new units, and retest.

3.8 COMMISSIONING

A. Spot check breaker settings against Short Circuit Study. Short Circuit Study to be performed by the contractor.

B. Test the operation of the starters in Hand and Off Automatic control will generally be tested with the functional testing of the device.

C. Spot check insulation resistance on the MCC bus and control circuits.

D. Spot check voltage levels and resistance to ground

3.9 CLEANING

A. Inspect interior and exterior of motor-control centers. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish. Clean devices internally, using methods and materials recommended by manufacturer.

3.10 DEMONSTRATION

A. Training:

1. Conduct a minimum of 4 hours of training in operation and maintenance as specified in Division 1 Section 01770, "Project Closeout". Include training relating to equipment operation and maintenance procedures.
2. Schedule training with at least 7 days' advance notice. Deliver maintenance manuals to Owner before training commences.

SECTION 16210
SWITCHES, DISCONNECT AND SAFETY

PART 1 -- GENERAL

1.1 SCOPE

A. Work Included: Not limited to the following:

1. Fabricate, provide and install disconnect and safety type switches where indicated on the Contract Drawing and hereinafter specified.

2. Comply with General Conditions, the General Requirements and the requirements of Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to the work of this Section.

3. Examine all other Sections for work related to those Sections which are required to be included as work under this Section.

1.2 QUALITY ASSURANCE

A. Conform to applicable provisions of Subsection 1.7 of Section 16020 –Municipal Facilities General Electrical Requirements.

B. Conform to applicable Codes and NEMA, ANSI, UL and IEEE Standards, Federal Specification W-S-865,

1.3 SUBMITTALS

Conform to applicable provisions of Section 01330 of Division 1 - General Requirements and Subsection 1.6 G of Section 16020.

PART 2 -- PRODUCTS

2.1 GENERAL

A. APPROVED MANUFACTURERS:

1. Appleton;

2. Eaton;

3. Schneider Electric;

4. Or equal.

B. Disconnect Switches: Provide with devices enabling the switch to be locked in the open or closed positions.

C. Manual Motor Switches: Tumbler type rated 3HP, 208 Volts three phase or single phase with or without overload heaters as required to protect equipment served.

D. Externally Operable Safety Switches: To have quick-make, quick-break mechanism, capable of

switching 10 times switch rating, with cover interlock to prevent opening with switch in ON position and defeat mechanism for maintenance.

E. Switches: Shall be Heavy Duty (HD) type unless otherwise indicated. Provide NEMA 1 enclosures for interior locations, NEMA 3R enclosures for exterior or wet locations, NEMA 4X 316 SS for corrosive locations and NEMA 7 for hazardous locations. Provide with number of poles, ampacity, voltage and HP rating, fusible or nonfusible as indicated.

F. Fusible Switches: Equip them with rejection clips for UL Class R fuses. Switches having a dual rating when used with dual element fuses shall have a rating so indicated.

G. 600 Amperes or Less Fuses: UL Class RKI with a minimum interrupting rating of 200,000 Amperes, Bussmann "Low-Peak Type" or equal.

PART 3 -- EXECUTION

3.1 GENERAL INSTALLATION

A. Locations: Install switches, disconnects and safety where indicated on the Contract Drawings.

B. Fastenings: Securely fasten switches to structural members or unistrut support as directed by the manufacturer.

C. Manual Motor Starters: Install flush mounted for switching motors 3HP and smaller in finished areas. Install surface mounted in equipment rooms and non-finished areas. Where installed above inaccessible ceilings provide access panels.

END OF SECTION

SECTION 16270
SERVICE AND DISTRIBUTION SWITCHBOARD

PART 1-- GENERAL

1.1 SCOPE

A. Work Included: Not limited to the following:

1. Fabricate, provide and install service and distribution switchboards as indicated on the Contract Drawings and hereinafter specified.

2. Comply with the General Conditions, the General Requirements and the requirements of Section 16020 of this Division 16, concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to the Work of this Section.

3. Examine all other Sections for work related to those Sections which are required to be included as Work under this Section.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1.3 QUALITY ASSURANCE

A. Conform to applicable provisions of Sub-Section 1.7 of Section 16020.

B. Conform to applicable Codes and NEMA, ANSI and IEEE Standards.

1.4 SUBMITTALS

A. Conform to applicable provisions of Section 01330 of Division 1 - General Requirements and of Sub-Section 1.6G of Section 16020.

B. Shop Drawings shall show and contain the following information:

1. Plans showing top and bottom of switchboards.

2. Front, rear and side elevations of switchboards.

3. Schematic Wiring Diagrams showing the following:

a. One-line diagram with each circuit numbered.

b. Schedule showing circuit number, description and rating of protective device(s).

c. Complete short circuit availability of bus.

4. 1/2" - 1'-0" scale drawings of electrical rooms or areas overall dimensions for equipment layout including space available for conduits and protective devices.

PART 2 -- PRODUCTS

2.1 MATERIALS

A. Each switchboard shall be U.L. listed deadfront, deadrear, completely self-supporting, with the required number of vertical sections bolted together to form one floorstanding switchboard. Construction shall be NEMA Class II with line and load and main bus connections accessible from the front. Provide switchboards of 1000 amperes or greater rating with line and load insulated bus bars. Overcurrent protective devices shall be grouped in convertible type construction. Vertical sections shall have full height bussing and where space for future devices is indicated on the Drawings all the necessary mounting hardware shall be furnished. Switchboards shall include all protective devices and other equipment indicated on the Contract Drawings with the necessary interconnections, instrumentation, and control wiring. Bus shall be copper with plated joints, or tin plated aluminum. Bus bars shall be mounted on supports of high impact-resistant, non-tracking insulating material, and braced to withstand the maximum available fault current as indicated on the Contract Drawings. Other ratings shall be as indicated on the Contract Drawings. Series-connected or "integrated equipment" short circuit ratings shall not be applied in lieu of, or to comply with, short circuit and interrupting capacity ratings indicated on the Drawings, unless specifically approved by the City Engineer. Switchboards shall be as manufactured by Eaton, Square D. Co., Power Style Class 2700 (Schneider), or equal.

B. Service and distribution sections shall contain circuit breakers, fusible switches, and combination motor starters, with shunt trips, motor operators, ground fault protection, and other accessories, as indicated on the Drawings, as well as provisions for utility metering in accordance with the serving electric utility requirements. Each disconnecting means shall be provided with a means for individual padlocking. Switches shall be heavy-duty, quick-make and quick-break, and horsepower rated through 500 HP. Switches rated over 600 amperes shall be bolted pressure contact type. Ratings of disconnecting means and overcurrent protective devices shall be as indicated on the Drawings. Combination motor controllers shall comply with applicable requirements of Section 16200 for Motor Control Centers.

C. Finish: Interior finish shall be a gray lacquer or enamel; exterior finish shall be a gray baked-on enamel or lacquer. Apply all finish coatings over a rust-inhibiting metal primer.

D. Identification: Each switchboard shall have an engraved laminated plastic nameplate identifying the switchboard as designated and located on the Contract Drawings, and indicating voltage, phase, and number of system conductors. For example, "Switchboard MS 277/480V. 3Ø 4W. Lettering shall be white on black finish and 1/4-inch high minimum. Nameplates shall be affixed by a minimum of two escutcheon pins or screws. Each device on the switchboard shall be provided with an engraved plastic nameplate as specified in Section 16190.

PART 3 -- EXECUTION

3.1 GENERAL INSTALLATION

A. Switchboard(s) shall be securely bolted to the flooring or structure. Final attachment means shall be in compliance with the seismic requirements of governing authority. Shop Drawings indicating the bolt down requirements shall be provided by the manufacturer along with all necessary calculations and shall be submitted with the Shop Drawings of the switchboard equipment. Refer to other Sections of the Specifications related to seismic requirements.

B. Switchboard(s) shall be installed on a level floor, with shims provided where necessary to attain both horizontal and vertical "plumb" conditions.

C. Switchboard(s) equipment shall be protected during construction in such a manner to prevent plaster, paint, dust, etc. from defacing the finish of equipment. Prior to final acceptance of the

equipment, the interior of the equipment shall be cleaned of all foreign materials and debris. Any blemishes or defects on the exterior of the equipment shall be repaired by painting the equipment with paint supplied by the manufacturer of the equipment to match the factory finishes.

D. No operating handles in any switchboard shall be located above 6-foot 6-inches above finish floor. Code clearances on all sides of the switchboard equipment shall be maintained.

E. Switchboards shall be mechanically grounded to the grounding system.

F. Furnish ammeters, voltmeters, current and potential transformers, test blocks, control switches, fuses and circuit breakers, and other devices as indicated on the Drawings. Meters shall be switchboard type semi-flush mounted, with phase selector switches. The height of all devices shall comply with Code and utility company requirements with the switchboard installed on a 2-inch high concrete pad.

G. For solidly grounded "wye" services of more than 150 volts to ground, but not exceeding 600 volts phase to phase, provide ground fault protection of equipment for each service disconnecting means for services rated 1000 amperes or more, without a single main disconnecting means. Provide ground fault protection of equipment for other systems as indicated on the Drawings.

H. Ground fault sensors shall be zero sequence type unless indicated otherwise on the Drawings. Trip settings shall be as indicated on the Drawings or as directed by the City Engineer.

I. Protection: Keep switchboards covered during construction operations. Clean interior and exterior after all connections are completed. Factory connections shall be checked and re-torqued tight as required. Damage shall be field or factory repaired to a condition acceptable to the City Engineer at no added cost to the City.

J. Operational Test of the ground fault protection system using the primary current injection method shall be performed by qualified personnel with suitable testing/recording equipment in the presence of the City Engineer. Provide the City Engineer with a "Certified Test Report" including test parameters.

3.2 COMMISSIONING OF SWITCHGEAR AND SWITCHBOARD ASSEMBLIES

A. General:

1. Inspect for physical damage.

2. Compare equipment nameplate information with latest single line diagram and report discrepancies.

3. Inspect for proper alignment, anchorage and grounding.

4. Check tightness of accessible bolted bus joints by calibrated torque wrench method. Refer to manufacturer's instruction for proper foot pound levels.

5. Spot check breaker settings against Short Circuit Study.

6. Key interlock systems shall be physically tested to insure proper function.

   a. Closure attempt shall be made on locked open devices. Opening attempt shall be made on locked closed devices.
   b. Key exchange shall be made with devices operated in off-normal positions.

7. All doors, panels and sections shall be inspected for paint, dents, and scratches.

END OF SECTION

SECTION 16280
SHORT CIRCUIT AND COORDINATION REPORT

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall prepare a power system analysis of short circuit calculations, a protective device coordination study and a harmonic analysis in accordance with the requirements of these Specifications and as shown.

B. The studies shall include all portions of the electrical distribution system for normal and standby power sources down to and including the (208 V) distribution system.

C. The work to be provided by the CONTRACTOR shall include protection studies for motors supplied with solid state overload and overcurrent protection devices.

D. The work to be provided by the CONTRACTOR shall include an evaluation of harmonic distortion and the furnishing and installation of filters and any other equipment as may be required for harmonic suppression.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The Work of the following Sections applies to the work of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this work.

1. Section 16020 Municipal Facilities General Electrical Requirements
2. Section 16270 Service and Distribution Switchboard
3. Section 16340 Low Voltage Motor Control

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the current provisions of the following codes and standards.

1. Codes:

LAEC	City of Los Angeles Electrical Code, latest adopted edition

2. Commercial Standards:

ANSI/IEEE 141	Recommended Practice for Electrical Power Distribution for Industrial Plants
ANSI/IEEE 242	Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems

ANSI C 37.010	Standard Application Guide for AC High-Voltage Circuit Breakers
ANSI C 37.5	Calculations of Fault Currents for Application of Power Circuit Breakers
ANSI C-37.13	Low-Voltage AC Power Circuit Breaker (600-Volt Insulation Class)
IEEE 519	Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with Section 16020 Municipal Facilities General Electrical Requirements and as specified herein.

B. The power system analysis shall be submitted to the ENGINEER prior to receiving final approval of the distribution equipment shop drawings and/or release of equipment for manufacture; approval from the ENGINEER may be obtained for a preliminary submittal of sufficient detail to ensure that device selection will be adequate. Preliminary submittal shall indicate the computer program for use in performing the work of this Section.

C. Studies for harmonic current, voltage and line notching test results shall be forwarded to the ENGINEER prior to acceptance testing of the project and subsequent to the installation of all harmonic generating and harmonic-sensitive equipment.

D. Submittals for solid state motor protective devices shall be forwarded to the engineer prior to loading the motor.

E. Final settings of Protective device shall be approved by the ENGINEER prior to project acceptance and shall be based on the results of the power system analysis.

F. The CONTRACTOR shall indicate in the submittal, changes to the protection scheme or equipment selection that will result in improved system reliability and safety.

1.5 QUALITY ASSURANCE

A. Organization's Qualifications:

1. Short circuit studies, protective device evaluation studies, and protective device coordination studies shall be performed by the medium voltage switchgear manufacturer or by an electrical testing service regularly engaged in the short circuit and protective device coordination studies for a period of at least 15 years. The study shall utilize proven computer programs for power system analysis. The studies shall be signed by the professional electrical engineer, registered in the State of California, responsible for the studies.

PART 2 -- PRODUCTS

2.1 GENERAL

A. The organization of the study shall include a single-line and an impedance diagram of the power system. This diagram shall identify all components considered in the study and the ratings of all power devices (this includes, but is not limited to: transformers, circuit breakers, relays, fuses, busses, and cables). The resistance and reactances of all cables shall be identified in the impedance diagram. The study shall contain, from the service utility company, all written data regarding maximum available short circuit current, voltage, and X/R ratio of the utilities' power system.

2.2 SHORT CIRCUIT STUDY

A. The short circuit study shall be performed with the aid of a digital computer program and shall be in accordance with ANSI C 37.5, IEEE Standard 242, and IEEE Standard 141.

2.3 PROTECTIVE DEVICE EVALUATION STUDY

A. A protective device evaluation study shall be performed to determine the adequacy of circuit breakers, molded case switches, automatic transfer switches, and fuses. Any problem areas or inadequacies in the equipment due to prospective short-circuit currents shall be promptly brought to the ENGINEER's attention.

2.4 PROTECTIVE DEVICE COORDINATION STUDY

A. A protective device coordination study shall be performed to provide the necessary calculations required to select or check the selection of power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated current transformers, and low-voltage breaker trip characteristics and settings. The results of the study shall govern the final selection of the protective devices.

2.5 TIME/CURRENT COORDINATION CURVES

A. As a minimum, the time/current coordination curves for the power distribution system shall include the following on 5-cycle log-log graph paper:

1. Time/current curves for each protective relay or fuse showing graphically that the settings will provide protection and selectivity within industry standards. Each curve shall be identified, and tap and time dial settings shall be specified.

2. Time/current curves for each device shall be positioned to provide the maximum selectivity to minimize system disturbances during fault clearing.

3. Time/current curves and points for cable and equipment damage.

4. Circuit interrupting device operating and interrupting times.

5. Indicate maximum fault values on the graph.

6. Sketch of bus and breaker arrangement.

7. Magnetizing inrush points of transformers.

8. All restrictions of the ANSI and LAEC shall be adhered to and proper coordination intervals and separation of characteristics curves shall be maintained.

9. Thermal limits of motors 250 hp and above.

2.6 HARMONIC MEASUREMENT

A. The CONTRACTOR shall prepare a report of the distribution system, at all voltage levels, which shall indicate the harmonic currents anticipated at each voltage level. This report shall indicate sources of harmonic currents, voltages, and line notching of all equipment. The report shall state the tolerance of sensitive equipment to harmonics.

B. CONTRACTOR shall measure harmonics present in the output of harmonic-generating equipment and at the input terminals of sensitive equipment. Install filters to prevent equipment malfunction, due to harmonics. Harmonic measurements shall be performed and documented after the filter installations.

C. All equipment which is required to conform to IEEE 519 shall be measured to determine output harmonic content. The CONTRACTOR shall take the corrective action necessary to attain compliance with IEEE 519, Table. Measurements and documentation shall be performed to demonstrate compliance with the standards.

2.7 MOTOR PROTECTION

A. Overload protection as phase overcurrent for medium voltage motors is specified in other Sections of these Specifications to be solid-state protective modules. The CONTRACTOR shall adjust these modules with respect to actual installed motor torque, current and thermal characteristics so that the best possible motor protection will result. Protective settings shall be submitted, and approved, before respective motors are run under load.

PART 3 -- EXECUTION

3.1 PROTECTIVE DEVICE TESTING, CALIBRATION AND ADJUSTMENT

A. The CONTRACTOR shall provide the services of a qualified field engineer and necessary tools and equipment to test, calibrate, and adjust the protective relays and circuit breaker trip devices as recommended in the power system analysis. The qualifications of the field engineer shall be subject to review and approval by the ENGINEER.

3.2 STUDY REPORTS

A. The results of the power system analysis shall be submitted summarized in a final report. The report shall include, but not limited to the following:

1. Single-line diagram

2. Impedance diagram

3. Tabulation of all protective devices, which shall be identified on the single-line diagram

4. Time/current coordination curves

5. Computerized fault current calculations

6. Specific recommendations, if any

7. Test instrumentation, condition and connections, as applicable, for each study

8. Harmonic measurement results

9. Harmonic distortion correction proposals.

END OF SECTION

SECTION 16290
MUNICIPAL FACILITIES GROUNDING SYSTEMS

PART 1 -- GENERAL

1.1 SCOPE

A. Required: Provide and ground electrical systems completely and effectively as required by Code and herein specified.

B. Comply with the General Conditions, General Requirements and the requirements of Section 16020 of this Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

1.2 SUBMITTALS

A. General: Submit each item in this article according to the conditions of the Contract and Division 1 Specification 01330.

B. Product Data for grounding rods, connectors and connection materials, and grounding fittings.

C. Field tests and observation reports certified by the testing organization and indicating and interpreting the test reports for compliance with performance requirements.

1.3 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1.4 QUALITY ASSURANCE:

A. Testing Agency Qualifications: A “National Recognized Teating Laboratory” (NRTL) As defined in OSHA Regulation 1910.7.

B. Comply with NFPA 70.

C. Comply with UL 467.

D. Listing and Labeling: Provide products specified in this Section that are listed and labeled.

1. The Terms “Listed” and “Labeled”: As defined in the National Electrical Code Article 100.

2 Listing and Labeling Agency Qualifications: A “Nationally Recognized Testing Laboratory” (NRTL) as defined in OSHA Regulation 1910.7.

1.5 REFERENCE STANDARDS:

A. NFPA 70: National Electrical Code – Article 250.

B. Federal Information Processing Standard Publication #94 “Guideline on Electrical Power for ADP Installations”.

C. IEE Std. 142-1982 “Grounding of Industrial and Commercial Power System (GREEN Book).

D. IEE Std. 1100-1992 “Powering and Grounding Sensitive Electronic Equipment” (Emerald Book).

1.6 SYSTEM DESCRIPTION

A. Ground the electrical service system neutral at service entrance equipment to metallic water service and to concrete encased grounding electrodes.

B. Ground each separately-derived system neutral to nearest effectively grounded metallic water pipe.

C. Provide telephone and data system grounding conductor at main terminals of respective system bonded to service entrance grounding electrode.

D. Bond together system neutrals, service equipment enclosures, exposed non-current carrying metal parts of electrical equipment, metal raceway systems, grounding conductor in raceways and cables, receptacle ground connectors, metallic plumbing systems and concrete encased electrode.

PART 2 -- PRODUCTS

2.1 MATERIALS

A. Grounding and Bonding Conductors: Soft-drawn stranded copper.

B. Buried or Concealed Joints: Exothermic welded, inspected and approved the Los Angeles City Building Department before concealment.

C. System grounding conductors shall be a minimum of #3 AWG unless otherwise indicated, and shall be continuous without joints or splices.

D. Bolted Connections: Everdur hardware, bolts, and lock washers or equal.

E. Welded Connections: Either Erico Cadweld Process or Continental Industries Thermoweld Process or equal.

F. Compression Connections: Thomas & Betts Series 5300 fittings or equal. Use manufacturer's specific instructions and tools for each connection.

G. Ground Rods: Copperweld Steel Company or equal. Provide 3/4 inch copperclad steel driven ground rods, 10 feet long, UL listed, in each manhole and where indicated on Contract Drawings.

PART 3 -- EXECUTION

3.1 GENERAL INSTALLATION

A. Grounding and Bonding: Provide in accordance with all requirements of NEC and other applicable codes, Contract Drawings and the following descriptions. Comply with the codes as a

minimum requirement with specifications where they are more stringent. Ground each electrical service to cold water systems and provide supplemental grounding as follows:

1. Structural Steel Electrode: Bond the structural steel frame of the building or structure to the point of ground at service equipment with a continuous bonding conductor equal in size to the grounding electrode conductor, but not smaller than No. 4 AWG or

2. Concrete-Encased Electrode: Provide three minimum No. 4 horizontal reinforcing bars in and near the bottom of the building or structure footing, each with a minimum continuous (no splices) length of 20 feet. Install a continuous bonding conductor equal in size to the grounding electrode conductors, but not smaller than No. 4 A.W.G., bonded to each reinforcing bar by means of corrosion-resistant clamps or welding, to the point of ground at service equipment. The bonding conductor shall be installed in schedule 40 rigid PVC conduit from a point within the footing continuous to the service equipment. A single size 3/0 bare copper conductor with a minimum continuous length of 20 feet may be used in lieu of the three No. 4 reinforcing bars.

B. Separate Buildings or Structures: When two or more buildings or structures are supplied from a common source or service, the grounding system in each building or structure shall have a grounding electrode connected to the metal enclosure of the building or structure disconnecting means and to the AC system grounded circuit conductor on the supply of the building or structure disconnecting means.

C. Separately Derived Systems: Shall be bonded and grounded in accordance with Code.

D. Customer-Station Transformer: Shall be bonded and grounded in accordance with the requirements of the serving electric utility.

E. Nonmetallic Raceways: A Code-sized green, or green with yellow stripe insulated conductor shall be installed with the circuit conductors, for equipment grounding. Ground conductor shall be installed in raceways with branch circuit wiring where indicated on the Contract Drawings.

F. Communication, Sound, and Signal Systems: Metal raceways and enclosures shall be grounded as directed by the City Engineer.

G. The interior metallic cold water pipe system shall be bonded to the main grounding electrode by a conductor sized in accordance with Code, but not smaller than No. 8 A.W.G.

H. Telephone service main backboard or cabinet shall be grounded in accordance with requirements of the telephone serving facility.

I. All grounding and bonding conductors shall be installed with sufficient slack to avoid breaking due to settlement and movement of conductors at attached points.

J. Flexible Conduit: Where equipment grounding or bonding conductors are required they shall be installed inside the conduit except bonding conductors may be installed exterior of the conduit if not over 3 feet maximum length, not smaller than No. 8 A.W.G., and if secured to the conduit at 6 inch. Flexible conduit not to be used as a ground path. Include code size green conductors in all flexible conduit.

K. Transformers and other isolated neutrals shall be grounded from the neutral bushing or connector to grounding electrodes, building steel or metallic code water pipe system.

L. All conduit stub-ups shall be grounded and where multiple stub-ups are made within an equipment enclosure such as a switchboard, they shall be equipped with grounding bushings and

bonded together to the enclosure, and the enclosure ground bus with code sized copper conductors.

M. Metallic conduits, wireways, metal enclosures of busways, electrical equipment housing and all non-current carrying metallic parts shall be grounded. The metallic conduit system shall be used for equipment and enclosure grounding but not as a system ground conductor.

3.2 MEASUREMENT OF RESISTANCE TO GROUND

A. All Systems**:** Measure by the "direct" method or the "Fall of Potential" method. The "direct" method, or two terminal test, includes a Megger Earth Tester with terminals connected to the electrode under test and to an all metallic water pipe system. The following limitations apply to this method:

1. The water pipe system must be extensive enough to have a negligible resistance.

2. The water pipe system must be metallic throughout, without any insulating couplings or flanges.

3. The earth electrode under test must be far enough away from the water pipe system to be outside its sphere of influence. Rule of thumb: Distance from the earth-electrode system to the water pipe system should be about 10 times the radius of the electrode or grid to obtain a measurement within an accuracy of p 10%.

4. Submit test report of the main building grounding electrode's resistance to ground to the City Engineer.

B. Test each receptacle or branch circuit breaker having ground-fault circuit protection to assure that the ground-fault circuit interrupter will not operate when subjected to a ground-fault current of less than 4 milliamperes and will operate when subjected to a ground-fault current exceeding 6 milliamperes. Perform testing using an instrument specifically designed and manufactured for testing ground-fault circuit interrupters. "TEST" button operation will not be acceptable as a substitute for this test. Replace receptacles that do not shutoff power with 5/1000 of an ampere within 1/40th of a second and retest. Submit test report signed by Test Engineer who performed this test.

END OF SECTION

SECTION 16320
TRANSFORMERS

PART 1- GENERAL

1.1 SCOPE

A. Required**:** Provide and install dry type transformers work as indicated on the Contract Drawings and Schedules and herein specified.

B**.** Comply with the General Conditions, General Requirements and the requirements of Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1. Section 16030 "Wastewater Facilities Electrical Testing Requirements" for testing requirements.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of power/distribution transformers of types and ratings required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Installer's Qualifications: Firm with at least 5 years of successful installation experience on projects utilizing electrical power and distribution transformers similar to those required for this project.

C**.** NEC Compliance: Comply with NEC as applicable to installation and construction of electrical power/distribution transformers.

D**.** ANSI Compliance: Comply with applicable requirements of ANSI Standards C57-Series pertaining to power/distribution transformers.

E**.** NEMA Compliance: Comply with requirements of NEMA Std Pub/No.'s ST 20; "Dry-Type Transformers for General Applications", TR 1.

F. UL Compliance: Comply with applicable requirements of ANSI/UL 506; "Safety Standard for Specialty Transformers". Provide power/distribution transformers and components which are UL-listed and labeled.

G. NESC Compliance: Comply with applicable requirements of National Electrical Safety Code (ANSI Std C2) pertaining to indoor installation of transformers.

H. Testing Agency Qualifications: In addition to requirements specified in Section 01453, "Quality Control," an independent testing agency shall meet OSHA criteria for accreditation of testing laboratories, Title 29, Part 1907; or shall be a full-member company of the InterNational Electrical Testing Association.

1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies, to supervise on-site testing specified in Part 3.

I. Listing and Labeling: Provide transformers specified in this Section that are listed and labeled.

1. The Terms "Listed" and "Labeled": As defined in NFPA 70, Article 100.

2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

1.4 SUBMITTALS

A. Conform to applicable provisions of Section 01330 and as herein specified.

B. Product Data: Submit manufacturer's technical product data including rated KVA, frequency, primary and secondary voltages, percent taps, polarity, impedance and certification of transformer performance efficiency at indicated loads, percentage regulation at 100% and 80% power factor, no-load and full-load losses in watts, % impedance at 75 deg. C, hot-spot and average temperature rise above 40 deg. C ambient temperature, sound level in decibels, and standard published data.

C. Shop Drawings: Submit manufacturer's drawings indicating dimensions, and weight loadings for transformer installations, showing layouts, mountings and supports, spatial relationship to panelboards and associated equipment, include transformer connections to electrical equipment.

D. Wiring Diagrams: Submit wiring protection and control diagrams for power distribution transformers. Clearly differentiate between portions of wiring that are manufacturer-installed and portions to be field-installed.

PART 2 -- PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work included, but are not limited to the following:

1. Eaton;

2. Schneider Electric;

3. Siemens;

4. Or equal.

2.2 DISTRIBUTION TRANSFORMERS

A. General: Except as otherwise indicated, provide manufacturer's standard materials and components as indicated by published product information, designed and constructed as recommended by manufacturer, and as required for completed installation.

B. 15 KVA and Above: Shall have drip-proof ventilated enclosures and copper coils of continuous wound construction impregnated with non-hygroscopic thermosetting varnish. Cores shall be constructed of high grade non-aging silicon steel, with high magnetic permeability and low hysteresis losses. Flux densities shall be well below the saturation point. Vibration-absorbing mounts shall be provided between the core/coil and the mounting base. Provide four 2-1/2 percent full capacity primary taps, two above and two below, the rated nominal voltage. Terminals shall be accessible from the front. Insulation materials shall be in accordance with NEMA ST20 standards for a 220 degrees C. U.L. recognized insulation system. Full load temperature rise shall not exceed 80 degrees C. in a 40 degrees C. ambient.

C. Less than 15 KVA: Wall mounted type, copper coils; full load temperature rise shall not exceed 115 degrees C. in a 40 degrees C. ambient.

D. Finishes: Coat interior and exterior surfaces of transformer, including bolted joints, with manufacturer's standard color baked-on enamel.

2.3 CONTROL AND SIGNAL TRANSFORMERS

A. Units comply with NEMA ST 1 and are listed and labeled as complying with UL 506.

B. Ratings: Continuous duty. If rating is not indicated, provide capacity exceeding peak load by 50 percent minimum.

C. Description: Self-cooled, 2 windings.

PART 3 -- EXECUTION

3.1 INSPECTION

A. Installer must examine areas and conditions under which power/distribution transformers and ancillary equipment are to be installed, and notify Contractor in writing of conditions detrimental to proper completion of the work. Do not proceed with the work until satisfactory conditions have been corrected in a manner acceptable to Installer.

B. Coordinate transformer installation work with electrical raceway and wire/cable work, as necessary for proper interface.

C. Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Std 486A and B.

3.2 GROUNDING

A. Provide equipment grounding connections for power/distribution transformers as indicated. Tighten connections to comply with tightening torques specified in UL Std 486A to assure permanent and effective grounding.

3.3 CLEANING

A. On completion of installation, inspect components. Remove paint splatters and other spots, dirt, and debris. Repair scratches and mars on finish to match original finish. Clean components internally using methods and materials recommended by the manufacturer.

3.4 INSTALLATION

A. Comply with safety requirements of IEEE C2, National Electrical Safety Code.

B. Arrange equipment to provide adequate spacing for access and for circulation of cooling air.

C. Identify transformers and install warning signs according to Section 16190, "Electrical Identification."

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.5 TESTING

A. Prior to energizing of transformers, check all accessible connections for compliance with manufacturer's torque tightening Specifications.

B. Prior to energizing, check circuitry for electrical continuity, and for short-circuits.

C. Upon completion of installation of transformers, energize primary circuitry at rated voltage and frequency from normal power source, and test transformers, including, but not limited to, audible sound levels, to demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units or components, and proceed with retesting.

END OF SECTION

SECTION 16330
PANELBOARDS

PART 1 -- GENERAL

1.1 SCOPE

A. Required: Provide and install complete equipment including circuit breakers and panelboards as indicated on the Contract Drawings and herein specified.

B. Comply with the General Conditions, General Requirements and the requirements of Section 16020 of this Division 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1.3 QUALITY ASSURANCE

A. Comply with applicable provisions of Subsection 1.2 of Section 16020.

B. Conform to the applicable provisions of Subsection 1.6 of Section 16020 related to legal requirements and standards including NEMA, ANSI and IEEE Standards, NFPA 70, and Federal Specifications.

1. 4 SUBMITTALS

A. Submit under the provisions of Section 01330.

B. Product Data: For each type of panelboard, overcurrent protective device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

C. Maintenance Data: For panelboards and components to include in maintenance manuals specified in Division 1. In addition to requirements specified in Section 01770, "Closeout Procedures," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

2. Time-current curves, including selectable ranges for each type of overcurrent protective device.

PART 2 -- PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Cabinets to House Panelboards: Cabinets shall be formed of galvanized metal, chemically cleaned, and all breaks in galvanizing shall be painted with metallic aluminum paint.

Minimum size: 20 inches wide by 5-3/4 inches deep. Trims and doors shall be chemically cleaned. Provide ANSI synthetic alkalyd factory enamel finish on the exterior and interior of panels. Provide for circuit directory behind door with glass or heavy plastic protection. Cabinets shall be flush or surface mounted type as indicated with screw cover, hinged doors with flush lock keyed to operate from one key. Cabinets greater than three feet shall have three trim bolts on each side.

B. Identification: Each panelboard shall have an exterior engraved laminated plastic nameplate identifying the panelboard as designated on the Drawings and indicating voltage, phases, and number of system conductors. For example:

"Panel A 277/480V. 3ph, 4W". Lettering shall be white on black finish and 3/16 inch high minimum. Nameplates shall be affixed with a minimum of two escutcheon pins or screws. Each circuit breaker shall have a permanent metal or plastic number to identify each circuit. A circuit schedule card and holder shall be mounted on the inside of the door and covered with plastic.

C. Protective Devices:

1. Protective devices, main, branch or sub-feed shall be thermal-magnetic-molded-case circuit breakers, bolt-on type ampacities as scheduled on Drawings. Provide single handle, common trip for two and three-pole units. Handle ties are not acceptable.

2. Circuit Breakers, 250A and Larger: Adjustable magnetic trip setting.

3. Electronic Circuit Breakers, 400A and Larger: RMS sensing; field-replaceable rating plug; with the following field-adjustable settings:

   a. Instantaneous trip.

   b. Long- and short-time pickup levels.

   c. Long- and short-time time adjustments.

   d. Ground-fault pickup level, time delay, and I^2t response. Where indicated on the drawings.

4. GFCI Circuit Breakers: Single- and two-pole configurations with 5-mA trip sensitivity, where indicated on the lighting and appliance panelboards.

5. Molded-case circuit breakers shall be suitable for application; Rype SWD for switching fluorescent lighting loads; Type HACR for heating, air-conditioning, and refrigerating equipment.

D. Electrical Equipment Adjacent to Panelboards: Where scheduled provide a separate cabinet with screw cover and hinged door with flush lock keyed alike with panelboard. A single cabinet may be used when a compartment (with appropriate barriers) under separate lockable door and cover is provided.

E. Finish: As specified for service switchboards in Section 16270 service and distribution switchboards.

2.2 DISTRIBUTION PANELBOARDS

A. Each distribution panelboard shall be a deadfront, deadrear, U.L. listed, circuit breaker type with copper buses and comply with Federal Specification W-P-115a. Construction shall be NEMA Class I. Electrical ratings shall be as indicated on the Drawings.

Series-connected or "integrated equipment" short circuit ratings shall not be applied in lieu of, or to comply with, short circuit and interrupting capacity ratings indicated on the Drawings unless specifically approved by the City Engineer. Provide fronts with flush cylinder tumbler locks, trim clamps, and concealed hinges.

Double doors or doors over 48 inches high shall have 3 point latching. Provide 2 keys for each panelboard. Furnish panelboards with main lugs or main circuit breakers and all other circuit breakers as indicated on the drawings. Each circuit breaker shall be provided with a means for individual padlocking. Distribution panelboards shall be Square D. Co. I-line type or equal.

2.3 LIGHTING AND APPLIANCE PANELBOARDS

A. Each lighting and appliance panelboard shall be a U.L. listed circuit breaker type with copper buses and meet Federal Spec. W-P115a. Electrical ratings shall be as indicated on the Drawings. Series connected or "integrated equipment" ratings shall not be applied in lieu of or to comply with short circuit and interrupting ratings indicated on the Drawings, unless specifically approved by the City Engineer. Provide fronts with flush cylinder tumbler locks, trim clamps, and concealed hinges. Provide two keys for each panelboard. Furnish panelboards with main lugs or main circuit breakers and all circuit breakers as indicated on the Drawings.

B. Each circuit breaker shall be provided with a means for individual padlocking. Lighting and appliance panelboards shall be Square D. Co. Type NQO for 120/240 or 208/120 volt systems, and Type NEHB for 480/277 volt systems.

2.4 FABRICATION AND FEATURES

A. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.

B. Directory Card: With transparent protective cover, mounted inside metal frame, inside panelboard door.

C. Bus: Hard-drawn copper, 98 percent conductivity or Tin-plated aluminum.

D. Main and Neutral Lugs: Mechanical type suitable for use with conductor material.

E. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment ground conductors; bonded to box.

F. Future Devices: Mounting brackets, bus connections, and necessary appurtenances required for future installation of devices.

G. Isolated Equipment Ground Bus: Adequate for branch-circuit equipment ground conductors; insulated from box, where indicated on the Drawings.

H. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads, where indicated on the Drawings.

I. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor. Provide back, sides and removable front.

J. Feed-through Lugs: Mechanical type suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device, where indicated on the Drawings.

PART 3 -- EXECUTION

3.1 GENERAL INSTALLATION OF PANELBOARDS

A. Install equipment square, level and secure to the building structure by bolting.

B. Align top of adjacent panelboards unless specifically noted otherwise. Install panelboards over 29 inches high to mount highest protective device handle a maximum of 6'-6" or 5'-6" for panelboards up to 29 inches high, except where adjacent to taller panelboards.

C. Flush enclosures shall be installed with the front edge flush with combustible finish surfaces and not more than 1/4 inch behind noncombustible finish surfaces, and shall be secured to framing or blocking except where embedded in masonry or concrete.

D. Provide weather-proof gaskets on trims and doors of panelboards located in mechanical areas.

3.2 OTHER APPLICABLE REQUIREMENTS

A. Provide a typewritten circuit directory for each branch circuit. Obtain City facility room numbers and use in final directory.

B. Provide a schematic diagram and sequence of operation for control devices installed under

separate door adjacent to panelboards.

C. Install nameplates in accordance with provisions noted in Section 16190 – Electrical Identification.

D. Equip each circuit breaker for electrical discharge lamps with a locking device unless circuit will be switched at panelboard. Equip each circuit breaker for night-light circuits, fire alarm, security and control circuits with a locking device.

E. Provide filler plates for all unused spaces.

F. Stub five 3/4-inch empty conduits from each flush mounted panelboard into accessible ceiling space and cap for future use. Stub four 1-inch empty conduits into raised floor space or below slab not on grade

G. Wiring in Panelboard Gutters: Arrange conductors into groups and bundle and wrap with wire ties after completing load balancing.

3.3 COMMISSIONING

A. Spot check breaker settings against Short Circuit Study

B. Spot check phase balance after system is under load. Ensure proper, thorough and accurate identification of load. Trip breakers and validate load identified. Test GFI breakers.

C. Receptacle Polarity Test: Spot check receptacles installed or reconnected under this contract with a receptacle circuit tester. Tester shall test for open ground, reverse polarity, open hot, open neutral, hot and ground reversed, hot or neutral and hot open.

D. Check circuit labeling by de-energizing circuits while circuit tester is in the receptacle. Labeling shall be checked on the load/receptacle and at the breaker

3.4 CLEANING

A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

END OF SECTION

This page intentionally left blank

SECTION 16340
LOW VOLTAGE MOTOR CONTROL

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish and install all group-mounted and unit motor control as required for each motor furnished for installation all in accordance with the requirements of the Contract Documents.

B. When motors furnished differ from the indicated, the CONTRACTOR shall, at no additional cost to the CITY, make the necessary adjustments to wiring, conduit, disconnect devices, motor starters, branch circuit protection, and other affected material or equipment to accommodate the motors actually installed.

C. Make like items of equipment provided hereunder the end products of one manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and manufacturer's service.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The work of the following Divisions or Sections applies to the work of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this work.

1. Section 16020 Municipal Facilities General Electrical Requirements.

2. Section 16100 Basic Materials and Methods.

3. Section 16490 Electric Motors

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. All work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these specifications.

1. Codes and Standards:

LAEC	City of Los Angeles Electrical Code, latest adopted edition
California Code of Regulations	Title 8, Industrial Relations, Subchapter 5, Electrical Safety Orders.

2. Commercial Standards:

UL 845	Standards for Safety Electric Motor Control Centers.

NEMA	ICS-1	General Standard for Industrial Control and Systems
NEMS	ICS-2	Industrial Control Devices, Controllers and Assemblies

1.4 CONTRACTOR SUBMITTALS

A. Shop drawing submittals shall comply with the "Contractor Submittals" paragraph of Section 16012, "Municipal Facilities General Electrical Requirements".

B. The following submittals and specific information shall be provided.

1. One-line diagrams,
2. Elementary diagrams,
3. Connection diagrams,
4. Interconnection diagrams,
5. Protective device time-current characteristics on conventional-sized transparencies,
6. Operational description,
7. Installation instructions,
8. Maintenance instructions,
9. Spare parts list,
10. Test reports, including procedures, test conditions, results and graphs**.**

1.5 QUALITY ASSURANCE

A. Quality assurance shall be in accordance with Section 16010 Wastewater Facilities General Electrical Requirements.

B. Electrical and Mechanical Testing: All components shall be factory tested in accordance with the applicable NEMA ICS requirements.

C. Field Testing: Field tests shall be performed in accordance with Electrical Testing Requirements.

PART 2 -- PRODUCTS

2.1 MOTOR CONTROL, GENERAL

A. Provide each motor with a suitable controller and devices that will function as specified for the respective motors and meeting NEMA ICS 2, the NEC, and UL.

B. Provide each motor controller with thermal overload protection in all ungrounded phases. Use protection consisting of thermal overload relays meeting NEMA ICS 2 which are sensitive to motor current and mounted within the motor controller, or a combination of thermal protectors embedded within the motor windings and controller-mounted overload relays, as indicated. Use overload protection devices of the inverse-time current characteristic type.

C. Provide controller-mounted overload relays of the manual-reset type with externally operated reset button when used without motor thermal protectors; when used in conjunction with thermal protectors, provide the automatic reset type. Select and install overload relay heaters after the actual nameplate full-load current rating of the motor has been determined.

D. If power factor correction capacitors are connected on the load side of the overload relays, incorporate the resulting reduction in line current in the selection of overload relay heaters.

E. Install and connect any required thermal protector monitoring relay provided by motor manufacturer in motor-control circuit and provide manual reset function

2.2 MANUALLY OPERATED STARTERS, FRACTIONAL HORSEPOWER

A. Provide starters meeting NEMA ICS 2 with the enclosures shown, rated 1 hp at single-phase, ac voltages of 115 and 230 volts, and with thermal overload protection, and toggle or pushbutton operation. Provide for locking in the OFF position.

2.3 MANUALLY OPERATED STARTERS, INTEGRAL HORSEPOWER

A. Provide starters meeting NEMA ICS 2 of the horsepower rating, voltage, number of phases, and enclosure shown and with thermal overload protection, and pushbutton or toggle switch operation. Provide for locking in the OFF position. Provide running overcurrent protection.

2.4 FULL VOLTAGE MAGNETIC STARTERS

A. Provide starters meeting NEMA ICS 2, Class A, with the rating and enclosure shown. Starters shall be full voltage, non-reversing horsepower rated, providing combined protection against running and stalled overloads. Thermal overload relays on all phases shall be temperature compensated bimetallic type with manual reset and inherent single phasing prevention.

2.5 REDUCED VOLTAGE STARTERS

A. Provide starters meeting NEMA ICS 2, Class A, with the rating and enclosure shown. Starters shall be single-step magnetic type, having closed circuit transition and an adjustable time interval between application of starting and running conditions to the motors. Provide autotransformers suitable for medium-duty service as specified in NEMA ICS 2, and with overtemperature protection. Provide taps giving approximately 50 percent, 65 percent, and 80 percent of line voltage at output terminals.

2.6 CONTROL POWER TRANSFORMERS

A. Supply individual control power transformers unless noted otherwise. The transformers shall have sufficient capacity to serve the connected load and limit voltage regulation to 10 percent during contact or pickup. Fuse one side of the secondary winding and ground the other side. Provide primary, current limiting fuses where fuses shown on Drawings, or where required by applicable codes and standards.

2.7 MOTOR CONTROL CENTERS

A. Provide motor control centers and components meeting the requirements of the latest revised NEMA and UL standards and the following requirements, unless otherwise indicated:

RATING

Voltage As indicated on the Drawings

Short Circuit Rating: 42,000 amps rms symmetrical, or as determined by electrical studies

NEMA Class	Class 2, Type B with all remote control and signal circuits wired to a separate terminal board compartment in each motor control center lineup; all additions and revisions shall be included in the final as-built record drawings

ENCLOSURE

Type	NEMA Type as shown
Vertical Section	90-inches high, 20-inches wide, or as shown
Dimensions	20-inches deep, Or depth as shown
Finish	Exterior: manufacturer's standard gray over a primer and rust inhibitor or as per architectural standard; Interior: white lacquer or enamel
Construction	Sheet steel reinforced with channel or angle irons, section constructed so they may be butted flush, end-to-end against a similar section without bolts, nuts, or cover plates causing interference; removable top cover plates and bottom cover plates
Section Mounting	Removable formed steel channel sills and removable lifting angles
Horizontal Wiring Compartments	Full width, top and bottom, accessible from front
Vertical Wiring	Full height, isolated from unit Compartment starters with a separate door, accessible from front

Unit Compartment	Individual compartments separated by steel barriers for each starter, feeder, or other unit capable of being wired from front without unit removal
Compartment Doors	Separate hinged doors for each starter, feeder, or other unit
Door Interlocking	Individual Starter and feeder doors mechanically interlocked so doors cannot be opened with unit energized; defeater mechanism to allow intentional access at any time; provisions for padlocking external disconnect handles in the OFF position
Cable Entrance	Main circuits enter from top or bottom depending on arrangement, control and feeder circuits enter from top or bottom depending on arrangement
Busway Entrance	Pull box with flanged connection for incoming busway, bus connection to motor control center main power bus and cable connection to ground bus and neutral bus; match dimensions of incoming busway;

BUS

Horizontal Power Bus	3-phase copper bus entire width of control center rated as indicated, constructed to allow future extension of additional sections; pressure type solderless lugs for each incoming line cable; Belleville washers on all bus connection bolts.
Vertical Power Bus	3-phase copper bus full height of section rated 300 amps minimum; "sandwich" type bus insulation that provides dead front construction with starter units removed except for bus stab openings; Belleville washers on all bus connection bolts
Neutral Bus	Copper; Belleville washers on all bus connection bolts
Ground Bus	Copper, 400A minimum capacity; Belleville washers on all bus connection bolts
Bus Bracing	As indicated or determined based on electrical studies, 42,000 minimum amps rms symmetrical.

MOTOR STARTER UNITS

General	Individual components and control devices including pushbuttons, selector switches, indicating lights, control relays, time delay relays, and elapsed time meters as specified in Section 16100, "Basic Materials and Methods".
Construction	Drawout combination type with stab connections, except

	where size and weight of equipment make this impracticable; readily interchangeable with starters of similar size; provide pull-apart unit control wiring terminal boards on all units
Starters	NEMA standard rating, NEMA Size 1; minimum meeting requirements specified under article 2.1, MOTOR CONTROL, GENERAL;
Disconnecting Device	disconnecting device lockable in OPEN position
Circuit Breakers	Molded case motor circuit protectors with manufacturer's recommended trip setting for maximum motor protection, tripping indicated by operating handle position; interrupting capacity required for connection to system with short circuit capacity indicated; shunt trip for ground fault protection; copies of circuit breaker time-current characteristics
Fused Switches	Heavy-duty (HD), motor rated, load-break, quick-make, quick-break type meeting requirements of UL and NEMA KS 1; current- limiting fuses as specified with rejection clips
Load Detector Relays	Manual reset with adjustable differential; Relays Cutler-Hammer Type D60LA, or equal
Motor Overload	Temperature compensated, three-pole, Protection bimetallic thermal overload relay; manual-reset overload relays when used independently of other overload protection; automatic-reset when used with integral motor thermal protector
Motor Thermal	Manual-reset interposing Protection Interface relay for connection to motor-mounted thermal protector system
Ground Fault	Same as under FEEDER UNITS Protection AND MAIN PROTECTIVE DEVICE, except instantaneous operation device
Capacitor Connection	Special terminals to allow easy connection of power factor correction capacitors on the source side of starter overload relays on all starters where capacitor connection is shown
CONTROL UNITS	
Disconnecting Device	Disconnecting device capable of de-energizing all circuits in the unit. Provide a warning sign giving location of disconnecting device if not located in the unit.
Control Devices	As indicated on the Drawings and as specified in Section 16100, "Basic Materials and Methods".
	Permanent sleeve type markers to be applied to all wires.

Wire Markers Control Wiring	Minimum wire size 14 AWG copper

FEEDER UNITS AND MAIN PROTECTIVE DEVICE

Construction	Same as under MOTOR STARTER UNITS with UL service entrance label on main protective device
Circuit Breakers	Unless otherwise indicated, molded case with thermal-magnetic trip and interrupting capacity required for connection to system with short circuit capacity indicated; tripping indicated by operating handle position; suitable for use with 75 degrees C wire at full NEC 75 degrees C ampacity; shunt trip for ground fault protection and phase monitoring relay; for main and feeder protective devices, use molded case circuit breakers with ambient insensitive solid state trips and having the current sensors and solid state logic circuits integral in the circuit breaker frame; use solid state current control providing adjustable ampere setting, adjustable long-time delay, adjustable short-time trip and delay band, fixed instantaneous trip set at 15 times the current sensor rating and adjustable ground fault trip and delay band; make settings behind a sealable tamper-proof transparent cover; locate a trip button on the front cover of the circuit breakers to permit mechanical simulation overcurrent tripping for test purposes and to trip the breaker quickly in an emergency situation; copies of circuit breaker time-current characteristics
Fused Switches	Heavy-duty (HD) motor rated, load-break, quick-make, quick-break type meeting requirements of UL and NEMA KS 1; suitable for use with 75 degrees C wire at full NEC 75 degrees C ampacity; current-limiting fuses as specified with rejection clips
Ground Fault	Suitable for 480-volt, 3-phase, Protection four-wire, solidly grounded wye system; consisting of ground sensors encircling all phase conductors and neutral conductor where used and connected to ground relays with adjustable pickup settings and time-current characteristics indicated; circuit breaker shunt trip and relay operating from a fused 120-volt ac control source within the control center; ground fault system ITE Ground Shield, General Electric Ground Break, or equal; copies of relay time-current characteristics
Key Interlocking	Kirk key interlocking where indicated
Phase Monitoring	3-phase monitoring relay to protect Motor against low Relay voltage, voltage unbalance, and phase reversal; Furnas Class 47, or equal

INSTRUMENTS

Voltmeter	Scale indicated, switchboard class with 250-degree scale, GE AB-40, or equal, panel type, nominal 4-1/2-inch

	model with ON/OFF single-phase
	3-phase phase-to-phase, phase-to-ground, OFF, seven-position selector switch
Ammeter	Scale indicated, switchboard class with 250-degree scale, GE AB-40, or equal, panel type, nominal 4-1/2-inch model with ON/OFF single-phase 3-phase OFF, four-position selector switch, C.T.'s with ratio indicated
Ground Detection Lights	Heavy-duty oiltight type with operation explanation nameplate
NAMEPLATES	Engraved with inscription as shown on the single-line diagram, laminated plastic nameplates for each motor control center and each unit, blank nameplates on spaces for future units
	Nameplates that are white and engraved to a black core; attach nameplates with stainless steel panhead screws
SPACE HEATERS	Thermostatically controlled space heater in the bottom of each vertical section for operation from an external 120V power source
DIAGRAMS	Schematic (elementary) and outline diagrams, equipment schedules, wireless unit connection diagrams,

2.8 ACCEPTABLE MANUFACTURERS

1. Eaton;
2. Schneider;
3. Or equal.

PART 3 -- EXECUTION

3.1 GENERAL

A. Perform work in a workmanlike manner with craftsmen skilled in the particular trade. Provide work presenting a neat and finished appearance.

3.2 INSTALLATION

A. Install equipment in strict accordance with submittal drawings and manufacturer's

recommendations. Install motor control centers in accordance with NEMA ICS 2.3 as a minimum. Secure motor control centers using approved means as per latest standards and regulations. Grout mounting channels provided with motor control into the floor or mounting pads.

B. Provide a qualified, factory-trained representative to supervise installation, final adjustment, and initial energization of this equipment. Make this representative available for as long as his services are required, but in any case for a period of 5 days minimum. At the end of installation and adjustment, provide certification signed by this representative that the equipment has been properly installed and tested, and is ready for energization.

C. Retighten to NEMA standards all current-carrying bolted connections and all support framing and panels.

D. Field adjust the trip settings of all motor starter magnetic trip only circuit breakers. Adjust as per manufacturer's recommendations. Determine motor rated current from motor nameplate following installation. In the selection of overload relay heaters, allow for motor current reduction where power factor correction capacitors are installed on the load side of the overload heaters. Prepare a typed tabulation of motor name, motor horsepower, nameplate full load current, measured load current, heater catalog number, protective device, trip setting, and include copy in the Technical Manual. Attach to the tabulation a copy of the starter manufacturer's overload heater selection tables, including only the tables for the particular starters provided.

E. After the equipment is installed, touch up any scratches, marks, etc., incurred during shipment or installation of equipment. If required by the ENGINEER because of undue amount of scratches, repaint the entire assembly.

3.3 FIELD TESTS

A. Field tests shall be in accordance with Electrical Testing Requirements.

END OF SECTION

This page intentionally left blank

SECTION 16360
MUNICIPAL FACILITIES LIGHTING

PART 1 -- GENERAL

1.1 SCOPE

A. Furnish and install lighting fixtures, lamps, drivers, control cabinets, and light poles, as indicated on the Contract Drawings and specified hereinafter.

B. Sports lighting including controls shall be provided as a complete system by a single manufacturer using LEDs as a light source.

C. Comply with the General Conditions, General Requirements and the requirements of Section 16020 of this Division 16 concerning definitions, guarantees, submittals, as-builts, testing, as applicable to work of this Section.

D. The work includes providing submittals, furnishing equipment, installing, and testing complete lighting systems as specified in the Contract documents, including sports fields, security, and park pathway lighting.

E. The work includes exterior sports lighting systems for two new baseball diamonds, security and pathway lighting, as shown in the drawings.

F. Provide lighting system warranties as specified.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1. Section 16020 “Municipal Facilities General Electrical Requirements”.

2. Section 16100 “Basic Materials and Methods”.

3. Section 16560 "Municipal Facilities Electrical Commissioning Requirements" for commissioning requirements.

4. Section 16570 "Municipal Facilities Electrical Testing Requirements" for testing requirements.

1.3 SUBMITTALS

A. Conform to applicable provisions of Section 01330 of the General Requirements and of Subsection 1.6 of Section 16020.

B. Conform to the following as applicable:

1. Complete luminaire photometric catalog data including manufacturer, model, lamp wattage, input watts, voltage, sound rating, power factor and type of LED driver, as well as levels of total harmonic distortion, candlepower distribution curves in 2 or more planes, lumen output charts, average-maximum brightness data, dimming

controls, wiring diagram, dimensions and luminaire finish. For exterior luminaires also provide cut-off characteristics, pole fastening details, and wind load data.

2. For lamps provide catalog data, voltage, color, life estimate in hours, base type, and dimming capabilities.

3. Ambient light (photocell) and motion detection data indicating switching capacity, means of adjusting the lighting pickup level and enclosure. Motion detection coverage. Control options combining ambient light, diming and motion over-ride.

4. For pole-mounted fixtures provide complete data on the pole material, finish, internal junction box, ballasts/drivers, anchoring and fixture attachment and support method. Pole and luminaire combination to be designed to withstand a 100-mph wind load without damage.

5. For sports field lighting provide electrical diagram showing total load on each pole, power and control cabling, and connection between driver panels and lighting control cabinet. Indicate size and number of conductors to each pole.

6. Provide a computer-generated photo metric study for the site to demonstrate that the proposed new lighting design meets the City of Los Angeles's lighting level requirements detailed in paragraph 2.2 of this Section. Provide lighting calculations showing average/minimum/ maximum foot candles for each space.

7. Pole Foundations: Submit pole foundation designs for all pole types and associated soil types. Designs to be stamped by a Structural Engineer registered in the State of California.

8. Substitutions for specified fixtures, etc. shall be based upon quality of specified fixture construction, light distribution, appearance, wind loading, and maintenance

.

1. 4 QUALITY ASSURANCE

A. Conform to applicable provisions of Subsection 1. 7 in Section 16020.

B. Work of this Section shall comply with applicable legal requirements and standards specified in Subsection 1.6 in Section 16020 and the following:

Reference	Description
NFPA 70	National Electrical Code (NEC)
LAEC	City of Los Angeles Electrical Code
ANSI/UL 8750	Standard for LED lighting Equipment
IESNA LM-5-04	Guide for Photometric Measurements of Area and Sports Lighting Installations.
ASHRAE/IES 90.1-1989	Standards for High Efficiency Electrical Lighting Systems.
State of California, Title 24	Exterior Lighting

C. Conform to California's 2013 Title 24 Energy Efficiency Standards, Part 6 - "Outdoor

Lighting".

D. Demonstrations:

1. Exterior lighting system operation shall be demonstrated during the hours of darkness to indicate that fixtures are properly focused, photocell and motion detection operation is correct, and that fixture switching functions as intended. Through demonstration, the CONTRACTOR shall also verify that panel schedules properly indicate the lighting outlets connected to each circuit.

2. Lighting demonstration shall occur within 2 weeks prior to project acceptance.

1.5 CLEANING PROCEDURES

A. Comply with applicable provisions of Section 01740 of the General Requirements.

B. Clean fixture lenses, diffusers, and reflectors just prior to time specified for required demonstrations **.**

C. Clean damaged finish of fixture trim, including poles and support brackets, prior to required refinishing.

D. Before installation of louvers, diffusers or lenses clean reflector surfaces and lamps of all lighting fixtures of accumulated dust, dirt, grease, plaster, paint, etc.

1. 6 WARRANTY AND MAINTENANCE

A. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provision of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Special Warranties: Written warranty, executed by manufacturer agreeing to replace or repair defects or failures in materials or workmanship within specified warranty period.

1. Special Warranty Period for Sports Lighting systems: Twenty five years from date of substantial completion. Defects in materials, equipment or workmanship, or drop in lighting levels below those specified, occurring in the warranty period, shall initiate repairs or replacement at the Contractors/ Manufacturer's expense.

2. Special Warranty Period for Pathway/ Parking Area Lights: Manufacturers' standard warranty, but not less than two years from date of Substantial Completion.

C. Maintenance Agreement

1. Sports lighting system Manufacturer shall offer a 25-year maintenance agreement covering the entire sports lighting and control system. The maintenance agreement to guarantee light levels, lamp replacement, monitoring and communications, spill-light control and structural integrity.

a. Maintain lighting levels within ± 10% of the maintained horizontal average illuminance level for the sports field.

b. Replace lamps if one or more lamps are extinguished on a pole.

c. Repairs to be completed within seventy-two (72) hours of notification by Owner unless agreed otherwise by Owner.

2. Manufacturer shall monitor the performance of the lighting system, including on/off status, hours of usage and luminaire outage for 25 years from the date of equipment shipment. Parts and labor shall be covered such that individual luminaire outages will be repaired when the usage of any field is materially impacted. Manufacturer is responsible for removal and replacement of failed luminaires, including all parts, labor, shipping, and equipment rental associated with maintenance. Owner agrees to check fuses in the event of a luminaire outage.

PART 2 -- PRODUCTS

2.1 LIGHTING SYSTEMS GENERAL REQUIREMENTS

A. Conform to ASHRAE/IES 90.1-1989 Standards for High Efficiency Electrical Lighting Systems.

B. Lighting fixtures shall have all parts and fittings necessary for complete and proper installation.

C. Where both catalog numbers and narrative descriptions are indicated, the narrative description requirements shall take precedence and prevail.

D. All fixtures of one type shall be one manufacturer and of identical finish and appearance.

E. Fixture types shall be as indicated on the Contract Drawings. However, if the fixture type is not shown, the bid shall be based on installing fixtures specified in similar areas.

F. Fixtures in exterior locations, wash-down areas, wet or moist locations shall bear a UL label for installation in wet or moist areas or locations.

G. All exposed metal parts of exterior lighting fixtures shall be stainless steel or anodized aluminum with specified finish over. Screws and fastening shall be stainless steel.

H. All above ground wiring shall be enclosed within the poles, crossarms or control cabinets.

I. Complete units and all electrical components for LED and special fixtures shall bear the Underwriters' Laboratories, Inc., IBEW and Electrical Testing Laboratory labels.

2. 2 LIGHTING PERFORMANCE

A. Illumination requirement and control

1. Baseball fields

Description	Average Target Illumination (foot candles)	Maximum to Minimum Uniformity Ratio	Grid points	Grid Spacing
Baseball No.1 Infield	50	2:1	25	20’ x 20’
Baseball No,1 Outfield	30	2.5:1	75	20’ x 20’
Baseball No.2 Infield	50	2:1	25	20’ x 20’
Baseball No,2 Outfield	30	2.5:1	75	20’ x 20’

B. Sports fields Security Lighting

Average (foot candles) minimum	Maximum (foot candles)	Average to Minimum Ratio
0.75	5	16:1

C. Parking Area Lighting (Not Used)

Average (foot candles) minimum	Maximum (foot candles)	Minimum (foot candles)	Max/ Min Ratio
2.5	4.5	1.2	3.75:1

D. City Ordinance exterior lighting requirements: All site and building mounted lighting shall be designed such that it produces a maximum initial luminance value no greater than 0.20 horizontal and vertical foot candles at the site boundary, and no greater than 0.01 horizontal foot candles 15 feet beyond the site. No more than 5.0 percent of the total initial designed lumens shall be emitted at an angle of 90 degrees or higher from nadir (straight down)

2. 3 LED FIXTURES

A. General:

1. Fixture to be an assembly consisting of LED light source array, housing, and electronic power supply, in accordance with UL 1598, UL 8750. Supply voltage as noted on the drawings.

2. Outside fixtures to be completely sealed against moisture and listed under UL 1598, for luminaires in wet locations.

3. The fixture lens shall be clear convex tempered glass.

4. Minimum service life of luminaire of 70,000 hours.

5. Power supply shall be rated for a life expectancy equal or greater than the luminaire, be designed for dimming and incorporate surge protection device (SPD) to protect against electrical transients. Each luminaire shall be independently fused.

6. Electronic module shall have operating temperature -40 deg F to 165 deg F, or better with built in thermal overload.

7. Power factor of unit to be 0.9 or higher and induce total harmonic distortion (current and voltage) of 20% or less in the AC supply line.

8. Control: Outside fixtures to include motion detection and automatic dimming when area is not occupied. Dimming bi-level 50%, or user adjustable dimming level.

9. Cut-off Requirements: Exterior lights shall have full cut-off light distribution.

10. Warranty: 5-year minimum manufacturer's warranty unless stated otherwise.

B. Car parking lighting (Not Used)

1. Post top mounted LED luminaire with die-cast aluminum housing, and integral motion detector, designed for lighting parking lots.

2. Finish: Metal parts of luminaire, pole and adapters, finished with corrosion resistant durable, dark bronze, powder coat finish

3. Pole: 20-foot round steel pole with 2 foot concrete base.

4. Approved manufacturer:

    a. Lithonia Lighting DSX2 LED 80C 700 40K T3M MVolt with integral motion detection. 20 foot round steel silver finish pole.

    b. Or equal.

C. Sports field lighting

1. Luminaires, poles, mounting hardware and lighting control system to be supplied by the same manufacturer.

2. Luminaires: High Lumen heavy-duty weather resistant LED Flood Light luminaire with die-cast aluminum housing designed for mounting on tall poles for sports field lighting.

    a. Adjustable yoke mounting to allow field adjustment of light on sports field. Provide an aiming plan for each sports fixture.

    b. UL listed and labeled as suitable for wet locations.

3. Remote lamp driver: Each floodlight to be operated from a remote lamp driver mounted inside a weather resistant enclosure mounted on the pole.

    a. Wiring between luminaires and ballast to be pre-wired and internal to pole.

    b. Driver to provide remote luminaire dimming control.

c. Pole disconnect, fuse per light circuit and surge protection to be provided inside the cabinet

d. Color rendering: CRI of 57000K

e. Electrical supply: 480 volts, 3 phase.

4. Finish: Metal parts of luminaire, pole and adapters, finished with corrosion resistant durable galvanized or sliver powder coat finish.

5. Pole mounting height as shown on the drawings. Pole structure to meet the following requirements:

a. Hybrid steel and pre-stressed concrete multi-section pole with pre-stressed concrete base foundation designed for direct embedment.

b. Designed to meet AASHTO requirements for wind loading, with deflection not exceeding 1.1% of the free height of the pole, under a wind loading equivalent to half of the specified maximum wind speed, including a 1.4% gust factor.

c. Provide a 4 x 10” conduit entrance opening approximately 10” below grade, and a 3.5” x 10.5” hand-hole frame with flush cover approximately 36 inches above grade.

d. Pole foundations: See paragraph 2.5 of this Section.

6. Mounting hardware. Heavy-gauge steel protected by a weather resistant coating. Adjustable yoke to allow field adjustment of light on sports field.

7. Approved Manufacturer: MUSCO Lighting or equal.

D. Security lighting mounted on sports field poles

1. Provide security light on each sports pole, mounted at 18 feet above grade, directed into the field. Include mounting hardware and driver boxes.

2. Luminaires: High Lumen heavy-duty weather resistant LED security light luminaire with die-cast aluminum housing designed for pole mounting.

3. Adjustable yoke mounting to allow field adjustment of light direction from each fitting.

4. UL listed and labeled as suitable for wet locations.

5. Color rendering: CRI of 57000K

6. Electrical supply: 277V single phase supply, with dimming control.

7. Approved manufacturer: CREE OSQ Series area flood.

2.4 LIGHTING CONTROLS

A. General: Provide an automatic, lighting control system manufactured by the sports lighting manufacturer.

B. Control system to be enclosed in a dedicated NEMA 3R cabinet containing all lighting contactors, switches, terminals and a microprocessor-based controller. The system to provide the following functionality:

1. A web based remote scheduling system allowing authorized users to control and monitor remotely by lighting zone. Control parameter options to include time of day, sun rise/ sunset times, and photocell input. Output control to include lighting On/ Off and dimming. Schedules to be stored by controller. Schedules able to be set up for a minimum of seven days in advance.

2. Astronomical time clock, with automatic daylight savings compensation, and calculation of sunrise/ sunset times.

3. Photocell input.

4. Off-On-Auto switches to allow for maintenance and manual operations of lights

5. Key over-ride, High-Medium-Low-Auto switches for light pre-set level dimming control.

6. Minimum of seven zones and twelve lighting contactors (30A/ 60A) per cabinet.

C. Photocells:

1. Provide automatic ON/OFF switching photo control device, completely self-contained in the die-cast aluminum housing, not affected by moisture, vibration, or temperature changes; ON at dusk and OFF at dawn; time delay feature to prevent false switching; and field adjustable to control operating levels.
Provide a by-bass switch to override photocell. Photocell to be compatible with lighting control panel.

2. Approved Manufacturers: MUSCO Control-Link or equal.

2.5 FOUNDATIONS

A. Install required number and type of reinforced concrete pole bases as indicated on the Contract Drawings.

B. Contractor to prepare pole and foundation drawings for each type of pole, pole loading, and soil type, and submit to the Engineer for approval. Drawings to be stamped by a certified structural Engineer, Register in California. Drawings to show design criteria, soil type, assumptions, code standards, size of foundation, depth of embedment, reinforcing, and backfill material.

C. Typical sports pole foundations are provided in Attachment A of this Section.

PART 3 -- EXECUTION

3. 1 INSTALLATION OF LIGHTING FIXTURES (LUMINARIES)

A. General:

Install fixtures in a manner recommended by the fixture manufacturer and accepted by the

City Engineer.

1. Furnish and install all additional supports, and other structural reinforcements to the concrete pole bases required to properly and safely mount luminaires, all acceptable to the City Engineer.

2. Be responsible for handling the luminaires, installing plumb and level, and keeping luminaires clean.

3. Where pole foundation penetrates the below ground liner in the bio-swale, seal liner to pole as indicated on the drawings.

4. After construction of total project is completed, remove all labels and other markings, wash dirty luminaires inside and out with a nonabrasive mild soap or cleaner. Clean luminaire plastic lenses with antistatic cleaners only. Touch up all painted surfaces of luminaires with high-grade exterior enamel, and poles with paint supplied by manufacturer.

B. Finished Areas:

1. Locate luminaires where shown on the Site Plan.

2. Install all luminaires straight and true.

3. Exterior fixtures requiring exposed exterior boxes shall be mounted on approved cast boxes equipped with suitable gaskets.

All adjustable lighting fixtures shall be aimed (during non-daylight hours) and set to the satisfaction of, and in the presence of, the City Engineer.

3.2 INSTALLATION OF LAMPS

A. After installation clean all lamps.

3. 3 MISCELLANEOUS

A. Provide all metal shims, spacers and/or mounting bolts necessary,

B. Louvers, diffusers or lenses shall not be installed in lighting fixtures until such time as all glazing has been completed and all construction work involving plastering, grinding, sanding, painting, etc., and final clean-up sweeping and dusting have been completed by the Contractor as noted in Subsection 1. 4 of this Section.

C. Reflector surfaces and lamps in all lighting fixtures shall be thoroughly cleaned of accumulated dust, dirt, plaster, paint, etc., before the installation of the louvers, diffusers or lenses.

D. After completion of this portion of the work, it shall be the responsibility of the Contractor to clean and/or repair any damage to the finished building caused by this work, to the complete satisfaction of the Architect at no added cost to the City.

3.4 INSTALLATION OF BALLASTS/ DRIVERS

A. Install in strict accordance with manufacturer's recommendations.

B. After the installation is completed, remove and replace any ballast or driver which are judged by the City Engineer to be excessively noisy.

3.5 LIGHTING CONTROL

A. Photocell: Install photo control as shown on Drawings.

B. Lighting Control Panel: Install as shown on the drawings and in strict compliance with manufacturer's recommendation

C. Lighting control panel Configuration: Provide initial configuration of control panel and web interface. Configure to ENGINEERS direction. Document configuration.

D. Contractor to notify lighting Control Panel Manufacturer at least 7 days before activation of the lighting system to allow him to run diagnostics and confirm system programming. Contractor shall assist with any needed corrections Manufacturer identifies.

3.6 FIELD QUALITY CONTROL

A. Inspect each installed fixture for damage. Replace damaged fixtures and components.

B. Advance Notice: Give dates and times for field tests.

C. Provide instruments to make and record test results.

D. Provide independent 3rd party testing and verification that installed lighting systems meet specified material and performance requirements. 3rd party shall be independent from the lighting subcontractor, and perform tests including but not limited to:

1. Verify normal operation of each fixture after installation.

2. Verify motion detection and dimming control.

3. Verify actuation and termination on photocell, timer, or other control function, as applicable, and in coordination with required testing per Section 16570.

4. Perform lighting illumination field measurement and analysis to demonstrate lighting system conforms to the requirements in Section 2.2.

5. Measure spill lighting levels at property boundary to ensure light level is within requirements detailed in paragraph 2.2.B of this Section

6. Report results in writing. Discuss any discrepancies with Engineer

E. Malfunctioning Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.

F. Corrosive Fixtures: Replace during warranty period.

3.7 COMMISSIONING (FOR LIGHTING CONTROL SYSTEMS)

A. Check the lighting systems start up and ensure that the all lamps are operational and fixtures are clean.

B. Check motion sensor placement and test reliability of activation/deactivation.

C. Test photocells for functionality and accuracy.

D. Check switches to ensure proper operation and circuiting.

E. Check lighting schedules to ensure they are programmed per the ENGINEER direction.

F. Test operation of circuits by changing system date and time to cause various circuits to switch modes.

G. For exterior fixtures, simulate night mode to validate function. Measure and record light level to ensure they meet the requirements and are generally provide adequate security. Check for excessive light level fluctuations or dark spots.

SECTION 16380
MUNICIPAL FACILITIES UNINTERRUPTIBLE POWER SYSTEM

PART 1 -- GENERAL

1.1 SCOPE

A. Required**:** Furnish and install the single or three phase uninterruptible power system (U.P.S.) and all accessories indicated on the Contract Drawings and herein specified.

B. Comply with the GENERAL CONDITIONS, GENERAL REQUIREMENTS and the requirements of Section 16020 of this DIVISION 16 concerning definitions, guarantees, submittals, as-builts, clean-up, etc. as applicable to work of this Section.

1.2 RELATED WORK

A. Related Sections: The following sections contain requirements that relate to this section:

1.3 LEGAL REQUIREMENTS AND STANDARDS

A. Comply with applicable Codes and Standards noted in Subsection 1.5 of Section 16020 and the following additional commercial standards:

1.	ANSI/IEEE 241	Electric Power Systems in Commercial Buildings, Recommended Practice for.
2.	ANSI/NEMA 250	Enclosures for Electrical Equipment.
3.	EIA	Electronic Industries Association Standards.
4.	IEEE-587	Standards for Surge Suppression.
5.	NEC	National Electrical Code; Article 700 Emergency Systems.
6.	NEMA PB2	Panelboard.
7.	UL 1012	Underwriter's Laboratory Listing.
8.	UL 1778	UL Standard for Safety – Uninterruptible Power Supply Equipment.
9.	IEEE 944	Recommended Practice for the Application and Testing of Uninterruptible Power Supply for power generating stations.
10.	NEMA PE1	Uninterruptible Power Systems.
11.	California Code of Regulations Commercial Standard:	Title 8, Industrial Relations Subchapter 5, Electrical Safety Orders.

1.4 SUBMITTALS

A. General: Conform to applicable provisions of Subsection 1. 6G in Section 16020 - GENERAL ELECTRICAL REQUIREMENTS.

B. Shop Drawings and Catalogue Data: Required to provide sufficient information to indicate scope and quality of the UPS System installation as follows:

1. Block diagram showing system relationships of major components and quantities and interconnecting cable requirements.

2. Control console and panel arrangements, equipment outlet devices, and special mounting details.

3. Wiring diagrams showing terminal identification for field-installed wiring.

4. One-line diagram showing input, output, DC, and bypass circuit breakers and their sizes

5. Operating and services manuals, furnish 6 copies for the system. The manuals shall be bound in flexible binders and all data contained therein shall be printed or typewritten. Each manual shall include all instruction necessary for proper operation and receiving of the system, and shall include a complete block diagram of the system, a complete circuit diagnosis of the system, and a wiring designation schedule for each amplifier as well as other major components, and a replacement parts list.

6. Outline, plan, and elevation drawings, showing dimensions. Mechanical details shall include anchor bolt size and location requirements and net operating and shipping weights for the equipment.

C. The CONTRACTOR shall obtain and submit to the Engineer the test reports for All equipment and material subject to factory testing.

D. The CONTRACTOR shall obtain from the manufacturer all pass codes necessary To perform diagnostic testing and troubleshooting of the system. These pass codes shall be submitted to the ENGINEER and included in the operations and Maintenance manuals.

E. Test Reports: Contractor to provide to the City a bound report of all inspections and tests required in Section 3.

1.5 QUALITY ASSURANCE

A. General: Conform to applicable provisions noted in Subsection 1.7 of Section 16020 - GENERAL ELECTRICAL REQUIREMENTS.

B. Uninterruptible power system components shall be manufactured by firms that are regularly engaged in the production of UPS system including auxiliary equipment similar to that required for this project and that have been in satisfactory service for at least 10 years.

C. Operation of the uninterruptible power system shall be demonstrated to the City Engineer to prove that under normal conditions UPS will provide power to the designated load without interruptions of functions and loss of stored information.

D. The UPS system, when specified as a three-phase unit, shall be a three-phase system in one unit. Use of three single-phase units to comprise a three-phase system is not acceptable.

E. Fabrication and assembly: Unless otherwise specified, the UPS shall be shop assembled in a single enclosure and shall utilize interchangeable plug-in printed circuit boards and power conversion components wherever possible. Shop assembly shall be performed by the UPS manufacturer; systems fabricated or assembled in whole or in part by parties other than the UPS manufacturer will not be acceptable.

F. Printed circuit boards: All printed circuit board components shall be sprayed on both sides with corrosion inhabitant compound, Konform C416, or equal.

G. During the warranty period, the CONTRACTOR shall respond to trouble calls with a competent repair person at the project site within 24 hours; the CONTRACTOR shall also maintain a full inventory of replacement parts so that all routine repairs can be completed within 24 hours. The manufacturer shall have a local representative to provide technical services.

1.6 WARRANTY

A. General Warranty: Special project warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

B. Special Project Warranty:

1. All materials and equipment furnished and installed here under shall be new and free from all defects.

2. The Contractor shall guarantee the uninterruptible power system (UPS) including equipment and labor for a period of two (2) years from the date of final acceptance.

3. Should any trouble develop within two (2) years from date of final acceptance of the work, due to faulty material and/or workmanship, the trouble shall be corrected by the Contractor without expense to the City.

1.7 MAINTENANCE

A. Required**:** The Contractor shall respond to trouble calls with a competent repair person at the project site within 24 hours; Contractor shall also maintain a full inventory of replacement parts so that all routine repairs can be completed within 24 hours.

PART 2 -- PRODUCTS

2.1 THE SYSTEM

A. General Description**:** This Specification describes a continuous duty, single-phase on-line, solid-state uninterruptible power system (UPS). The UPS shall operate in conjunction with the plant

electrical system to provide power conditioning, back-up, and distribution for electronic equipment loads.

B. The UPS shall consist of the following major equipment:

1. Inverter/charger.

2. Static bypass switch.

3. Enclosed, sealed, maintenance-free battery. Battery cabinets for longer protection times.

4. Input, battery, and output breakers.

5. Microprocessor controlled logic and control panel.

6. Six-pole output distribution panelboard.

7. System Metering.

8. Control Panel Display.

2.2 MODES OF OPERATION

A. Modes of This On-Line Fully Automatic System**:**

1. Normal: The critical load is continuously controlled by the inverter/charger. It derives power as needed from the commercial ac source and supplies filtered and regulated ac power to the critical load. In addition, simultaneous float-charging of the battery occurs.

2. Emergency: Upon failure of the commercial ac power, the critical load continues to be supplied by the inverter, which without any switching obtains its power from the storage battery. There is no interruption to the critical load upon failure or restoration of the commercial ac source.

3. Recharge: Upon restoration of the commercial ac source, the inverter/charger recharges the battery. This is an automatic function and causes no interruption to the critical load.

4. Bypass Mode: If the UPS must be taken out of service for overload, load fault, or internal failures, the bypass switch automatically transfers the load to the commercial ac power. Return from bypass mode to normal mode of operation is automatic, except for overload trip which requires manual reset. Transfer to bypass mode can also be initiated manually by operating a key controlled ON/OFF switch on the control panel.

5. Maintenance Mode: If the UPS must be taken out of service for maintenance or repair, the external manual bypass switch must be operated to transfer the load to the alternate source. This transfer shall occur without interruption.

6. Downgrade: If the batteries alone are taken out of service, they shall be disconnected from the by circuit breakers. The UPS shall continue to function and meet all of the performance criteria specified herein, except for the reserve time capability.

2.3 UPS PERFORMANCE CHARACTERISTICS

A. Power Ratings**:** 3.0 kVA or as calculated to meet specified backup power requirements for load power factor range of 0.85 lagging to 0.9 leading.

B. Input:

1. Nominal Input Voltage and Frequency: 60 Hz models: 120/240 vac, single-phase

2. Operating Input Voltage Range: +13 percent to -20 percent of nominal without battery discharge.

3. Input Power Factor: 0.9 minimum at full load and nominal input voltage.

4. Input Current THD: 10 percent typical at full load (linear or non-linear).

5. Input Surge Suppression: Per IEEE-587 Standards.

C. Output:

1. Nominal Output Voltage: Same as input voltage.

2. Output Voltage Regulation: Within $\pm$2 percent from nominal output voltage for all operating conditions.

3. Manual Output Voltage Adjustment: Within $\pm$5 percent from nominal.

4. Transient Voltage Response: Within ±8 percent from nominal peak voltage for a 100 percent load step.

5. Transient Voltage Recovery: 100 msec to within ±2 percent of nominal.

6. Frequency Regulation: ±0.1 Hz.

7. Output Voltage Harmonic Distortion: 3 percent THD for 100 percent linear load, [5] [10] percent THD for 100 percent non-linear loads at nominal input voltage.

8. Output fully isolated from input and battery.

9. Common mode noise attenuation (without static switch): 55 dB up to 500 kHz.

D. Static Bypass: A static bypass switch includes transfer control logic which automatically transfers the load to bypass upon the following conditions:

1. Output overvoltage or undervoltage.

2. Overload condition of a duration longer than 10 minutes.

3. Overtemperature.

4. Inverter failure.

Return to UPS mode of operation upon restoration of normal operating conditions shall be automatic except for overload or inverter failure which shall require a manual restart. Electro-

mechanical transfers are break before make.

E. Microprocessor Controlled Logic: Fully automatic operation of the UPS shall be provided through the use of microprocessor controlled logic. All operating and protection parameters shall be firmware controlled, to eliminate the need for manual adjustments to compensate for component tolerances. The logic includes system and battery test capability to facilitate maintenance and troubleshooting. Start-up, transfers, and battery recharge shall be all automatic functions.

F. Control Panel**:** The UPS shall be equipped with a control panel that provides the following metering, monitoring, and control functions:

ac input voltage	(LINE VOLT)
ac input current	(LINE AMP)
ac input frequency	(LINE HZ)
dc battery voltage	(BATT VOLT)
dc battery current	(BATT AMP)
ac inverter voltage	(LOAD VOLT)
ac inverter current	(LOAD AMP)
ac inverter frequency	(LOAD HZ)

The metering display shall automatically blank after five minutes.

1. Alarm Monitoring: The following alarm indicators shall be provided on the control panel display:

   a. System Normal (Green): Line is supplying power to the UPS. The UPS is controlling the load voltage, and charging the battery.

   b. Alarm (Red): This indicator flashes whenever an alarm condition exists.

   c. Battery undervoltage (Yellow): The battery voltage has fallen below 128 v dc. Alarm condition ceases when the battery voltage reaches 132 v dc.

   d. Battery discharge (Yellow): The battery is supplying power to the load.

   e. Output Overload (Red): The output current exceeds the maximum rating of the system. If the output current exceeds 105 percent of system rating for 10 minutes, the system will respond by transferring to bypass.

   f. Sync Loss (Red): The utility line frequency has exceeded safe operating tolerances (±1 Hz or ±3 Hz, switch selectable) and/or the UPS is not synchronized within 5 degrees phase angle of the desired operating point.

   g. AC Input Failure (Red): The line voltage is not within normal operating range for the equipment (+13 percent to -20 percent of nominal). The load is being powered by the battery, if not in bypass mode of operation.

   h. Over Temp (Red): The internal temperature of the UPS cabinet is above 65 degrees C. UPS will transfer to bypass.

   i. Shutdown Imminent (Red): Inverter shutdown is imminent (triggered by the battery discharging below 110 v dc or output overload over eight minutes). The load will be dropped when the battery falls below 95 v dc or the overload exceeds 105 percent for 10 minutes unless the bypass reacts.

j. On Bypass (Red): The load is receiving power which is bypassing the power protection circuitry of the UPS.

k. Inverter not ready (Red): The inverter is not ready to support the critical load.

2. Controls: The following control functions shall be provided on the control panel:

ON/OFF: Key operated switch which activates and deactivates UPS operation.

Alarm Off: Pushbutton which silences the audible alarm. The alarm will sound again at the reoccurrence of an alarm condition.

Test: Pushbutton which initiates a system test routine by simulating a utility power outage. The critical load will be supplied by the battery. When the pushbutton is released, the control circuitry resynchronizes the inverter to the input line and resumes battery charging.

3. Other controls located behind the front door shall include:

Audible Alarm Volume Control: Loud, soft and off.

Manual Restart: Pushbutton used to restart UPS after an overload or inverter failure trip.

G. Alarm Contact: A dry type summary alarm contact shall be provided for remote indication of alarm conditions.

H. Built-In Distribution: A 6-pole distribution panelboard shall be provided on the output of the system.

I. Environmental Conditions:

1. Efficiency at full, unity power factor load and nominal input voltage: 90 percent for a 3.0 kVA model, or 85 percent for a 1.5 kVA model.

2. Elevation: 5,000 feet (1,500 m) without derating.

3. Acoustical Noise: 50 dB at one meter. (Measured at +25 degrees C.)

4. EMI Suppression: Electromagnetic effects are minimized to ensure that computer systems or other similar electronic systems are neither adversely affecting to, nor are adversely affected by, the UPS. The UPS is certified to meet the requirements of Class A, Subpart J of Part 15 of the FCC Rules and Regulations.

5. Electrostatic Discharge (Commonly Encountered in Carpeted Offices) Immunity: Withstands up to ±25 kV with no disturbance or adverse effect to the load.

6. Ambient Temperature: 40 degrees C.

J. Battery Pack: The battery consists of battery tray(s) either fully enclosed within the UPS cabinet or enclosed in metal cabinet(s) which match the UPS module in appearance. Individual battery trays are modular and individually fused.

1. Battery Type: a sealed, maintenance-free, high-rate
type battery shall be used as a stored energy source for the UPS. The battery shall be sized to

support the inverter at rated load or the kilowatt load specified for the protection time specified 60 min. The battery shall consist of one or more banks of cells as required, and be a common source for each inverter.

2. Expected Life: 5 years or 200 full discharge cycles at full load.

3. Minimum Final Discharge Voltage: 1.66 volts per cell.

4. Nominal Float Voltage: 2.25 volts per cell.

5. Battery Circuit Breaker: A molded case breaker is provided for battery short circuit protection and as a means of manual disconnection for battery maintenance.

2.4 FUNCTIONAL DESCRIPTION

A. Inverter/Charger**:** The inverter/charger shall employ Pulse Width Modulation (PWM) technology utilizing transistor power blocks as switching elements. The inverter shall be capable of providing the specified quality output power while operating from the ac utility or dc source within the specified operating range. In addition, the inverter shall simultaneously float charge the battery.

B**.** Electrical Protection:

1. Input protection shall be provided by a thermal-magnetic molded case circuit breaker and transient suppression circuitry.

2. Battery protection shall be provided by individual fusing of each battery tray and a thermal-magnetic molded case circuit breaker.

3. Output protection shall be provided by thermal-magnetic circuit breaker(s), fuses in the inverter circuit, and current limit circuitry.

2.5 ENCLOSURES

A. The UPS shall be housed in a free standing, double dead front (safety shields behind front door) enclosure equipped with casters and leveling feet. Enclosures shall be designed for office or computer room applications. If system consists of more than one cabinet, the cabinets shall be shipped with joining hardware to be bolted together at time of installation.

B**.** Ventilation: Electronics cabinets shall be designed for natural conversion cooling aided by a thermostatically controlled fan. Air inlets shall be in the lower front and rear; air outlets shall be in the upper rear. Battery cabinets shall be convection cooled.

C. Cable Entry: Units equipped with input cord and plug and output receptacles shall not require any installation. Hard wired systems shall provide for conduit entry through knockouts located in the rear of the unit. Connection between UPS and battery cabinets shall be provided and shall consist of cables and power plugs.

D. Front Access: Major subassemblies shall be modular and shall be replaceable from the front of the unit.

2.6 WARRANTY:

A. The system warranty shall be no less than 12 months after initial startup, and must include all costs including repair, parts, labor, travel and living expenses for the manufacturer’s service

personnel, within the United States. The manufacturer shall guarantee, in writing, the stated system efficiency.

2.7 DOCUMENTATION AND TRAINING.

A. The UPS shall be supplied with sufficient documentation, including a concise operation and maintenance manual, also including proprietary troubleshooting information, to allow training personnel to troubleshoot and service the UPS. The UPS vendor shall make available a maintenance training school for customer personnel.

B. Operating and Maintenance Manual: The CONTRACTOR shall furnish 6 copies of the operating and maintenance manuals. The manuals shall possess sufficient detail and clarity to enable the owner's technicians to understand and operate the system equipment, and to identify replaceable parts.

PART 3 -- EXECUTION

3.1 GENERAL

A. The uninterruptible power system shall be installed as shown, shall conform with Section 16010, Wastewater Facilities General Electrical Requirements and in accordance with the equipment manufacturer's installation instructions.

B. Detailed Requirements:

1. The Contractor shall receive, store, and assemble all sections of the UPS to form complete units. The Contractor shall make all internal wiring interconnections as required for complete assembly of each UPS. Where wiring connectors are not supplied by the manufacturer, the Contractor shall furnish the connectors required to complete internal wiring terminations.

2. The Contractor shall take all necessary precautions to eliminate moisture and foreign material from the equipment at all times during storage and installation. Special care shall be taken to prevent corrosion of and damage to the UPS.

3. Each UPS shall be set level and plumb on its floor channels furnished, installed, and grouted in by the Contractor as shown. The Contractor shall furnish all shims necessary to accomplish these requirements.

3.2 INSTALLATION

A. The UPS system shall be set in place, wired and connected in accordance with the approved shop drawings and manufacturer's instructions.

B. Equipment shall be adequately anchored and braced per details on structural contract drawings to withstand the seismic forces at the location where installed.

3.3 ACCEPTANCE INSPECTION AND TESTS

A. Installation, adjustment and testing of the equipment shall be supervised by a manufacturer's representative.

B. All tests shall be witnessed by the ENGINEER.

C. Field Tests: As a minimum, the startup and field test procedures shall include the following:

1. Compare equipment nameplate data with specifications and approved shop drawings.
2. Ensure that shipping members have been removed.
3. Inspect physical, electrical, and mechanical condition.
4. Clean the UPS.
5. Attach a phase rotation meter to the UPS input, output and bypass buses, and observe proper phase sequences.
6. Torque test bus and battery connections at shipping splits.
7. Check each electrical bus for proper phasing and identification.
8. Check and test selector switches and meters for proper operation.
9. Check doors for proper alignment and operation.
10. Check and test each protective device for proper mechanical and electrical operation.
11. Verify protective device overcurrent trip settings against approved coordination study.
12. Verify the correct operation of all sensing devices, alarms, and indicating devices.
13. Perform manufacturer's onsite field test procedures.
14. Demonstrate to the ENGINEER that the interlocks have been tested and agree with the interlocking scheme.

D. Load Test: The installed system shall be load tested for a continuous 24 hour period by means of resistive load banks, provided by equipment manufacturer. The system shall be continuously tested at 1/2 load for 8 hours, 3/4 load for 8 hours and full load for 8 hours. Instrument readings shall be recorded every half hour for the following:

1. Input voltage and current (all three phases, for each module).
2. Input and output frequency.
3. Battery voltage for each module.
4. Output voltage and current (all three phases, for each module).
5. Output kilowatts for each module.
6. Output voltage and current (all three phases).
7. Output kilowatts.

E. Full Load Burn In Test :

1. The installed system shall undergo an additional full load burn-in period of 24 continuous hours. If a failure occurs during the burn-in period, the tests shall be repeated. Instrument readings shall be recorded every half hour as above. During the burn-in period, the following tests shall be performed:

    a. With the UPS carrying maximum continuous design load and supplied from the normal source, switch 100 percent load on and off a minimum of five times within the burn-in period.
    b. With the UPS carrying maximum continuous design load and supplied from the emergency source, repeat the switching operations described. Also, verify that the UPS module rectifier charger unit(s) go into the second-step current limit mode.
    c. With the UPS carrying maximum continuous design load and operating on battery power, repeat the switching operations described above.
    d. Continue operation on battery power for 1 minute, and then restore normal power.

F. Battery Discharge Test:

1. With the battery fully charged, the system shall undergo a complete battery discharge test to full depletion and a recharge to nominal conditions. Instrument readings shall be recorded every minute during discharge for the following:

    a. Battery voltage and current for each module.
    b. Output voltage and current (all three phases) for each module.
    c. Output kilowatts for each module.
    d. Output voltage and current (all three phases - system output).
    e. Output kilowatts (system output).
    f. Output frequency.

3.4 POSTING FRAMED DATA AND INSTRUCTIONS

Wiring and control diagram instructions and data shall be framed and posted under acrylic glass in a location adjacent to the UPS system as directed by the ENGINEER. Condensed operating instructions, prepared in typed form, shall be framed as specified above and posted beside the diagrams. The framed instructions shall be posted before acceptance testing of the system.

3.5 FOLLOW-UP VERIFICATION

Upon completion of acceptance checks, settings, and tests, the Contractor shall show by demonstration in service that the central uninterruptible power supply is in good operating condition and properly performing the intended function.

3.6 TRAINING OF CITY PERSONNEL

A field training course shall be provided by a certified factory-trained technician for designated City personnel. Training shall be provided for a total period of 8 hours of normal working time and shall start after the system is functionally complete but prior to final acceptance test. Field training shall cover the items contained in the operating and maintenance manuals.

SECTION 16490
ELECTRIC MOTORS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. General: The CONTRACTOR shall furnish and install electric motors, accessories, and appurtenances as specified herein and in conformance with the individual specifications of driven equipment, to provide a complete and operable installation, all in accordance with the requirements of the Contract Documents.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The work of the following Sections and Divisions applies to the work of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this work.

1. Section 16020 Municipal Facilities General Electrical Requirements.

2. Division 16 as applicable, Electrical.

3. Division 11 as applicable, Equipment.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. All work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these specifications.

1. LAEC City of Los Angeles Electrical Code, latest adopted edition.

2. Commercial Standards

NEMA MG 1	Motors and Generators
NEMA MG 2	Safety Standard for Construction and Guide for Selection, Installation and Use of Electric Motors and Generators
NEMA MG 10	Energy Management Guide for Selection and Use of Polyphase Motors
I EEE 43	Recommended Practice for Testing Insulation Resistance of Rotating Machinery
IEEE 85	Standard Test Procedure for Airborne Sound Measurement on Rotating Electric Machinery
I EEE 112	Standard Test Procedure for Polyphase Induction Motors and Generators.

I EEE 113 Guide on Test Procedures for DC Machines

I EEE 115 Test Procedure for Synchronous Machines

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with the requirements of Section 16020 Municipal Facilities General Electrical Requirements.

B. Complete motor data shall be submitted with the driven machinery shop drawings. Motor data shall include:

1. Machine name and specification number of driven machine.

2. Motor manufacturer.

3. Motor type or model and dimension drawing.

4. Nominal horsepower.

5. NEMA design.

6. Frame size.

7. Enclosure.

8. Winding insulation class and treatment.

9. Rated ambient temperature.

10. Service factor.

11. Voltage, phase, and frequency rating.

12. Full load current at rated horsepower for application voltage.

13. Starting code letter, or locked rotor kVA, or current.

14. Special winding configuration such as part-winding, star-delta. Include winding diagram.

15. Rated full load speed.

16. Power Factor at full load.

17. Noise certification and data sheets.

18. Replica of motor nameplate.

19. Bearing types and catalog numbers.

C. If water cooling is required for motor thrust bearings, the shop drawing submittals shall indicate this requirement.

D. The following submittals and specific information shall be provided.

1. General Description:

a. Motor dimensional drawings. Net motor weight shall be noted on the dimensional drawings. Shipping weight shall also be noted if motors are to be shipped separately from the driven equipment.

b. Complete motor rating and enclosure type

c. Lists of special characteristics and features being provided as specified

d. Bearing life

e. Type of bearing lubrication

f. Statement that carbon brushes are being provided that are suitable for the low speed, continuous operation specified

2. Motor Characteristics:

a. Guaranteed minimum efficiency at rated load at rated voltage.

b. Guaranteed minimum power factor at rated load at rated voltage.

c. Expected efficiency at 1/2, 3/4, and full load at rated voltage.

d. Expected power factor at 1/2, 3/4, and full load at rated voltage.

e. Motor no-load current at rated voltage.

f. Full load current at rated voltage.

g. Full load current at 110 percent voltage.

h. Starting current at rated voltage.

i. Full load speed.

j. Certified copy of test report for identical motor tested in accordance with NEMA MG 1-12.53a and IEEE Standard 112, Test Method B, showing full load efficiency not less than specified value. Motors not as specified will be rejected.

k. Recommended maximum kVAR of power factor correction capacitors when capacitors are switched with motor.

l. Time in seconds motor can be subjected to locked rotor current at rated voltage without damage to motor with (1) motor initially at rated ambient temperature, and (2) with motor initially at rated temperature rise.

m. Speed torque curves

3. Motor Tests and Test Reports:

a. Certified copies of test reports on actual motors being provided.

b. Short commercial tests, including running light current at rated voltage, high potential, and locked rotor current.

1.5 QUALITY ASSURANCE

A. Quality assurance shall be in accordance with all applicable requirements of Section 16010 Wastewater Facilities General Electrical Requirements.

B. Adjustable frequency driven motors shall be tested as an assembly with the drive and the driven equipment prior to delivery to the site.

1.6 SERVICES OF MANUFACTURER'S REPRESENTATIVE

A. Where motors are part of packaged equipment such as Bridge Crane and Air-Conditioning Unit, a qualified manufacturer's representative shall supervise the unpacking, installation and field testing.

PART 2 -- PRODUCTS

2.1 MATERIALS

A. Materials and equipment shall be standard products of established manufacturers who have produced continuously the type of equipment specified. All equipment and material shall be new and of high quality insuring long life and reliable operation.

2.2 SERVICE CONDITIONS

A. Motors shall be designed and manufactured for continuous severe duty service.

2.3 RATING AND APPLICATION

A. Unless indicated otherwise in Divisions 11, 13, 14 and 15 in which the design equipment is specified or on the motor data sheets, motor enclosures shall be of the following type(s) approved for its intended purpose:

1. Motors installed indoors and outdoors shall be totally enclosed fan cooled (TEFC) with a service factor of 1.15.

2. Motors to be installed in classified areas shall conform to the requirements of NEC Article 500.

B. Motors shall be rated in accordance with the following, unless otherwise specified.

1. Motors below 1/2 hp shall be rated 115 volts, single phase, 60 Hertz and shall be of the capacitor-start, induction-run type.

2. Motors 1/2 hp through 200 hp inclusive shall be rated 460 volts, three phase, 60 Hertz.

3. Motors 250 hp and above shall be rated three phase, 60 Hertz and voltage as specified.

C. Motor mechanical design shall be in accordance with this Specification and the detailed requirements indicated on the individual motor data sheet.

D. The design and construction of all motors shall be coordinated with the driven equipment requirements.

E. Motors shall be designed for full-voltage starting and rated for continuous operation as shown on the Contract Drawings.

F. Motors shall operate successfully under running conditions at rated load at plus or minus 10 percent of rated voltage or plus or minus 5 percent of rated frequency or a combination of the two.

G. In sizing motors, the horsepower rating of the motor, as stamped on the nameplate, shall not be exceeded during any operating conditions of the driven equipment.

H. Starting current at full voltage shall not exceed 650 percent of the motor full load current for all integral horsepower alternating current motors.

I. All motors shall have a safe stall (locked rotor) time equal to or greater than the maximum accelerating time under the worst voltage conditions specified.

J. Motor fans shall be suitable for rotation in either direction. They shall be nonsparking, corrosion resistant material, accurately balanced before assembly on the motor.

K. All motors shall be NEMA Design "B" unless otherwise specified on the motor data sheet, or required by the application.

L. Totally enclosed motors shall be "Severe Duty Chemical Service" type including shaft seals, internal surfaces coated with corrosion resistant paint or epoxy varnish, external surfaces coated with alkyd paint or epoxy enamel.

M. All motors shall be "high-efficiency" design, capable of operating at a higher normal efficiency than the standard industry design.

1. Motors built in NEMA Frames 143T through 445T shall have the guaranteed efficiency stamped on the nameplate. The basis for motor efficiency evaluation shall be IEEE test procedure 112, Method B, using accuracy improvement by segregated loss determination including stray load loss measurements.

2. Motors built in frames larger than 445T shall have the guaranteed efficiency stamped on the nameplate. The test method used in determining efficiency (e.g. Method B-Dynamometer, Method E-Input or Method F-Equivalent Circuit) shall be designated by the CONTRACTOR.

2.4 TERMINAL BOXES

A. Terminal boxes of the split type shall be furnished for each motor unless the base or housing of the motor is of a design which incorporates provisions for incoming cables.

B. Terminal boxes for medium-voltage motors shall have sufficient interior space to permit stress cones to be formed on the incoming cables and to permit the cable shields to be properly terminated and grounded. In addition, boxes shall be sized to contain surge protection equipment.

C. Separate terminal boxes shall be furnished for each accessory device, such as space heaters, temperature detectors, and other items.

D. All boxes shall be heavy duty class, weather tight and thoroughly coated internally and externally with corrosion-resistant paint.

2.5 INSULATION

A. The insulation system shall be Class F with temperature rise (based on maximum ambient temperature of 40 degrees C) of 80 degrees C measured by the resistance method.

B. Motors constructed in NEMA Frame 364 and larger, except totally enclosed motor, shall be vacuum pressure impregnated with 100 percent solids epoxy resins. The completed insulation shall have

a minimum resistance of 10 mega-ohms after 168 hours of testing in a humidity chamber maintained at 100 percent relative humidity and 40 degrees C ambient. In addition, motors with form wound coils shall also meet NEMA MG1-20.48 Qualification Test.

C. Totally enclosed motors shall be dipped and baked in epoxy resin. The completed insulation shall have a minimum resistance of 1.5 mega-ohms after testing as in 2.5B above.

2.6 BEARINGS AND LUBRICATION - HORIZONTAL MOTORS

A. All horizontal motors rated 200 hp and below shall have anti-friction bearings, selected to provide an L10 life of 100,000 hours for direct connected motors and 17,500 hours for belt or chain drive motors when belted or chain driven in accordance with the information contained on the data sheets. Further, bearings shall be re-greaseable while running via installed grease fittings.

B. Bearings on horizontal motors rated 250 hp and larger shall be anti-friction or sleeve-type as indicated on the individual Motor Data sheet(s). Bearings shall be constructed and provided with seals so that dirt, moisture, or lubricant leakage around seals will not enter the motor.

C. Motors which have split capsule type sleeve bearing and split bearing brackets shall be designed to permit bearing replacement without removing the bottom bearing bracket. Reservoirs shall be provided with drains, tapped fill openings and separate level gage glasses. Oil throwers and catchers and close running shaft seals shall be designed to prevent oil escape from the bearings and creepage along the shaft. Vents for equalizing bearing oil pressure shall be provided with screens and caps to prevent the entrance of rodents and the like.

D. Motors with sleeve bearings shall have a minimum motor rotor end float and a maximum coupling end float in accordance with NEMA MG1.

E. The requirement for bearing temperature protection will be specified on the individual motor data sheets. When specified, protection shall be resistance type bearing temperature detectors 120 ohms at 0 degrees C tip sensitive with leads brought out to the head of the device where suitable connection can be made. The detector holder and head assembly shall be suitable for the area classification in which the motors will be installed. The detectors shall sense the temperature at the outer shell of sleeve type bearings.

F. Motors shall be greased type and lubricated with Chevron SRI grease NLGI-2 or equal.

2.7 BEARINGS AND LUBRICATION - VERTICAL MOTORS

A. Vertical motors shall be solid shaft or hollow shaft and bearings shall be anti-friction type grease.

B. Motors for "Process" or "In-Line" service shall be "In-Line, Solid Shaft" type construction with a clamped and locked bearing arrangement. Mounting and shaft extension dimensions and tolerances shall be in accordance with NEMA MG1-18.620 or 18.625. The bearings shall be rated for a L10 minimum life of 2 years or 17,500 hours at the maximum expected up or down thrust the driven equipment may impose during startup or operation at any capacity including shutoff.

2.8 SPACE HEATERS

A. Space heaters shall be supplied to maintain the interior of the motor enclosure above the dew point on all motors 30 hp and larger installed outdoors and on all motors 50 hp and larger installed indoors.

B. Heaters shall be unaffected by the accumulation of moisture and shall have terminals adequately protected against moisture under severe weather conditions. Heaters shall be mounted on noncombustible material and shall operate without thermal damage to the motor or themselves.

Heaters shall be rated 120 volts single phase. They shall have a maximum sheath temperature of 200 degrees C.

C. Leads for the heaters shall be brought out into a terminal box separate from the main power leads terminal box or in a separate cabinet, if required.

D. Where motors are provided with space heaters, warning nameplate shall be red background with white letters and shall read: "CAUTION - CONTAINS AN EXTERNAL VOLTAGE SOURCE."

2.9 WINDINGS AND WINDING PROTECTION

A. Stator windings shall be copper.

B. Leads shall be brought out to a terminal box separate from the main power leads terminal box.

C. Motors 250 hp and larger or as indicated shall be furnished with surge capacitors and lightning arrestors mounted in the main power leads terminal box or in a separate cabinet, if required.

D. Motors controlled by variable frequency shall be supplied with thermostats in two phases as a minimum. Any overload condition shall cause all phases to open.

2.10 GROUNDING

A. Each motor shall have a threaded hole in the motor frame with either a bronze bolt and lock washer or a bronze post-type connector for connection to an external ground conductor. The hole shall be for a 1/2 inch bolt or post-type connector except for motors of 100 hp or less where the size of the bolt or post-type connector may be 3/8 inch. The hole in the motor frame shall be threaded to a depth not less than 1 1/2 times the diameter of the hole to ensure a firm connection. If necessary, a metal pad shall be bonded to the motor frame to provide this depth for the threaded hole. The grounding means shall be located on the same side of the motor as the main lead terminal box.

2.11 BALANCE AND VIBRATION

A. Motors shall be dynamically balanced. Method of measuring dynamic balance shall be when measured in accordance with NEMA MG1-12.06 or MG1-20.52 and with the maximum amplitude values as shown in NEMA MG1-12.05.

B. Motors shall have a maximum peak-to peak amplitude of vibration in accordance with MG1-20.52 when measured in accordance with MG1-12.06 B or MG1-20.53.

2.12 NOISE

A. Maximum sound pressure levels 3 feet from any motor shall not exceed 85dbA.

B. All motors shall be "quiet line" type and shall be so indicated on the submittals, Quiet Line type motors shall be capable of operating at a lower noise level than the standard industry design.

C. Measurement procedures shall in general be guided by the provisions of IEEE Publication No. 85.

2.13 NAMEPLATES

A. Each motor shall have a corrosive-resistant nameplate containing information in accordance with NEMA MG1. In addition the service factor and efficiency shall be included. For motors of 250 hp and larger, the nameplate shall also state any limitations on the number of starts per day, and conditions of restarting.

PART 3 -- EXECUTION

3.1 INSTALLATION

A. Motors shall be installed in accordance with Division 11, EQUIPMENT, Division 16, ELECTRICAL and in accordance with the manufacturer's recommendations.

B. CONTRACTOR shall make provision to protect motors from moisture by connecting power to space heaters.

1. The space heaters shall be connected while in storage and/or before commissioning.

END OF SECTION

SECTION 16560
MUNICIPAL FACILITIES ELECTRICAL SYSTEMS COMMISSIONING

PART 1 – GENERAL

1.1 DESCRIPTION

A. The purpose of this section is to specify Division 16 responsibilities in the commissioning process which are being directed by the CA. Other electrical systems testing are required under the direction of the CM.

B. The list of commissioned equipment and systems is found in Section 01810, Part 1.12.

C. Commissioning requires the participation of Division 16 to ensure that all systems are operating in a manner consistent with the Contract Documents. The general commissioning requirements and coordination are detailed in Division 01. Division 16 shall be familiar with all parts of Division 01 and the commissioning plan issued by the CA and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

1.2 RESPONSIBILITIES

A. Electrical Contractors. The commissioning responsibilities applicable to the electrical contractor are as follows (all references apply to commissioned equipment only):

1. Construction and Acceptance Phases

a. Include the cost of commissioning in the contract price, if not yet let.

b. In each purchase order or subcontract written, include requirements for submittal data, O&M data and training.

c. Attend a commissioning kickoff meeting and other necessary meetings scheduled by the CA to facilitate the construction process.

d. Contractors shall provide normal cut sheets and shop drawing submittals to the CA of commissioned equipment.

e. Provide additional requested documentation, prior to normal O&M manual submittals, to the CA for development of start-up and functional testing procedures.

(1) Typically this will include detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, full details of any owner-contracted tests, fan and pump curves, full factory testing reports, if any, and full warranty information, including all responsibilities of the Owner to keep the warranty in force clearly identified. In addition, the installation and checkout materials that are actually shipped inside the

equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Commissioning Agent.

(2) The Commissioning Agent may request further documentation necessary for the commissioning process.

(3) This data request may be made prior to normal submittals.

2. Provide a copy of the O&M manuals submittals of commissioned equipment, through normal channels, to the CA for review and approval.

a. Contractors shall assist (along with the design engineers) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures

b. Provide assistance to the CA in preparation of the specific functional performance test procedures specified in Section 16570. Subs shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests.

c. Develop a full start-up and initial checkout plan using manufacturer's start-up procedures and the prefunctional checklists from the CA. Submit manufacturer's detailed start-up procedures and the full start-up plan and procedures and other requested equipment documentation to CA for review.

d. During the startup and initial checkout process, execute and document the electrical-related portions of the prefucntional checklists provided by the CA for all commissioned equipment.

e. Perform and clearly document all completed startup and system operational checkout procedures, providing a copy to the CA.

f. Address current A/E punch list items before functional testing.

g. Provide skilled technicians to execute starting of equipment and to execute the functional performance tests. Ensure that they are available and present during the agreed upon schedules and for sufficient duration to complete the necessary tests, adjustments and problem-solving.

h. Perform functional performance testing under the direction of the CA for specified equipment in Section 16570 and 01810. Assist the CA in interpreting the monitoring data, as necessary.

i. Correct deficiencies (differences between specified and observed performance) as interpreted by the CA, CM and A/E and retest the equipment.

j. Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built

conditions.

k. During construction, maintain as-built red-line drawings for all drawings and final CAD as-builts for contractor-generated coordination drawings. Update after completion of commissioning (excluding deferred testing). Prepare red-line as-built drawings for all drawings and final as-builts for contractor-generated coordination drawings.

l. Provide training of the Owner's operating personnel as specified.

m. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

3. Warranty Period

a. Execute seasonal or deferred functional performance testing, witnessed by the CA, according to the specifications.

b. Correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

B. Electrical Designer/Engineer

1. Refer to Section 01810 for the responsibilities of the Electrical Designer/Engineer.

1.2 RELATED WORK

A. Refer to Section 16570 for functional testing requirements.

PART 2 -- PRODUCTS

2.1 TEST EQUIPMENT

A. Division 16 shall provide all test equipment necessary to fulfill the testing requirements of this Division (i.e. light meters).

PART 3 -- EXECUTION

3.1 SUBMITTALS

A. Division 16 shall provide submittal documentation relative to commissioning to the CA as requested by the CA. Refer to Section 01810 Part 3.3 for additional Division 16 requirements.

3.2 STARTUP

A. The electrical contractors shall follow the start-up and initial checkout procedures listed in the Responsibilities list in this section and in 01810 Part 3.4. Division 16 has start-up responsibility and is required to complete systems and sub-systems so they are fully functional, meeting the design objectives of the Contract Documents. The commissioning

procedures and functional testing do not relieve or lessen this responsibility or shift that responsibility partially to the commissioning agent or Owner.

B. Functional testing is intended to begin upon completion of a system. Functional testing may proceed prior to the completion of systems, or sub-systems at the discretion of the CA and CM. Beginning system testing before full completion does not relieve the Contractor from fully completing the system, including all prefunctional checklists as soon as possible.

1. Functional performance tests

a. Refer to Section 16570 for specific details on the required functional performance tests.

2. Testing documentation, non-conformance and approvals

a. Refer to Section 01810 Part 3.6 for specific details on non-conformance issues relating to prefunctional checklists and tests.

b. Refer to Section 01810 Part 3.5 for issues relating to functional performance tests.

3. Operations and maintenance (O&M) manuals

a. Division 16 shall compile and prepare documentation for all equipment and systems covered in Division 16 and deliver to the GC for inclusion in the O&M manuals, according to Section 01810.

b. The C shall receive a copy of the O&M manuals for review.

4. Training of owner personnel

C. The GC shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed. Refer to Section 01810 for additional details.

D. The CA shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment. Refer to Section 01810 for additional details.

E. Electrical Contractor. The electrical contractor shall have the following training responsibilities:

1. Provide the CA with a training plan two weeks before the planned training according to the outline described in Section 01810, Part 3.8.

2. Provide designated Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned electrical equipment or system.

3. Training shall start with classroom sessions, if necessary, followed by hands on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.

4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment is required. More than one party may be required to execute the training.

6. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

7. Training shall include:

    a. Use the printed installation, operation and maintenance instruction material included in the O&M manuals.

    b. Include a review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.

    c. Discuss relevant health and safety issues and concerns.

    d. Discuss warranties and guarantees.

    e. Cover common troubleshooting problems and solutions.

    f. Explain information included in the O&M manuals and the location of all plans and manuals in the facility.

    g. Discuss any peculiarities of equipment installation or operation.

    h. The format and training agenda in Guidelines for Commissioning HVAC Systems, ASHRAE, 1989R, 1996 is a recommended reference.

    i. Classroom sessions shall include the use of overhead projections, slides, video and audio taped material as might be appropriate.

8. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and maintenance of all pieces of equipment.

9. The electrical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.

    a. Training shall occur after functional testing is complete, unless approved

otherwise by the Project Manager.

b. Duration of Training. The electrical contractor shall provide training on each piece of equipment according to the following schedule.

Hours	System
4	Lighting controls, controllers, and schedules
2	Occupancy sensors and photo sensors

F. Deferred testing

1. Refer to Section 01810, Part 3.9 for requirements of deferred testing.

G. Written work products

1. Written work products of Contractors will consist of the startup and initial checkout plan described in Section 01810 and the filled out startup, initial checkout and pre-functional checklists.

END OF SECTION

SECTION 16570
MUNICIPAL FACILITIES ELECTRICAL TESTING REQUIREMENTS

PART 1 – GENERAL

1.1 INCLUDED SYSTEMS AND EQUIPMENT

A. The following is a list of the equipment and system test requirements included in this section:

1. Lighting sweep controls (weekday, weekend, and holiday schedules).
2. Occupancy sensors.
3. Photo sensors (indoor and outdoor).
4. Lighting controllers (indoor and outdoor).

1.2 DESCRIPTION

A. This section specifies the functional testing requirements for Division 16 systems and equipment. From these requirements, the Commissioning Authority (CA) shall develop step-by-step procedures to be executed by the Subs. The general functional testing process, requirements and testing methods definitions are described in Section 01810. The test requirements for each piece of equipment or system contain the following:

1. The contractors responsible to execute the tests, under the direction of the CA.
2. A list of the integral components being tested.
3. Prefunctional checklists associated with the components.
4. Functions and modes to be tested.
5. Required conditions of the test for each mode.
6. Special procedures.

.

7. Required methods of testing.
8. Required monitoring.
9. Acceptance criteria.
10. Sampling strategies allowed.

1.3 PREREQUISITES

A The following applicable generic prerequisite checklist items are required to be listed on each written functional test form and be completed prior to functional testing.

1. All related equipment has been started up and calibrated and start-up reports and prefunctional checklists submitted and approved ready for functional testing. Sample prefunctional checklists can be found in Section 01813. These are

samples and for reference only. Final prefunctional checklists will be provided as part of the Construction Phase Commissioning Plan.

2. All A/E punchlist items for this equipment corrected.

3. These functional test procedures reviewed and approved by installing contractor.

4. Safeties and operating ranges reviewed by the CA.

5. Test requirements and sequences of operation attached.

6. Schedules and set points attached.

7. Record of all values for pre-test set points changed to accommodate testing has been made and a check box provided to verify return to original values (control parameters, limits, delays, lockouts, schedules, etc.).

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3-1 LIGHTING SWEEP CONTROLS

A. Parties Responsible to Execute Functional Test

1. Lighting Controls contractor: operate the controls

2. Electrical contractor: assist in testing sequences

3. CA: to witness, direct and document testing.

B. Prerequisites

1. The applicable prerequisite checklist items listed in the beginning of Section 16570 shall be listed on each functional test form and checked off prior to functional testing.

C. Functions / Modes Required To Be Tested and Test Methods

1. The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable.	Verbal discussion of features
2. Power failure and battery backup and power-up restart functions.	Demonstration
3. Security and access codes.	Demonstration
4. Verify override duration setting.	Demonstration

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
5. Scheduling features fully functional and setup, including weekdays, weekends, and holidays.	Observation in terminal screens or printouts
SWEEP FUNCTIONS	
1. 50% of the zones with a minimum of 2 zones per controller or relay must be verified by turning on at least 25% of the lights in the zone and witnessing an actual sweep.	Either
OVERRIDE FUNCTIONS	
1. Manual occupant overrides: 25% of the local override switches, with a minimum of 4 switches must be verified by turning the override switches ON after a sweep and seeing the lights turn back on. 100% of the remainder of the switches should be sight verified to be in place.	Either

D. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the sweep controls, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

E. Sampling Strategy for Identical Units

1. Sample the units per the above table. If 10% of the units in the first sample fail the functional performance tests, test another 10% of the group (the 2nd sample). If 10% of the units in the 2nd sample fail, test all remaining units in the whole group, fully at the contractor's expense.

3-2 OCCUPANCY SENSORS

A. Parties Responsible to Execute Functional Test

1. Electrical contractor: assist in testing sequences
2. CA: to witness, direct and document testing.

B. Prerequisites

1. All occupancy sensor calibration and set points shall be verified prior to functional testing.

2. The applicable prerequisite checklist items listed in the beginning of Section 16570 shall be listed on each functional test form and checked off prior to functional testing.

C. Functions / Modes Required To Be Tested and Test Methods

1. The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, calibrated, debugged and fully operable.	Verbal discussion of features
2. Occupant over-ride functions and duration setting.	Demonstration
OCCUPANCY SENSOR FUNCTIONS	
1. Test the sequence of operation for all features and modes.	Manual
2. Verify that the controls and sensors are not easily overridden or disabled by occupants.	Visual inspection
3. Verify that the occupancy sensor is in an adequate location and is not being affected by obstructions.	Visual inspection

D. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the dimming controls, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

E. Sampling Strategy for Identical Units

1. Each occupancy sensor and its controlled zone must be tested (no sampling).

3-3 PHOTO SENSORS

A. Parties Responsible to Execute Functional Test

1. Electrical contractor: assist in testing sequences

2. CA: to witness, direct and document testing.

B. Prerequisites

1. All photo sensor calibration and set points shall be verified prior to functional testing.

2. The applicable prerequisite checklist items listed in the beginning of Section 16570 shall be listed on each functional test form and checked off prior to functional testing.

C. Functions / Modes Required To Be Tested and Test Methods

1. The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, calibrated, debugged and fully operable (indoor and outdoor sensors).	Verbal discussion of features
PHOTO SENSOR FUNCTIONS	
1. Test the sequence of operation for all features and modes (weekday, weekend, and holiday schedules) and interlocks with time clocks, if any.	Manual
2. Verify that the controls and sensors are not easily overridden or disabled by occupants.	Visual inspection
3. Verify that the photo sensor is in an adequate location and is not being affected by obstructions.	Visual inspection
DIMMING FUNCTIONS	
1. Verify that dimming does not cause lower than specified light levels in adjacent “non-dimmed” spaces.	

D. Acceptance Criteria (referenced by function or mode ID)

1. For the conditions, sequences and modes tested, the dimming controls, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

E. Sampling Strategy for Identical Units

1. Each photo sensor and its controlled zone must be tested (no sampling).

END OF SECTION

This page intentionally left blank

SECTION 17100
METERS, GENERAL

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish and install all meters and flow measurement devices with associated instrumentation and controls as shown and specified herein, complete and operable, for functions including (but not limited to) flow measurement, density determination, and batch metering of water, wastewater, sludge, chemicals and gases in accordance with the requirements of the Contract Documents.

B. Furnish meters for functions in addition to those listed above wherever required by the Contract Documents and/or required by the specified process.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Division 2 and 11, as applicable.

B. Section 09800 Protective Coating.

C. Section 11000 Equipment General Provisions (Mechanical).

D. Section 16100 Basic Materials and Methods (Electrical).

E. Section 17400 Process Instrumentation and Control.

1.3 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

A. Comply with reference specifications of Section 17400 Process Instrumentation and Control.

B. Commercial Standards:

1.	ANSI/ASME B16.1	Gray Iron Pipe Flanges and Flanged Fittings (Classes 25, 125, 250).
2.	ANSI/AWWA C207	Steel Pipe Flanges for Waterworks Service - Sizes 4 In. Through 144 In. (100 mm Through 3,600 mm).
3.	ANSI/AWWA C701	Cold-Water Meters - Turbine Type, for Customer Service.
4.	ANSI/AWWA C702	Cold-Water Meters - Compound Type.
5.	ANSI/AWWA C704	Propeller-Type Meters for Waterworks Applications.
6.	ASME REPORT	Fluid Meters, Latest Edition.

1.4 CONTRACTOR SUBMITTALS

A. Comply with applicable subsections of Section 17400 Process Instrumentation and Control.

B. Shop Drawings: The CONTRACTOR shall submit complete shop drawings of all meters for review in accordance with Section 01330 Shop Drawings / Submittals of the GENERAL REQUIREMENTS.

Each meter shall be identified with its equipment number / tag number as shown or specified.

C. Manufacturer's Data: With the shop drawings, the CONTRACTOR shall also furnish certified calibration curves indicating flow versus differential pressure and any other information called for in the individual meter specifications.

D. O & M Manuals: The CONTRACTOR shall furnish to the ENGINEER eight (8) copies of complete operation and maintenance instructions for all of the metering systems provided to the project including instrumentation and controls, as specified under Section 01782 Technical Manuals of the GENERAL REQUIREMENTS.

E. Spare Parts: The CONTRACTOR shall obtain and submit from the manufacturer a list of suggested spare parts for each piece of equipment according to the provisions of Section 01781 Spare Parts of the GENERAL REQUIREMENTS. After approval, CONTRACTOR shall furnish such spare parts suitably packaged, identified with the equipment number, and labeled. CONTRACTOR shall also furnish the name, address, and telephone number of the nearest distributor for each piece of equipment. All spare parts are intended for use by the CITY, only, after expiration of the guaranty period. Any spare parts which the ENGINEER permits the CONTRACTOR to use for startup activities shall be replaced by the CONTRACTOR prior to the CITY's acceptance of beneficial use of the equipment.

F. During the term of this Contract the CONTRACTOR shall notify the ENGINEER in writing regarding any manufacturer's modification of the approved spare parts, such as part number, interchangeability, model change or others. If the ENGINEER determines that the modified parts are no longer applicable to the supplied equipment, the CONTRACTOR at its expense shall provide applicable spare parts.

G. Special Tools: A list of special tools required shall be submitted to the ENGINEER for approval. After approval the CONTRACTOR shall supply these tools suitably wrapped and identified for application. Special tools shall include substitute steel spools for each meter for maintenance purposes. Each spool shall be labeled to identify the meter for which temporary replacement is required. The label shall include the meter identification number, size and service.

1.5 QUALITY ASSURANCE

A. Inspection and Testing Requirements: The CONTRACTOR shall obtain the services of an experienced factory service representative to inspect and test all meters for proper performance and installation.

B. Accuracy Requirements: Unless otherwise specified herein, the flow meters shall be guaranteed to register flow to an accuracy of $\pm$2 percent of actual flow throughout the range specified. All density measuring equipment shall have a reference accuracy within $\pm$2 percent of actual solids content over the range specified for each density measurement system.

1.6 MANUFACTURER'S SERVICE REPRESENTATIVE

A. Erection and Startup Assistance: During erection and startup of the plant the CONTRACTOR shall obtain all necessary assistance from an experienced factory service representative to ensure a correct and high quality installation, in accordance with the Contract Documents and the manufacturer's instructions.

B. Instruction of CITY'S Personnel: After completion of the installation and during startup of the plant, the CONTRACTOR shall instruct the CITY'S personnel in the proper operation, maintenance and repair of all metering equipment. For this purpose, the CONTRACTOR shall obtain the services of an experienced factory service representative, who shall spend sufficient time on the site to fully instruct the CITY'S operating personnel on all phases of its equipment. The ENGINEER shall be the sole judge of what is appropriate and sufficient training.

1.7 CLEANUP

A. After completion and testing of its work, the CONTRACTOR shall remove all debris from the site, clean all meters, controls, cabinets, and other metering appurtenances, and deliver to the CITY each system in proper operating condition.

B. Purge all piping and capillary tubing before connection to the meter. Use water, high pressure air, and/or mechanical mandrel as applicable.

C. Purge all electrical and signal conduits before installation of wiring. Use high pressure air followed by mechanical mandrel passed through the conduits from end to end by pull rope.

1.8 GUARANTEES, WARRANTIES

A. After completion the CONTRACTOR shall furnish to the CITY the manufacturer's written guarantees that the metering systems will operate within the published accuracies and flow ranges and meet these Specifications. The CONTRACTOR shall also furnish the manufacturer's warranties as published in its literature and as specified.

B. Warranty period shall not be less than one (1) year beginning from the day of first beneficial use by the City. Contractor testing shall not be counted in this period. Where necessary the CONTRACTOR shall purchase extended warranty coverage from the manufacturer to meet this requirement. All costs shall be included in the CONTRACTOR'S Bid price for the project.

PART 2 -- PRODUCTS (NOT USED)

PART 3 -- EXECUTION

3.1 INSTALLATION

A. The CONTRACTOR shall assemble and install all equipment specified herein, in strict accordance with the manufacturer's published instructions, under the supervision of the manufacturer's representative, and under the general review of the ENGINEER. All installations shall be accomplished by competent craftsmen of the appropriate trades and in keeping with the highest industrial standards for workmanship.

B. The meters shall be installed in easily accessible locations for ease of reading and maintenance. Where indicated, meters may be used for balancing of flow in several lines in conjunction with throttling and shut-off valves. Wherever possible, all meter installations shall provide the manufacturer's recommended straight run of piping upstream and downstream of the meters. All meters, shut-off and balancing valves shall be firmly supported from the structure or from the floor with approved supports. In-line meters shall be installed to provide full-line flow and not less than the manufacturer's recommended head at all times.

3.2 TESTING

A. Equipment shall be prepared for operational use in accordance with manufacturer's instructions, including bench test and calibration, where required.

B. Each item shall be subjected to an operating test over the total range of capability of the equipment. Where applicable, tests shall be conducted in accordance with the Test Code of the Standards of the Hydraulic Institute. The CONTRACTOR shall obtain copies of factory test certifications and shall notify the ENGINEER 1 week in advance of all tests to be conducted on site.

3.3 ACCEPTANCE BY CITY

A. Final acceptance of the equipment is contingent on satisfactory operation after installation.

3.4 INSTALLATION, CALIBRATION, TESTING, PRECOMMISSIONING, START-UP AND INSTRUCTION

A. Comply with the applicable subsections of Section 17400 Process Instrumentation and Control, Part 3 – EXECUTION.

B. CONTRACTOR questions regarding conduct of any part of the work shall be submitted in writing to the ENGINEER for resolution.

END OF SECTION

SECTION 17240
AV FLOW METERS - FIELD MOUNTED

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. The CONTRACTOR shall furnish and install field-mounted ultrasonic flow meters and all appurtenant work, complete and operable, in accordance with the requirements of the Contract Documents.

B. Each meter shall consist of 2 acoustic sensors, a local flow indicator, an electronic transmitter, associated mounting hardware, cables, junction box, and accessories. The meter shall be bi-directional in measurement, utilizing an ultrasonic velocity measurement to characterize flow volume in the pipe.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 17100 Meters, General.

B. Section 17400 Process Instrumentation and Controls.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference specifications of: Section 17400 Process Instrumentation and Control.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with Section 01330, Shop Drawings / Submittals, of the GENERAL REQUIREMENTS.

B. Comply with applicable subsections of Section 17400 Process Instrumentation and Control.

1.5 QUALITY ASSURANCE

A. The CONTRACTOR shall obtain the services of a factory-trained specialist to install, check, and calibrate all field-mounted ultrasonic flow meters.

B. All materials and equipment shall be of the highest available quality, new and unused.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Basic Design: Field-mounted ultrasonic flow meters shall consist of transducers mounted in bosses welded directly to metal pipes, or transducers mounted to gasketed saddles strapped to concrete or plastic pipe. The meters shall be suitable for measuring stormwater with an accuracy of ±2 percent (of reading) for flow velocities above one foot per second, and a rangeability of 10 to 1 (or 25 to 1 for higher velocities).

B. Schedule of Field-Mounted Transit-Time Ultrasonic Meters: Field-mounted ultrasonic flow meters shall be provided as indicated on the drawings.

2.2 BASIC MATERIALS

A. Materials of construction shall be all 316 stainless steel including transducers, fasteners and all other accessories and appurtenances. Sensor enclosures shall have IP68 waterproof rating.

B. Metering Elements: Combined digital doppler radar velocity sensing with ultrasonic pulse echo depth sensing to remotely measure open channel flow from above the water surface (non-contact type). Flow meters shall produce a flow measurement based on the principle that the speed of a doppler radar signal varies with flow velocity. The measurement of signal speed or the measurement of transmitted and reflected frequencies infers the pipeline's average velocity. The primary element shall utilize a single pair of electro-acoustic transducers mounted inside a manhole above the water surface. Meters shall provide flow measurement during manhole surcharge flow conditions in addition to open-channel flow conditions.

C. Two sensors shall be permanently mounted to a straight pipe provided by the CONTRACTOR, with concrete anchors and installation parts provided by the meter manufacturer. The equipment manufacturer shall review and certify in writing that the installation arrangement and details will provide best possible accuracy.

D. The Transmitter shall be provided with a data logger and integral digital display scaled in engineering units and contained in a NEMA 4X enclosure. The electronics shall incorporate dual phase-lock loops in the flow measuring circuitry, one for each direction of sonic transmission. The electronics shall also incorporate automatic gain control circuitry and interference rejecting circuitry for tuning and to mitigate noise and maintain accuracy in the presence of traces of bubbles, solids, electrical noise and pipe vibration. The output signals from the transmitter shall be 4-20 mA DC proportional to flow rate. Overall metering system accuracy shall conform to ± 1 percent of flow rate for velocities over 1 ft/sec.

E. Transmitter shall be provided with manufacturer-supplied interconnecting cable of up to 1000 ft length as required based on distance between sensor and data logger/control panel. External dessicants and potting/sealant kits shall be provided as needed for proper installation.

2.3 Manufacturers:

A. Hach Flo-Dar AV Sensor with FL1500 stationary data logger;

B. Or equal.

PART 3 -- EXECUTION

3.1 INSTALLATION, CALIBRATION, TESTING, PRECOMMISSIONING, START-UP AND INSTRUCTION

A. Comply with the applicable subsections of Section 17400 Process Instrumentation and Control Part 3 - EXECUTION.

B. The sensors shall be positioned in accordance with the manufacturer's published specifications, using mounting templates provided by the manufacturer. The sensors shall be installed with a minimum of 10 pipe diameters of unobstructed straight upstream approach, and a minimum of 3 pipe diameters of unobstructed straight downstream pipe.

C. Installation shall be in strict accordance with the manufacturer's printed instructions.

D. Field welding or boring of piping and mounting of transducers shall be done only by highly skilled technicians certified in this area of expertise and recommended by the Manufacturer.

END OF SECTION

This page intentionally left blank

SECTION 17400
PROCESS INSTRUMENTATION AND CONTROL

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. This section sets forth the general specification and requirements for the instrumentation work for the construction of the Project.

B. A single Prime Contractor, through the use of a qualified Instrumentation and Control System Subcontractor, shall furnish, install, and place into service the operating process instrumentation, all the control systems, and all the appurtenant work, being provided under this section of these Specifications and the integration of the Control and Instrumentation system and control devices provided under this project all in accordance with the requirements of the Contract Documents. The prime CONTRACTOR may act as an instrumentation and Control System Subcontractor provided the prime CONTRACTOR has been qualified to do the work as required in paragraph 1.1 C herein for Instrumentation Subcontractors.

1. Furnish and install complete instrumentation systems as indicated on the Contract Drawings and as specified herein. Complete all required engineering work such as installation details, As-built drawings, Shop submittals, test procedures, training syllabuses and materials, and similar work described in this Specification, to produce a complete, fully documented and properly operating process instrumentation and control system. Other additional drawings and text records to complete this work shall be provided.
2. The Instrumentation and Control System Subcontractor shall assume full responsibility for integration and signal compatibility of the control and instrumentation systems with existing devices and devices provided under other specification sections and the City SCADA control system.
3. As a minimum, the Instrumentation and Control System Subcontractor under the direction of the CONTRACTOR shall provide:

    a. Implementation of the control and instrumentation system;

        1). Provide all engineering, labor and materials required to prepare analog hardware submittals; design, develop, electronically draft and submit loop drawings and control panel designs; prepare test plan, training plan, and spare parts submittals; procure hardware; fabricate panels; factory test panels; supervise the installation of all instrumentation and, control devices and panels. Perform and document all loop tests, system commissioning, and the performance of the Thirty (30) continuous day test for the entire control and instrumentation system.

        2). Provide all engineering, labor, and materials required to prepare Operations and Maintenance Manuals, conduct training classes, and to submit "as-built" or record drawings which reflect the installed state of the control and instrumentation system at the time of acceptance.

b. Integration of the control and instrumentation system with instrumentation and control devices being provided under other specification sections;

1). Provide all engineering, labor, and materials required to review vendor drawings and to design, develop, electronically draft and submit all requisite loop drawings and "As-Built" loop drawings associated with;

a). Equipment being provided under other divisions of these specifications.

b). Owner furnished or existing equipment.

2). Provide all engineering, documentation, labor, and materials required to resolve signal, power, or functional incompatibilities between the control and instrumentation system and interfacing devices.

3). Provide all engineering, labor, and materials required to:

a). Supervise and install all instrumentation and control panels (including City supplied equipment).

b). Verify compliance with the manufacturer's installation recommendations.

c). Conduct, document, supervise the performance, and documentation of testing.

c. The design, development, drafting and submission of all required loop drawings and as-built loop drawings associated with; (a) equipment provided under Division 17; (b) equipment provided under other divisions of these specifications; and (c) CITY furnished equipment. It is the intent of these specifications that all instrumentation loops associated with this project shall be drafted and documented in a CITY approved format as Loop Drawings and shall be submitted for CITY review and approval. All loop drawings shall be developed in an electronic format. The As-Built (final version) shall be submitted both in hard copy and electronic format.

d. All instruments shown on the loop drawings shall be itemized in an instrumentation summary generated by the Instrumentation and Control System Subcontractor. The instrument summary shall be on an electronic Excel and hardcopy format and shall list all of the key attributes of each instrument provided under this contract. As a minimum, attributes shall include:

1). Tag Number

2). Reference Drawing No.

3). Loop Drawing Number

4). Service

5). Area Location

6). Associated LCP, PLC PCM, or RTU

7). Calibration Range

8). Manufacturer

9). Model Number

10). Manufacturer serial number.

4. The Instrumentation and Control System Subcontractor shall obtain from the Prime CONTRACTOR the required information on those primary elements, valve actuators, vendor packages, and other control equipment or devices which are furnished by others but are required to be interfaced under this Division.

5. The Instrumentation and Control System Subcontractor shall coordinate his work to ensure that:

   a. All components provided under this Section are properly installed.

   b. The proper type, size, and number of control wires and data communication cables with their conduits are provided, installed, and tested.

   c. The proper type, size, and number of flexible pneumatic tubes with their conduits are provided and installed.

   d. Proper electric power circuits are provided for all instrumentation components and systems.

C. Instrumentation and Control System Subcontractor Experience Requirements: Prime Contractor shall at bid, submit to the CITY documentation listed below for his proposed Instrumentation and Control System Subcontractor:

1. Documentation describing at least two projects of similar size and complexity that have been successfully completed in which the Instrumentation and Control System Subcontractor performed system engineering, system fabrication and installation, documentation (including schematic, wiring and panel assembly drawings), field testing, calibration and start-up, operator instruction and maintenance training. In addition, list the following information for each project:

   a. Name of plant, owner, contact name and telephone number.

   b. Name of manufacturer for the instrumentation furnished.

   c. Type of instruments/equipment furnished

   d. Approximate number of input functions to the system, analog and digital.

   e. Approximate number of output functions from the system, analog and digital.

   f. Contracted cost of the instrumentation and Control System including change orders

   g. Date of completion or acceptance.

2. Identify individual responsible for office engineering and management, and the individual who will be responsible for field testing, calibration, start-up and operator training for this project. Include references of recent projects for these persons.

3. Documentation showing that the Instrumentation Subcontractor has been in the instrumentation and control systems business for minimum of four years.

D. Instrumentation and Control System Subcontractors not having the experience requirements and /or failing to submit the above listed documentation will be considered not-qualified for the project. The Contractor shall be responsible for substituting the bid listed Instrumentation Subcontractor with one

having the required experience and documentation at no extra cost of the City.

E. The PRIME CONTRACTOR shall assign the Instrumentation and Control System Subcontractor full responsibility for the complete operation of all new and modified instrumentation and control systems. The CONTRACTOR shall have said Subcontractor perform all engineering and coordination necessary in order to select, furnish, install, connect, calibrate, and place into operation all sensors, instruments, alarm equipment, control boards, panels, computers, process control modules, human-machine interfaces, accessories and all other equipment as specified herein. Furthermore, said Subcontractor must calibrate and demonstrate the operability of said systems in accordance with the Contract Documents.

F. The Instrumentation and Control System Subcontractor shall provide all engineering work and installation drawings to produce a complete instrumentation system. If it is necessary to produce additional drawings (due to subcontractor selecting equivalent equipment/instruments in leu of the ones shown on Contract Documents); to complete and document the work, such drawings shall be made at no additional cost to the CITY.

G. The Instrumentation and Control System Subcontractor shall examine all drawings, specifications, and details to become fully acquainted with the method of construction and to evaluate the quantity of Work to be performed. In case of conflicting or incomplete technical information, the Instrumentation and Control System Subcontractor shall include costs in its lump sum bid to coordinate the resolution of these conflicts and deficiencies with the ENGINEER at no additional cost to the CITY. Resolution of these discrepancies shall be obtained from the ENGINEER by the Instrumentation and Control System Subcontractor prior to purchasing of the instrument item.

H. Instrumentation and Control System Subcontractor shall note that the equipment loop, logic and elementary diagrams are based on non-certified vendor information and indicate minimum scope of supply from the Equipment Manufacturer. The Instrumentation and Control System Subcontractor shall include all costs in this bid to add additional instruments, wiring, computer inputs/outputs, controls, conduit, interlocks, electrical hardware, drawing revisions and all related documents and drawings, into the design based on Equipment Manufacturer's final certified prints. Such changes to instrumentation and electrical work shall be incorporated into the scope of work at no additional cost to the CITY.

I. Provide all instrumentation and all related wiring as specified on any one of the following instrument or electrical documents: instrument location drawings, Instrument Index, I/O Tabulation, Loop Descriptions, one-line electrical diagrams, or as indicated on any other Contract Document. Indication of required instrumentation work on any one of these Contract Documents shall require supply and installation of the instrument and related wiring, supports and appurtenances at no additional cost to the CITY.

J. Provide all equipment, all materials, all labor supervision, all consumables and all scaffolding for the installation of the instrumentation systems, including the following:

1. Provide field engineering design, as required, for mounting and supporting details of all field mounted components.

2. Provide coordination, as required, between manufacturer's drawings and Contract Installation Drawings.

3. Provide any additional schematics and any additional interconnection diagrams that may be required to facilitate erection or completion of equipment installation.

4. Assemble and make interconnection of instruments disconnected for shipping purposes.

5. Remove all temporary supports, all bracing or other foreign objects that were installed in instrument control panels or other equipment to prevent damage during shipping, storage and/or erection.

6. Coordinate work with that of the different trades and disciplines so that interference between conduit, piping, equipment, architectural and structural work shall be avoided.

7. Install and support all instruments and all instrument piping not installed and supported by others. The Instrumentation and Control System Subcontractor shall furnish all hardware and all stands required to mount these items and provide modifications, as required, to meet actual site conditions.

8. All piping shall be field measured prior to fabrication/or erection. Any significant discrepancies between drawings and field measurements shall be reported to the ENGINEER. The CITY shall not be responsible for any costs for rework because of failure to field measure prior to initiating fabrication.

9. Capillary tubing shall be adequately supported and protected. All extra tubing shall be carefully coiled, tied, and protected at the instrument location.

10. Provide temporary nitrogen purging to all panels (LCP, PCM, CSI, City supplied equipment) on site before being permanently installed only where the environment requires purge.

K. Prime Contractor shall be responsible for coordination with the City SCADA system for interface, communication, loop tests, and performance of complete control system.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The WORK of the following Sections applies to the WORK of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this WORK.

1. Section 09800 Protective Coating

2. Section 11000 Equipment General Provisions

3. Section 15320 Electrical Requirements for Mechanical Equipment

4. Section 16020 Municipal Facilities General Electrical Requirements

5. Section 16100 Basic Materials and Methods

6. Section 17450 PLC, SCADA, Network and Communications

B. The monitoring and control system configurations indicated are diagrammatic. The locations of equipment are approximate unless dimensioned. The exact locations and routing of wiring and cables shall be governed by structural conditions and physical interferences and by the location of electrical terminations on equipment.

C. The Prime CONTRACTOR shall arrange a meeting with the engineer, and CITY at the site in order to identify equipment location prior to roughing in. The CITY reserves the right to require minor changes in location of equipment prior to roughing in without incurring any additional costs or charges.

D. Determine exact routing and final terminations for all signal, power, data communication wiring/cable. A site visit and review of the existing system control panel is mandatory.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Comply with the reference specifications of the GENERAL REQUIREMENTS

B. Prime Contractor shall procure all necessary permits, pay all associated costs, and shall furnish the ENGINEER with evidence of permit procurement prior to the commencement of the Work.

C. The equipment, materials and installation shall comply with the applicable standards, specifications and regulations of the following:

1. Instrument Society of America/International Society for Automation (ISA).
2. American Petroleum Institute (API).
3. National Electrical Manufacturers Association (NEMA).
4. Occupational Safety and Health Administration (OSHA).
5. American National Standards Institute (ANSI).
6. Military Standards (MIL Standards).
7. National Fire Protection Association (NFPA).
8. Scientific Apparatus Makers Association (SAMA).
9. Institute of Electrical and Electronic Engineers (IEEE).
10. National Electrical Code (NEC).
11. Insulated Cable Engineers Association (ICEA).
12. Local Power and Telephone Companies.
13. Local Authorities having jurisdiction over the work.
14. City of Los Angeles Electrical Code (CLAEC)
15. Underwriters Laboratories (UL).
16. City of Los Angeles, Department of Public Works, Bureau of Sanitation, “Operator Interface Graphic Display Standards”.
17. National Institute of Standards and Technology (NIST).
18. Society of Automotive Engineers (S.A.E).
19. American Society for Testing and Materials (ASTM).
20. Steel Structures Painting Council (SSPC).
21. “GREEN BOOK” Standard Specifications for Public Works Construction – latest Edition Adopted by City of Los Angeles.
22. Federal Information Processing Standard (FIPS).

D. All electrical equipment, components, devices, shall be Underwriters Laboratories APPROVED (have the UL label and/or be listed with reexamination in UL Publication Reference No.1). Alternatively, the equipment shall be APPROVED by a testing laboratory recognized by the City of Los Angeles and shall conform to all applicable requirements of the City of Los Angeles Department of Building and Safety.

1. Review and approval by the CITY Department of Building and Safety Electrical Test Laboratory (ETL) requires submittal of the equipment, components or devices and any current testing documents to the ETL. Where major equipment is submitted to ETL for approval, the Prime CONTRACTOR shall submit to the ENGINEER a detailed schedule showing the approval process and approximate equipment delivery dates to ensure that there will be no effect on the project completion date. No electrical equipment will be approved for delivery to the jobsite without ETL approval. All costs incurred in the approval process shall be included in the Bid.

2. Products being specified in the Contract Specifications does not express or imply approval by UL, the Department of Building and Safety or any other testing laboratory. Shop drawing approval by the ENGINEER shall not supersede the requirements of the Department of Building and Safety for listed equipment.

1.4 SUBMITTALS/SHOP DRAWINGS

A. Submittals shall be made in accordance with Section 01330**,** Shop Drawings / Submittals of the GENERAL REQUIREMENTS.

B. Shop Drawings: Coordinate the work required in these Specifications so that a complete instrumentation and control system for the facility will be provided and will be supported by accurate shop and as built drawings. The Instrumentation Subcontractor shall prepare and submit complete and organized shop drawings, as specified herein. Interface between instruments, motor starter, control valves, variable speed drives, flow meters, existing instruments, chemical feeders, instrumentation symbols, and abbreviations, piping and instrumentation, local control panels, new instruments, and equipment related to instrumentation and control shall be included in the shop drawing submittal.

C. A table of Contents shall be provided at the beginning of each binder or volume of the Submittal/Manual and shall list entries down to instrument and device level indexed by name, tag number and sequential page number. All pages of each binder/volume shall be sequentially numbered for ease of reference and review. During the period of preparation of this submittal, the Prime CONTRACTOR shall authorize direct, informal liaison between the Instrumentation Subcontractor and the ENGINEER for exchange of technical information. As a result of this informal liaison, oral communication shall not alter the scope of work or cause increase or decrease in the Contract price. During this informal exchange, no oral statement by the ENGINEER shall be construed to give formal approval of any component or method, nor shall any statement be construed to grant formal exception to or variation from these Contract Documents.

D. The Instrumentation and Control System Subcontractor shall submit an analog/digital hardware submittal that utilizes detailed shop drawings and data prepared and organized for easy reference. Section Tabs, Sequential page numbering and Table of Contents / Index Tables shall be used throughout. All shop drawings shall include the letter head and/or title block of the Prime CONTRACTOR responsible for this project. The title block shall include, as a minimum, the Prime CONTRACTOR'S registered business name and address, project name, drawing name, revision level, and personnel responsible for the content of the drawing. The quantity of submittal sets required shall be as specified in Section 01330 of the general requirements. The analog/digital hardware submittal shall be submitted as a complete bound package at one time within ninety (90) calendar days of receipt of Notice to Proceed, and shall include:

1. Drawings showing definitive diagrams for every instrumentation loop and system. These diagrams shall show and identify each component of each loop or system using legend and symbols from

ANSI/ISA S5.4, extending the format as shown on Instrumentation Drawings and as defined by the most recent revision in ISA. Each System or Loop diagram shall be drawn on a separate drawing sheet with no more than four loops per drawing. Develop, submit, update and maintain in an as-built condition the loop drawings for all loops in this project including vendor supplied packages, equipment supplied under Division 17 and CITY supplied packages. The loop drawings shall also show all software modules and linkages. In addition to the expanded ISA S5.4 requirements the Loop Diagrams shall also contain the following details:

a. ISA tag number

b. Functional name of each Loop

c. Tag number of the loop

d. Reference name, drawing, and Loop diagram numbers for any signal continuing off loop diagram sheet.

e. MCC Panel, circuit, and breaker numbers for all power feeds to the loops and instrumentation (i.e., 24VDC and 120VAC).

f. Designation and if appropriate terminal assignments associated with every manhole, pull box, junction box, conduit and panel the loop circuits pass through.

g. Vendor panel, instrument panel, conduit, junction boxes, equipment and DCS terminations, termination identification wire numbers and colors, power circuits, and ground identifications.

h. Calibration range

i. Manufacturer

j. Model Number

2. Fully executed ISA-S20 data sheets for each component, together with a technical product brochure or bulletin. The technical product brochures must be complete enough to verify conformance to all Contract Document requirements. The data sheets, as a minimum, shall show:

a. Component functional description used herein and on the Drawings.

b. Manufacturer's model number or other product designation.

c. Project tag number used herein and on the Drawings.

d. Project system or loop of which the component is a part.

e. Project location or assembly at which the component is to be installed.

f. Input and output characteristics.

g. Scale range and units and multiplier.

h. Requirements for electric supply.

i. Requirements for air supply.

j. Materials of component parts to be in contact with, or otherwise exposed to, process media;

k. Optional/Special requirements or features.

3. A complete index shall appear in the front of each bound submittal volume. A separate technical brochure or bulletin shall be included with each instrument data sheet. The data sheets shall be indexed in the submittal by systems or loops, as a separate group for each system or loop. If, within a single system or loop, a single instrument is employed more than once, one data sheet with one brochure or bulletin may cover all identical uses of that instrument in that system. Each brochure or bulletin shall include a list of tag numbers for which it applies. System groups shall be separated by labeled tags.

4. Drawings showing both schematic and wiring diagrams for control circuits: Complete details on the circuit interrelationship of all devices within and outside each Control Board shall first be submitted using schematic control diagrams. Subsequent to return of this first submittal by the ENGINEER, piping and wiring diagrams shall be prepared and submitted for review by the ENGINEER; the diagrams shall consist of component layout drawings to scale, showing numbered terminals on components together with the unique number of the wire to be connected to each terminal. Piping and wiring diagrams shall show terminal assignments from all primary measurement devices, such as flow meters, and to all final control devices, such as pumps, valves, chemical feeders and vendor panels. Should an error be found in a shop drawing at any time in the project, it shall be corrected including any field changes found and an "As Built" drawing shall be prepared and submitted for review and approval by the ENGINEER prior to the acceptance of the project. Furnish all necessary equipment suppliers' shop drawings to facilitate inclusion of this information. Respond to all comments on the shop drawing re-submittals made by the ENGINEER either by noted corrections or stating why it was not revised. Any resubmittals received by the ENGINEER which do not contain responses to the ENGINEER's previous comments shall be returned marked "Rejected." No further review by the ENGINEER shall be performed until responses are made to all comments.

5. Assembly and construction drawings for each alarm annunciator, local indicating panel and for other special enclosed assemblies for field installation: These drawings shall include dimensions, identification of all components, surface preparation and finish data, nameplates, and the like. These drawings also shall include enough other details, including prototype photographs, to define exactly the style and overall appearance of the assembly; a finish treatment sample shall be included.

6. Installation, mounting, and anchoring details for all components and assemblies to be field-mounted, including conduit connection or entry details shall be shown in the submittal drawings.

7. A Bill of Material shall be submitted for each field mounted device or assembly as well as cabinet assemblies and sub-assemblies. Bills of Material shall include all items within an enclosure, and shall be complete and detailed. An incomplete submittal shall be rejected, and no further evaluation performed until a completed and detailed bill is submitted.

E. Organization and Binding of Shop Drawings: The organization of the initial shop drawings submittal shall be compatible to eventual inclusion with the technical manuals submittal and shall include final alterations reflecting "As Built" conditions. Accordingly, the final approved multiple-copy shop drawing submittal shall be separately bound in 3-ring binders.

F. Technical Manuals: In addition to updated shop drawing information to reflect actual existing conditions, each set of technical manuals shall include installation, connection, operating, troubleshooting, maintenance and overhaul instructions in complete detail. This shall provide the CITY with comprehensive information on all systems and components to enable operation, service, maintenance and repair. Exploded or other detailed views of all instruments, assemblies and accessory components shall be included together with complete parts lists and ordering instructions. For additional requirement see the GENERAL REQUIREMENTS.

G. Control Panel Engineering Submittal: The Instrumentation and Control System Subcontractor shall submit a control panel engineering submittal (CPES) for each control panel being provided under this Specification Including intrinsically safe and Fiber Optic patch panels. The CPES shall completely define and document the construction, finish, layout, power and UPS circuits, signal and safety grounding circuits, fuses, circuit breakers, signal circuits, switches, surge protectors, internally mounted instrumentation components, faceplate mounted instrumentation components, internal panel arrangements, and external panel arrangements. All panel drawings shall, as a minimum, be ANSI "B" size (11" X 17") with all data sheets and manufacturer specification sheets being ANSI "A" size (81/2" X 11"). The submittal shall be in conformance with latest, NEMA Standard and shall be submitted as a singular complete bound volume or multi-volume package within 120 calendar days after notice to Proceed and shall have the following contents:

1. A complete index shall appear in the front of each bound volume. All drawings and data sheets associated with a panel shall be grouped together with the panels being indexed by systems or process areas. All panel tagging and nameplate nomenclature shall be consistent with the requirements of the Contract Documents.

2. Construction drawings drawn to a 1-1/2-inch = 1-foot scale which define and quantify the type and gage of fabrication steel to be used for panel fabrication, the ASTM grade to be used for structural shapes and straps, panel door locks and hinge mechanisms, type of bolts and bolt locations for section joining and anchoring, details on the utilization of "UNISTRUT" and proposed locations, stiffener materials and locations, electrical terminal box and outlet locations, electrical access locations, print pocket locations, writing board locations and lifting lug material and locations.

3. Physical arrangement drawings drawn to 1-1/2-inch = 1 foot scale which define and quantify the physical groupings comprising control panel sections, auxiliary panels, subpanels, and racks. Cutout locations with nameplate identifications shall be provided.

4. Schematic/Elementary diagrams shall depict all control devices and circuits and their functions.

5. Wiring/Connection diagrams shall locate and identify electrical devices, terminals, installed Components/Instruments and interconnecting wiring. These diagrams shall show interconnecting wiring by lines, designate terminal assignments, and show the physical location of all electrical and control devices.

6. Interconnection diagrams shall locate and identify all external connections between the control panel/control panel devices and associated equipment. These diagrams shall show interconnecting wiring by lines, designate terminal assignments, and show the physical location of all panel ingress and egress points.

7. Control sequence diagrams shall be submitted to portray the contact positions or connections required to be made for each successive step of the control action.

8. Manufacturer specification sheets which verify the products conformance to the requirements of the Contract Documents.

9. A bill of material which enumerates all devices associated with the control panel.

H. Test Procedure Submittal:

1. The Instrumentation and Control System Subcontractor shall submit the Procedures proposed to be followed during the tests required under this project. Procedures shall include statement indicating test objectives, test descriptions, forms, and checklists to be used to control and document the required tests.

2. Prior to the preparation of the detailed test procedures, submit outlines of the specific proposed tests. Submittals shall include examples of the proposed forms and checklists. Once the Preliminary Test Procedure Submittals have been reviewed by the ENGINEER and returned stamped either "no exceptions noted" or "make corrections noted", the Instrumentation Subcontractor shall submit the proposed detailed test procedures, forms, and checklists.

3. Once the detailed Test Procedures Submittals have been reviewed by the ENGINEER and returned stamped either "no exceptions noted" or "make corrections noted", the tests shall be scheduled in coordination with ENGINEER.

4. Upon completion of each required test, a copy of the signed-off test procedures shall be submitted as test documentation. These requirements shall apply to the factory testing of all panels, and all on-site tests.

I. The Instrument Subcontractor shall submit the integrated hardware/communication loop testing results from field to the DCS at the end of project.

J. The organization of the initial shop drawing submittal required above shall be compatible to eventual inclusion with the Technical Manuals submittal and shall include final alterations reflecting "record" conditions. Submittals not organized as described above and incomplete submittals for a given Loop will not be accepted. Accordingly, the initial multiple-copy shop drawing submittal shall be separately bound in standard size, 3-ring, loose-leaf, vinyl plastic, hard cover binders suitable for bookshelf storage. Binder ring size shall not exceed 2-inches.

K. Control Valve Submittal: Submit the following data within 90 days after Notice to Proceed:

1. Type, Dimensional Outline, Mounting Details, body material, packing gland material, Trim material & shaft material.

2. Diagrams (wiring, schematic, logic)

3. Certified Performance Data

4. Calculations for Valve Sizing

5. Welding procedures, Qualification Test, & Non-destructive testing procedures.

6. Cross Sections with Parts List

7. Inspection and Test Plan Prior to acceptance, the control valve supplier shall submit function test verification certifications and hydrostatic leak test certifications.

L. Instrument Installation Detail and Submittal: Submit the following data within 180 days after Notice to Proceed:

1. Detail and Instrument Installation drawings

2. Bill of Materials.

1.5 QUALITY ASSURANCE

A. Accuracy: The accuracy of each instrumentation system or loop shall be determined as a probable maximum error; this shall be the square-root of the sum of the squares of certified "accuracies" of the

designated components in each system, expressed as a percentage of the actual span or value of the measured variable. Each individual instrument shall have a minimum accuracy of ±0.5 percent of full scale and a minimum repeatability of ±0.25 percent of full scale unless otherwise specified. Instruments which do not conform to or improve upon these criteria are not acceptable.

B. Where materials and equipment are specified to conform to the standards of the Underwriter's Laboratories, the label of, or listing with reexamination in latest UL Publication, shall be accepted as enough evidence that the items conform to Underwriter's Laboratories requirements. In lieu of such label, listing of the materials or equipment by a recognized approved testing laboratory as stated in the CITY of Los Angeles Electrical Code will be acceptable as interpreted by the CITY's Department of Building and Safety.

1.6 PRESUBMITTAL CONFERENCE

A. Arrange and conduct a Pre-submittal Conference on the instrumentation and control system work within 15 days after the notice to proceed. The Instrumentation Subcontractor shall allow one eight-hour working day for the conference. The purpose of the Pre-submittal Conference shall be to informally review with the CONTROL SYSTEM ENGINEER and approve the way the Instrumentation and Control System Subcontractor should respond to the Contract requirements before any submittals are prepared. The Instrumentation and Control System Subcontractor shall prepare the following items for presentation at the Pre-submittal Conference:

1. A list of equipment and materials required for the control system and the manufacturer and model number which the Instrumentation and Control System Subcontractor proposes to use for each item.

2. A list of proposed exceptions to the Specifications and Drawings, along with a brief explanation of each. Approval shall be subject to formal submittal and review by the ENGINEER.

3. An exact one-to-one sample of each type of submittal specified herein.

4. A bar chart type schedule for all system related activities from the Pre-submittal Conference through startup and training, plant acceptance and project closeout. The schedule shall include the dates relative to submittals, design, fabrication, programming, factory testing, deliveries, installation, field testing, and training. The schedule shall be subdivided to show activities relative to each major item or group of items.

5. Provide **3** copies on paper, and 1 electronic copy compatible with City Standard software of Pre-submittal Conference data to the ENGINEER.

B. Keep formal meeting minutes. Prior to adjournment of the conference, all parties must concur in writing with the accuracy of the minutes.

C. Preparation of shop drawings shall not commence until after the Pre-submittal Conference. Submittals required for that conference are exempted.

1.7 GUARANTEE

A. The Instrumentation and Control System Subcontractor shall guarantee all equipment and installation, as specified herein, for a period of one year following the date of completion of the work. To fulfill this obligation, the Instrumentation Subcontractor shall utilize technical service personnel designated by the Instrumentation Subcontractor whom he originally assigned project responsibility for instrumentation. Services of a non-critical nature shall be performed within 5 calendar days after notification by the CITY, and critical services as (determined by the ENGINEER) within 24 hours after

notification.

1. Equipment, software, and materials which do not achieve design requirements after installation shall be replaced or modified to attain compliance at no additional cost to the CITY. Following replacement or modification, retest the system and perform any additional procedures needed to return/restore complete system to satisfactory operation at no additional cost to the CITY and obtain design compliance approval from the ENGINEER.

2. All parts, materials (excluding consumables), labor, travel, subsistence, or other expenses incurred in providing all services and service visits during the one-year warranty period shall be included in the Bid.

1.8 MANUFACTURER'S REPRESENTATIVE SERVICES

A. Provide jobsite visits and services of a manufacturer's technical field representative for the following items of equipment for calibration, testing and start-up:

1. Flow meters

2. Process Analyzers

3. Programmable controller, HMI

4. Valve actuators

5. Any process sensing devices and indicating devices

B. Provide the following services of qualified technical representatives (see Installation, Calibration, Testing, Pre-commissioning, Start-up, and Instruction herein):

1. Install and connect all instruments, all elements, and all components of every system, including connection of instrument signals to primary measurement elements and to final control elements such as pumps, valves, and chemical feeders.

2. Make all necessary adjustments, calibrations hardware/software interfacing and tests, as called out in the specifications, and drawings.

3. Instruct Plant operating and maintenance personnel on the instrumentation. This time shall be in addition to whatever time is required for other facets of work at the site and shall be during the CITY's normal working days and hours.

1.9 SHOP INSPECTION

A. Shop Inspection and Performance Testing: Arrange for shop inspection and performance testing of the equipment according to Division 11 specifications.

1. All equipment shall be subject to shop inspection in accordance with the GENERAL REQUIREMENTS.

2. The INSPECTOR and CITY Control Systems Engineer of Record shall inspect and participate in the shop/factory testing of all panels prior to shipment.

3. For all equipment, obtain and submit the following to the ENGINEER at least 6 weeks before test date for approval:

a. The Manufacturer's factory test procedure, and report forms, and testing schedule prior to equipment testing.

b. Shop testing of the equipment shall be defined as operation of all panels with simulated input/output. The purpose of the shop test shall be to test mechanical, electrical/control, and instrumentation systems. Verify compliance with the Contract Specifications and drawings and intended design function and make any necessary adjustments or repairs prior to shipment. Simulation of faults and trips from the control panel shall be included. If all panels are to be stored at the Prime Contractor's facility, the shop test shall be successfully completed prior to storage. All panels shall not be shipped until they have been successfully shop tested.

B. Field Performance Test and Reports: All equipment shall be performance tested after installation at the field operating site according to Division 11 specifications.

1. Testing shall not start until all preliminary checks and calibrations have been completed, the installation has been certified ready for testing by the Manufacturer's representative, and the test forms and procedures have been approved by the ENGINEER.

2. All test information shall be recorded on forms provided by the CITY or approved by the ENGINEER. If forms are not available from the CITY, prepare test forms and submit for approval prior to the scheduled start of the test.

3. Submit the test procedure for approval prior to the scheduled start of the test.

4. Prepare a field performance test report, including all raw data, and submit the report within 14 calendar days after approved completion of the equipment field test.

1.10 PERSONNEL TRAINING; Refer to General Requirements.

PART 2 -- PRODUCTS

2.1 GENERAL

A. Provide all instrumentation and related wiring as specified on any of the following instrumentations and electrical documents:

1. Instrument Location Drawings, Instrument Index, Instrument Data Sheets, Loop/Logic Diagrams, I/O Tabulation, Loop Description, One-Line Electrical Diagrams, and/or as indicated on any other Contract Document.

2. Indication of required instrumentation work on any of these Contract Documents shall require supply and installation of the instrument and related wiring, supports, accessories and appurtenances, at no additional cost to the CITY.

3. Assume full responsibility to perform all engineering to select, furnish, install, program, test, calibrate, and place into operation all instrumentation, control panels, programmable controllers, and hardware/software interfacing with existing Plant DCS, for a complete and functional system.

B. The monitoring and control system configurations indicated are diagrammatic. The locations of equipment are approximate unless dimensioned. The exact locations and routing of wiring and cables shall be governed by structural conditions and physical interferences and by the location of electrical terminations on equipment. All equipment shall be located and installed so that it will be readily

accessible for operation and maintenance. The CITY reserves the right to require minor changes in location/orientation of equipment prior to roughing in without incurring any additional costs or charges. The Instrumentation Subcontractor shall review the existing site conditions and examine all shop drawings for the various items of equipment in order to determine terminations for all wiring and cables. All deviations from the Drawings or Specifications must be approved in writing by the ENGINEER.

C. All meters, instruments, and other components shall be new and un-used, and the most recent field-proven models marketed by their manufacturers at the time of submittal of the shop drawings unless otherwise specified to match existing equipment.

D. All panel mounted instruments shall have matching style and general appearance. Instruments performing similar functions shall be of the same type, model, or class, and shall be of one manufacturer.

E. All instrumentation shall be rated for operation in the ambient conditions at the equipment installation locations. 316 Stainless Steel NEMA 4X rated enclosures suitable for the environment shall be furnished in all general purpose areas.

F. All instrumentation in hazardous areas shall be approved for use in the particular hazardous classification in which it is to be installed, and shall at a minimum be NEMA 4X.

G. Analog measurements and control signals shall be electrical as indicated herein and shall vary in direct linear proportion to the measured variable, except as otherwise noted. Electrical signals outside control board(s) shall be 4 to 20 milliamperes dc except as noted. Signals within enclosures may be 1-5 volts dc. Dropping resistors shall be installed at all field side terminations in the control panels to ensure loop integrity.

H. All control panels shall be provided with redundant power supplies which are configured in a fault-tolerant manner to prevent:

1. Interruption of service upon failure.

2. Interruption of service necessitated by the replacement of a power supply.

3. All power supplies shall have an excess rated capacity of forty (40) percent.

I. Each signal and control loop shall be individually fused.

J. Equipment or methods requiring redesign of any project details are not acceptable without prior approval of the ENGINEER. Any changes inherent to a proposed alternative shall be at no additional cost to the CITY. The required approval shall be obtained in writing by the Instrumentation and Control System Subcontractor prior to submittal of shop drawings and data. Any proposal for approval of alternative equipment or methods shall include evidence of improved performance, operational advantage and maintenance enhancement over the equipment or method specified or shall include evidence that a specified component is not available. Otherwise, alternative equipment (other than direct, equivalent substitutions) and alternative methods shall not be proposed.

K. All field mounted instruments, control equipment/enclosures mounted outside of protective structures shall be equipped with suitable electrical surge protective/arresting devices to protect the equipment from damage due to electrical transients induced in the interconnecting lines from lightning discharges or nearby electrical devices. Protective devices used on 120V ac inputs to field mounted equipment shall be secondary surge protectors conforming to the requirements of latest IEEE Standard (latest ANSI C62.1), and UL 1449 latest edition.

L. Provide all equipment, material, labor supervision, consumables, scaffolding, for the installation of the instrumentation systems in accordance with the Drawings and Specifications listed herein.

1. Provide field engineering design, as required, for mounting and supporting details of all field mounted components.

2. Provide coordination, as required, between manufacturer's drawings and contract installation drawings.

3. Provide any additional schematic and interconnection diagrams that may be required to facilitate erection or to complete the installation of equipment.

4. Assemble and make interconnection of instruments disconnected for shipping purposes.

5. Remove all temporary supports, bracing or other foreign objects that were installed in instruments, control panels or other equipment to prevent damage during shipping, storage and/or erection.

6. Contractor shall coordinate his work with that of the different trades so that interference between conduit, piping, equipment, architectural and structural work shall be avoided.

7. Install and support all instruments and instrument piping related to this project not installed and supported by others. Furnish all hardware and stands required to mount these items and modify to meet actual site conditions.

8. All piping shall be field measured prior to fabrication/or erection. Any significant discrepancies between drawings and field measurements shall be reported to the ENGINEER. The CITY shall not be responsible for any costs for rework caused by failure to field measure prior to initiating fabrication.

9. Adequately support and protect capillary tubing. All extra tubing shall be carefully coiled, tied, and protected at the instrument.

M. The equipment loop, logic and elementary diagrams are based on non-certified vendor information and indicate minimum scope of supply from the equipment manufacturer. Include additional costs in the bid to add additional instruments, wiring, computer inputs/outputs, controls, conduit, interlocks, electrical hardware and similar items, into the design based on equipment manufacturer's final certified vendor prints. Revise or produce new loop, logic, and elementary diagrams to meet the equipment manufacturer's wiring requirements. Such changes to instrumentation and electrical work shall be incorporated into the scope of work at no additional cost to the CITY.

N. Provide the following:

1. Furnish and install all pneumatic piping/tubing and make connections at control panels, instruments and control valves. All tubing/pipe fittings and instrument valves shall be 316 stainless steel (SS).

2. Provide field engineering and design to install instrument air supply taps and piping/tubing as herein specified.

3. Install adequate support for pneumatic piping/tubing runs in accordance with Drawings and Specifications.

4. Check all air supply branch headers by blowing with clean compressed air before placing in service and check for tightness/leaks.

5. Clean all transmission and control piping/tubing by blowing with dried and filtered air prior to connecting to instrument components.

6. Leak test all pneumatic control circuits and enclosures in accordance with ISA Recommended Practice RP-7.1.

7. Set manufacturer's recommended supply pressure at all instrument air regulators.

8. Installation, wiring, termination, and installation tests for all analog instruments local control panels, Control System Interfaces (CSIs), panels and equipment furnished by the CITY.

2.2 SPARE PARTS

A. See the provisions of Section 01781, Spare Parts, of the GENERAL REQUIREMENTS unless otherwise noted

2.3 CONTROL PANELS

A. General

1. The Instrumentation and Control System Subcontractor shall furnish, supply and install all control panels and enclosures for this project.

2. All panels and enclosures shall be rated NEMA 4X. For hazardous locations they shall be rated NEMA 7 or 9.

3. Dimensions shall be in accordance with manufacturer's requirements. Elevations and horizontal spacing shall be subject to ENGINEER's approval.

3. Furnish, supply and install all control panels for this project. This also covers requirements for local control panels being supplied by the Equipment Manufacturer due to the corrosive environments at wastewater treatment plants, the control panels shall be provided with all required taps, fittings, rotameters, regulators, and when specified alarm interlocks to enable the implementation of an air purge system which is in conformance with ISA-S12.4 Type Z requirements.

4. This Specifications covers the requirements for the fabrication of instrument panel boards, mounting, finishing, piping and wiring of instrument equipment.

5. Front of panel layouts for all control panels shall be submitted to the ENGINEER for review and approval prior to start of fabrication. Refer to other requirements as outlined in Drawings section below.

6. All conduit entries shall utilize Myers hubs or equivalent and shall be made watertight at the point of entry into the cabinet with O-ring or gasket seals. In runs of PVC coated conduits, the hubs shall also be PVC coated in accordance with the conduit manufacturers requirements for fittings and accessories (i.e. Rob Roy Plasti-Bond 2 Red Hot PVC coated Rigid galvanized steel (PVC RGS) or equal.

7. Purge systems shall be provided as defined in the Specifications and Drawings.

B. Mounting of Instruments

1. The panel vendor shall provide cut-outs, and shall mount all instrument items shown or specified to be panel mounted, including any instruments specified to be furnished by other vendors but installed in panel.

2. The panel vendor shall also mount, behind the panels, other instrument accessory items as required and/or specified.

3. Enclosure for all the front panel mounted instruments shall be NEMA 4X rated. Instruments which are not rated NEMA 4X shall be covered with a windowed door to provide overall NEMA 4X rating.

4. Rear of panel mounted equipment shall be installed with due regard to accessibility, commissioning adjustments, servicing requirements and cover removal.

5. Spare space shall be kept clear of wiring, to give maximum space for future additions.

C. Piping Requirements

1. The panels shall be furnished with terminal connections near the top, rear of the panel for all tubing and piping which connect to instruments, valves, instrument air supply and other pressure leads to the panel. Terminal connections for tubing are to be bulkhead tube unions as described below. Those for pipe shall be threaded couplings, plugged for shipping purposes.

2. All tubing, pipe fittings and instrument valves shall be 316 stainless steel (SS).

3. Each terminal connection shall have an engraved metal or plastic plate with a terminal and instrument tag number.

D. Electrical Requirements for Control Panels

1. Furnish and install all the necessary conduit, wireways, switches, and electrical fittings with wire for all circuits to instruments and other panel electrical devices to assure a complete and acceptable installation.

2. Signal and low voltage wiring shall be run separately from power and 120-volt control wiring.

3. Conduit, wireways, junction boxes and fittings shall be installed for all signal/instrument wires. Conduit and wireway runs shall include those required between sensors, indicators, between the thermocouple wireway and junction boxes to instruments.

4. Each terminal connection shall have a plastic plate with a terminal and instrument tag number. All wiring shall be identified with permanent machine printed tubular wire markers.

5. Freestanding panels shall be provided with switched LED (9 WATT) back-of-panel lights with built-in diffuser to prevent bright spots and shadows. One light shall be provided for every 4-feet of panel width and shall be mounted inside and in the top of the back-of-panel area.

6. Freestanding panels shall be provided with a 15-amp, 120-volt, ground fault interrupted

(GFI) service outlet circuit within the back-of-panel area. The circuit shall be provided with three-wire, 120-volt, 15-ampere, duplex receptacles, one for every 4-feet of panel width (two minimum per panel) and spaced evenly along the back-of-panel area.

7. Panels shall be so sized as to adequately dissipate heat generated by equipment mounted in or on the panel.

8. Where panels are mounted outside or in unshaded areas or indoors where ambient temperatures can exceed 80°F or fall below 60°F, they shall be provided with thermostatically controlled heaters that will maintain their inside temperature above 60 °F. Thermostatically controlled refrigeration type air conditioning shall be provided where necessary to prevent overheating of the equipment enclosed.

9. For all control panels, provide heat-load calculations from the cabinet manufacturer for sizing heaters and air conditioners and for setting thermostats. In general, interior cabinet temperatures shall not exceed 80°F and shall not fall below 60°F unless otherwise recommended by the manufacturers of instrumentation and control equipment to be housed in the control panels.

E. Wiring Methods:

1. Wiring methods and materials for all panels shall be in accordance with the N.E.C. requirements for General Purpose (no open wiring), unless otherwise specified. Open wiring in closed cabinet type panels is allowed when specified in the material specifications. Unless otherwise specified by the material specification, design and installation of materials shall conform to the requirements of the latest edition of the following standards and codes as a minimum.

   a. The National Electrical Code

   b. City of Los Angeles Electrical Code

   c. All National Safety Codes

   d. American Petroleum Institute Standard RP-550

   e. Applicable Local Law and Regulations

2. Unless otherwise specified by the material specifications, all instruments, alarm systems and motor controls shall operate on 120 VAC, 60-Hertz and/or 24 VDC circuits.

3. At a location on the top or bottom of the panel, the panel fabricator shall furnish and install terminal block connections for the main power supply entry.

4. Power Supply switches for alarm units shall be three-pole type, arranged to open both the power and alarm circuits. Each annunciator shall be equipped with a separate switch.

5. Instruments located on the same panel section and serving the same process unit may be connected to a common branch circuit from the power supply. The numbers of circuits that depend on the circuit load are as noted in the contract documents. A 15-amp, two-pole circuit breaker shall be provided in each branch circuit. The circuit load shall not exceed 10 amps. Different panel sections or different process units shall not use common branch circuits.

6. When instruments do not come equipped with integral fuses, the panel fabricator shall

furnish and install fuses as required for the protection of individual instruments against fault currents. Fuses shall be mounted on the back of the panel, in DIN rail, fused terminal blocks with knife-blade disconnect switch, blown fuse indicator (LED) and screw terminals for connecting circuit wiring and identified by a service name tag.

7. Where alarm units are single unit types, one switch may be used to disconnect not more than six alarm units located on the same or adjacent panels.

F. Material:

1. Wire for all 120 volt circuits shall be No. 14 AWG stranded with lugs with Type THWN or THHN insulation. All terminals for external wiring connections shall be suitable for wire size Nos. 16 through 12 AWG.

2. Flexible conduit shall not be allowed except when specifically approved by the ENGINEER in writing.

3. Conduit fittings shall be cast metal fittings as specified in the electrical specifications Section 16110, with PVC coating.

4. Splicing of wires in conduits shall not be permitted. All wire terminations/connections shall have crimped wire lugs and shall be landed terminated on strips or blocks in pull boxes or panels.

5. For case grounding, panels shall be furnished with a 1/4" x 1" copper ground bus complete with solderless connectors for one No. 4 AWG bare stranded copper cable. The copper cable shall be furnished and installed and connected to a system ground loop/ground rod.

G. Electrical Locations:

1. When Contract Drawings or Specifications call for thermocouple actuated instruments, the thermocouple lead wire shall be installed, without junction or splicing. The panel vendor shall furnish dedicated empty conduit or wireway running from the instrument(s) to the top or bottom of the panel as called for in the material specifications or as otherwise required. Sizing of the conduit or wireway shall be in accordance with the capacity and number of instrument wires of the instrument(s).

2. Terminal boxes for incoming and outgoing signal leads shall be located at the top or bottom of the panel as specified in the material specification, or as otherwise required.

H. Panel Annunciation

1. Unless otherwise noted, the following color code and inscriptions shall be followed for the lenses of all indicating lights:

STATUS	INSCRIPTION(S)	COLOR
ON	ON	RED
OFF	OFF	GREEN
OPEN	OPEN	RED

CLOSED	CLOSED	GREEN
LOW	LOW	RED
FAIL	FAIL	RED
HIGH	HIGH	RED

2. Lettering shall be black on white and amber lenses. Lettering shall be white on red and green lenses.

3. Unless otherwise noted, the following color codes and inscriptions shall be followed for all pushbuttons:

LABEL / ABBREV.	INSCRIPTION(S)	COLOR
OO	ON / OFF	RED/GREEN
OC	OPEN / CLOSE	RED/GREEN
OCA	OPEN / CLOSE / AUTO	RED/GREEN/BLUE
OOA	ON / OFF / AUTO	RED / GREEN / BLUE

MA	MANUAL / AUTO	AMBER / BLUE
SS	START / STOP	RED / GREEN
E-STOP	EMERGENCY STOP	RED
RESET	RESET	BLACK

All other buttons shall be black. Lettering shall be white on black labels and nameplates.

I. Construction Methods:

1. Materials: Type 316 Stainless Steel shall be standard. Other types may be proposed in writing for use in specific service locations but must be reviewed and approved in writing by the ENGINEER.

   a. Panel section faces shall be #10 gauge minimum thickness, 316 SS for free standing panels and #14 gauge minimum thickness 316 SS for smaller panels. All materials shall be selected for levelness and smoothness.

   b. Relay rack high density type panels shall utilize standard relay racks with 14 gauge 316 SS frame and supports.

   c. Structural Shapes and Strap 316 SS: ASTM A-283.

2. Construction:

   a. All dimensions shall be in accordance with Vendors' requirements and as required in the Contract Documents.

   b. The elevations and horizontal spacing shall be subject to the ENGINEER's approval.

J. Fabrication Requirements:

1. End plates, top plates and top closure panels (to hung ceiling) shall be furnished when required by the material requisition. End plates, top plates and top closure panels shall be removable with countersunk bolts to match panels. Top closure panels shall be furnished in lengths which match the widths of standard panels, except that one top closure panel may extend across two 4-feet 6-inches wide or five 2-feet 0-inches wide standard panels. The vertical joints of these panels shall align with the vertical joints of the standard panels.

2. End closure or rear closure doors shall be provided when specified. Such doors shall be flush fitting and gasketed and be of the hinged lift-off type with lockable door handles. A common key shall be provided for all doors on one panel assembly. Where removable access panels are specified, they shall be furnished with dished handle fasteners. Screwdriver 1/4 turn or Dzus type fasteners are not acceptable. Handles of adequate size, strength and number (provide in pairs with 2 minimum), shall be furnished and installed on each lift-out section to give a lifting effort of not more than 25 pounds per handle based on the weight of the panel section. Handles shall have padded non-slip surfaces for secure gripping to avoid accidents, and shall be large enough size to enable use of workman's gloves and adequate strength that there will be no bending or deformation in use even when sustaining twice the maximum indicated load.

3. The flanged edges of all panels shall be straight and smooth. Corners shall be welded and

ground smooth.

4. The face of the panel shall be true and level after flanging.

5. Panel cut-outs and holes shall be cut or drilled by a method that will not cause deformation, scarring or overheating of the surface. Burrs and sharp edges shall be ground smooth.

6. All seams shall be welded and ground smooth. There shall be no exposed sharp edges on the inside or outside of the enclosure.

7. The cabinet bottom flange for anchoring to the foundation pad shall be rolled (not welded) from the vertical walls of the cabinet and shall run around the entire inside perimeter of the enclosure at the manufacturer's standard width.

8. Adjacent panels shall assemble with faces flush. Gaps or cracks shall not be visible from the front of the assembled instrument board.

9. Stiffeners shall be welded to the back of panels as required to prevent panel deformation due to the weight of panel mounted instruments.

10. Data pocket shall be high impact thermoplastic.

11. Panel doors shall have Heavy duty ¼ turn 3-point latching mechanism constructed of 316L stainless Steel, with nylon rollers at the end of latch rods.

12. Panels shall be self-supporting as defined below.

K. Frameworks and Supports:

1. The rear of each panel section shall have a 316 SS framework assembled to it for supporting conduit, tubing, wireways, switches, air piping and all instrument accessory items such as relay or terminal enclosures, transducers, pressure switches, valves and air relays. The main framework shall be constructed of standard structural shapes. Special shapes such as 316 SS "Unistrut" may be used for secondary supports. Framework must not interfere with instrument connections or access needed for maintenance or adjustments.

2. Two removable lifting lugs shall be provided and shall be designed for moving the fully assembled control panel sections without causing distortion or bending.

L. Preparation of Panel Surface (following shall not apply to 316 stainless Steel):

1. The surface of the panel shall be prepared for finishing in a manner equal to that described below. The entire surface shall comprise the front and rear face of the panel top and bottom, both sides and the edges of all flanges, and the periphery of all holes or cut-outs.

2. All high spots, burrs, and rough spots and sharp edges shall be ground smooth.

3. The surfaces shall be sanded or sandblasted to a smooth, clean bright finish.

4. All traces of oil shall be removed with solvent.

5. The first coat of primer shall be applied immediately.

M. Panel Finishing (does not apply to 316 Stainless Steel):

1. A thin coat of primer shall be applied over the entire panel surface. Minimum dry film thickness of primer coat shall be 1 mil.

2. Wet sand to smooth clear finish and then dry.

3. At least two coats of air-dry, epoxy paint shall be applied over the entire surface. Dry film thickness of lacquer enamel shall be 1 to 2.5 mil. Color to be as approved by the ENGINEER.

4. Supply two one-pint containers of air drying, matching paint for field touch-up of the panel.

N. Instrument Finishing:

1. The final coats applied to painted surface of instrument cases, doors, or bezels which are visible from the front of panels shall be manufacturer's standard unless otherwise specified.

2. Black japan or "crinkle" finishes on instrument cases are not acceptable.

O. Preparation for Shipment and Shipping:

1. All panels shall be crated for shipment using a heavy framework and skids.

2. The panel sections shall further be cushioned satisfactorily to protect the finish of the instruments and panel during shipment.

3. All instruments which are shipped with the panel shall further have suitable shipping stops and cushioning material installed in a manner to protect instrument parts which could be damaged due to mechanical shock during shipment.

4. Each separate panel unit shall be provided with removable lifting lugs to facilitate handling.

5. All shipments shall be by air ride van, unless otherwise specified or approved.

P. Labor and Workmanship:

1. All panels shall be fabricated, piped and wired by fully qualified workers who are properly trained, experienced and supervised.

2. All personnel used on the project shall be subject to CITY approval.

Q. Drawings:

1. Furnish copies of preliminary drawings for approval. These drawings shall include:

a. Complete panel layouts showing all outside dimensions, locations and dimensions of panel cutouts, locations of back of panel stiffeners, and panel face drawings to exact scale.

b. Terminal point locations with coded identification for wiring, and piping connections (includes all pneumatic transmission lines).

c. Back of panel piping.

d. Back of panel wiring, including dimensioned location of connections.

2. Fabrication of panels, piping and wiring shall not proceed without the CITY's written release for fabrication or approval of shop drawings by the ENGINEER.

3. The ENGINEER's requirements for final certified drawings include final approved copies of the above described shop drawings as well as certified drawings of instrument equipment furnished by the panel fabricator.

4. The number of copies of final certified drawings required by the ENGINEER and the required procedure for identification of these drawings are covered by Section 01330, Shop Drawings/Submittals, of the GENERAL REQUIREMENTS.

R. Inspection and Approval:

1. Panel fabricator must carry out the following tests prior to arrival of the ENGINEER and the INSPECTOR for factory testing (FAT):

a. All air lines shall be purged and adequately tested for leaks.

b. All alarm circuits shall be rung out to determine their operability and proper function.

c. All electrical circuits shall be checked for continuity and where applicable, proper function.

d. All nameplates shall be checked for correct spelling and correct size of letters.

e. Perform any/all other tests needed to place the control panel in proper operating condition.

2. Furnish all necessary testing devices and manpower to perform the tests required by the ENGINEER and the INSPECTOR.

3. If the above tests have not been performed and confirmed prior to the arrival of the ENGINEER and the INSPECTOR, the CONTRACTOR shall be liable for back charges by the ENGINEER for the extra time required for the inspection services.

S. Photographs:

1. Fabricator shall furnish two (2) copies of 8 x 10 glossy photographs of the front, rear and all interior wiring and devices of the finished panel for the ENGINEER's record.

2. Additional photographs shall be provided at the ENGINEER's request where needed for proper documentation.

3. Photos shall be taken in digital format and shall be provided to the ENGINEER in both hard copy and digital form.

2.4 GENERAL ENCLOSURE COMPONENTS

A. Signal Isolators, Converters, and Power Supplies: Signal isolators shall be furnished and installed in each measurement and control loop, wherever required, to ensure adjacent component impedance match, or where feedback paths may be generated or to maintain loop integrity when the removal of a component of a loop is required. Signal converters shall be included where required to resolve any

signal level incompatibilities. Signal power supplies shall be as follows, as required by the manufacturer's instrument load characteristics, to ensure enough power to each loop component:

1. Moore Industries;
2. Acromag:
3. Red Lion;
4. Phoenix Contact:
5. Or equal.

B. General Purpose Relays: General purpose relays in the Control Panel (s) shall be plug-in type with 2DPDT contacts rated 10 amperes at 120 VAC. Each relay shall be enclosed in a clear plastic heat and shock resistant dust cover, relays shall also include manual test button, LED status light and hold-down clip. Sockets for relays shall have screw type terminals. Relays shall be:

1. Eaton;
2. Schneider Electric;
3. Allen Bradley;
4. Or equal.

C. Time Delay Relays: Time delay relays shall be pneumatic or electric on-delay or off-delay type, with contacts rated 10-amperes at 120 VAC. Units shall include adjustable dial with graduated scale covering the time range in each case. Time delay relays shall be:

1. Eaton;
2. Schneider Electric;
3. Allen Bradley;
4. Or equal.

D. Interposing/Slave Relays: Additional relays (interposing/slave relays) shall be installed and wired when the number or type of contacts indicated exceed the contact capacity of the specified relays and timers or to isolate field voltages. These relays shall be like general purpose relays as indicated in paragraph “B” above.

E. Circuit Breakers: Circuit breakers shall be single pole, 120 VAC, 15 ampere rating, or as required to protect wires and equipment and mounted inside the panels. Branch circuit breakers in control panels shall be miniature, DIN rail mounted.

F. Nameplates/tag numbers: Nameplates/tag numbers shall be provided for instruments, function titles for each group of instruments, and other components mounted on the front panel(s) as shown.

1. A nameplate and tag number shall be provided for each signal transducer, signal converter, signal isolator, each electronic trip, and the like, mounted inside the panel(s).

2. They shall be descriptive, to define the function and system of such element.

3. Nameplates/tag numbers shall be of the same material as those on the front of the panel(s).

4. The nameplates/tag numbers shall be descriptive to define the equipment tag, function and system.

5. The nameplates/tag numbers shall be, made from phenolic material 1/8-inch thick having a black exterior and white center.

6. Nameplates shall be fastened with stainless steel machine screws, or epoxy adhesive where penetrations to the panel are not permitted by the NEMA rating (i.e. NEMA 4/4X).

7. Tag numbers for instruments and equipment numbers for machinery shall be coded to CITY numbering system**.**

8. Nameplates/Tag numbers shall be fabricated from Laminated plastic**.** Colors, lettering, styles, abbreviations and sizes shall be in conformance with latest ISA-RP-60.6 standard with an intended viewing distance of three (3) to six (6) feet as shown or as selected by the ENGINEER.

9. Instrument tags made of 316 stainless steel shall be provided and installed for all field instruments located:
   a. Outdoors

   b. In underground pipe galleries

   c. In Tunnels

   d. In utility trenches

   e. Within 200 feet of any process area

   The Tags shall be stamped or engraved with the instrument Tag Number shown on the Contract Drawings and shall be attached to the instrument with 316 stainless steel wire.
   Otherwise, the Tags shall be made of engraved laminated plastic material (see Nameplates above) and shall be attached to the instrument with black zip ties guaranteed for sunlight exposure by the manufacturer.

10. Before being produced, submit a list indicating the wording and tag numbering of all equipment identification Nameplates/Tags along with a sample to the Engineer for approval.

    Manufacturers shall be:

    a. Brady

    b. Or equal.

G. Terminal Blocks: Terminal blocks shall be molded plastic with barriers and box lug/compression screw terminals and shall be rated 15 amperes at 600-volts. White marking strips, fastened securely to the molded sections, shall be provided and wire numbers or circuit identifications shall be marked thereon with permanent marking fluid. Terminal blocks shall be:

1. Allen Bradley;

2. Phoenix Contact;

3. Weidmuller**;**

4. Or equal.

H. Totalizer LED: Totalizers (counters) shall be electronic LED type with 7 (minimum) non-resettable digits. Counters shall be approximately 2"h x 2"w x 3"d and shall be suitable for front panel mounting. Character height shall be 0.140 inches minimum. Each electronic counter shall have a standby battery or non-volatile memory capable of maintaining the last totalized value for a minimum of 72 hours after a utility power failure. Totalizers (counters) shall be:

1. Allen Bradley;

2. Schneider Electric;

3. Or equal.

I. Signal Isolator: Signal isolators shall have complete isolation of the input, output and power circuits. Signal input shall be 4-20 mA into 50 ohms maximum; signal output shall be 4-20 mA into 1000 ohms minimum. Power input shall be 120 VAC 60 Hz. Span and zero shall be adjustable; accuracy shall be
±1 percent of span. Units shall be surface, or rack mounted. Signal isolators shall be:

1. Phoenix Contact;

2. Moore Industries.

3. AGM Electric;

4. Or equal.

J. Signal Converter: Signal converters shall have complete isolation of the input, output and power circuits. Signal input shall be 1-5 VDC into a minimum of 5 megohms input impedance. Signal output shall be 4-20 mA into 1000 ohms minimum. Power input shall be 120 VAC 60 Hz. Span and zero shall be adjustable; accuracy shall be ±0.1 percent of span. Units shall be surface, or rack mounted. Signal converters shall be:

1. Phoenix Contact;

2. Moore Industries;

3. AGM Electric.

4. Or equal.

K. Current Alarm Trip (Switches): Current alarm trips shall be single or dual type as shown. Units shall accept voltage or current input signals. Dead bands shall be adjustable over 100 percent of span for single/dual trips. Alarm trips shall be equipped with 10A DPDT contacts. Alarm trips shall include setpoint dials calibrated 0-100 percent for each trip point. Single alarm trips shall include a dead band adjustment dial calibrated 0-100 percent. Alarm trips shall be:

1. Phoenix Contact;

2. Moore Industries;

3. AGM Electric;

4. Or equal.

L. Selector and Pushbutton Switches: Selector and pushbutton switches shall be rated 10-amperes at 600 volts, shall be heavy-duty, oil-tight and shall have the number of positions and poles indicated. Operators shall be nickel or chrome plated. Switches shall be:

1. Allen Bradley;

2. Eaton;

3. Schneider Electric;

4. ABB

5. Or equal.

M. Indicating Lights: Indication lights shall be high-brightness LED, push-to-test type, and shall be NEMA heavy-duty, oil tight. Each light shall have a screwed-on glass prismatic lens approximately one-inch in diameter. Each light shall have a factory-engraved legend plate, as shown on the Drawings. Indicating lights shall be:

1. Allen Bradley;

2. Eaton;

3. Schneider Electric;

4. Or equal.

N. Signal and Control Circuit Wiring:

1. Wire type and sizes: Conductor shall be flexible stranded copper machine tool wire; these shall be UL listed Type MTW and shall be rated 600-volts. Wires for instrument signal circuits and alarm input circuits shall be No. 14 AWG. All other wires, including shielded cables, shall be No. 16 AWG minimum.

2. Analog signal, digital signals and power wiring shall each be run in separate conduits.

3. Wire Insulation Colors: Conductors supplying 120 VAC power on the line side of a disconnecting switch shall have a black insulation for the ungrounded conductor. Grounded circuit conductors shall have white insulation. Insulation for ungrounded 120 VAC control circuit conductors shall be red. All wires energized by a voltage source external to the Control Panel(s) shall have yellow insulation. Insulation for all DC conductors shall be blue.

4. Wire Marking: Each signal, control, alarm, and indicating circuit conductor connected to a given electrical point shall be designated by a single unique number which shall be shown on all shop drawings. These numbers shall be marked on all conductors at every terminal using white numbered wire markers which shall be plastic-coated cloth or shall be permanently machine marked heat-shrink plastic and easily visible and readable. Manufacturers shall be:

a. Brady,

b. Or equal

2.5 EQUIPMENT SPECIFICATIONS

A. Differential Pressure type Flow Transmitter: Differential pressure flow transmitters shall be two wire devices with the following features: continuously adjustable span, zero and damping adjustments, integral indicator scaled in engineering units, square root extraction, solid state circuitry and 4-20 mA output plus HART. The transmitter shall be rated to withstand up to 2000 psig on either side without incurring damage. Accuracy shall be ±0.25 percent of calibrated span. Process wetted materials shall be 316 SS. Body materials shall be 316 SS. Process connections shall be ½" NPT. A five-valve manifold shall be furnished with the transmitter. Unless otherwise specified, the manifold wetted materials shall be the same as specified for the transmitter. The differential pressure flow transmitter shall be:

1. Emerson- Rosemount;

2. Endress+ Hauser;

3. Honeywell,

4. Or equal.

B. Liquid Level Transmitter: The level transducer shall be a flanged, differential pressure sensing unit. The transmitter shall be a two wire device with the following features: continuously adjustable span, zero and damping adjustments, integral indicator scaled in engineering units, solid state circuitry, and 4-20 mA output plus HART. Accuracy shall be ±0.25 percent of span. Process wetted parts shall be 316SS Body and flange shall be 316SS. The flanged process connection shall be ANSI 3 or 4 inch 150 lbs. The level transmitter shall be:

1. Emerson- Rosemount;

2. Endress+ Hauser;

3. Honeywell**;**

4. Or equal.

C. Ultrasonic Level Transmitter: The system shall use ultrasonic ranging to measure the level of liquid and shall consist of a sensor with interconnecting cable and control transmitter unit which can be located up to 600 feet from the sensing unit. Level sensing shall be automatically compensated over the system temperature range of at least 0 to 50 degrees C and shall incorporate non-linear digital filtering and moving average techniques to reduce noise and atmospheric interference. Transmitter shall be microprocessor based. Calibration shall require no reference targets. Accuracy shall be 1 percent or better. In the case of momentary signal loss, relays shall maintain their last state. Output shall be 4 - 20 mA plus HART proportional to the range of level sensing. Ultrasonic transmitter shall also have a minimum of **five** programmable contacts rated at 10 amps and 115 VAC outputs (SPDT each) with adjustable set points and dead bands which can be used for pump control. The ultrasonic unit shall be powered by 120 VAC. Twenty-five feet of transducer to transmitter interconnecting cable shall be provided or as specified in the Instrument Schedule. Ultrasonic unit shall be:

1. Siemens/ Miltronics Hydroranger;

2. ABB;

3. Endress + Houser;

4. Or equal.

D. Bubbler Assemblies: Bubbler air regulating systems shall be furnished as shown including piping, pressure or level gages, shut-off valves, pressure regulating valves, filter, differential pressure regulator, rotameter, level transmitters, and/or pressure switches. For those bubbler systems not receiving plant air, a non-lubricated top end air compressor with receiving tank shall be furnished. The continuous air stream generated is intended to provide a self-purging action for low maintenance operation.

E. Pneumatic Systems: Each assembly shall consist of the electrical, electronic, and pneumatic components defined in the specifications and shown on the drawings. Interconnecting tubing for the low pressure connections shall be ½" stainless steel with stainless steel fittings. The connection from the low pressure connection on each level transmitter shall be piped to a screened breather-drain. Air pressure gages shall be scaled in psig, bubbler tube level gages shall be scaled in inches or feet of W.C. with minor division not to exceed 3" W.C. All level and pressure gages shall have indicating dials that are a minimum of 2.5" in diameter. The purge air flow shall be set by a needle valve and the flow rate shall be indicated on a direct reading rotameter scale. This scale shall be in standard cubic feet per hour (SCFH) units and shall have a scale range of 0.25 to 2.5 SCFH.

F. Pressure Transmitters: Pressure transmitters shall be two wire devices with the following features: continuously adjustable span, zero and damping adjustments, integral indicators scaled in engineering units, solid state circuitry and 4-20 mA output plus HART. The transmitter shall be rated to withstand up to 2000 psig without incurring damage to the transmitter. Accuracy shall be ±0.25 percent of span. Process wetted materials and body shall be 316 SS. Process connections shall be ½" NPT. The transmitter housing shall be rated NEMA 4X plus NEMA 7 or 9 for hazardous locations. Conduit hubs shall be cast integral with the instrument housing and shall be ¾" NPT. Pressure transmitter shall be.

1. Emerson- Rosemount;

2. Endress+ Hauser;

3. Honeywell**;**

4. Or equal.

G. Differential Pressure Transmitter: Differential pressure transmitters shall be two wire devices with the following features: continuously adjustable span, zero and damping adjustments, integral indicator scaled in engineering units, solid state circuitry and 4-20 mA output plus HART. Accuracy shall be ± 0.25 percent of span. Process wetted diaphragm materials shall be as shown on the specification sheets herein. Body materials shall be as shown on the specification sheets herein. Process connections shall be 1/4" or ½" NPT as indicated. The transmitter housing shall be rated NEMA 4X (plus NEMA 7 or 9 for hazardous locations).The differential pressure transmitter shall be:

1. Emerson- Rosemount;

2. Endress+ Hauser;

3. Honeywell**;**

4. Or equal.

H. Level Switch Float Tilt Type: Liquid level switches shall be float actuated type designed for use for wastewater sump control. The float when tilted magnetically actuates hermetically sealed SPDT switch within the unit. Switch rated at minimum of 240 VAC, 10 amps. Switch enclosure shall be the appropriate NEMA rating. Process wetted materials shall be PVC or polypropylene. Liquid level switches shall be:

1. Magnetrol Model T10;

2. Warrick Series 10;

3. Xylem Flygt ELM-10 ;

4. Or equal.

I. Pressure Switches: The pressure switches shall be double-pole, double-throw with adjustable differential range. Minimum differential shall be less than 10 percent of range. Allowable surge pressure shall be 1.5 times range or better. Each pressure switch shall have visible scale and visible contact operation. Pressure switches shall have a contact rating of 10 amperes at 120 volts AC. Pressure switches shall be non-mercury wetted type or snap switches and shall be in NEMA 4X rated enclosures (plus NEMA 7 or 9 for hazardous installations). All pressure switches shall be provided with diaphragm seals. Diaphragm seals shall be provided and included with the pressure switches at the locations shown on the Drawings. Pressure switches shall be:

1. Ashcroft Type 1125A with contacts;

2. Mercoid Series 1000;

3. Or equal.

J. Temperature Switches: Temperature switches shall be either bimetallic or filled system type with three-quarter inch (0.750 inch) NPT thermowell process connection per applicable piping code. Switches shall have SPDT contacts and provided with an adjustable set point. Enclosure shall be rated NEMA 4X plus NEMA 7 or 9 for hazardous environments.

K. Pressure and Vacuum Gages: Pressure gages shall be provided where shown. In all locations where pressure may vary from below to above atmospheric head, compound gages shall be installed.

1. Gage Construction: Gages shall be industrial grade with type 316 stainless steel movement and stainless steel or alloy case or phenol case. Unless otherwise shown or specified, gages shall have a 4-1/2-inch dial, ½-inch threaded connection, a Type 316 stainless steel snubber adapter, and a shut-off valve. Gages shall be calibrated to read in engineering units, with an accuracy of ±1 percent of reading, and shall withstand pressures equal to 150 percent of the rated working pressure or vacuum without failure or damage to the gage. All gages shall be vibration and shock resistant (sealed liquid filled). Pressure gages shall be:

a. Ashcroft Duraguage;

b. Ametek 1981

c. Or equal.

2. Diaphragm Seal: Gages attached to systems involving chemical solutions, corrosive fluids, or other liquids containing one percent or less of solids, shall be equipped with diaphragm seals. For liquid having 1 percent or greater solids content saddle type diaphragm seals shall be used:

    a. Ametek;

    b. Rosemount;

    c. Or equal.

3. Elastomer Diaphragm Seal - For liquids containing solids, pulsating flow: Utilize seals of type 316 stainless steel for liquids having grit, solids or pulsating flows, and for pressures over 1 psi. Use an elastomer diaphragm for pressures of 1 psi and below. All nuts, bolts, fasteners and accessories shall be Type 316 stainless steel. Provide fill connection and valved flush port size 1/4-inch NPT, Gages/Seals shall be capable of disassembly without loss of fill fluid.

4. Installation: All gages and appurtenances shall be installed at the locations shown in the Contract Documents and in accordance with the manufacturer's printed instructions. Care shall be taken to minimize the effect of water hammer or vibrations on the gages. Where indicated or necessary for proper operation, gages shall be mounted independently of vibrating piping or machines and connected to the process with diaphragm seals and flexible capillary tubing.

L. Differential Pressure Gages with Alarm Set points: Differential pressure indicators shall have a six inch dial with differential pressure flow in engineering units. Accuracy shall be ±0.5 percent of full scale. Other requirements shall be like Gages above.

1. Each differential pressure gage (and other device – i.e. transmitters and switches) shall be furnished with a three valve manifold constructed entirely of **316 stainless steel.**

2. Differential pressure gages shall be complete with integral high and low alarm set points as shown on the Contract Documents. Alarm setpoint controls shall have indicating scales and shall be adjustable over the entire scale range. Each alarm output shall be a SPDT dry contact rated at 5 amps at 120 VAC minimum.

3. The enclosure shall be rated NEMA 4X (plus NEMA 7 or 9 for hazardous locations). Gages shall be:

    a. Dwyer Series 3000 with switch;

    b. Or equal.

2.6 ELECTRIC ACTUATORS

A. General: As applicable, see Instrument Data Sheet/s in Attachment C and the Contract Plans and other parts of these Specifications for additional requirements.

B. Equipment Requirements: Where electric motor actuators are shown, an electric motor-operated valve control unit shall be attached to the valve operating mechanism by means of a flanged motor adaptor piece. All electric motor operators shall be capable of operating at any mounting angle and position and shall be modulating or open-close type, multi-turn or ¼-turn as required by the application.

C. Gearing: The motor operator shall include the motor, reduction gearing, reversing starter, torque

switches, and limit switches in a weatherproof NEMA 4X and 6 and IP68 (submersible to 20 ft for 72 hours as a minimum) and other necessary equipment in the assembly. Additionally, comply with NEMA 7, Class 1 DIV 1 / 2 where applicable as indicated on the drawings and/or attached valve schedule or other parts of the Contract Documents. The actuator shall be designed and constructed to not require power to be connected during storage or prior to start-up/ commissioning to protect its interior. The operator shall be a single or double reduction unit consisting of spur or helical gears and worm gearing. The spur or helical gears shall be of hardened alloy steel and the worm gear shall be alloy bronze. All gearing shall be accurately cut with hobbling machines. All power gearing shall be oil lubricated to allow for mounting in ANY position, in a sealed housing. Ball or roller bearings shall be used throughout. Operator output speed changes shall be mechanically possible by removing the motor and changing the exposed or helical gear set ratio without further disassembly of the electric operator. For applications requiring the use of external gearboxes, to match a certain speed and torque, or for quarter-turn installations, all power gearing shall be accurately cut to assure minimum backlash. Nonmetallic, aluminum or cast gearing will not be acceptable. Anti-friction bearings shall be used throughout. Multi-turn applications shall use a heavy-duty bevel gearbox, and quarter-turn actuators shall use a heavy duty worm gearbox.

D. Hammer Blow Operation: The unit shall be so designed that a hammer blow is imparted to the stem nut when opening a closed valve or closing an open valve. The device should allow free movement at the stem nut before imparting the hammer blow, enabling the motor to reach full speed before engaging the stem load.

E. Torque Switches - Travel in the opening and closing directions shall be governed by a switch responsive to mechanical torque developed in seating the valve, or by an obstruction met in opening or closing. The torque switch shall be adjustable and shall function without auxiliary relays or other devices. Torque shall be adjustable from 40-100% of the actuator capacity, and adjustable in 1% increments, non-intrusively (no removal of covers).

F. Position Switches - Four contacts shall be provided which can be selected to indicate any position of the valve with each contact selectable as normally open or normally closed. The contacts shall be rated at 5A, 120V AC, 30V DC. Provision shall be made for 4 additional contacts should they be required or needed for the specified control.

G. Position Indication - The actuator shall provide a local display of the position of the valve and to track and monitor any manual operation of the actuator, even when the power supply is not present. The display shall be able to be rotated in 90° increments to provide easy viewing regardless of actuator mounting position. The local display shall be large enough to be readable from six (6) feet when the actuator is powered up. The actuator shall include a digital position indicator with a display indicating valve position from fully open to fully closed in 1% increments. Red, green, and yellow lights corresponding to Open, Closed, and Intermediate positions shall be included on the actuator.

H. The actuators transformer shall provide 24 VDC or 120 VAC power available for customer use.

I. Jammed valve protection: Torque switch and motor thermal protection shall be provided to prevent motor burn-out. Remote indication of availability/non-availability status of the actuator shall be provided for remote monitoring and control. Monitor relays shall be provided to detect a loss of local three phase or control voltage supply, motor thermostat trip, the local stop button locked off or the selector switch not set to the REMOTE position. Availability of the actuator for remote control shall be indicated by electrical contacts, series connected for all of the above conditions. These contacts shall be connected to a single interposing (monitor) relay integral with the actuator with dry contacts for remote wiring.

J. The remote-control signals shall be 24 VDC or 120 VAC without the need for additional relays.

K. The operator shall be wired in accordance with the schematic diagram and all wiring for external

connections shall be connected to marked terminals. The electric circuit diagram of the actuator shall not vary with valve type remaining identical regardless of whether the valve is to open or close on torque or position limit. Two 1-inch and one 1-1/4 or 1-1/2-inch conduit connections shall be provided in the enclosing case.

L. Handwheel Operation: A handwheel shall be provided for emergency operation engaged when the motor is declutched by a lever or similar means; the drive being restored to power automatically by starting the motor. The hand/auto selection lever shall be padlockable in both in Hand and Auto positions. It shall be possible to select hand operation while the actuator is running or start the actuator motor while the hand/auto selection lever is locked in Hand position without damage to the actuator.

M. The handwheel drive shall be mechanically independent of the motor drive, and any gearing shall be such as to permit emergency manual operation in a reasonable time. Worn or damaged gears shall not prevent manual operation. Clockwise operation of the handwheel shall give closing movement of the valve unless otherwise stated in the Contract specification. Valves mounted higher than 5 feet-6 inches above floor or operating level shall have chain operators and a remote-control station at ground level that performs all of the same functions as the actuator mounted station, and complying with all of the test laboratory, NEMA, and other ratings required for the actuator. Station shall be stand mounted per instrumentation mounting details found in the Contract Drawings.

N. For safety purposes, it shall be possible to disengage the electric drive with the declutch lever. This disengagement and any subsequent reengagement shall not cause any damage to the valve or actuator - even with the motor running.

O. The maximum torque required on the handwheel under the most adverse conditions specified herein shall not exceed 60 ft-lb, and the maximum force required on the rim of the handwheel shall not exceed 60 lb. An arrow and either the word "open" or "close" shall be cast on the handwheel to indicate the direction to turn for manual operation.

P. Motor: The motor shall be of the totally-enclosed, non-ventilated, high-starting torque, low-starting current type for full voltage starting or as otherwise required for modulating service. It shall be suitable for operation on 480-volt, 3-phase, 60-Hz input power, and have Class B insulation, and a motor frame with all dimensions in accordance with the latest revised NEMA Standards. The observed temperature rise by thermometer shall not exceed 55 degrees C above an ambient temperature of 40 degrees C when operating continuously for 15 minutes under full rated load, with a line voltage of not more than 10 percent above or 10 percent below the rated voltage, the motor shall develop full rated torque continuously for 15 minutes without causing the thermal contact protective devices, imbedded in the motor windings to trip or the starter overloads to drop out. All bearings shall be of the ball type and thrust bearings shall be provided where necessary. All bearings shall be provided with suitable seals to confine the lubricant and prevent the entrance of dirt and dust. Motor conduit connections shall be watertight. Motor construction shall incorporate the use of stator and rotor as independent components from the valve operation such that the failure of either item shall not require operator disassembly or gearing replacement. The actuator shall include a device to ensure that the motor runs with the correct rotation for the required direction of valve travel with either phase sequence of the three-phase power supply connected to the actuator. The motor shall be de-energized in the event of stall when attempting to unseat a jammed valve, or if single phasing occurs. Motor temperature shall be sensed by a thermostat to protect against overheating. For On/Off service, this starter shall be an electromechanical type suitable for 60 starts per hour and of a rating appropriate to the motor size. For modulating duty, a solid-state starter shall be supplied that is suitable for up to a maximum of 1,200 starts per hour. Instant reversal of actuator from one direction to another shall be protected by an automatic time delay circuit.

Q. Starter: There shall be furnished and installed in the integral weatherproof housing on the valve

actuator, unless otherwise shown, a suitably sized amperage rated reversing starter with its coils rated for operation on 120-VAC, 1-phase, 60-Hz current. A control power transformer shall be included to provide a 120-VAC source. The starter shall be equipped with 3 overload relays of the automatic reset type (NOTE! Space heaters are not required in properly sealed enclosures, per this revised specification).

R. Operator Appurtenances: The operator for each valve shall be supplied with a push button station with mechanical or electrical lockout device. The pushbutton station enclosure, if separate, shall also be rated for NEMA 4X environments and hazardous duty if needed to meet the area requirements.

S. Terminal Compartment: A separate terminal compartment which is sealed from the rest of the actuator assembly, shall be provided as part of the actuator housing so that electrical components shall remain sealed (not exposed to the outside environment) during site wiring. The terminal compartment shall be O-ring sealed at the cover and also have an inner watertight and dustproof “O” ring seal between the terminal compartment and the internal electrical elements of the actuator, fully protecting the motor and all other internal components from ingress of moisture and dust when the terminal compartment cover is removed to perform wring on site. Enclosure shall be able to allow for temporary site storage without the need for temporary electrical power supply connection.

T. All external fasteners on the actuator shall be stainless steel and shall be lubricated with anti-seize compound to prevent galling. Threaded covers and other appurtenances shall also be lubricated with anti-seize.

U. Power terminals shall be of the stud type, segregated by an insulating cover. At least three conduit entries shall be provided, threaded with an NPT standard tap with 2/4 inch taper per foot. Fine stranded wire with solderless compression connectors (ring tongue type), shall be used for all electrical connections to the actuator. Terminals for remote controls shall be provided. No external wiring or conduit shall be used for interconnection of components on the actuator.

V. It shall be possible to carry out the setting of the torque, turns, and configuration of the indication contacts via an infra-red setting tool, without opening or removing any electrical compartment covers. Diagnostic information shall be available from both an integrally mounted display window and through non-intrusive means of reading and writing data to the actuator, Two way communication shall be possible to facilitate downloading actuator setup and reading/analyzing the “on board” Data Logger via an IrDA port and non-intrusive hand-held computer/PDA. Diagnostic information from the Data Logger shall include, as a minimum, historical valve torque profiles and an actuator events log that can be stored and analyzed. Provision shall be made to display valve torque demand as a percent of rated actuator torque and position simultaneously, in order to facilitate valve trouble shooting and diagnostics.

W. Closing and opening speeds: The electric actuators and motors shall be sized to close or open the valves at a speed of 12” per minute, unless otherwise shown on the drawings or spec. Startup Kit: Each actuator shall be supplied with a startup kit comprising of installation instructions, electrical wiring diagrams, and enough spare cover screws and seals to compensate for any site losses during the startup/commissioning period.

2.7 PENUMATIC ACTUATORS

A. The pneumatic actuators shall be used to modulate valves/dampers with a positioner. The pneumatic actuator shall have an integral pressure to milliamp transducer/positioner in order to be able to respond to analog signals of 4-20 mADC at 0 to 30 VDC. The actuator material shall be suitable for the environment that it will be operating in as well as requirements described in the attached design documents Contractor shall prepare and submit ISA data sheets to document compliance with specification requirements. All pneumatic tubing of the actuator shall

be 316 SS.

2.8 HYDRAULIC ACTUATORS

Refer to mechanical specifications.

PART 3 -- EXECUTION

3.1 INSTALLATION

A. The Instrumentation Subcontractor shall utilize personnel provided by its assigned organization to accomplish, or oversee the physical installation of all elements, instruments, accessories or assemblies which it furnishes. The Instrumentation Subcontractor shall employ installers who are skilled and experienced in the installation and connection of all elements, instruments, accessories, and assemblies being furnished under this Contract.

B. In summary, it is the general intent of this Contract that all field cabling external to the Local Control panels shall be furnished and installed under provisions of Division 16 Electrical. Further, it is the general intent that all field wiring, i.e., 4-20 mA signal circuits, process equipment control wiring, signal wiring to field instruments, LCPs and PCM input and output wiring, be furnished and installed under Division 16 and be terminated and identified under provisions of Division 17 Instrumentation and Control.

C. The Instrumentation Subcontractor's attention is directed to the electrical and mechanical schematics and details of this project. Referral to these portions of the contract documents shall be required in order to understand the full intent and scope of work required.

3.2 CONTROL PANEL SIGNAL AND CONTROL CIRCUIT WIRING

A. Wiring Installation: All wires shall be run in plastic wireways except (1) field wiring, (2) wiring run between mating blocks in adjacent sections, (3) wiring run from components on a swing-out panel to components on a part of the fixed structure, and (4) wiring run to panel-mounted components. Wiring run from components on a swing-out panel to other components on a fixed panel shall be made up in tied bundles. These bundles shall be tied with nylon wire ties and shall be secured to panels at both sides of the "hinge loop" so that conductors are not strained at the terminals.

B. Wiring run to control devices on the front panels shall be tied together at short intervals with nylon wire ties and secured to the inside face of the panel using adhesive mounts.

C. Wiring to rear terminals on panel-mount instruments shall be run in plastic wireways secured to horizontal brackets run above or below the instruments in about the same plane as the rear of the instruments.

D. Conformance to the above wiring installation requirements shall be reflected by details shown on the shop drawings for the ENGINEER'S review and approval.

E. Wire Marking: Each signal, control, alarm, and indicating circuit conductor connected to a given electrical point shall be designated by a single unique number which shall be shown on all shop drawings. These numbers shall be marked on all conductors at every terminal using white numbered wire markers which shall be plastic-coated cloth, or permanently machine marked heat-shrink plastic and easily visible and readable.

3.3 INSTRUMENT CABLE TESTS

A. General: The following tests shall be performed on each instrumentation and control system cable which is installed under this Contract. All tests shall be end-to-end tests of installed cables with the ends supported in free air, not adjacent to any grounded object. Complete records of all tests shall be made and delivered to the ENGINEER for review and approval.

B. Continuity tests shall be performed by measuring wire/shield loop resistance of each signal cable as the wires, taken one at a time, are shorted to the channel shield. No loop resistance measurement shall vary by more than ±2 ohms from the calculated average loop resistance value.

C. Insulation resistance tests shall be performed by using a 1000 volt Megger for insulations rated 600V or higher and 500 volts Megger for insulations rated 500V or lower. Megohmmeter shall be used to measure the insulation resistance between each conductor , between each conductor and the conductor shield, between individual conductor shields in a multi-channel cable, between each individual conductor shield and the overall cable shield in a multi conductor cable, between each conductor and ground, and between each shield and ground. Values of resistance less than 1 megohms will be unacceptable. For further detail refer to electrical specifications.

3.4 INSTALLATION, CALIBRATION, TESTING, PRECOMMISSIONING, START-UP

A. General: All systems specified in the applicable Sections of Division 17, shall be installed, Connected/terminated, calibrated and tested, and in coordination with the ENGINEER, shall be started to place the plant processes in operation. This shall include final calibration in concert with equipment specified elsewhere in these Contract Documents, including pumps, samplers, valves and chemical feeders. The installation personnel shall have a final reviewed copy of the shop drawings and data.

B. Installation and Connection: Install and connect all field-mounted components and assemblies under the criteria imposed in this Section under "Manufacturer's Representative Services." The installation personnel shall have a final reviewed copy of the shop drawings and data.

1. The instrument process sensing lines and air signal tubing shall, in general, be installed in a similar manner to the installation of conduit specified under Division 16 specifications. Individual tubes shall be run parallel and near the surfaces from which they are supported. Supports shall be used at intervals of not more than 3 feet of rigid tubing.

2. Bends shall be formed with the proper tool and to uniform radii and shall be made without deforming or thinning the walls of the tubing. Ends of tubing shall be square-cut and cleaned before being inserted in the fittings. Bulkhead fittings shall be provided at all panels requiring pipe and/or tubing entries.

3. All instruments and connecting lines shall have allowance made for movement of equipment caused by seismic loading, vibration, or expansion or contraction caused by temperature changes. This shall be demonstrated to the ENGINEER during witnessing of field installation work prior to startup.

4. All accessory items required for installation and proper operation of the equipment shall be provided. Such items may include instrument valves, seal pots pigtails.

5. Lines or connections open to atmosphere shall be protected against ingress of foreign matter.

Unprotected openings shall have a goose neck, or equivalent, attached to protect against falling particles. Bird screen and insect screens shall be installed.

6. Comply with installation detail in the specifications for mounting of the instrument.

7. Verify that all Differential Pressure elements have three valve 316 SS manifolds.

8. All flexible cables and capillary tubing shall be installed in flexible conduits. The lengths shall be enough to withdraw the element for periodic maintenance.

9. All power and signal wires shall be terminated with spade type lugs.

10. All connectors shall be, as a minimum, watertight.

11. All wires shall be mounted clearly with identification tags at both ends that is of a permanent and reusable nature.

12. All wire and cable shall be connected from terminal to terminal without splices unless specifically approved by the ENGINEER and arranged in a neat manner and securely supported in cable groups. All wiring shall be protected from sharp edges and corners.

13. Verify that all mounting stand and bracket materials and workmanship comply with requirements set forth in the specifications and drawings.

14. Provide a technical field representative to instruct the installation personnel on any and all installation requirements; thereafter, the technical field representative shall be readily available by telephone to answer questions and supply clarification when needed by the installation personnel.

15. Finally, after all installation and connection work has been completed, the technical field representative shall check for correctness, verifying polarity of electric power and signal connections, making sure all liquid or pneumatic process connections are free of leaks, and all other similar details. The technical field representative shall certify in writing that for each loop or system checked out, all discrepancies have been corrected by the installation personnel.

16. Bear all costs and provide all personnel, equipment and materials necessary to implement all activities specified herein.

C. Process Connections: Process Connections and root valves shall be located so that they are accessible. Root valves stem and handle shall be installed clear of mainline insulation.

1. Consistent with measuring needs, process connections shall be located to have minimum movement. Therefore, they shall be as close to the system anchor points as possible.

2. For instruments mounted on a local board, the process connection shall be located as close as practical to the board.

3. Process connections in pipelines shall be oriented to avoid gas pockets in the sensing lines for liquid and vapor, and to avoid liquid pockets in the sensing lines for gas.

D. Valves: Root valves shall conform in design to the main-line class. If a globe-pattern root valve is used for pressure ranges of 0-15 psig, or differential pressure ranges of 0-100 inches H_2O, or vacuum service, its stem shall be installed horizontally. All other globe-pattern root valves shall have the stem vertical. All valves shall be full port ball where available.

1. Relief valves shall be installed without isolation valves.

2. To allow isolation of instruments, each instrument, EXCEPT FOR RELIEF VALVES, shall have a shutoff valve that is close to the instrument and is readily accessible. Where the root valve serves this purpose, instrument valves are not required.

3. If the root valve for a test point is not accessible, pipe or tubing shall be added and an instrument valve installed at convenient location.

E. Instruments: Locate locally mounted instruments near the most convenient point of use consistent with good measuring practice and accessibility. Sensing lines shall be as short as practical.

1. When consistent with good measuring practice, local boards or racks may be used to mount instruments that are grouped together because of common locations or related function.

2. Sensing instruments are preferred to be elevated as follows relative to the process connection in order to avoid gas pockets in a liquid-sensing line or liquid pockets in a gas or vapor sensing line:

Fluid	Preferred Instrument Elevation
Liquid	Below Line
Slurry	Below Line
Steam over 20 psia	Below Line
Steam not over 20 psia	Above Line
Gas	Above Line

3. Instruments and local boards shall not block walkways. For use, calibration, and repair, they shall be accessible without requiring instrument disassembly or the removal of piping, grating, or other structure.

4. Instruments shall be 4' - 6" above the floor. Exceptions may be made for seismic supports, for instruments accessibility, or for other factors, but must be approved by the ENGINEER prior to the work being done. Enough lighting shall be provided for night-time use.

5. Instruments shall be protected against shock and vibration. Because of vibration, electro-pneumatic signal converters shall not be mounted on control valves.

6. High temperature, high humidity and other ambient factors must be considered when locating instruments that require access for service.

7. Fluid-filled sensing systems, or "capillary tubes", are sealed to the instrument by the instrument manufacturer and are not repairable in the field. Such systems shall not be opened or cut during or after installation and shall be routed and protected as required to guard against damage. Avoid sharp bends in capillary tubing (i.e. bend radius shall not be less than 10 times the diameter of the capillary tubing). Excess lengths of capillary tubing shall be neatly coiled in a protected area or enclosure, e.g., coiled inside a protective shipping cap for 12-inch pipe.

8. Manufacturer's installation requirements, including those relating to unsupported span and minimum bend-radius of capillary tubing, must be submitted for review and approval by the ENGINEER.

9. All instruments shall have nameplates and tag numbers engraved on tags made of 316

stainless steel and attached with 316 stainless steel wire.

F. Sensing Lines: Sensing lines shall have a continuous slope to promote their being kept either full or free of liquid, as appropriate. The slope shall be one inch, or more, per foot of run. For instruments sensing steam at pressures up to 20 psia, 2 inches per foot of run is required as minimum.

1. If an instrument having a large dynamic displacement, e.g., a U-tube manometer, is in liquid service and is mounted above the main line, the sensing line shall descend for at least 36" close to the process connection and before sloping up to the instrument with the intent of preventing the entrapment of a non-condensable in the sensing line and shall be located below process taps.

2. If a sensing line has a liquid purge, the line shall be arranged so that the purge flow is up. If a gas purge is used into a process liquid, the purge flow shall be down.

3. Low points, except for pigtails, shall have a valved drain connection. Drip or dirt chambers shall be installed where needed. For dirty or freezing services, drain valves shall be a gate or ball type suitable for rod out.

4. High points shall have a vent connection with a manual or automatic vent valve except when the fluid is a non-condensable gas and except for pigtails. Not for U-Tube Manometers.

5. The discharge of bleed connections shall be piped to a safe disposal point if opening the bleed may create a hazard. The outlet of the valve on an atmospheric bleed shall not be plugged or capped, otherwise potentially hazardous pressure buildup may occur downstream of the valve.

6. Process fluids shall not be piped to a control room, or control panel, except instrument air, nitrogen, or other inert gas at pressure not exceeding 150 psig.

7. Dead-end sensing lines shall preferably be not over 50 feet long when using 1/4" O.D. tubing. The tubing diameter shall be increased to **½" O.D.** if a line is over 50 feet long or if the sensing instrument has a large dynamic displacement.

8. Hydrostatic head in a sensing line may affect a measurement. The effect of head shall be considered, particularly for low measuring ranges or low operating pressures.

9. Instruments in steam or vapor service shall have a pigtail or equivalent wet-leg to keep the instrument cool. The pigtail shall be close to the instrument. A wet-leg shall have a filling connection, usually at the top. If the instrument is mounted above the line, it shall be insulated up to the pigtail to minimize refluxing.

10. Use of a condensate pot may be necessary for any measured variable. If used, condensate and seal pots shall be located as close as possible to the process connection.

11. Pulsation dampers, when required, shall be installed close to the instrument, downstream of the instrument block valve.

12. Sensing lines shall be protected against mechanical loads and wear. Otherwise, additional wall thickness shall be required for mechanical strength. Unsupported spans of process and pneumatic tubing shall not exceed 3 feet in length.

13. Expansion bends shall be provided as necessary to allow for movement of supporting structures or change of length due to temperature change.

14. Hot lines shall be covered with insulation for personnel protection.

15. The main-line pipe class shall apply up to the instrument side of the root valve. Beyond that point, the appropriate instrument pipe class shall be used.

G. Fittings: Fittings shall not be used between the process connection and the root valve nor for pipe on the process side of condensate or seal pots, except that displacement and float-type level instruments are normally installed using pipe fittings.

1. So far as practical, bends rather than fittings shall be used to change the direction of a run of tubing or pipe. The minimum bending radius for cold-bending of tubing shall be three times the outside diameter of tubing. .

2. The ferrule of a flareless tube fitting shall be harder than the tube on which it is used.

3. Lubricant and sealant compounds shall be used as required by the city and equipment suppliers.

4. Where a detail specifies a size and type of fitting, a combination of fittings of other sizes but of the same or equivalent type giving the same or better overall effect may be substituted for convenience or if the desired part is not available. Flareless or threaded connections may not be used where weld connections are required. Where a ½" socket-weld fitting is required, a pipe 1/2" tube socket-weld fitting plus a 1/2" x 3/8" tube socket-weld fitting may be substituted. A flareless-end valve may be substituted for a threaded valve with flareless connectors, or vice versa. A weld fitting may replace a threaded or flareless fitting unless maintenance access will require the ability to make and break the connection. Each substitution shall require written approval of the ENGINEER.

5. Welding shall conform to project requirements.

H. Instrument Installation Notes - Flow: Condensate pots are not required for a sensing element, e.g., a force balance flow transmitter, which has negligible dynamic displacement. If displacement is not negligible, as for a U-tube manometer, and if the process fluid is either steam, other condensable fluid, water hotter than 250 Deg. F, other fluid that may flash, or moisture laden air then condensate pots shall be used. The pots shall have a volume not less than three times the displaced volume.

1. A pair of condensate pots shall be at the same elevation and as high as, or higher than, the higher process connection.

2. The pipe from a process connection to a condensate pot shall be insulated for process fluids hotter than 250 Deg. F.

3. A pair of head-type sensing lines shall be run together to the maximum extent practical so as to keep both lines at the same temperature. If they are to be insulated, they shall be insulated together.

4. Head-type sensing lines shall be checked to make sure that they are connected to the proper sides, HP and LP, of the instrument.

5. The edges of the holes for orifice taps shall be square or slightly rounded, clean, and free

from burrs, wire edges, or other irregularities.

6. For all Differential Pressure type elements, use a 316 SS five valve manifold.

7. Flow meter Installation Criteria: The following table lists the straight pipe run requirement upstream and downstream of each type of meter in terms of the number of required pipe diameters.

TYPE	UPSTREAM	DOWNSTREAM
Orifice plates	20	5
Venturi Tubes	20	5
Pitot Tubes	40	10
Propeller Meters	15	4
Ultrasonic Meters	10	5
Magnetic Meters	5	3

I. Instrument Installation Notes - Level: The lower connection on a vessel for piping to a level instrument is preferred to be on the side of the vessel rather than to come vertically down from the bottom. The intent is to minimize the trapping of solids in the sensing lines.

1. Head-type level instruments shall be located below the process connections on the vessel unless a gas purge is used, in which case the instruments may be located at any convenient elevation.

2. A stilling well shall be used in all cases to reduce the turbulence for displacement type elements located inside a vessel. A well may be required to protect a bubble tube against excessive turbulence.

3. So far as practical, level devices shall be placed away from areas of turbulence and shall not interfere with other vessel parts or instruments, such as thermowells or sample nozzles that may be required.

4. Stilling wells and bubble tubes shall be firmly supported. Head room shall be provided to permit withdrawing the tubes for cleaning and maintenance.

5. Gage glasses and their associated level instruments shall be installed adjacent to each other. The gage glasses and the other instruments shall be visible from a walkway.

6. External-chamber level instruments shall be installed with main-line-class pipe. Gate valves shall be used for root valves and other shutoff valves for these instruments, except that the manufacturer's standard pattern may be used for gage-glass valves.

7. An external-chamber instrument or a differential-pressure-type instrument used to measure level in a vessel that is open to atmosphere may have one of its input connections, as appropriate, open to atmosphere instead of being connected to the vessel. An external-chamber instrument thus installed may require additional bracing.

8. A pair of sensing lines for head-type level measurement shall have an equalizing manifold with bleed valves. Because of support problems, commercial manifold assemblies having flanged outlets shall not be used in seismic applications. In other applications, their use is not recommended for the same reason.

9. The usual level-instrument connections on vessels are:

Head-type instruments:	
Piped	3/4"
Flanged-mounted	3"
Float or Displacement-type Switches	1-
1/2" Displacement-type Transmitters and Controllers:	
External	1-1/2" or 2"
Internal	4"
Multi-instrument standpipes	3"

10. Displacement and float-type level instruments shall be placed as close as possible to the vessel to improve response. If any external-chamber instrument or a standpipe unavoidably cannot be located close to the vessel, the size of the connecting pipes shall be enlarged to facilitate the transfer of liquid on level changes, thereby reducing the loss of response caused by the long sensing and equalizing lines. The ENGINEER shall review and approve such installation.

J. Instrument Installation Notes - Pressure Differential: Condensate pots are not required for a sensing element, e.g., a force-balance transmitter that has negligible dynamic displacement. If displacement is not negligible as for a U-tube manometer, and if the process fluid is either steam, other condensable fluid, water hotter than 250^{o}F, or other fluid that may flash, then condensate pots shall be used. The pots shall have a volume not less than three times the displaced volume.

1. A pair differential-pressure sensing lines shall be run together to the maximum extent practical to keep both lines at the same temperature. If they are to be insulated, they shall be insulated together.

2. A pair of condensate pots must be at the same elevation and as high or higher than the higher process connection.

3. The pipe from a process connection to a condensate pot shall be insulated for process fluids hotter than 250^{o}F.

4. The differential-pressure sensing lines shall be checked to make sure that they are connected to the proper sides, HP and LP, of the instrument.

5. A pair of differential-pressure sensing lines shall have an equalizing manifold with bleed valves. Because of support problems, commercial manifold assemblies having flanged outlets shall not be used in seismic applications. In other applications, their use is not recommended for the same reason.

K. Installation – Pressure gauges; All gages and appurtenances shall be installed at the locations shown in the Contract Documents and in accordance with the manufacturer’s printed instructions.

1. Care shall be taken to minimize the effect of water hammer or vibrations on gages. Gages shall be filled with oil.

2. Where indicated or necessary for proper operation, gages shall be mounted independently of vibrating piping or machines, and connected to the process with diaphragm seals, snubbers, and flexible capillary tubing.

L. Instrument Installation Notes - Pneumatic: Air supply headers shall be sized as noted on the P&ID. Air-supply branch taps shall come off the top of the header but may come off the side if necessary.

1. Lines for air that is not dry shall be sloped. Dry air lines shall be sloped where possible. Low points shall have drain connections. Air header drains shall be 1/2" size.

2. Branch isolation valves shall be installed as required to reduce interdependence of branches and to facilitate maintenance.

3 Each pneumatic instrument shall have a local 5-Micron air filter, which may be part of an air set if the supply pressure is required to be reduced. When pressure is reduced for an instrument, a relief valve, which may be integral with the reducing regulator in an air set is generally required. The regulator shall be provided with a small output-pressure gage if the instrument does not have a supply-pressure gage.

4. Lubricated air may be required for certain piston actuators or other devices But shall not be used for any other pneumatic devices. If necessary, use a local lubricator.

M. Instrument Installation Notes - Temperature: Non-standard wells are not allowed to be connected to the process pipe or vessel. It is necessary to make sure that there is internal clearance for insertion and that no excessive obstruction to flow is created.

1. Direct-connected readout instruments, e.g., thermometers or indicating transmitters, shall be located near the most convenient point of use consistent with good measuring practice.

2. Filled-system temperature instruments shall follow the manufacturer's limitations, if any, regarding (a) relative elevations of bulb and measuring instrument, and (b) ambient temperatures.

3. Pressure and Temperature instruments shall be installed to minimize exposure to shock, vibration, and radioactivity, and to avoid temperature extremes.

4. Instruments shall not block walkways. For use, calibration, and repair, they shall be accessible without requiring instrument disassembly or the removal of piping, grating, or other structure.

5. Where a pipe is reduced or enlarged for a temperature connection, consideration shall be given to the orientation of the pipe and the possibility of the change of pipe size causing high- or low-point pockets that may affect the measurement by entrapment of material or that may accumulate a radioactive substance.

6. Temperature connections shall be located to provide external clearance for insertion and removal of their sensing elements.

7. The materials and pressure-temperature ratings of pipe fittings used for temperature connections shall conform to the applicable pipe class.

8. Welding shall conform to project requirements.

9. A temperature-well connection to a pipe, which is made by weld-attachment of a fitting or nozzle, shall be drilled to have a hole approximately the same size as the inside

diameter of the fitting or nozzle. The intent is to provide clearance for insertion of the well and to minimize the entrapping of fluid.

10. For threaded connections of stainless steel to stainless steel, lubrication is required to prevent seizing and galling.

11. Filled-system temperature elements shall be sealed to the instrument by the instrument manufacturer and are not repairable in the field. Filled systems shall not be opened or cut during installation and shall be routed and protected as required to guard against damage. Excess lengths of capillary tubing for filled systems shall be neatly coiled in a protected area or enclosure, e.g., coiled inside a protective shipping cap for 12 inch pipe, preferably avoiding ambient temperature extremes.

12. Manufacturer's installation requirements, including those relating to unsupported span and minimum bend-radius of capillary tubing, shall be followed.

N. Calibration: Analog instrumentation and control system equipment shall be calibrated and tested after installation to verify that control system requirements are satisfied.

1. The Instrumentation Subcontractor shall provide all necessary labor, tools, and equipment to calibrate and test each instrument in accordance with the manufacturer's specifications and instructions.

2. Each instrument shall be calibrated at a minimum of five points using test equipment to simulate inputs and read outputs. A fewer number of calibration steps may be used for selected instruments if prior written approval has been obtained from the ENGINEER.

3. All test equipment and instruments used to simulate inputs and read outputs shall be suitable for the purpose intended and shall have a current calibration record certified to an accuracy greater than that required for the instrument under test. Such test equipment shall have accuracy traceable to the National Bureau of Standards as applicable. All analog instruments shall be calibrated and tested in place without removal.

4. All test data shall be entered on test forms that verify compliance with all applicable contract accuracy requirements, instrument manufacturer published performance specifications, and permissible tolerances at each point of calibration.

5. A report shall be delivered to the ENGINEER for each instrument, certifying that the instrument has been calibrated, in the presence of the ENGINEER or the ENGINEER's designated representative and meets contract and system requirements. The report shall include but not be limited to pertinent manufacturers name plate data, units span setting, any error in percent at each test point, switch and alarm set points, valve stroking and controller balancing information.

O. Analog/Digital Loop Tests: The Instrumentation and Control System Subcontractor shall provide all necessary labor, tools, and equipment to field test, inspect and adjust each instrument installed under this contract to its specified performance requirement in accordance with manufacturer's specifications and instructions. Any instrument furnished by the Instrumentation and Control System Subcontractor which fails to meet any Contract requirement, or any published manufacturer performance specification for functional and operational parameters, shall be repaired or replaced, by Instrumentation Subcontractor at no cost to the CITY. The Instrumentation and Control System Subcontractor shall bear all costs and provide all personnel, equipment and materials necessary to implement all installation tests and inspection activities specified herein.

1. At least 15 days before the anticipated initiation of installation testing, the Instrumentation and Control System Subcontractor shall submit to the ENGINEER a detailed description, in duplicate, of the installation tests to be conducted to demonstrate the correct installation of the instrumentation and control system and the anticipated dates the testing will occur.

2. Elements such as controllers, electronic function modules, shall be tested and exercised by the Instrumentation Subcontractor to demonstrate correct operation, first individually and then collectively as functional analog networks. Each hardwired analog control network shall be tested to verify proper performance within specified accuracy tolerances. Specified accuracy tolerances for each analog network shall be defined as the root-mean-square (RMS) summation of individual component accuracy requirements. Individual component accuracy requirements shall be as specified by contract requirements or by published manufacturer accuracy specifications, whenever contract accuracy requirements are not specified.

3. Each analog network shall be tested by applying simulated analog/digital and/or discrete inputs to the first element(s) of an analog/digital network (i.e., applying simulated analog and/or discrete signals to element(s) of the network; e.g., controllers, alarms, indicators, valve operators). For networks which incorporate analog elements, simulated sensor inputs corresponding to 10 percent, 50 percent, and 90 percent of span shall be applied, and the resulting element outputs read to verify compliance to calculated root-mean-square- summation accuracy tolerance requirements. Continuously variable analog inputs shall be applied to verify the proper operation and setting off discrete devices (i.e., alarms). Provisional settings shall be made on controllers, alarms, during analog loop tests. All analog loop test data shall be recorded on test forms, which include calculated root-mean-square-summation system accuracy tolerance requirements for each output.

4. Air systems shall be tested for leaks in compliance with ISA RP7.1. When installation tests have been successfully completed for all individual instruments and all separate analog control networks, a certified copy of all test forms signed by the ENGINEER or the ENGINEER's representative as a witness, with test data entered, shall be furnished to the CITY together with an unequivocal statement that all instrumentation has been successfully calibrated, inspected, and tested.

5. Digital loops shall be tested for loop integrity and on/off function.

P. System Pre-commissioning: The Instrumentation and Control System Subcontractor shall submit an instrumentation and control system Pre-commissioning Completion Report, which shall state that all Contract requirements have been met and shall include a listing of all instrumentation and control system maintenance/repair activities conducted during the pre-commissioning testing. Acceptance of the instrumentation and control system pre- commissioning testing must be provided in writing by the engineer before the seven day operational testing may begin. Pre-commissioning shall commence after acceptance of all wire, calibration and loop tests, and all inspections have demonstrated instrumentation and control system compliance with all contract requirements. Pre-commissioning shall demonstrate proper operation of all systems under this Contract with process equipment operating over full operating ranges under actual operating conditions.

1. All pre-commissioning and test activities shall follow detailed test procedures, check lists previously developed by the Instrumentation and Control System Subcontractor and reviewed and accepted by the ENGINEER. All test data shall be acquired using equipment as specified and recorded on test forms, previously reviewed by the ENGINEER, which include calculated tolerance limits for each step. Completion of all system pre-commissioning and test activities shall be documented by a certified report, including all test forms with test data entered, delivered to the ENGINEER with a clear and unequivocal statement that all system pre-commissioning and test requirements have been satisfied.

2. Proper operation of all final control elements, control panels and instrumentation furnished under this Contract shall be verified by tests specified herein. Where feasible, system pre-commissioning activities shall, to the greatest extent possible, simulate normal final control element operating conditions in terms of applied process loads, operating ranges and environmental conditions (e.g. using water). Final control elements, control panels, and ancillary equipment shall be tested under start-up and steady-state operating conditions to verify that proper and stable control is achieved using motor control center and local field mounted control circuits. All hardwired and software control circuit interlocks and alarms shall be operational. The control of final control elements and ancillary equipment shall be tested using both manual and automatic (where provided) control circuits. The stable steady-state operation of final control elements running under the control of field mounted automatic analog controllers or software based controllers shall be assured by adjusting the controllers, as required, to eliminate oscillatory final control element operation. Transient stability of final control elements operating under the control of field mounted, and software based automatic analog controllers shall be verified by applying control signal disturbances, monitoring the amplitude and decay rate of control parameter oscillations (if any) and making necessary controller adjustments, as required, to eliminate excessive oscillatory amplitudes and decay rates.

3. All electronic control stations incorporating proportional, integral and/or differential control circuits shall be optimally tuned, experimentally, by applying control signal disturbances and adjusting the gain, reset and/or rate setting(s) as required to achieve a proper response. Measured final control element variable position/speed setpoint settings shall be compared to measured final control element position/speed values at 25 percent, 50 percent, 75 percent and 100 percent of span and the results checked against specified accuracy tolerances. Specified accuracy tolerances are defined as the root-mean-square-summation of individual component accuracy requirements. Individual component accuracy requirements shall be as specified in the Contract or as specified by published manufacturer accuracy specifications whenever Contract accuracy requirements are not specified.

Q. 30-Day Operational Testing: The Instrumentation and Control System Subcontractor shall provide start-up support to include the Instrumentation and Control System Subcontractor's personnel, electrical personnel, and any instrument manufacturers' representatives as required during the testing period to produce a fully operational system. This support shall be provided at no additional cost to the CITY.

R. Record Drawings: Keep current an approved set of complete loop and schematic diagrams which shall include all field and panel wiring, piping/tubing runs, routing, mounting details, point-to-point diagrams with cable, wire, tube and termination numbers. These drawings shall include all instruments and instrument elements for the complete instrument loop as furnished under Divisions 11, 13, 15, 16 and 17 of this Contract. Drawings shall be a record of work as actually constructed and shall be prepared and submitted as specified in the GENERAL REQUIREMENTS.

3.5 INSTRUMENT LOOP DESCRIPTION -- SEE LOOP DESCRIPTIONS in the drawings.

3.6 INSTRUMENT AND I/O SUMMARIES - SEE INSTRUMENT SUMMARY, included in the drawings.

A. General: An Instrument and I/O Summary has been compiled for most instruments specified to be furnished under this contract.

B. This index is intended to complement the plans and specifications and shall not be construed as representing a complete itemization of instruments specified to be furnished under this contract. Instruments not presently included in the index, but which can be inferred from the Contract Documents and/or are required elsewhere herein shall be included and incorporated into the

instrument and I/O summary.

3.7 INSTRUMENT DATA SHEETS - Contractor shall prepare and submit instrument data sheets for instruments specified to be furnished under this project. Data sheets are intended to complement the Instrument and I/O Summary, plans and specifications.

3.8 CALIBRATION FORMS – Contractor shall prepare and submit calibration forms for instruments specified to be furnished under this contract.

SECTION 17450
SCADA, PLCS, NETWORK AND COMMUNICATIONS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. This section specifies requirements for PLCs, SCADA, networks, and data communications shown on the drawings.

B. The Contractor shall furnish, install, configure, test, and document, all copper and fiber-optic communications network systems, including cables, switches, firewalls, software, and software licenses. The work includes accessories and appurtenances needed to provide reliable communications systems, as specified.

C. Operator HMIs

1. The System Integrator shall create an overview display for the stormwater diversion system at the new Honeywell HMI (in LCP-01) attached to the new ControlEdge PLC. Display screens to include alarms, trending, and provide gate control.

2. Venice pump station will monitor the PLC, via the new EPL connection. As part of the scope of this project, the LCP-01 HMI displays will be replicated on the Venice station's new Honeywell DCS. The Contractor will provide an Allowance for Honeywell to perform Venice configuration and testing.

D. Ethernet Private Line (EPL) communications will be provided between LCP-01 and Venice Pump Station. The Contractor to coordinate with the City to arrange installation and testing of the EPL communications line and mounting of the Service Provider's EPL modem/router and associated fiber-optic patch panel.

E. SCADA configuration at Venice Pump Station

1. Contractor and System Integrator shall coordinate with City and Honeywell control system staff for implementation of control strategies, graphic user interface screens, alarming, reports, and communication connectivity.

2. Contractor and System Integrator shall lead a minimum of two (2) workshops with City to coordinate PLC and HMI approaches and interface requirements.

3. Contractor and System Integrator shall lead a minimum of two (2) field testing sessions to verify stormwater diversion controls and displays at Venice Pump Station.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of the WORK of this Section.

1. All Division 16000 Sections.

2. Section 17400 Process Instrumentation and Controls.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. The following documents referenced shall mean:

1. EIA Electronics Industry Alliance
2. TIA Telecommunications Industry Association
3. NEC National Electric Code. NFPA 70
4. NECA National Electrical Contractors Association

B. Comply with the applicable provisions of the latest edition of the following standards for design, materials, installation, and testing:

1.	TIA/EIA-568-B	Telecommunications Cabling Standard.
2.	ANSI/ ICEA S-83-596	Optical Fiber Premise Distribution Cable.
3.	ANSI/ ICEA S-87-640	Optical Fiber Outside Plant Communications Cable.
4.	ANSI/ NECA 301	Standard for Installing and Testing Fiber Optic Cable.
5.	TIA/ EIA-526-7	Measurement of Optical Power Loss of Installed Single Mode Fiber.
6.	Bellcore GR-20-Core	Generic Requirements for Optical Fiber and Optical Fiber Cable.
7.	TIA/ EIA 568-B	Telecommunications Cabling Standard.

1.4 SUBMITTALS

A. See submittal requirements of Section 17400 “Process Instrumentation and Control”.

B. Furnish submittals including shop drawings, product literature and datasheets,

C. Network and communications test plans: Submit a detailed test plan including the following:

1. Media to be verified and test methodology
2. Test equipment to be used with calibration certificate.
3. Testing procedures.
4. Network diagrams.

D. Control Systems testing procedure. See Section 17400.

E. Shop Drawings: The shop drawings shall include a full description of the PLC system, including documentation of operation theory, programming methods, i.e. ladder logic diagram (All contacts, coils, timers, latches and each section of the ladder shall be clearly annotated and defined. The annotation of each of the input contacts representing a field device shall clearly define the status of the device.), data codes and security features, maintenance and trouble-shooting information. Schematics of all cards or units within the system along with point-to-point wiring diagrams shall be

furnished after award of contract.

1. The documentation shall, also, provide a sequential flow chart of the logic implemented. The format of the flow chart and the annotation shall be proposed for acceptance by the ENGINEER before implementation.

2. Two sets of the program and documentation shall be forwarded for review and comments at least 30 days before factory test

3. Control system architecture and interconnection cabling diagrams for the complete system. Include each cable fiber and copper network cable connection.

F. Product data

1. Manufacturers brochures with proposed materials and options clearly marked.

2. Data sheets, including catalog numbers with code for determining catalog number code. Include data sheets for all cabinet components, instruments, cables, Ethernet switches, firewalls, and cable management.

3. Manufacturer’s installation instructions for equipment proposed.

4. Submit results of an un-witnessed test performed prior to the witnessed test. Any deficiencies found are to be noted and corrected before the witnessed test. Unwitnessed Test Results together with any re-testing, to be signed by Contractor as being correct.

G. Test Report results: Submit a hardcopy report for approval by the Engineer:

H. O&M Manual: Include in the submitted O&M Manual the following as a minimum:

1. Manufacturers network device data sheets and installation instructions.

2. System Network Diagram showing device model numbers and network addresses

3. Documentation of all final device configuration settings, IP addresses and passwords.

1.5 QUALITY ASSURANCE

A. Training: A manufacturer's representative shall supply 40 hours of on-site training if required, for CITY personnel. The training shall include, but not be restricted to, operation of programming unit, trouble shooting of system hardware, software, and program development

B. Communications system installer qualifications: The communications system installer shall:

1. Demonstrate direct experience with installation and testing of communications systems on at least two similar recent projects in the last three years.

2. Utilize qualified, experienced personnel, familiar with the design, installation, and configuration of communications systems.

3. Provide special tools and equipment needed for the installation and testing of the communications system, including but not limited to tools for terminating and testing copper/fiber-optic cables, jack stands for cable reels or cable winches, and OTDR testing

1.6 COMMUNICATIONS WITH VENICE PUMP STATION

A. The Contractor to coordinate with the City of LA and the selected Ethernet Private Line (EPL) Service Provider, to install and test the communications link to Venice Pump Station.

B. The Contractor shall install the Service Providers modem and fiber-optic patch panel in the Local Control Panel (LCP-01).

C. The Contractor to coordinate with Honeywell and the Engineer/ City to provide PLC register data to allow proper configuration of the SCADA screens at Venice Pump Station and testing of the communications link to the station

D. The City's Information Technology Agency (ITA) is responsible for selecting and contract with the EPL Service provider to establish the communications link.

PART 2 – PRODUCTS

2.1 PROGRAMMABLE LOGIC CONTROLLER HARDWARE

A. PLC hardware shall be Honeywell – ControlEdge 900 platform, no equal, and provide the following features:

1. All PLC components, including power supplies, racks, CPUs, memory, I/O modules and cables shall be standardized to minimize the spare parts inventory and maximize interchangeability, and to conform to the City's LAWINS Standards.

2. All I/O modules shall be installed with appropriate type and size of Remote Termination Cables (RTP) and associated RTP module for field wiring terminations.

3. All CPUs shall have 16MBIts non-volatile memory for retention of key programming.

4. Each PLC shall have the ability to provide 4GBits of Dynamic memory capacity (RAM) and 2GBits of Program memory capacity (Flash).

5. Each PLC shall have the ability to operate in redundant or non-redundant modes and shall have the capability of a maximum of thirty-one (31) I/O bases and 372 Slots.

6. Each PLC shall be provided with redundant power supplies and shall be sized as required for I/O and field requirements. Power supplies shall provide a minimum of 5VDC @ 3.0A and 24VDC @ .6A. Power supply shall be Honeywell 900P01-0101.

7. Input power: 120VAC, 60Hz

B. PLC hardware shall be:

Honeywell ControlEdge PLC Hardware

Part Number	Manufacturer	Description
900CP1 - 0200	Honeywell	Control Processor Module (CPM), ControlEdge 900
900SP1 - 0200	Honeywell	Expansion Processor Module (EPM), ControlEdge 900
900R12 - 0200	Honeywell	12 I/0 Slot Rack
900P01 - 0301	Honeywell	120/240 VAC. 60W Rack Power Supply
900G32 - 0101	Honeywell	Digital Input, 24 VDC, 32 Channel
900H32 - 0102	Honeywell	Digital Output, 24 VDC 32 Channel
900A16 - 0103	Honeywell	Analog Input High Level, 16 Channel
900B01 - 0301	Honeywell	Analog Output, 0 to 20 mA, 4 Channel
900TCK - 0200	Honeywell	Digital I /0 - A/I - Terminal Block
900TEK - 0200	Honeywell	Analog Output - Terminal Block
900TNF - 0200	Honeywell	Filler Block Cover, Spare I/0 Slot

1. PLC I/O modules shall be Honeywell Universal Input/Output Module (900U01-0100), no equal.

2. Interposing relays shall be provided for all relay outputs

2.2 HUMAN MACHINE INTERFACE HARDWARE (HMI-100)

A. Where required, panel mounted HMI shall be Honeywell, Model HC 900 family, no equal.

B. The panel mounted HMIs shall have a keypad and touch-screen, including dedicated membrane keyboard to access up to 80 preformatted graphic displays.

C. The display screen shall be a minimum of 10.4” LCD color screen.

D. The HMI shall be capable of communicating with the PLC via an Ethernet TCP/IP or Modbus TCP connection.

E. Input power: 120VAC, 60Hz via 24VDC Power Supply.

2.3 PLC AND HMI PROGRAMMING DEVELOPMENT SOFTWARE

A. The PLC programming software shall be Honeywell ControlEdge Builder– Latest Revision

1. The PLC programming software version for the PLCs shall be certified to run on the latest version of Microsoft Windows.

2. The PLC programming software shall comply with the International IEC 61131-3 standard and support Ladder Diagram, Sequential Function Chart and Structured Text programming language formats.

B. The HMI programming software shall be Honeywell MasterLogic ”Station Designer” for HC 900 family, or equal – Latest Revision

1. The HMI programming software version shall be certified to run on the latest Microsoft Windows platform.

2. The HMI programming software shall be capable of directly accessing tag information in the PLC by using the tag name, and not the memory address.

2.4 PLC APPLICATION SOFTWARE DESIGN CRITERIA

A. PLC Program Design:

1. CONTRACTOR shall organize the PLC application software into:

a. Sections:

1) Contains all sequential control logic for a specific unit of operation

2) Each section consists of a general logic subsections, followed by unit operation subsections.

b. Subsections: Contains all sequential control logic for specific equipment such as a pump, valve or loop.

2. Program Documentation

a. Note and describe start of a new program section.

b. Annotate the PLC program.

c. Briefly describe the control objectives.

d. Identify subsections.

e. Subsection documentation includes brief description of control objective followed by a description and tag of the equipment being controlled

f. CONTRACTOR shall provide an, internal or external, organizational index for PLC application software that can be used to quickly search and locate a specific section, such as:

1) Flow, pressure and other process variable monitoring

2) Control valve or VFD PID control

3) Unit pump control

4) Unit blower control

5) Alarms

6) Data communications

7) System time-synchronization

8) PLC program initialization

g. The PLC program shall be able to initialize and bring a PLC unit from an inactive condition (e.g., power failure or hardware reset) to a state of operational readiness. Initialization shall include determination of system status prior to start-up of the operating system software and application software. Initialization shall also include the loading of all memory resident software, operator-entered setpoints, timers, counters, queues and all dynamic database values. For example, existing operator-entered setpoints shall not require operator re-entry after a power failure or after the downloading of a new PLC program.

2.5 HMI APPLICATION SOFTWARE DESIGN

A. General:

1. CONTRACTOR shall develop and submit HMI application software in accordance with ASM guidelines and in strict accordance with these requirements.

2. The following items outline the key objectives in designing the HMI graphic displays:

a. Easily navigated menus

b. Provide no more than three (3) mouse actions to navigate to any graphic display

c. Maintain consistency in graphic display and controls design

d. Maintain consistent and predictable window operations

e. Accurate representation of the facility and its operation

f. Represent control options in an easily understood fashion

g. Wherever possible, design overview displays similar to the physical layout of the facility. The perspective to the physical layout should be from the local main control room.

h. Provide operator access to process and alarm setpoints, including the following:

1) Process alarms (High-High, High, Low, and Low-Low)

2) Control setpoints.

3) Process timer setpoints.

4) Sequence setpoints for volume, level, time, etc.

5) Set or correct the time and date of the Real Time Clock for both the PLC and HMI. The time and date of both the PLC and HMI shall be synchronized to the DCS clock once per day.

i. Provide an alarm/event screen with listing of current and historical alarms and events, e.g., operator login/commands/set-point entry, change in pump/blower/equipment status, including descriptions, times of occurrence, operator acknowledgement and return to normal status.

j. Configure the HMI to provide four levels of user access security.

1) Visitor: View screens only

2) Operator: View screens, enter process setpoints, and select equipment configuration.

3) Supervisor: All access provided to an Operator, but in addition ability to change alarm setpoints and PID controller parameters.

4) Administrator: Access to all functions.

B. HMI's graphics screens shall be programmed to comply with City (WINS) latest HMI standards including symbols, colors, layout, navigation. Provide the following:

1. Overall Facility Layout Operating/Monitoring/Troubleshooting screens.

2. Log – in screen.

3. Process status screen (s).

4. Plant configuration screens.

5. Setpoint entry screens.

6. Alarm logs.

7. Event log.

8. Maintenance screen.

9. Communication screen.

10. Trend screen.

11. Report screens.

12. All screens shall have top three lines to display latest alarms, with date and time stamp, with navigational buttons for navigating between screens.

13. Screen graphics presentation to follow the recommendations of ISA-101, and the existing plant SCADA screens symbols, color scheme, and alarming.

14. Provide pop-up windows for: mini-trends.

15. Provide active page connectors for navigation.

C. Provide pre-configured local trend displays of the following historical data with a choice of time ranges of at least 1hr, 4 hrs, 24 hrs and 7 days.

1. Stormwater diversion flow together wetwell and/or basin level.

2. Pump on/off together with pump discharge flow and pump kW.

3. Facility kW (15 minute average) and kW/ 1000 gallons of pump discharge flow.

D. PLC/HMI I/O DATABASE

1. CONTRACTOR shall segment all I/O and cards to increase the reliability of all systems and limit any single I/O card failure causing an outage.

2. CONTRACTOR shall provide, coordinate, manage and document a PLC Database in accordance with LAWINS tag naming conventions. The Database shall have the following functions:

a. The database shall contain all the fields necessary to configure the various points including the following per point type:

1). Discrete Point configuration: CONTRACTOR shall provide a PLC/HMI Discrete I/O database of all the analog and discrete points. The I/O list includes the following fields:

a). Loop Number.

b). Tag Number

c). Type

d). Point description

e). Alarm description 1

f). Alarm description 2

g). Closed Condition Input: Description of the state of the input parameter of device when the field or internal PLC contacts are in the CLOSED position.

h). Open Condition Input: Description of the state of the input parameter of device when the field or internal PLC contacts are in the OPEN position.

i). Closed Condition Output: Description of the state of the output signal in the CLOSED condition

j). Open Condition Output: Description of the state of the output signal in the OPEN condition.

k). PLC name and/or number

l). PLC network address

2). Analog Point Configuration: CONTRACTOR shall provide a PLC/HMI I/O database of all analog points that are communicated to and from the DCS and the HMI. The analog I/O database shall include, but is not limited to, the following fields:

a). Attributes that further define the function of the points as listed below: Note that the attributes will be used for sorting and development of the I/O driver configuration. Additional attributes shall be developed to meet the software needs:

i Setpoint read

ii Setpoint write

iii Process variable

iv Flow totalizer read

v Equipment run time

b). Point description

c). Alarm description 1

d). Alarm description 2

e). Engineering units

f). Scale range

g). Alarm ranges:

i High-High

ii High

iii Low

iv Low-Low

v Signal fail

vi Rate of Change

vii Other

h). PLC number

i). PLC I/O hardware address

j). PLC I/O memory addresses

E. System Growth

1. Contractor shall provide twenty (20) percent spare capacity. Spare capacity shall be based on current ‘equipped’ I/O counts.

F. Operations and Maintenance Manuals: Furnish to the ENGINEER 10 complete sets of Operation and Maintenance manuals. The manuals shall include data sheets, catalog cuts, approved shop drawings, manufacturer’s technical manuals, information drawings, etc., for the system, subsystems, and all components, and shall include names, addresses and telephone numbers of equipment suppliers, representatives and repair facilities.

1. This shall include a complete description of the recommended operating procedures, maintenance procedures, and spare/replacement parts list for equipment items with catalog data, diagrams, and drawings or cuts describing the equipment.

2. Each set shall include full size assembly and wiring diagrams; drawings showing "as built" conditions shall be furnished to the CITY.

2.6 PLC PANEL

A. Refer to Section 17400 “Process Instrumentation and Control”.

B. Provide 316 stainless steel NEMA 4X PLC cabinet with air conditioner. Size conditioner for a maximum ambient of 110 deg F. Provide cabinet thermal calculations with shop drawing submittal.

C. PLC cabinet to exclude motor starters, VFDs and any 480V devices.

2.7 SPARES

A. The following spare parts shall be provided:

1. One of each type of PLC controller module

2. One of each type of communications and remote I/O module.

3. One I/O module for each ten of each type installed, with a minimum of 2 per type

4. One spare PLC power supply.

5. One field termination module of each type for every ten installed, with a minimum of 2 per type.

6. One of each type of preformed interconnection cable.

2.8 MANAGED INDUSTRIAL ETHERNET SWITCH WITH INTEGRAL FIREWALL.

A. Furnish industrial managed Ethernet switches with firewall as shown on the drawings and complying with the requirements of this Section, to provide network connectivity between network components.

B. The Ethernet switch manufacturer shall be CISCO, Industrial Security Appliance 3000, no exceptions.

C. Provide the switch with the following minimum features:

1. Fan-less metal enclosure. DIN rail or rack mounting. Built for harsh environments.

2. Ports: As required. Minimum of two shielded RJ45 10/100 Mbps Ethernet ports with auto negotiation. One Ethernet RJ console port.

3. Support Small Form-factor Pluggable (SFP) transceivers, selectable for copper and single/ multi-mode fiber networks. Provide a minimum of 2 SFP ports.

4. SFP fiber transceivers as shown on the drawings. Coordinate transceiver model with the requirements of the ESL Service Provider.

5. Ethernet /IP support. Port security and access control.

6. Rapid Spanning Tree Protocol, and bandwidth control.

7. Power supply: 120 VAC

8. Minimum operating temperature range: -40 to 70 deg C (-40 to 158 deg F)

D. Provide threat defense/malware application and 5-year update subscription. License in the name of the City of LA

2.9 UNMANAGED INDUSTRIAL FAST ETHERNET SWITCH

A. Furnish industrial unmanaged Ethernet switch as shown on the drawings and complying with the requirements of this Section, to provide network connectivity between network components.

B. The Ethernet switch manufacturer shall be CISCO, Industrial Security Appliance 2000, Red Lion N-Tron series, Allen Bradley, or equal.

C. Provide the switch with the following minimum features:

1. Compact, fan-less metal enclosure. DIN rail mounting. Built for harsh environments.

2. Copper ports: As required. Minimum of four shielded RJ45 10/100 Mbps full duplex Ethernet ports with auto negotiation. One Ethernet RJ console port.

3. Support Small Form-factor Pluggable (SFP) transceivers, selectable for copper and single/ multi-mode fiber networks. Provide a minimum of 2 SFP ports.

4. SFP fiber transceivers as shown on the drawings. Coordinate transceiver model with the

requirements of the ESL Service Provider.

5. Ethernet /IP support. Port security and access control.

6. Rapid Spanning Tree Protocol, and bandwidth control.

7. Power supply: 120 VAC

8. Minimum operating temperature range: -40 to 70 deg C (-40 to 158 deg F)

9. DIN rail mounting kit.

2.10 FIBER OPTIC PATCH PANELS

1. All fiber-optic cable terminations shall be made in optical patch panel assemblies. Patch panel assemblies shall be of the pre-assembled chassis type with associated rack or wall mounting hardware.

2. To facilitate the transition between outside plant cable and the pre-connectorized cable assemblies, the fibers shall be fusion spliced and housed in a splice tray. Splice tray shall be positioned in the optical patch panel assembly per manufactures recommendation. Splice attenuation shall not exceed 0.2 db. Splice shall be covered with a protective sleeve. Splice tray to provide fiber storage.

3. Provide one port for each fiber specified. Terminate all spare fibers within the patch panel.

4. Provide protection and strain relief for cables entering the patch panels

5. Provide fiber-optic patch cords to connect between the fiber-optic panel and fiber-optic network equipment.

6. Provide machine printed port labels, and cable management items to maintain a greater than minimum cable bending radius.

7. Manufacturer shall be: Corning Cable Systems, Panduit, Commscope, or equal.

2.11 FIBER-OPTIC CABLE

A. Single mode fiber cables:

1. Type: Single mode, loose tube, gel-free, indoor/outdoor rated with water blocking layer.

2. Designed for inter-building and intra-building backbones Flame retardant, low smoke, zero halogen.

3. Core/ clad diameter: 8.2/ 125 micron

4. Number of fibers: As shown on the drawings. Minimum of 12.

5. Maximum attenuation: 0.4 dB/km at 1310 nm, 0.3 db at 1550 nm

6. Maximum connector loss: 0.75 db

7. Maximum splice loss: 0.2 db

B. Multimode fiber cables

1. Loose-tube, gel free, indoor/outdoor rated with water blocking layer. Color coded fibers according to TIA/EIA-598.

2. Designed for inter-building and intra-building backbones Flame retardant, low smoke, zero halogen.

3. Core/ Clad diameter: 50/125 micron

4. Number of fibers: As shown on the drawings. Minimum of 12 fibers.

5. Maximum attenuation: 2.5 dB/km at 850 nm, 0.3 db at 1550 nm

6. Maximum connector loss: 0.75 db

7. Maximum splice loss: 0.2 db

C. Connectors: LC/UPC-90° (TIA/EIA-604-10A) polished connectors unless required otherwise by equipment.

2.12 COPPER NETWORK CABLE

A. Category 5E, 6 network cable

1. Cable: CAT 5E, 6 UTP, rated indoor/outdoor as required by NEC Article 800

2. Jacket: FEP/PVC

3. Conductors: 4 pair, 23 AWG minimum

4. Manufacturer: Belden, Berk-Tek, General Cable or equal.

PART 3 -- EXECUTION

3.1 INSTALLATION

A. Install communications equipment and cables as recommended by the manufacturer and in accordance with TIA-568-C.0/ C.1, C.2, C.3

B. Ensure maximum pulling tensions of communications cables are not exceeded, and cable bends maintain proper radius.

C. Prior to installation, physically inspect cable for damage to the jacket as it is taken from the reel. Do not install damaged cable.

D. Install equipment and cables as recommended by the Manufacturer and in accordance with TIA-568-C.0/C.1, C.2, C.3.

E. Provide all device configuration required to implement the full functionality of the networks/ communication system. Document the final configuration parameters, IP addresses, and passwords. Include a copy in the submitted Operations and Maintenance Manuals.

.

F. Category 5E, 6 Ethernet network cable testing.

1. Test Ethernet cables with cable network test set (Fluke LinkIQ or similar) and record results.
2. Measure values and determine pass/fail result for each parameter. Include:

a. Continuity and attenuation

b. Shorts between conductors

c. Crossed and reversed pairs

d. Cable length

e. Bandwidth

3.2 TESTING - GENERAL

A. All control panels and other control system equipment shall be factory tested to verify all functions and features of the equipment; both the manufacturer's published specifications and compliance with all requirements of these Contract Specifications.

B. The ENGINEER may witness testing of the units.

C. Solid-state logic systems shall be tested as complete assemblies. Testing of individual components or modules will not be acceptable. All testing shall be witnessed by the representative of the City Engineer. All costs for travel, lodging, transportation, meals, per-diem and other related expense shall be paid by the Contractor as part of the Contract Bid price. See General Requirements, Section 01453: Sampling, Testing and Fabrication Inspection.

D. Seven Day Acceptance Test:

1. After startup has been completed, the System shall undergo a seven (7) day acceptance test. The System must run continuously for seven (7) consecutive days. During this period, all System functions shall be exercised, and any System interruption and accompanying component, subsystem, or program failure shall be logged for cause of failure, as well as time of occurrence and duration of each failure. A failure shall cause termination of the seven (7) day acceptance test. When the cause of a failure has been corrected, a new seven (7) day acceptance test shall be started. Skilled technicians shall respond to all trouble calls by the CITY.

2. The technician responding to a System malfunction, must prepare a report which includes details concerning the nature of the complaint or malfunction and the resulting repair action required and taken, plus time and date of occurrence and correction.

3. The System Malfunction Report form shall be submitted to the ENGINEER for review and approval before the time of re-start of testing. Failure to obtain ENGINEER approval for the Report form shall cause postponement of testing.

3.3 FIBER-OPTIC CABLE TESTING

A. Provide 100% attenuation testing of all cable fibers while on the reel and prior to installation. Document results including cable manufacturer, date of manufacture, shipping date, cable identification, length and fiber identification. Submit results for approval prior to installation

B. Install communications equipment and cables as recommended by the manufacturer and in accordance with TIA-568-C.0/ C.1, C.2, C.3

C. Ensure maximum pulling tensions of communications cables are not exceeded, and cable bends maintain proper radius.

D. Visual inspection for continuity. Connector and loss testing after installation.

1. Fiber Connector Inspection: Use a fiber optics microscope to check the quality of the termination. A well-made connector is smooth, polished, scratch free with no signs of cracks, chips or areas where the fiber is either protruding from the end of the ferrule or pulling back into it. Remake poor connections.

E. After cable installation use a power meter per EIA/TIA 455-78-B and OTDR per ANSI/TIA/EIA-455-8-2000 to perform bi-directional cable testing of each fiber/ connector system from end to end. Match the source type and wavelength (850, 1300, 1550 nm). Calculate the loss using the average of the two bi-directional measurements.

F. Fiber acceptance power loss for cable, connectors and splices:

1. For each mated connector pair, a maximum of 0.7 dB. Typical 0.5 dB.

2. For each splice a maximum of 0.2 dB

3. For fiber: Attenuation as specified by the manufacturer.

4. Maximum allowable link loss:

Maximum loss = (0.7dB X # of mated pairs of connectors) +(0.2 dB X #of splices) +fiber loss of total length of cable

G. If the measured loss is greater than the allowable maximum loss, take necessary measures to bring the link loss into compliance.

1 INTRODUCTION

In accordance with your request and authorization, we have performed a geotechnical evaluation at David M. Gonzales Recreation Center located at 10943 Herrick Avenue in Pacoima, California as part of the Los Angeles Bureau of Engineering (LABOE) Stormwater Capture Parks Program (Figure 1 [all figures are located at the end of the text of this report]). The purpose of our study was to evaluate the soil and geologic conditions at the site and to provide preliminary geotechnical recommendations for pre-design of proposed Best Management Practices (BMPs) at the site for stormwater infiltration. Our evaluation was performed in general accordance with Task Order Solicitation (TOS) No. 25 (LABOE, 2019) and our referenced proposal dated May 18, 2020 (Ninyo & Moore, 2020a). This report presents our findings, conclusions, and recommendations for the David M. Gonzales Recreation Center project.

The intent of the Stormwater Capture Parks Program is to capture up to 2,912 acre-feet of stormwater and urban runoff per year that drain from 5,868 acres within a portion of the San Fernando Valley in order to reduce the potential for flooding, improve stormwater quality, increase water supplies through stormwater capture, and provide recreational, social, and economic benefits (LABOE, 2019). The stormwater runoff will be diverted into proposed stormwater capture and infiltration BMPs within nine City of Los Angeles parks generally located along the SR-170 corridor, including the subject David M. Gonzales Recreation Center, for replenishment of the San Fernando Groundwater Basin. According to the Conceptual Study Report (CSR) (Los Angeles Department of Water & Power [LADWP], 2018), the project at David M. Gonzales Recreation Center is anticipated to capture and infiltrate stormwater runoff from a tributary area of approximately 575 acres.

2 SCOPE OF SERVICES

Our scope of services was prepared based on our review and the conceptual design provided in the CSR (LADWP, 2018), an anticipated infiltration invert depth of 29 feet, and discussions with the client, CDM Smith, and included the following:

- Project coordination and planning with subcontractor, CDM Smith, LABOE, and Los Angeles Department of Recreations and Parks (RAP) personnel, and attendance at a project kick-off meeting.
- Review of readily available background materials, including published topographic maps, geologic maps, fault and seismic hazard maps, groundwater data, stereoscopic aerial photographs, project related plans, and in-house geotechnical information.
- Acquisition of a Los Angeles County Environmental Health Department (LACEHD) permit.
- Acquisition of a City of Los Angeles Encroachment permit for drilling within the City right-of-way on Norris Avenue.

- Field reconnaissance to observe and document the site conditions, mark-out proposed hollow-stem-auger (HSA) boring and cone penetration test (CPT) sounding locations for underground utility clearance by Underground Service Alert, meet with RAP personnel regarding site access and constraints, and meet with the City of Los Angeles inspectors.

- Subsurface exploration consisting of the drilling, sampling, and logging of eight HSA borings, ranging in depths from approximately 16½ feet to 51 feet, and five CPTs to depths ranging from approximately 13 feet to 24 feet. The purpose of the borings and CPTs was to evaluate the subsurface soil conditions and percolation rates of the on-site soils.

- Field percolation testing in five of the borings in general accordance with the methods presented in the County of Los Angeles (COLA) Guidelines for Geotechnical Investigation and Reporting Low Impact Development Stormwater Infiltration (COLA, 2017).

- Geotechnical laboratory testing of representative soil samples to evaluate in-situ moisture content and dry density, gradation, percentage of particles finer than the No. 200 sieve, consolidation, direct shear strength, and soil corrosivity.

- Data compilation and engineering analysis of the information obtained from our background review, subsurface evaluation, infiltration testing, and laboratory testing.

- Preparation of this geotechnical report presenting our findings, conclusions, and preliminary recommendations pertaining to the design and construction of the proposed improvements.

3 SITE DESCRIPTION

David M. Gonzales Recreation Center is a City of Los Angeles park located on the northeastern side of the San Fernando Valley, approximately 1¾ miles to the east of the intersection of California State Route (SR) 118 and Interstate 5 (I-5), approximately 1¼ miles southwest of the intersection of SR-118 and I-210, and ¾ mile west of Hansen Dam (Figure 1). The park consists of a relatively flat rectangular-shaped lot bounded by Herrick Avenue on the northeast, Pierce Street on the southeast, Norris Avenue on the southwest, and Pacoima Charter School on the northwest (Figure 2). Residential and multi-family properties are located to the north, east, and west of the park and Whiteman Airport is located to the south of the park. The southeast approximate half of the park consist of two baseball diamonds with dirt infields and grass-covered outfields lined by trees. The northwest approximate half of the park includes a grass field area, recreation center building, picnic area, and playground area. An asphalt concrete (AC) parking lot is located along Herrick Avenue on the northeast side of the park. The project area also consists an approximately 760-foot-long section of Norris Avenue between the park and Van Nuys Boulevard to the northwest. Norris Avenue is paved with AC and bounded by residential properties on the southwest and Pacoima Charter School on the northeast.

Based on our review of topographic maps (NavigateLA, 2020), the park slopes gently downward toward the south with site elevations ranging from approximately 1,042 feet above mean sea level (MSL) at the north corner of the park to approximately 1,031 feet (MSL) at the south corner of the

park. Norris Avenue slopes gently downward toward the southeast with site elevations ranging from approximately 1,044 feet above MSL at Van Nuys Boulevard to the and approximately 1,040 feet (MSL) adjacent to the east side of the park.

4 PROJECT DESCRIPTION AND PROPOSED CONSTRUCTION

Based on our review of TOS 25 (LABOE, 2019), the David M. Gonzales Recreation Center project would consist of the installation of new BMPs within the park to infiltrate stormwater diverted from an existing 84-inch-diameter reinforced concrete pipe (RCP) storm drain along Van Nuys Boulevard and an existing 63-inch-diameter RCP storm drain along Pierce Street (Figure 3). The new BMPs would consist of the installation of an underground infiltration gallery to store approximately 1,250,000 cubic feet of water, a diversion structure, in-line pretreatment devices, flow measuring devices, supervisory control and data acquisition (SCADA), educational signage, and park restoration/improvements. According to the CSR (LADPW, 2018), which was included as part of TOS 25, the conceptual infiltration gallery would have a footprint of approximately 130,800 square feet (sf) with an inner height of approximately 12 feet (11 feet of storage), and an invert depth of approximately 29 feet below the ground surface (bgs). As indicated our proposed scope of services (2020) was based on our review of the CSR (LADPW, 2018). We understand that the gallery will likely consist of prefabricated, modular concrete vaults with open bottoms underlain by drain rock over a layer of filter fabric. Based on our discussions with CDM Smith, it is our understanding that the gallery may be supported on concrete strip footings. Upon completion of the BMP installation, the BMPs will be buried with compacted fill and the ground surface returned to its existing condition for continued use and additional development as a park

Subsequent to performing our subsurface exploration, presented herein, we received conceptual plans from our client (CDM Smith, 2020), which include three BMP options (Alternatives 1 through 3) for the project. The improvements generally involve the construction of an underground infiltration gallery within the existing fields at the park. We understand that these proposed alternatives are subject to change as further design is performed. The three options are described below.

Alternative 1 – According to CDM Smith (2020), Alternative 1 consists of the installation of a subterranean infiltration gallery (94,300 sf) within the existing baseball fields that will have an interior height of 14 feet, invert depth ranging from approximately 19 to 24 feet, and fill cover of approximately 5 feet. The alternative will include the construction of new concrete structures, including two diversion structures (one on Pierce Street adjacent to the park and one in the intersection of Norris Avenue and Van Nuys Boulevard), hydrodynamic separators, and manhole vaults, and new 36-inch-diameter pipelines that connect the structures to the gallery. The invert

depths of the structures and pipelines are anticipated to be on the order of 12 to 16 feet in depth. The proposed layout of Alternative 1 is presented on Figure 3.

Alternative 2 – Alternative 2 consists of the installation of a smaller subterranean infiltration gallery (9,800 sf) within the existing parking lot along the northeast side of the baseball diamonds along with nine approximately 50-foot-deep dry wells within and adjacent to Herrick Avenue. The gallery would have an interior height of 14 feet, invert depth of approximately 24 feet, and fill cover of approximately 10 feet. The alternative also includes the installation of concrete structures, including a diversion structure in Pierce Street and an in-line pretreatment device within the park, new 36-inch-diameter pipelines between the structures and gallery, and bioswales on both sides of Herrick Avenue. The invert depths of the structures and pipelines are anticipated to be on the order of 13 to 18 feet in depth Additional pipelines would connect the dry wells to the gallery.

Alternative 3 – Alternative 3 consists of the installation of a smaller subterranean infiltration gallery (20,000 sf) within the park, northwest of the existing baseball diamonds, along with twelve approximately 50-foot-deep dry wells within the park along Norris Avenue. The gallery would have an interior height of 14 feet, invert depth of approximately 19 feet, and fill cover of approximately 5 feet. The alternative also includes the installation of concrete structures, including a diversion structure at the intersection of Van Nuys Boulevard and Norris Avenue, an in-line pretreatment device within the park, and new manhole vaults, and new 36-inch-diameter pipelines between the structures and gallery. The invert depths of the structures and pipelines are anticipated to be on the order of 12 to 16 feet in depth. Additional pipelines would connect the dry wells to the gallery.

5 SUBSURFACE EVALUATION AND LABORATORY TESTING

Our subsurface evaluation was conducted on March 25 through April 2, May 28, and May 29, 2020, and consisted of the drilling, logging, and sampling of eight HSA borings (B-1 through B-3 and P-1 through P-5) and five CPT soundings (CPT-1 through CPT-5). The borings were drilled using a truck-mounted drill rig with 8-inch diameter augers. The depths of the borings were based on the conceptual design depths for the infiltration basin presented in the CSR (LADWP, 2018) and on our discussions with CDM Smith regarding the possible use of deeper dry wells. Borings B-1, B-2, P-3, P-4, and P-5 were drilled to proposed depths of approximately 36, 16½, 51, 31½ and 31 feet, respectively. Drilling refusal was encountered in borings B-3, P-1, and P-2 at depths of approximately 35½, 28, and 37 feet (proposed depths of 80, 30, and 50 feet), respectively. The borings were logged in the field by a representative of Ninyo & Moore and representative bulk and relatively undisturbed soil samples were collected from the borings at selected depths for laboratory testing. Percolation testing was performed in borings P-1 through P-5 as further discussed in Section 8 of this report. The CPT soundings (CPT-1 through CPT-5) were performed

using a 30-ton CPT rig with a 15 square centimeter cone to depths of approximately 23.3, 13.7, 22.0, 24.0, and 13.2 feet, respectively. Since the proposed depths of the CPT soundings were 60 feet, and relatively shallow refusal was encountered, CPT-2 and CPT-5 were repeated as CPT-2A and CPT-5A within approximately 5 feet of each previous CPT. The repeated CPTs also encountered refusal at depths of approximately 13.4 and 12.9 feet, respectively. Continuous soil profiles, including cone tip resistance and sleeve friction, were recorded during the sounding. A representative of Ninyo & Moore was on site to observe the CPT soundings. Logs of the exploratory borings and CPT soundings are provided in Appendices A and B, respectively. The approximate locations of the borings and CPTs are presented on Figures 2 and 3. The borings and CPTs were backfilled with cement-bentonite grout upon completion of the drilling and percolation testing in general accordance with the requirements of LACEHD.

Geotechnical laboratory testing of representative soil samples included tests to evaluate in-situ moisture content and dry density, gradation, percentage of particles finer than the No. 200 sieve consolidation, direct shear strength, and soil corrosivity. Moisture and density test results are presented on the boring logs in Appendix A. The remaining test results are presented in Appendix C.

Soil cuttings from the borings and CPT were placed in 55-gallon drums, and composite soil samples of the drummed soil were collected in 8-ounce jars for waste characterization. The samples were stored in a chilled cooler and delivered to SunStar Laboratories, Inc. for analytical testing under chain-of-custody protocol. The samples were tested for total petroleum hydrocarbons (TPH) (gas and diesel range) per United Stated Environmental Protection Agency (EPA) Test Method 8015B, Title 22 metals per EPA Test Methods 6010B/7470/7471, and volatile organic compounds per EPA Test Method 8260B. Based on the characterization test results, the drums were disposed at an approved landfill (Soil Safe in Adelanto, California) by a licensed transportation subcontractor (Belshire) as non-hazardous. The test results and a copy of the transportation manifest are provided in Appendix D.

6 GEOLOGIC AND SUBSURFACE CONDITIONS

The project site is within the San Fernando Valley, which is generally bounded by the Santa Monica Mountains on the south, Verdugo Mountains on the east, Santa Susana Mountains on the north, and Chatsworth Hills on the west. The valley along with these bounding mountain ranges are part of the Transverse Ranges Geomorphic Province. The province encompasses an approximately 40- to 60-mile-wide area (north to south) that extends approximately 320 miles (west to east) from Point Arguello and San Miguel Island to the Eagle and Pinto Mountains of the Mojave Desert (Norris and Webb, 1990). The province generally consists of a region of east to

west-trending mountain ranges considered atypical to the predominant northwest to southeast structural fabric of California. The atypical trend of the Province is the result of a restraining bend ("the Big Bend") on the San Andreas Fault that has rotated and compressed the region to its current configuration. The compression has resulted in folding and reverse/thrust faulting with similar east to west trends, and regional uplift. The Santa Monica Mountains are the southernmost of the east to west trending ranges of the province and the San Fernando Valley is a synclinal valley infilled with relatively thick deposits of sedimentary rock overlain by alluvial deposits (Norris and Webb, 1980).

Review of regional geologic maps indicate that the locations of the proposed project improvements, including the buried concrete structures, pipelines, and park BMPs, are underlain by Holocene to Pleistocene-age alluvial fan deposits consisting of unconsolidated gravel, sand, and silt of the Pacoima alluvial fan (Campbell et al., 2014) (Figure 4). The California Department of Mines and Geology (CDMG, 1997) has also mapped the site as being underlain by alluvial fan deposits consisting of loose to medium dense, silty sand and sand with minor clay.

Materials encountered during our subsurface exploration generally consisted of undocumented fill underlain by alluvium. AC pavement was encountered at the ground surface in borings B-1 and B-2 on Norris Avenue. The pavement sections consisted of approximately 5½ to 6 inches of AC underlain by approximately 4 inches of aggregate base (AB). The AB generally consisted of brown, dense, poorly graded gravel with sand. Undocumented fill was encountered in our borings to depths ranging from approximately 1 to 6 feet bgs. The undocumented fill generally consisted of brown, moist, loose to very dense, silty sand, clayey sand, poorly graded sand with silt, and poorly graded sand with variable amounts of organic material, gravel, and cobbles. Documentation regarding the limits of fill or the placement and compaction of the fill soils was not available for our review. Alluvium was encountered beneath the undocumented fill to the total depth explored of up to approximately 51 feet. The alluvium generally consisted of interbedded granular deposits of light brown and brown, moist, medium dense to very dense, poorly graded sand, poorly graded sand with silt, well-graded sand, well-graded sand, silty sand, poorly graded gravel, and poorly graded gravel with silt with variable amounts of gravel and cobbles. Boulders may also be present. More detailed descriptions of the subsurface materials are presented on the boring logs and CPT soundings in Appendices A and B, respectively.

7 GROUNDWATER

Seepage and/or groundwater was not encountered in our borings or CPT to the total depth explored of up to approximately 51 feet. CDMG (1998) indicates that the historic high depth to groundwater at the project site is between 100 and 120 feet bgs increasing in depth towards the

southwest. Groundwater monitoring well data (Stratus Environmental, Inc., 2012) available on the State of California Water Resources Control Board's GeoTracker website (SWRCB, 2020) indicates that groundwater was reportedly encountered at a depth ranging from approximately 66 to 79 feet bgs at a monitoring well located approximately 900 feet northwest of the park. The depth to groundwater in a Los Angeles County groundwater monitoring well (Well ID 4892A) located 0.9 mile northeast of the site was approximately 125 feet in 2009 (the latest posted measurement) (COLA, 2020). The depth to groundwater in this well ranged from approximately 107 and 199 feet between 1966 and 2009. Since the depths to groundwater measured in the adjacent wells are approximately consistent with the historic high groundwater depth at each well location, it is anticipated that the depth to groundwater at the site will be similar to the historic high depth to groundwater at the site of approximately 100 to 120 feet (CDMG, 1998). Fluctuations in the level of groundwater will occur due to variations in ground surface topography, subsurface stratification, rainfall, irrigation practices, groundwater pumping, and other factors that were not evident at the time of our field evaluation.

8 FIELD PERCOLATION TESTING

Percolation testing was performed in percolation borings P-1 through P-5 in general accordance with the County of Los Angeles Guidelines for Geotechnical Investigation and Reporting Low Impact Development Stormwater Infiltration (COLA, 2017). The testing was performed to evaluate the infiltration rate of the on-site soils for use in design of the BMPs by CDM Smith. The approximate locations of the percolation test borings are shown on Figures 2 and 3.

Borings P-1 through P-5 were drilled to depths ranging from 28 to 50.7 feet. Preparation of each boring for percolation testing included the installation of a 2-inch-diameter polyvinyl chloride (PVC) pipe in the borings, the lowest 15 feet of which was slotted, and backfilling the bottom approximately 15 feet of annular space between the borehole wall and pipe with clean gravel. The infiltration zones were pre-soaked with water for at least one hour prior to performing percolation testing. After the borings were pre-soaked, constant-head percolation testing was performed in borings P-1, P-2, P-4, and P-5 and falling-head percolation testing was performed in boring P-3.

The constant-head testing was performed by placing clean water in the PVC pipe at a constant flow rate to establish a stabilized head. The flow rate was measured using a digital flow meter. Once a stabilized head was established in the borings, the constant-head test was initiated and the flow was maintained for a period of approximately 2 hours. The field percolation rate was calculated by measuring the total volume of water infiltrated during the total duration of the test and dividing by the surface area of the tested zone of the boring. The measured field percolation rates are presented in Table 1.

A constant-head could not be established in boring P-3 since the flow rate was lower than the threshold of our equipment. Accordingly, the percolation rate at boring P-3 was evaluated using the falling-head test method. The falling-head test method involved placing clean water into the PVC pipe to establish a head of water and measuring the rate at which the water level dropped in the pipe at consecutive time intervals (approximately 10 minutes). The test was repeated until three consecutive tests provided similar results and a stabilized rate was obtained. The field percolation rate was calculated by measuring the total volume of water infiltrated during the time interval and dividing by the surface area of the tested zone of the boring. The measured field percolation rates are presented in Table 1.

The County of Los Angeles guidelines (COLA, 2017) indicate that the measured field percolation rates should be reduced to account for the long-term performance of the proposed BMPs by dividing the rates by the “Total Reduction Factor (RF).” They define the RF as the product of the "test-specific" reduction factor (RF_t), the "site variability" reduction factor (RF_v), and the "long-term siltation, plugging, and maintenance" reduction factor (RF_s) (i.e., $RF = RF_t \times RF_v \times RF_s$).

The guidelines (COLA, 2017) indicate that the RF_t is applied to account for variations in the direction of flow during the test and the reliability of the different test methods. The guidelines provide RF_t values to be used in the equation that vary based on the test method performed. Values of 2 and 3 are specified for the falling-head and constant-head percolation tests, respectively, and were applied to the RF equation accordingly. The RF_v value is applied to account for site variability, number of tests, and thoroughness of the subsurface investigation and ranges from 1 to 3. For the subject park, it is our opinion that an RF_v value of 1.2 should be used due to the variability of the on-site soils and field percolations rates. The long-term siltation, plugging, and maintenance value (RF_s) also ranges from 1 to 3 and will generally vary on the level of pre-treatment performed prior to infiltration and the level of future maintenance of the system. Based on our discussions with the BMP designers, an RF_s value of 1 has been applied since pre-treatment systems will be used to remove silt prior to water entering the infiltration gallery/deep wells. The RF_s value and resulting RF should be adjusted by the BMP designer as needed. The RF_t, RF_v, RF_s, and resulting RF values used in our analysis are presented in Table 1. The adjusted percolation rates and average adjusted percolation rate based on these values are also presented in Table 1.

Table 1 – Percolation Test Results								
Test Boring	Test Type	Approximate Depth of Tested Zone (feet)	Field Percolation Rate (inches/hour)	Reduction Factor				Adjusted Percolation Rate (inches/hour)
				RF_t	RF_v	RF_s	RF	
P-1	Constant Head	17 – 28	5.8	3	1.2	1	3.6	1.6
P-2	Constant Head	22 – 37	6.5	3	1.2	1	3.6	1.8
P-3	Falling Head	40 – 51	0.6	2	1.2	1	3.6	0.3
P-4	Constant Head	19 – 31½	12.3	3	1.2	1	2.4	3.4
P-5	Constant Head	19 – 31	10.1	3	1.2	1	2.4	2.8
Average Adjusted Percolation Rate (inches/hour)								2

Notes:
RF_t – Test Specific Reduction Factor
RF_v – Site Variability Reduction Factor
RF_s – Long-Term Siltation, Plugging, and Maintenance Reduction Factor (To be adjusted by the BMP designer)
RF – Total Reduction Factor

Based on our evaluation, we recommend that the average adjusted percolation rate of 2 inches per hour, following adjustments by the BMP designer for RF_s, be used for design at David M. Gonzales Recreation Center for both shallow and deep infiltration.

In addition, we recommend the new or existing buildings be set-back from the proposed infiltration gallery a minimum of 15 feet or a distance where the bottom of the lowest foundation element of the structure is 10 feet or more (horizontally) outside of an imaginary 1:1 (horizontal:vertical) plane projected downward and outward from the top of the gallery. Where basement levels are proposed that extend beneath the top of the infiltration gallery elevation, additional evaluation should be performed to confirm the appropriate set-back.

9 FLOOD HAZARDS

Based on our review of flood insurance rate maps for the project area (Federal Emergency Management Agency [FEMA], 2020), the project site is not located in the 100-year Flood Hazard Zone, A99. Zone A99 includes areas to be protected from a 100-year flood by the Federal Flood Protection System under construction at the time of publication of the FEMA map; no base flood elevations are given. The site is located within Other Flood Areas – Zone X, which includes areas of 500-year floods and areas of 100-year floods with average depths of less than one foot and areas protected by levees from 100-year floods.

10 FAULTING AND SEISMICITY

The site is in a seismically active area, as is the majority of southern California, and the potential for strong ground motion in the project area is considered significant during the design life of the proposed project. Figure 5 shows the approximate site location relative to the major faults in the region. The site is not located within a State of California Earthquake Fault Zone (EFZ) (formerly known as an Alquist-Priolo Special Studies Zone) (Hart and Bryant, 2018). The nearest mapped

active fault to the site is the Verdugo fault located approximately 0.62 mile (1.0 kilometer) southwest of the site (United States Geological Survey [USGS], 2008) (Figure 4).

The principal seismic hazards evaluated at the subject site are surface fault rupture, ground motion, and liquefaction. A brief description of these principal seismic hazards are discussed in the following sections.

10.1 Surface Fault Rupture

Surface fault rupture is the offset or rupturing of the ground surface by relative displacement across a fault during an earthquake. Based on our review of referenced geologic and fault hazard data, the project site is not transected by known active faults. Therefore, the potential for surface rupture is relatively low. However, lurching or cracking of the ground surface as a result of nearby seismic events is possible.

10.2 Site-Specific Ground Motion

Considering the proximity of the site to active faults capable of producing a M_{max} of 6.0 or more, the project area has a high potential for experiencing strong ground motion. The 2019 California Building Code (CBC) specifies that the risk-targeted maximum considered earthquake (MCE_R) ground motion response accelerations be used to evaluate seismic loads for design of buildings and other structures.

In accordance with Chapter 20 of the American Society of Civil Engineers (ASCE) Publication 7-16 Minimum Design Loads and Associated Criteria for Building and Other Structures (2016), the Site Class should be classified based on the average shear wave velocity (V_S) in the upper 100 feet (i.e., 30 meters) (V_{S30}), the average field standard penetration resistance in the upper 100 feet (blow counts, N), or the average undrained shear strength in the upper 100 feet (S_u). After reviewing the blow counts obtained from our borings and correlations from our CPTs, the field penetration blow counts in the upper 100 feet are within the range of 15 to 50 blows per foot. Additionally, we estimated that the V_{S30} at the site is 918 feet per second (ft/s) (i.e., 280 meters per second [m/s) (CGS/Willis Site Classification Map) using the Open Seismic Hazard Analysis software developed by USGS (USGS, 2019). ASCE 7-16 defines a site as Site Class D (stiff soil) if the V_{S30} ranges from 600 to 1,200 ft/s (180 to 370 m/s) and if the blow counts in the upper 100 feet range from 15 to 50 blows per foot. Accordingly, the site is classified as Site Class D.

Per the 2019 CBC, a site-specific ground motion hazard analysis shall be performed for structures on Site Class D with a mapped MCE_R, 5 percent damped, spectral response acceleration parameter at a period of 1 second (S_1) greater than or equal to 0.2g in accordance with

Sections 21.2 and 21.3 of ASCE 7-16. We calculated that the S_1 for the site is equal to 0.826g using the 2020 Applied Technology Council [ATC] seismic design tool (web-based)]; therefore, a site-specific ground motion hazard analysis was performed for the project area.

The site-specific ground motion hazard analysis consisted of the review of available seismologic information for nearby faults and performance of probabilistic seismic hazard analysis (PSHA) and deterministic seismic hazard analysis (DSHA) to develop acceleration response spectrum (ARS) curves corresponding to the MCE_R for 5 percent damping. Prior to the site-specific ground motion hazard analysis, we obtained the mapped seismic ground motion values and developed the general MCE_R response spectrum for 5 percent damping in accordance with Section 11.4 of ASCE 7-16 (ATC, 2020). The V_{S30} is assumed to be 918 ft/s (i.e., 280 m/s) (CGS/Willis Site Classification Map) and the depths to V_S = 3,281 ft/s (i.e., 1,000 m/s) and V_S = 8,202 ft/s (i.e., 2,500 m/s) are assumed to be 722 feet (i.e., 220 meters) and 6,299 feet (i.e., 6,627 meters), respectively (Southern California Earthquake Center [SCEC] Velocity Model Version 4, Iteration 26, Basin Depth). These values were evaluated using the Open Seismic Hazard Analysis software developed by USGS (USGS, 2019).

The 2014 next generation attenuation (NGA) West-2 relationships were used to evaluate the site-specific ground motions. The NGA relationships that we used for developing the probabilistic and deterministic response spectra are by Chiou and Youngs (2014), Campbell and Bozorgnia (2014), Boore, Stewart, Seyhan, and Atkinson (2014), and Abrahamson, Silva, and Kamai (2014). The Open Seismic Hazard Analysis software developed by USGS (USGS, 2019) was used for performing the PSHA. The Calculation of Weighted Average 2014 NGA Models spreadsheet by the Pacific Earthquake Engineering Research Center was used for performing the DSHA (Seyhan, 2014).

PSHA was performed for earthquake hazards having a 2 percent chance of being exceeded in 50 years multiplied by the risk coefficients per ASCE 7-16. The maximum rotated components of ground motions were considered in PSHA with 5 percent damping. For the DSHA, we analyzed accelerations from characteristic earthquakes on active faults within the region using the California Department of Transportation (Caltrans) ARS (Caltrans, 2020c) seismic design tool (web-based) and the hazard curves and deaggregation plots at the site using the USGS Unified Hazard Tool application (USGS, 2020a). A magnitude 7.5 event on the Verdugo fault with a distance of 0.62 mile (i.e., 1.0 kilometer) from the site is the controlling earthquake. Hence, the DSHA was performed for the site using this event and corrections were made to the spectral accelerations for the 84th percentile of the maximum rotated component of ground motion with 5

percent damping. The results of our site-specific seismic hazard analysis are presented in Appendix E.

The site-specific MCE_R response spectrum was taken as the lesser of the spectral response acceleration at any period from the PSHA and DSHA, and the site-specific general response spectrum was determined by taking two-thirds of the MCE_R response spectrum with some conditions in accordance with Section 21.3 of ASCE 7-16. Figure 6 presents the site-specific MCE_R response spectrum and the site-specific design response spectrum. The general mapped design response spectrum calculated in accordance with Section 11.4 of ASCE 7-16 is also presented on Figure 6 for comparison. The site-specific spectral response acceleration parameters, consistent with the 2019 CBC, are provided in Section 12.3 of this report for the evaluation of seismic loads on buildings and other structures. The site-specific maximum considered earthquake geometric mean (MCE_G) peak ground acceleration, PGA_M, was calculated as 1.001g.

10.3 Liquefaction

Liquefaction is the phenomenon in which loosely deposited granular soils with silt and clay contents of less than approximately 35 percent and non-plastic silts located below the water table undergo rapid loss of shear strength when subjected to strong earthquake-induced ground shaking. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to a rapid rise in pore water pressure and causes the soil to behave as a fluid for a short period of time. Liquefaction is known generally to occur in saturated or near saturated cohesionless soils at depths shallower than 50 feet bgs. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking.

The State of California Hazard Zones map (CDMG, 1999) indicates that the subject site is not located within a mapped area that is considered susceptible to seismically induced liquefaction (Figure 7). Based on the historic high groundwater depth of approximately 100 to 120 feet bgs (CDMG, 1998) and the presence of dense sands with scattered gravel, it is our opinion that liquefaction and liquefaction-related seismic hazards (e.g., dynamic settlement, ground subsidence, and/or lateral spreading) are not design considerations for the project.

11 CONCLUSIONS

Based on the results of our evaluation, it is our opinion that the proposed BMPs at David M. Gonzales Recreation Center are feasible from a geotechnical standpoint, provided the

recommendations presented in this report are incorporated into the design and construction of the project. In general, the following conclusions were made:

- The subject site is underlain by up to approximately 6 feet of undocumented fill underlain by granular alluvial materials. The fill and alluvium generally consisted of moist, loose to very dense, poorly graded sand, poorly graded sand with silt, well-graded sand, well-graded sand, silty sand, clayey sand, poorly graded gravel, and poorly graded gravel with silt. Variable amounts of gravel and cobbles (and possible boulders) were encountered in the fill and alluvium.

- Our five percolation tests performed in borings P-1 through P-5 indicate that the on-site soils tested at depths ranging from approximately 28 to 51 feet have adjusted percolation rates ranging from approximately 0.3 to 4.1 inches per hour. For design purposes, we recommend using a percolation rate of 2 inches per hour for both shallow (gallery) and deep (dry well) infiltration systems. However, this rate should be adjusted as needed in accordance with COLA 2017 guidelines.

- In general, excavations and drilling in the existing fill soil and alluvium should be feasible with earthmoving equipment in good working condition. However, difficult excavating and drilling conditions should be anticipated by the contractor where excavations encounter cobbles/boulders in the alluvium. Oversized materials should be anticipated in the undocumented fill and alluvium by the contractor.

- We anticipate that the on-site excavated materials should be suitable for re-use as engineered fill and trench backfill provided they are free of trash, debris, roots, contamination, deleterious materials, and cobbles or hard lumps of material in excess of 4 inches in diameter. Processing of the materials to bring them near the laboratory optimum moisture content (i.e., drying and/or wetting) prior to use as fill should be planned by the contractor.

- The on-site soils are generally granular and will be prone to caving during excavation. The on-site soils should be considered as Type C soils in accordance with United States Department of Labor Occupational Safety and Health Administration (OSHA) regulations. Accordingly, temporary excavations deeper than 4 feet in depth should be laid back at inclinations of 1½ to 1 (horizontal to vertical) or flatter.

- Where excavations cannot be laid back, temporary shoring is anticipated. Shoring should be designed by the contractor to support the excavation sidewalls and to reduce the potential for settlement of adjacent structures, roadways and other site improvements. Shoring should be designed in accordance with OSHA regulations.

- Groundwater was not encountered in our exploratory borings to the total depth explored of approximately 51 feet. The depth to groundwater is anticipated to be similar to the historic high depth to groundwater level of approximately 100 to 120 feet bgs (CDMG, 1998). Fluctuations in the level of groundwater will occur due to variations in ground surface topography, subsurface stratification, rainfall, irrigation practices, groundwater pumping, and other factors that were not evident at the time of our field evaluation.

- The site is not located within a mapped Seismic Hazards Zone considered susceptible to liquefaction (CDMG, 1999).

- The site is not located within an EFZ with the potential for fault rupture as defined by the Alquist-Priolo Earthquake Fault Zoning Act (Hart and Bryant, 2018).

- Hydro-collapse is not considered a design issue given the proposed depth of the infiltration gallery (approximately 24 feet [CDM Smith, 2020]) and the results of our laboratory testing.

- The site is not located within a designated flood inundation zone from failure of a dam or the 100-year and 500-year flood events (FEMA, 2020).
- Based on our laboratory corrosion testing, the on-site soil can be classified as non-corrosive based on the Caltrans Corrosion Guidelines (Caltrans, 2018).

12 PRELIMINARY RECOMMENDATIONS

The following sections present our preliminary geotechnical recommendations for design and construction of the project. This project is in preliminary design phase and some aspects of the design will be subject to change. Detailed plans regarding the design of the BMPs have not been developed yet. Accordingly, the following recommendations should be considered preliminary. Ninyo & Moore should review the final plans and develop additional geotechnical recommendations as appropriate. These recommendations are based on our evaluation of the site geotechnical conditions, our understanding of the planned construction, and experience in the vicinity of the project. The work should be performed in conformance with the recommendations presented in this report, project specifications, and appropriate agency standards.

12.1 Earthwork

We anticipate that earthwork at the site will consist of cuts and fills associated with excavations to install the proposed BMP improvements, including the gallery, diversion structures, in-line pretreatment devices, pipelines, and maintenance holes, and drilling for proposed dry wells. Open cut trench and backfilling will also be involved to construct the proposed pipelines, including along Norris Avenue. Based on the preliminary plans (CDM Smith, 2020), excavations for the proposed BMP improvements, to be on the order of 12 to 24 feet in depth. Earthwork will also include finish grading for establishment of site drainage. Earthwork operations should be performed in accordance with the requirements of applicable governing agencies and the recommendations presented in the following sections.

12.1.1 Pre-Construction Conference

We recommend that grading and foundation plans be submitted to Ninyo & Moore for review to check for conformance to the recommendations provided in this report. We further recommend that a pre-construction conference be held to discuss the grading recommendations presented in this report. The owner and/or their representative, the governing agencies' representatives, the civil engineer, Ninyo & Moore, and the contractor should be in attendance to discuss the work plan, project schedule, and earthwork requirements.

12.1.2 Clearing and Site Preparation

Prior to excavating or other earthwork, the proposed area of improvements should be cleared of surface obstructions, debris, pavement, abandoned utilities, and other deleterious materials. Obstructions that extend below finish grade, if any, should be removed and the resulting holes filled with compacted soils. Materials generated from the clearing operations should be removed from the project site and disposed at a legal dump site.

12.1.3 Excavation Characteristics

We anticipate that excavations and drilling in the undocumented fill and alluvium should be feasible with earthmoving equipment in good working order. The undocumented fill and alluvial materials generally consisted of moist, loose to very dense, poorly graded sand, poorly graded sand with silt, well-graded sand, well-graded sand, silty sand, clayey sand, poorly graded gravel, and poorly graded gravel with silt with variable amounts of organic material, gravel, and cobbles. Cobbles and possible boulders were encountered in our subsurface exploration and should be anticipated in the excavations. These oversized materials may lead to difficult excavating and/or drilling, where encountered. Processing of the excavated materials to bring them near the laboratory optimum moisture content (i.e., drying and/or wetting) prior to use as fill should be planned by the contractor.

12.1.4 Subgrade Preparation for the Infiltration Gallery

Based on our exploratory borings, test pits, and CPTs, alluvium is anticipated at the bottom of the planned infiltration gallery that should be suitable for support of the gallery and overlying compacted fill. The excavation bottom should be evaluated by our representative during the excavation work. In the event that unsuitable material is encountered along the bottom of the excavation, including undocumented fill and/or waste, the unsuitable material encountered at the bottom of the gallery excavation should be removed and replaced with loosely-packed clean sand or gravel, such as additional drainage rock. The actual recommendations for removal and replacement should be based on our field observations. suitable on-site material. We recommend that minimal compaction be performed on the exposed subgrade, materials used to replace unsuitable materials (if needed), and and/or rock blanket placed beneath the gallery. We recommend that the rock blanket consist of open-graded gravel of ¾-inch to 1½-inch diameter rock underlain by filter fabric consisting of Mirafi 140N or equivalent. Compaction of the subgrade could potentially reduce the infiltration rate of the gallery. If the subgrade of the infiltration gallery is compacted, we recommend that additional percolation testing be performed.

If foundations are to be installed along the bottom of the gallery, such as strip footings, the upper approximately 8-inches of subgrade, only beneath the foundations, should be scarified, moisture-conditioned to near optimum moisture content, and recompacted to a relative compaction of 90 percent as evaluated by ASTM International (ASTM) D 1557. If unsuitable materials, including undocumented fill, waste, loose/soft, and/or wet materials, are encountered along the excavation bottom that extend beneath proposed footings, specific recommendations for removal and replacement of these materials, if warranted, will be provided by our firm based on field observations. If loose, soft, and/or wet materials are encountered beneath the foundations, removal and recompaction of the materials may be warranted. The excavation bottoms should be evaluated by our representative during the excavation work.

12.1.5 Subgrade Preparation for the Other Buried Structures and At-Grade Structures

In order to provide suitable support for proposed buried and/or at-grade structures, including, the catch basins, diversion structures, in-line pretreatment devices, and maintenance holes, we recommend that the existing undocumented fill and upper loose alluvial deposits be removed from beneath the structures. In addition, the structure foundations should be founded on 2 feet or more of newly compacted fill material. The over-excavation should remove undocumented fill and expose relatively dense alluvial deposits. Additional over-excavation of loose, soft, and/or wet areas may be appropriate. The excavation bottom should be evaluated by our representative during the excavation work and additional recommendations, if needed, be based on field observations. The limits of removal should extend approximately 2 feet beyond the footprint of the foundations. If drainage rock is placed beneath the foundations, this can be considered part of the 2-foot thick layer of compacted fill beneath the foundations. Prior to placing compacted fill and/or drainage rock, the upper approximately 8 inches of the exposed bottom should be scarified, moisture-conditioned to near optimum moisture content, and recompacted to a relative compaction of 90 percent as evaluated by ASTM D 1557.

12.1.6 Temporary Excavations and Shoring

We recommend that excavations be designed and constructed in accordance with OSHA regulations. These regulations provide shoring design parameters for excavations and trenches up to 20 feet deep based on the soil types encountered. Trenches over 20 feet deep should be designed by the contractor's engineer based on site-specific geotechnical analyses. For planning purposes, we recommend that top soil and alluvium be considered as

OSHA Type C soil. For trench or other excavations, OSHA requirements regarding personnel safety should be met by using appropriate shoring or by laying back the slopes no steeper than 1½:1 (horizontal to vertical) in the site top soil and alluvium. Temporary excavations that encounter seepage may need shoring or may be mitigated by placing sandbags or gravel along the base of the seepage zone. Excavations encountering seepage should be evaluated on a case-by-case basis.

Based on our review of the project drawings, we anticipate that site excavations will be laid-back using temporary slopes (CDM Smith, 2020). Where slopes cannot be laid back, shoring may be appropriate. If shoring systems are used for site excavations, they should be designed for the anticipated soil conditions using the lateral earth pressure values shown on Figures 8 through 9 for braced and cantilevered excavations, respectively. The recommended design pressures are based on the assumption that the shoring system is constructed without raising the ground surface elevation behind the shored sidewalls of the excavation, that there are no surcharge loads, such as soil stockpiles and construction materials, and that no loads act above a 1:1 (horizontal to vertical) plane ascending from the base of the shoring system. For a shoring system subjected to the above-mentioned surcharge loads, the contractor should include the effect of these loads on the lateral earth pressures acting on the shored walls.

We anticipate that settlement of the ground surface will occur behind the shored excavations. The amount of settlement depends heavily on the type of shoring system, the contractor's workmanship, and soil conditions. To reduce the potential for distress to adjacent improvements, we recommend that the shoring system be designed to limit the ground settlement behind the shoring system to ½ inch or less. Possible causes of settlement that should be addressed include settlement during installation of the shoring elements, excavation for structure construction, construction vibrations, and removal of the support system. We recommend that shoring installation be evaluated carefully by the contractor prior to construction and that ground vibration and settlement monitoring be performed during construction.

The contractor should retain a qualified and experienced engineer to design the shoring system. The shoring parameters presented in this report are minimum requirements, and the contractor should evaluate the adequacy of these parameters and make the appropriate modifications for their design. We recommend that the contractor take appropriate measures to protect workers. OSHA requirements pertaining to worker safety should be observed.

12.1.7 Fill Material

In general, the on-site soils should be suitable for reuse as fill materials, provided they are free of trash, debris, oversize material, or other deleterious materials. Fill should generally be free of rocks or lumps of material in excess of 4 inches in diameter. Rocks or hard lumps larger than approximately 4 inches in diameter should be broken into smaller pieces or should be removed from the site.

Imported fill material, if used, should also consist of clean, granular material with a low expansion potential, corresponding to an expansion index of 50 or less. The soil should also be tested for corrosive properties prior to importing. We recommend that the imported materials satisfy the Caltrans (2018) criteria for non-corrosive soils (i.e., soils having a chloride concentration of 500 parts per million [ppm] or less, a soluble sulfate content of approximately 0.15 percent (1,500 ppm) or less, a pH value of 5.5 or higher, or an electrical resistivity of 1,100 ohm-centimeters or more). Materials for use as fill should be evaluated by Ninyo & Moore prior to importing. The contractor should be responsible for the uniformity of import material brought to the site.

12.1.8 Fill Placement and Compaction

In general, fill material, including retaining wall, trench backfill, fill placed beneath gallery footings, and other, should be moisture-conditioned and compacted in horizontal lifts to a relative compaction of 90 percent or more as evaluated by ASTM D 1557. Fill material with less than 5 percent fines (passing No. 200 sieve) should be compacted to 95 percent relative compaction in accordance with City of Los Angeles guidelines as evaluated by ASTM D 1557. The rock blanket and granular materials placed as fill along the bottom of the gallery excavation, with the exception of fill placed beneath footings, should generally not be compacted. Fill material should be moisture-conditioned to slightly above the laboratory optimum moisture content. The lift thickness for fill soils will depend on the type of compaction equipment used but generally should not exceed 8 inches in loose thickness. Special care should be exercised to avoid damaging pipes during compaction of trench backfill. Placement and compaction of the fill soils should be in general accordance with local grading ordinances and good construction practice.

12.2 Underground Utilities

We anticipate that underground pipelines will be supported on native alluvial deposits. Based on the preliminary plans, pipeline inverts may be on the order of 18 feet in depth.

12.2.1 Pipe Bedding

We recommend that pipes be supported on 6 inches or more of granular bedding material, such as sand, with a sand equivalent value of 30 or more. Bedding material should be placed around the pipe and 12 inches or more above the top of the pipe in accordance with the current "Greenbook" Standard Specifications for Public Works. Special care should be taken not to allow voids beneath the pipe. Compaction of the bedding material and backfill should proceed up both sides of the pipe. Trench backfill, including bedding material, should be placed in accordance with the recommendations presented in Section 12.1.

12.2.2 Modulus of Soil Reaction for Pipe Design

The modulus of soil reaction is used to characterize the stiffness of soil backfill placed along the sides of buried flexible pipelines for the purpose of evaluating deflection caused by the weight of the backfill above the pipe. We recommend that a modulus of soil reaction of 1,000 pounds per square inch be used for design, provided that granular bedding material is placed adjacent to the pipe, as recommended in the previous section.

12.3 Site-Specific Seismic Design Considerations

Design of the proposed improvements should be performed in accordance with the requirements of governing jurisdictions and applicable building codes. Table 2 presents the site-specific spectral response acceleration parameters in accordance with the CBC (2019) guidelines.

Table 2 – 2019 California Building Code Seismic Design Criteria

Site Coefficients and Spectral Response Acceleration Parameters	Values
Site Class	D
Mapped Spectral Response Acceleration at 0.2-second Period, S_s	2.446g
Mapped Spectral Response Acceleration at 1.0-second Period, S_1	0.826g
Site-Specific Spectral Response Acceleration at 0.2-second Period, S_{MS}	2.393g
Site-Specific Spectral Response Acceleration at 1.0-second Period, S_{M1}	1.890g
Site-Specific Design Spectral Response Acceleration at 0.2-second Period, S_{DS}	1.595g
Site-Specific Design Spectral Response Acceleration at 1.0-second Period, S_{D1}	1.260g
Site-Specific Maximum Considered Earthquake Geometric Mean (MCE_G) Peak Ground Acceleration, PGA_M	1.001g

12.4 Foundations

It is our opinion that the proposed infiltration gallery may be supported on strip footings and that other underground structures (i.e., catch basins, in-line pretreatment devices, etc.) may be supported by mat foundations. Spread foundations may also be used to support other at-grade structures, if planned. The following are our recommendations for project foundations:

12.4.1 Spread Footings for Infiltration Gallery and At-Grade Structures

Spread footings for the infiltration gallery (i.e., strip footings) should be placed directly on low expansion alluvial materials and/or compacted fill in accordance with the recommendations presented in the Earthwork section of this report. Spread footings for at-grade structures bearing on low expansion compacted fill in accordance with the recommendations presented in the Earthwork section of this report should extend 18 inches or more below the lowest adjacent finished grade. Continuous and isolated footings should have a width of 24 inches or more. Continuous footings should be reinforced with two No. 4 steel reinforcing bars, one placed near the top and one placed near the bottom of the footings, and further detailed in accordance with the recommendations of the structural engineer.

Footings, as described above and bearing on alluvial materials and compacted fill, may be designed using a net allowable bearing capacity of 2,500 pounds per square foot (psf). Total and differential settlements for footings designed in accordance with the above recommendations are estimated to be less than approximately 1 inch and ½ inch over a horizontal span of 40 feet, respectively.

Footings bearing on alluvial materials and compacted fill may be designed using a coefficient of friction of 0.35, where the total frictional resistance equals the coefficient of friction times the dead load. Footings may be designed using a passive resistance value of 300 psf per foot of depth, with a maximum value of 3,000 psf. The allowable lateral resistance can be taken as the sum of the frictional resistance and passive resistance, provided the passive resistance does not exceed one-half of the total allowable resistance. The passive resistance (including the maximum value) may be increased by one-third when considering loads of short duration such as wind or seismic forces.

12.4.2 Mat Foundations

Mat foundations for other underground structures (i.e., catch basins, in-line pretreatment devices, etc.) may be supported on alluvial materials and/or compacted fill in accordance with the recommendations presented in the Earthwork section of this report. Foundations should be designed in accordance with structural considerations and the following recommendations. In addition, requirements of the appropriate governing jurisdictions and applicable building codes should be considered in the design of the structures.

The mat foundations may be designed using a net allowable bearing capacity of 4,000 psf. The total and differential settlement corresponding to this allowable bearing load are

estimated to be less than approximately 1 inch and ½ inch over a horizontal span of 40 feet, respectively.

Mat foundations typically experience some deflection due to loads placed on the mat and the reaction of the soils directly underlying the mat. A design modulus of subgrade reaction (K) of 50 tons per cubic foot may be used for the subgrade soils in evaluating such deflections.

12.5 Lateral Earth Pressures

Walls for below-grade structures when constructed as recommended above may be designed for lateral pressures represented by the pressure diagram on Figure 10. To reduce the potential for pipe-to-wall differential settlement, which could cause pipe shearing, we recommend that a flexible pipe joint be located close to the exterior of the wall. The type of joint should be such that minor relative movement can be accommodated without distress. The pipe connections should be sufficiently flexible to withstand differential settlement of approximately ¾ inch.

12.6 Exterior Flatwork

We recommend that new exterior concrete sidewalks and flatwork (hardscape) have a thickness of 4 inches and be reinforced with No. 3 steel reinforcing bars placed 24 inches on-center (each way) near the mid-height of the slab. The hardscape should be underlain by 4 inches of clean sand and installed with crack-control joints at an appropriate spacing as designed by the structural engineer to reduce the potential for shrinkage cracking. Positive drainage should be established and maintained adjacent to flatwork. To reduce the potential for differential offset, joints between the new hardscape and adjacent curbs, existing hardscape, building walls, and/or other structures, and between sections of new hardscape, should be doweled.

12.7 Pavement Reconstruction

Trenching within the street right-of-way will result in the replacement of pavement for the project. In general, pavement repair should conform to the material and compaction requirements of the adjacent pavement sections. Aggregate base material should conform to the latest specifications in Section 200-2.2 for crushed AB or Section 200-2.4 for crushed miscellaneous base of the Greenbook and should be compacted to a relative compaction of 95 percent in accordance with ASTM D 1557. AC should conform to Section 2036 of the Greenbook and should be compacted to a relative compaction of 95 percent in accordance with ASTM D 1560 or California Test Method (CT) 304. Actual pavement reconstruction should conform to the requirements of the appropriate governing agency.

12.8 Corrosivity

Laboratory testing was performed on representative samples of near-surface soil to evaluate soil pH, electrical resistivity, water-soluble chloride content, and water-soluble sulfate content. The soil pH and electrical resistivity tests were performed in general accordance with CT 643. Chloride content tests were performed in general accordance with CT 422. Sulfate testing was performed in general accordance with CT 417. The laboratory test results are presented in Appendix C.

The soil pH of the samples tested was measured to range from 6.9 and 7.6 and the electrical resistivity was measured to range from 7,455 and 7,775 ohm-centimeters. The chloride content of the samples was measured to range from 30 to 40 ppm. The sulfate content of the samples was measured to be 0.001 to percent by weight (i.e., 10 ppm). Based on the laboratory test results and Caltrans criteria (2018), the project site can be classified as a non-corrosive site, which is defined as having earth materials with a pH of more than 5.5, an electrical resistivity of more than 1,100 ohm-centimeters, chloride concentrations of less than 500 ppm, and less than 0.15 percent sulfates (i.e., 1,500 ppm).

12.9 Concrete Placement

Concrete in contact with soil or water that contains high concentrations of water-soluble sulfates can be subject to premature chemical and/or physical deterioration. Based on the CBC (2019), the potential for sulfate attack is negligible for water-soluble sulfate contents in soil ranging from 0.00 to 0.10 percent by weight, moderate for water-soluble sulfate contents ranging from 0.10 to 0.20 percent by weight, severe for water-soluble sulfate contents ranging from 0.20 to 2.00 percent by weight, and very severe for water-soluble sulfate contents over 2.00 percent by weight. The soil samples tested for this evaluation, using CT 417, indicate a water-soluble sulfate content of approximately 0.001 percent by weight (i.e., 10 ppm). Accordingly, the on-site soils are considered to have a negligible potential for sulfate attack. However, due to the potential variability of the on-site soils, consideration should be given to using Type II/V cement for the project.

To reduce the potential for shrinkage cracks in the concrete during curing, we recommend that the concrete for the proposed improvements, if applicable, be placed with a slump of 4 inches based on ASTM C 143. The slump should be checked periodically at the site prior to concrete placement. We further recommend that concrete cover over reinforcing steel for foundations be provided in accordance with CBC (2019). The structural engineer should be consulted for additional concrete specifications.

12.10 Stormwater Infiltration Gallery

Based on our subsurface evaluation, the park is generally underlain by granular alluvial deposits consisting of poorly graded sand, poorly graded sand with silt, well-graded sand, well-graded sand, silty sand, clayey sand, poorly graded gravel, and poorly graded gravel with silt with variable amounts of gravel and cobbles. The wide range of infiltration rates (0.3 to 3.4 inches per hour) is likely due to lateral and vertical variations in material types, including silt content of alluvial interbeds and lenses. Due to site variability and the number of percolation tests performed, we recommend that an infiltration rate of 2 inches per hour, following adjustments by the BMP designer for RF_s, be used for design at David M. Gonzales Recreation Center for both shallow and deep infiltration based on our review of our boring logs and laboratory test results. We recommend that the bottoms of the infiltration BMPs be further evaluated during construction. Additional recommendations may be provided at that time if fine-grained materials are present along the bottom of the basin, such as removing the fine-grained material and replacing it with granular material.

Based on our evaluation, the potential for hydro-collapse settlement associated with infiltration is generally low due to the proposed depth of infiltration. However, we generally recommend a setback of 15 feet or more between settlement sensitive structures and proposed infiltration areas.

12.11 Drainage

Proper surface drainage is imperative for satisfactory site performance. Positive drainage should be provided and maintained to direct surface water away from existing foundations. Positive drainage is defined as a slope of 2 percent or more for a distance of 5 feet or more away from foundations and tops of slopes. Surface waters should not be allowed to pond adjacent to footings. We recommend that above-ground structures, if constructed, have roof drains and downspouts installed to collect runoff.

12.12 Landscaping

Project landscaping should consist of drought tolerant plants. Landscape irrigation should be kept to a level just sufficient to maintain plant vigor. Overwatering should not be permitted

13 CONSTRUCTION OBSERVATION

The recommendations provided in this report are based on our understanding of the proposed project and our evaluation of the data collected based on subsurface conditions disclosed by widely spaced exploratory borings. It is imperative that the geotechnical consultant checks the interpolated subsurface conditions during construction. We recommend that Ninyo & Moore

review the project plans and specifications prior to construction. It should be noted that, upon review of these documents, some recommendations presented in this report may be revised or modified.

During construction we recommend that the duties of the geotechnical consultant include, but not be limited to:

- Observing site clearing, grubbing, and removals.
- Observing excavation bottoms, and the placement and compaction of fill, including trench backfill.
- Observing the drilling of dry wells, if chosen for the project.
- Evaluating imported materials prior to their use as fill (if used).
- Performing field tests to evaluate fill compaction.
- Observing foundation excavations for bearing materials and cleaning prior to placement of reinforcing steel or concrete.
- Performing material testing services including concrete compressive strength and steel tensile strength tests and inspections.

The recommendations provided in this report assume that Ninyo & Moore will be retained as the geotechnical consultant during the construction phase of this project. If another geotechnical consultant is selected, we request that the selected consultant indicate to the owner and to our firm in writing that our recommendations are understood and that they are in full agreement with our recommendations.

14 LIMITATIONS

The field evaluation, laboratory testing, and geotechnical analysis presented in this geotechnical report have been conducted in general accordance with current practice and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be encountered during construction. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation will be performed upon request. Please also note that our evaluation was limited to assessment of the geotechnical aspects of the project, and did not include evaluation of structural issues, environmental concerns, or the presence of hazardous materials.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

This report is intended for design purposes only. It does not provide sufficient data to prepare an accurate bid by contractors. It is suggested that the bidders and their geotechnical consultant perform an independent evaluation of the subsurface conditions in the project areas. The independent evaluations may include, but not be limited to, review of other geotechnical reports prepared for the adjacent areas, site reconnaissance, and additional exploration and laboratory testing.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. If geotechnical conditions different from those described in this report are encountered, our office should be notified, and additional recommendations, if warranted, will be provided upon request. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

NOTES:

1 The probabilistic ground motion spectral response accelerations are based on the risk-targeted Maximum Considered Earthquake (MCE_R) having a 2% probability of exceedance in 50 years in the maximum direction using the Chiou & Youngs (2014), Campbell & Bozorgnia (2014), Boore et al. (2014), and Abrahamson et al. (2014) attenuation relationships and the risk coefficients.

2 The deterministic ground motion spectral response accelerations are for the 84th percentile of the geometric mean values in the maximum direction using the Chiou & Youngs (2014), Campbell & Bozorgnia (2014), Boore et al. (2014), and Abrahamson et al. (2014) attenuation relationships for deep soil sites considering a Mw 7.5 event on the Verdugo fault zone located 1.0 kilometers from the site. It conforms with the lower bound limit per ASCE 7-16 Section 21.2.2.

3 The Site-Specific MCE_R Response Spectrum is the lesser of spectral ordinates of deterministic and probabilistic accelerations at each period per ASCE 7-16 Section 21.2.3. The Site-Specific Design Response Spectrum conforms with lower bound limit per ASCE 7-16 Section 21.3.

4 The Mapped Design MCE_R Response Spectrum is computed from mapped spectral ordinates modified for Site Class D (stiff soil profile) per ASCE 7-16 Section 11.4. It is presented for the sake of comparison.

APPENDIX A

Boring Logs

APPENDIX A

BORING LOGS

Field Procedure for the Collection of Disturbed Samples
Disturbed soil samples were obtained in the field using the following method.

Bulk Samples
Bulk samples of representative earth materials were obtained from the exploratory borings. The samples were bagged and transported to the laboratory for testing.

The Standard Penetration Test (SPT) Sampler
Disturbed drive samples of earth materials were obtained by means of a Standard Penetration Test sampler. The sampler is composed of a split barrel with an external diameter of 2 inches and an unlined internal diameter of $1^3/_8$ inches. The sampler was driven into the ground 12 to 18 inches with a 140-pound hammer free-falling from a height of 30 inches in general accordance with ASTM D 1586. The blow counts were recorded for every 6 inches of penetration; the blow counts reported on the logs are those for the last 12 inches of penetration. Soil samples were observed and removed from the sampler, bagged, sealed and transported to the laboratory for testing.

Field Procedure for the Collection of Relatively Undisturbed Samples
Relatively undisturbed soil samples were obtained in the field using the following method.

The Modified Split-Barrel Drive Sampler
The sampler, with an external diameter of 3 inches, was lined with 1-inch-long, thin brass rings with inside diameters of approximately 2.4 inches. The sample barrel was driven into the ground with the weight of a hammer in general accordance with ASTM D 3550. The driving weight was permitted to fall freely. The approximate length of the fall, the weight of the hammer, and the number of blows per foot of driving are presented on the boring logs as an index to the relative resistance of the materials sampled. The samples were removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

Soil Classification Chart Per ASTM D 2488

Primary Divisions			Secondary Divisions	
			Group Symbol	Group Name
COARSE-GRAINED SOILS more than 50% retained on No. 200 sieve	**GRAVEL** more than 50% of coarse fraction retained on No. 4 sieve	CLEAN GRAVEL less than 5% fines	GW	well-graded GRAVEL
			GP	poorly graded GRAVEL

CPT SOUNDINGS

Field Procedure for Cone Penetration Testing

The cone penetration testing (CPT) described in this report was conducted by Kehoe Testing and Engineering in general accordance with ASTM D 5778. The cone penetrometer assembly used for this project consisted of a conical tip and a cylindrical friction sleeve. The conical tip had an apex angle of 60 degrees and a cross-section area of approximately 15 square centimeters. The interior of the CPT probe was instrumented with strain gauges that allowed simultaneous measurement of cone tip resistance and friction sleeve resistance during penetration. The cone hydraulically pushed into the soil using the reaction mass of a specially designed 30-ton truck at a constant rate while the cone tip resistance and sleeve friction were recorded at an approximately 1-inch interval and stored in digital form. The computer generated logs presented in the following pages include cone resistance, sleeve friction, pore pressure, and soil behavior type.

APPENDIX C

Geotechnical Laboratory Testing

APPENDIX C

GEOTECHNICAL LABORATORY TESTING

Classification
Soils were visually and texturally classified in accordance with the Unified Soil Classification System (USCS) in general accordance with ASTM D 2488. Soil classifications are indicated on the logs of the exploratory borings in Appendix B.

In-Place Moisture and Density Tests
The moisture content and dry density of relatively undisturbed samples obtained from the exploratory borings were evaluated in general accordance with ASTM D 2937. The test results are presented on the logs of the exploratory borings in Appendix B.

Gradation Analysis
Gradation analysis tests were performed on selected representative soil samples in general accordance with ASTM D 422. The grain-size distribution curves are shown on Figures C-1 through C-8. These test results were utilized in evaluating the soil classifications in accordance with the USCS.

200 Wash
An evaluation of the percentage of particles finer than the No. 200 sieve in selected soil samples was performed in general accordance with ASTM D 1140. The results of the tests are presented on Figure C-9.

Consolidation Test
Consolidation testing was performed on a selected relatively undisturbed soil sample in general accordance with ASTM D 2435. The sample was inundated during testing to represent adverse field conditions. The percent of consolidation for each load cycle was recorded as a ratio of the amount of vertical compression to the original height of the sample. The results of the test are summarized on Figure C-10.

Direct Shear Tests
Direct shear tests were performed on relatively undisturbed samples in general accordance with ASTM D 3080 to evaluate the shear strength characteristics of selected materials. The samples were inundated during shearing to represent adverse field conditions. The results are shown on Figures C-11 through C-13.

Soil Corrosivity Tests
Soil pH and resistivity tests were performed on a representative sample in general accordance with California Test (CT) 643. The soluble sulfate and chloride content of the selected sample were evaluated in general accordance with CT 417 and CT 422, respectively. The test results are presented on Figure C-14.

Notes and Definitions

QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Irvine CA, 92618	Project Manager: Spencer Marcinek	04/15/20 16:02

Notes and Definitions

QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
B-ND	The analyte is found in the method blank at a level greater than the reporting limit but the associated samples are ND. There is no impact on data.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

SAMPLE RECEIVING REVIEW SHEET

Batch/Work Order #: T201980

Client Name: Ninyo & Moore Project: LABOE Stormwater Capture Program/David M Gonzales

Delivered by: ☐ **Client** ☒ **SunStar Courier** ☐ **GSO** ☐ **FedEx** ☐ **Other**

If Courier, Received by: Dave Date/Time Courier Received: 4-7-20 12:45

Lab Received by: Brian Date/Time Lab Received: 4-7-20 13:03

Total number of coolers received: 0 Thermometer ID: SC-1 Calibration Due: 6/27/20

Temperature: Cooler #1	1.4	°C +/- the CF (+ 1.2°C) =	2.6	°C corrected temperature
Temperature: Cooler #2		°C +/- the CF (+ 1.2°C) =		°C corrected temperature
Temperature: Cooler #3		°C +/- the CF (+ 1.2°C) =		°C corrected temperature

Temperature criteria = ≤ 6°C (no frozen containers)	Within criteria?	☒**Yes** ☐**No**
If NO:		
Samples received on ice?	☐Yes	☐**No → Complete Non-Conformance Sheet**
If on ice, samples received same day collected?	☐Yes → Acceptable	☐**No → Complete Non-Conformance Sheet**

Custody seals intact on cooler/sample	☐Yes	☐No*	☒N/A
Sample containers intact	☒Yes	☐No*	
Sample labels match Chain of Custody IDs	☒Yes	☐No*	
Total number of containers received match COC	☒Yes	☐No*	
Proper containers received for analyses requested on COC	☒Yes	☐No*	
Proper preservative indicated on COC/containers for analyses requested	☐Yes	☐No*	☒N/A
Complete shipment received in good condition with correct temperatures, containers, labels, volumes preservatives and within method specified holding times	☒ **Yes**	☐**No***	

* Complete Non-Conformance Receiving Sheet if checked Cooler/Sample Review - Initials and date: DM 4-7-20

Ninyo & Moore, 2020, Proposal for Methane Gas Surveys, Fernangeles and David M. Gonzales Park, Stormwater Capture Parks Program, Los Angeles Bureau of Engineering Task Order Solicitation (TOS) No. 25, Los Angeles, California, dated February 5.

Dear Mr. Dellinger:

In accordance with your request, Ninyo & Moore performed a methane survey during the Pre-Design phase of the Stormwater Capture Parks Program project (TOS 25) at David M. Gonzales Park (site) located at 10943 Herrick Avenue, in Pacoima, California (Figure 1). Our services were performed in general accordance with our referenced proposal dated February 5, 2020, and included methane site testing at the locations of the proposed David M. Gonzales Park infiltration galleries. The methane surveys were performed in order to evaluate for the presence of methane gas at the locations of these proposed structures in general accordance with Bulletin P/BC 2014-101 (City of Los Angeles, Department of Building and Safety [LADBS], 2014), and to list mitigation requirements as indicated in the City of Los Angeles, Municipal Ordinance No. 175790. Our findings, conclusions, and recommendations regarding our methane surveys of the proposed locations of the Pacoima infiltration galleries are provided herein.

Based on our review of the referenced map (City of Los Angeles, 2004), we understand that the proposed project is located in an area of Los Angeles that is mapped as being within a Methane Zone. According to Bulletin P/BC 2014-101 (LADBS, 2014), methane surveys are required in construction sites located within LADBS jurisdiction and within Methane and Methane Buffer Zones. Due to the potential hazards associated with methane gases, we have been requested to perform

the subject methane survey in general accordance with the LADBS requirements. Ninyo & Moore is certified by LADBS to perform methane field testing (License #10087).

METHANE GAS SURVEY

As part of the methane survey, Ninyo & Moore performed a shallow soil gas test and a gas probe test at the site in general accordance with Bulletin P/BC 2014-101 (LADBS, 2014). The methane survey was conducted between May 4 through May 8, 2020.

Shallow Soil Gas Test

The shallow soil gas test was conducted by installing 13 shallow soil gas probes (MS-1 through MS-13) within the proposed infiltration gallery footprints. The number of shallow soil gas wells installed were based on anticipated infiltration galleries total footprint of approximately 126,000 square-feet (SF) and a rate of one shallow soil gas sample per 10,000 SF of site area, per LADBS P/BC 2014-101. The approximate locations of the proposed infiltration galleries and shallow soil gas tests are shown on Figure 2. A gas probe was installed in each test location at a depth of approximately 5 feet below ground surface (bgs) by our drilling subcontractor, Strongarm Environmental Field Services, Inc. (Strongarm), of Fullerton, California. If refusal was encountered at a boring location, Strongarm advanced step-out borings until a total depth of 5 feet bgs was achieved at each location. Soil borings for the shallow soil gas test were advanced to total depth using a stainless steel hand auger drill kit. Each probe was placed within an approximately 1-foot-thick zone of sand filter pack at the bottom of the well. The portion of the well above the sand was filled/sealed with hydrated granular bentonite. The probe was connected to the ground surface with a ¼-inch-diameter nylon tube that extended through the clay with an open/close valve at the surface. After a minimum of two hours after the installation of the soil gas probes, methane concentrations were measured at each shallow soil gas test location using a calibrated RKI Eagle II combustible gas analyzer. The shallow methane concentrations were recorded on field logs and are provided in the LADBS P/BC 2014-101 Form 1, Certificate of Compliance for Methane Test Data, which is included in Attachment A.

Gas Probe Test

After the shallow soil gas test, triple-nested soil gas probe test wells were to be installed at the shallow test locations that exhibited the highest recorded methane concentrations. Since methane was not detected in the shallow soil gas probes, the gas probe test well locations were selected to be well-distributed across the site. The gas probe test wells were installed by Strongarm using a GeoProbe 6620 DT track-mounted direct-push drill rig. Based on our understanding of the project, the proposed infiltration gallery invert elevation is 19 feet bgs and the targeted depths for placement

of gas probes is approximately 5, 10, and 20 feet below the invert elevation. During drilling activities, Strongarm encountered many large cobbles causing all borings to encounter refusal, ranging from 14 to 31 feet bgs. When refusal was encountered before reaching 20 feet bgs, Strongarm advanced step-out borings until a minimum total depth of 20 feet bgs was achieved. Because each deep soil boring encountered refusal prior to reaching the targeted depth of 39 feet bgs, each deep boring was advanced until the drill rig encountered refusal (between approximately 20 and 31 feet bgs), then the triple-nested probes were set at 5-foot intervals beginning at the boring's total depth. Deep probe placements are included in Attachment A. Based on a rate of one location per 20,000 SF of site area, even triple-nested soil gas probe test wells (MD-1 through MD-7) with gas probes placed at depths of between approximately 10 and 31 feet bgs were installed beneath the site. As stated earlier, probe depths were derived from the point at which the drill rig encountered refusal at each boring location.

Initial gas probe test methane concentrations and soil gas pressure readings were measured from each gas probe after allowing the probe to equilibrate for a minimum of two hours after installation. Methane concentrations were measured using a calibrated RKI Eagle II combustible gas analyzer. Soil gas pressures were measured using a magnehelic gauge with a range of 0.00 to 2.50 inches of water column. A second round of methane and soil gas pressure field measurements were collected 24 hours or more after the initial round of gas probe test measurement readings. Measurements from both soil gas test readings were recorded on the field logs and are provided in the attached Certificate of Compliance for Methane Test Data, Form 1 (Attachment A).

RESULTS

As requested, Ninyo & Moore performed methane surveys of the proposed infiltration gallery locations in general accordance with the requirements of LADBS (2014). The City of Los Angeles, Municipal Ordinance No. 175790, indicates various levels of methane mitigation design for structures based on methane concentrations and gas pressures observed during the methane survey.

Methane concentrations and soil gas pressures detected at the site correspond to Municipal Ordinance No. 175790 methane mitigation design levels for planned structures in City of Los Angeles Methane Zone. The Design Methane Concentration, Design Soil Gas Pressure, and associated Methane Design Level are as follows:

Location	Design Maximum Methane Concentration (ppm)	Percent of Lower Explosive Limit (LEL)	Design Soil Gas Pressure (inches of water column)	Ord #175790 Methane Design Level
MD-4 & MD-6	15	0%	0.00	Level I

Notes:
ppm – parts per million
LEL – methane = 50,000 ppm
% – percent

Based on results of this methane gas survey, Ninyo & Moore concludes that a small amount of methane gas exists in the soil beneath the location of the infiltration galleries at the site. Ninyo & Moore recommends that the methane mitigation design for the proposed construction at the site be prepared in accordance with the LADBS Municipal Ordinance No. 175790 requirements for Methane Zone Design Level I with 0.0 inches of water column pressure. Based on Ordinance No. 175790 and our understanding of the proposed infiltration gallery structures, the minimum methane mitigation requirements should include a passive venting system to prevent methane from accumulating in the structure and trench dams to prevent soil gas from migrating along trench backfill and into the structure.

Ninyo & Moore appreciates the opportunity to provide services on this project.

Sincerely,
NINYO & MOORE

Certificate of Compliance for Methane Test Data, Form 1

FORM 1 - CERTIFICATE OF COMPLIANCE FOR METHANE TEST DATA

Part 1: Certification Sheet

Site Address: 10943 Herrick Ave, Pacoima, California 91331
Legal Description: Tract: Pacoima Lot: 1462 & 1463 Block: 58
Building Use: Subsurface Stormwater Infiltration

Architect's, Engineer's or Geologist's Stamp:

Name of Architect, Engineer, or Geologist:
Travis Coburn, PE
Mailing Address:
475 Goddard, Suite 200
Irvine, CA 92618
Telephone: 949-753-7070

Name of Testing Laboratory:
Ninyo & Moore
City Test Lab License #:10087
Telephone:949-753-7070

I hereby certify that I have tested the above site for the purpose of methane mitigation and that all procedures were conducted by a City of Los Angeles licensed testing agency in conformity with the requirements of the LADBS Information Bulletin P/BC 2014-101. Where the inspection and testing of all or part of the work above is delegated, full responsibility shall be assumed by the architect, engineer or geologist whose signature is affixed thereon.

Signed: _____ date 6/2/2020

Required Data:

- Project is in the (Methane Zone) or (Methane Buffer Zone).
- Depth of ground water observed during testing: N/A feet below the Impervious Membrane.
- Depth of Historical High Ground Water Table Elevation*: 100 feet below the Impervious Membrane.
- Design Methane Concentration**: 15 parts per million in volume (ppmv).
- Design Methane Pressure***: 0.00 inches of water column.
- Site Design Level: (Level I, Level II, Level III, Level IV, Level V) with 0.00 inches of water column.

De-watering:

- De-watering (is) (is not) required per Section 7104.3.7.
- Pump discharge rate _____N/A___ cubic feet per minute per reference geology or soil report: _____ dated _____.

Additional Investigation:

- Additional investigation (was) (was not) conducted.

Latest Grading on Site:

- Date of last grading on site (was) (was not) more than 30 days before Site Testing.
- See Attached explanation of the effect on soil gas survey results by grading operations.

Notes:

* Historical High Ground Water Table Elevation shall mean the highest recorded elevation of ground water table based on historical records and field investigations as determined by the engineer for the methane mitigation system.

** Design Methane Concentration shall mean the highest recorded measured methane concentration from either Shallow Soil Gas Test or any Gas Probe Set on the site.

*** Design Methane Pressure shall mean the highest total pressure measured from any Gas Probe Set on the site.

1.0 PURPOSE

This Storm Water Pollution Prevention Plan (SWPPP) lists and describes Best Management Practices (BMPs) that will be used during this construction project to minimize the potential for pollutants to leave the site during construction activities. Construction BMPs can include structural devices, material storage methods, and operational procedures used to prevent, control, and treat storm water pollution emanating from the site. Construction activities can disturb large areas that result in erosion and transportation of related particulates such as sediments and dust to nearby waterways. In excess amounts, these particulates can increase water turbidity and consequently impair aquatic life and beneficial uses of the water.

Pollutants such as hydrocarbons, metals, nutrients, toxic substances, trash, and other debris can be generated from a variety of construction activities and can travel with eroded sediments. Potential pollutants traveling with the sediments may include the organic components in the top soil, plant residues, nutrient elements, organic material, deposited atmospheric pollutants, and other liquid and solid wastes.

The amended federal Clean Water Act of 1987 (CWA) added a requirement to address construction site storm water pollution. In California, construction activities consisting of one acre or more of soil are subject to the National Pollutant Discharge Elimination System (NPDES) General Permit for Discharges of Storm Water Runoff Associated with Construction Activity (General Permit). This permit requires all dischargers (i.e. landowners or developers) to prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) prior to disturbing a site. This (SWPPP) is designed to meet the requirements of the General Permit. This SWPPP must also be implemented at the appropriate level to protect water quality at all times throughout the entire construction project, including both dry and wet weather. BMPs must be implemented and maintained to control erosion, sediment, other construction pollutants, and non-storm water discharges year-round. Other requirements of this SWPPP include employee training, site inspections, and proper maintenance of BMPs as necessary. Los Angeles Department of Water and Power (LADWP) construction crews and personnel, as well as its contractors and subcontractors, are required to follow the guidelines and BMPs outlined in this SWPPP. They are also required to ensure proper implementation and maintenance of such BMPs for the entire duration of this project.

A copy of this SWPPP must be maintained at the construction site. This SWPPP must be modified as necessary to reflect any changes in personnel or construction site conditions.

Amendments to this SWPPP must be documented using the forms provided in Appendix G**.**

2.0 OBJECTIVES

A. The SWPPP shall be designed to address the following objectives:

1. All pollutants and their sources, including sources of sediment associated with construction, construction site erosion and all other activities associated with construction activity are controlled;

2. Where not otherwise required to be under a Regional Water Board permit, all non-storm water discharges are identified and either eliminated, controlled, or treated;

3. Site BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the BAT/BCT standard;

4. Calculations and design details as well as BMP controls for site run-on are complete and correct, and

5. Stabilization BMPs installed to reduce or eliminate pollutants after construction are completed.

B. To demonstrate compliance with requirements of this General Permit, the QSD shall include information in the SWPPP that supports the conclusions, selections, use, and maintenance of BMPs.

C. The discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone. -

2.1 TRAINING QUALIFICATIONS AND CERTIFICATION REQUIREMENTS

A. General

The discharger shall ensure that all persons responsible for implementing requirements of this General Permit shall be appropriately trained in accordance with this section 2.1.(See Section *5.5 (a) Employee Training Program* for more details). Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Those responsible for preparing and amending SWPPPs shall comply with the requirements in this section.

The discharger shall provide documentation of all training for persons responsible for implementing the requirements of this General Permit in the Annual Reports.

B. SWPPP Certification Requirements

1. Qualified SWPPP Developer: The discharger shall ensure that SWPPPs are written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

   a. A California registered professional civil engineer;

   b. A California registered professional geologist or engineering geologist;

   c. A California registered landscape architect;

   d. A professional hydrologist registered through the American Institute of Hydrology;

   e. A Certified Professional in Erosion and Sediment Control (CPESC) ™ registered through Enviro Cert International, Inc.;

   f. A Certified Professional in Storm Water Quality (CPSWQ) ™ registered through Enviro Cert International, Inc.; or

   g. A professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET);

   Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

2. The discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

3. Qualified SWPPP Practitioner: The discharger shall ensure that all BMPs required by this General Permit are implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   a. A certified erosion, sediment and storm water inspector registered through Enviro Cert International, Inc.; or

   b. A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc. Effective two years

after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

4. The LRP shall list in the SWPPP, the name of any Approved Signatory, and provide a copy of the written agreement or other mechanism that provides this authority from the LRP in the SWPPP.

5. The discharger shall include, in the SWPPP, a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

6. The discharger shall ensure that the SWPPP and each amendment will be signed by the Qualified SWPPP Developer. The discharger shall include a listing of the date of initial preparation and the date of each amendment in the SWPPP.

3.0 List of Contractors and Subcontractors

The tables below list the contractors and subcontractors conducting work at the site.

4.0 PROJECT INFORMATION

4.1 Project Description

As part of the Stormwater Capture Parks Program with Los Angeles Department of Public Works Bureau of Engineering (LABOE) and the Los Angeles Department of Water and Power (LADWP), the David M. Gonzales Recreation Center Stormwater Capture Project includes the construction of a subsurface infiltration gallery, storm drain diversion structure and piping, and improved park facilities. The project will divert and infiltrate stormwater to replenish the San Fernando Groundwater Basin in order to increase local water supply; alleviate localized flooding; improve water quality; attenuate peak flow at downstream water bodies (i.e. Los Angeles River); and improve park amenities, and recreational and environmental education opportunities for the local community. The stormwater capture facilities are sized to ensure full capture of the entire 85th percentile, 24-hour storm event for the tributary areas upstream of the site. The total project site area is approximately 465,000 square feet (sf), with 235,000 sf having land disturbing activities. Approximately 170,000 sf of the site is impervious surface. The proposed ground cover post construction will be the same as the existing condition, except for the 12 ft wide access road and walkways around the baseball field.

After the installation of proposed stormwater facilities is completed in the park, the excavated areas will be backfilled and graded to provide appropriate access to and drainage from the proposed field improvements. Stormwater collection infrastructure would be assessed for upgrades within the areas impacted by construction.

Site grading will reuse as much native soil as possible—no imported fill is anticipated for the Project. It is anticipated that there will be excess excavated material that would need to be hauled away and disposed of or reused at an appropriate location. Where possible, consideration should be given during detailed design to the potential reuse of small amounts of spoils onsite (e.g., for landscape mounding) in order to minimize off-haul volumes.

Site grading and drainage will be coordinated with a separate renovation project at the park.

This project R factor is 0, LS factor is 0, K factor is 0 and it's receiving water risk is Low. Therefore, the project risk level is Level 1.

4.2 Project Location

The David M. Gonzales Recreation Center is owned by the Los Angeles Department of Recreation and Parks (RAP). The park is bounded by Herrick Avenue to the northeast, Pierce Street to the southeast, Norris Avenue to the southwest, and Pacoima Elementary School to the northwest in the Pacoima neighborhood. The park is predominately surrounded by single and multi-family residential homes. Opposite the park on Herrick Avenue are residential properties, and opposite the park on Pierce Street is a commercial complex that houses Cosmetic Enterprises Ltd and Caluco. The

Pacoima Hills apartment complex and the Guardian Angel Catholic Church and School are located across from the park on Norris Avenue.

4.3 Project Schedule

A condensed list of significant construction milestones can be found in the table below.

CONSTRUCTION PHASE	ESTIMATED COMPLETION DATE
Initial Construction Support Activities	08/11/2023
Infiltration Gallery No. 1 – West Side	01/19/2024
Infiltration Gallery No. 2 – West Side	01/19/2024
Infiltration Gallery No. 1 – East Side	06/28/2024
Infiltration Gallery No. 2 – East Side	06/28/2024
Influent Facilities to Infiltration Gallery No. 1	06/21/2024
Influent Facilities to Infiltration Gallery No. 2	05/10/2024
Site Work and Amenities	12/06/2024
Startup and Testing	12/31/2024

4.4 Existing Site Conditions

The park's acreage is approximately 300,000 square feet (sf), or approximately 7 acres. Approximately 50,000 sf of the park is impervious surface. The site features an auditorium, community room, indoor gym, two (2) baseball fields, indoor and outdoor basketball courts, handball courts, children's play area, picnic tables, soccer field, boxing gym, boxing ring, kitchen, and stage. There is an existing asphalt pavement parking lot with two driveways for vehicular entry/egress off Herrick Avenue in the northeast side of the park. In the southwest corner of the park, there is a driveway for vehicular entry/egress off Norris Avenue to access a paved RAP maintenance yard. Mature trees of varying types and sizes are present along the perimeter of the park along Norris Avenue and Pierce Street—the centerline of the tree trunks are observed to be located between 4 to 6 feet from the perimeter chain-link fence. The park slopes generally from north to south—the ball field area slopes from approximately elevation 1,040 feet to 1,030 feet towards the intersection of Norris Avenue and Pierce Street. Runoff from the park drains to catch basins along Norris Avenue and Pierce Street. The perimeter of the park along Norris Avenue and Pierce Street is observed to be raised 4 to 12 inches above the adjacent sidewalk elevation. The existing site is approximately 1-2 ft above the adjacent streets. The potential for stormwater to run on to the construction site from surrounding areas is unlikely.

The site consists of undocumented fill encountered to depths up to approximately 6 feet, underlain by granular alluvial materials. The fill and alluvium were found to be comprised of a variety of soil characteristics: a) moist, loose to very dense, poorly graded sand, b) poorly graded sand with silt, c) well-graded sand, d) well-graded sand with silt, e) silty sand, f) clayey sand, g) poorly graded gravel, and h) poorly graded gravel with silt. There was also variable amounts of cobbles and possible boulders. In general, excavations and drilling in the existing fill soil and alluvium should be feasible, but difficulties should be anticipated upon encountering cobbles, boulders, and other

oversized materials in the alluvium and undocumented fill. Groundwater was not encountered in exploratory borings to a depth of approximately 51 feet. The depth to groundwater is anticipated to correspond to the historic high level of approximately 100 to 120 feet bgs.

5.0 EFFLUENT LIMITS, POLLUTANT SOURCES, AND BMP IDENTIFICATION

5.1 Introduction

The General Permit requirements must be met on a year-round basis, not just during the wet season (November through April). Therefore, this SWPPP, and prescribed Best Management Practices must be implemented at the appropriate level and in a proactive manner during all seasons until the construction project is complete. Post-construction BMPs will be implemented after the project is complete as required by the General Permit (refer to Section 9.0 POST-CONSTRUCTION STANDARDS of this Plan).

BMPs are defined as "any program, technology, process, siting criteria, operational methods or measures, or engineered systems, that when implemented, prevent, control, remove or reduce pollution."

5.2 *Effluent Standards: Numeric and Narrative Limitations*

A. Numeric – There is no Numeric Effluent Limitation (NEL) for pH or Turbidity.

B. Narrative – Risk Level 2 dischargers shall comply with the Narrative Action Levels as follows:

1. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

2. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

3. The Numeric Action Level (NAL) for pH is 6.5 – 8.5. The test method is a field test with a calibrated portable instrument.

4. The NAL for turbidity is 250 NTU. The test method is EPA 180.1 and/or field test with a calibrated portable instrument.

5.3 Unauthorized Non-Storm Water Discharges

Elimination or reduction of "unauthorized non-storm water discharges" to the storm drain system or receiving waters is a major goal of the General Permit. Most non-storm water discharges are prohibited. Unauthorized non-storm water discharges can be generated from a variety of sources. Examples include, but are not limited to: waters from the rinsing or washing of vehicles, equipment, buildings and pavement; materials that have

been improperly disposed of or dumped and spilled, and leaked materials. Such discharges should be eliminated or reduced to the maximum extent practicable.

5.3 (a) Non-Storm Water Management

A. Dischargers shall implement measures to control all non-storm water discharges during construction.

B. Dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

C. Dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

5.4 Authorized Non-Storm Water Discharges

The General Permit authorizes certain non-storm water discharges that may be necessary for the completion of construction projects. Such discharges include, but are not limited to: irrigation of vegetative erosion control measures; fire hydrant flushing; potable water sources related to the operation and maintenance of potable water systems; drinking fountain water; atmospheric condensates including refrigeration, air conditioning, and compressor condensate; irrigation drainage; springs; ground water; and foundation or footing drainage. These discharges are allowed provided they are: 1) not relied upon to clean up failed or inadequate construction or post construction BMPs designed to keep materials on site; 2) infeasible to eliminate; 3) include BMPs described herein; and 4) do not cause or contribute to a violation of water quality standards. The General Permit prohibits the discharge of sediment-laden water offsite without prior treatment (detention or filtering).

5.5 Best Management Practices

The BMPs described in this document will be implemented to minimize the potential for pollutants to leave the project area and enter the storm drain system to the maximum extent practicable. The BMPs listed below are designed to minimize non-storm water discharges, minimize pollutants in storm water drainage and minimize the release of pollutants that can eventually be carried off by runoff, wind, or tracked out into the storm drain system. BMPs also include planning and preparing for rainfall. The site should be stabilized before a storm and BMPs should be checked for correct implementation prior to storm events. Appendix H lists sources for weather forecasts. Through proactive BMP implementation and good housekeeping measures, the construction site will pose a minimum threat of polluting local waterways through storm water runoff.

BMPs must be implemented to prevent or reduce the contact of non-storm water discharges with potential pollutant sources (i.e. waste storage areas, soil piles) and minimize to the extent practicable the flow or volume of non-storm water discharges.

Detailed descriptions of various types of BMPs for construction projects are located in Appendix M.

5.5 (a) Employee Training Program

All employees working on the site shall receive a general briefing about the importance of preventing storm water pollution, potential sources of storm water pollution, and the BMPs to be implemented at the site. New employees shall be briefed prior to work. Storm water pollution control training may be integrated with other training sessions, such as those conducted for worker safety, spill prevention, or hazardous materials management. Employees are encouraged to provide suggestions/feedback to improve training sessions and implementation of control practices.

Employees responsible for implementing, inspecting, maintaining, or repairing storm water pollution control practices should receive copies of relevant portions of this SWPPP and become familiar with their responsibilities. When such responsibilities shift from one employee to another, the outgoing employee shall pass on all necessary information to ensure the continuing effectiveness of the BMPs and SWPPP compliance, including copies of this SWPPP and inspection checklists. The table provided in Section 3.0 List of Contractors and Subcontractors, may be used to identify employees and their respective SWPPP responsibilities.

For projects that start during the dry season, refresher sessions on storm water pollution control must be conducted prior to the wet season. Additional training will be provided as necessary, based on site inspections and evidence of storm water quality problems.

Documentation of training will be maintained as part of this plan. Training documentation forms are located in Appendix F. Completed training records must be kept with this SWPPP.

5.5(b) Good Site Management "Housekeeping"

A. Documentation of BMPs in SWPPP
   Dischargers shall document all housekeeping BMPs in the SWPPP and in the REAP (See Section 6.0 Rain Event Action Plan (REAP)) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

B. Housekeeping
   Dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Dischargers shall implement the following good housekeeping measures:

1. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e., poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).
2. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).
3. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed)
4. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks. etc.).
5. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

C. Waste Management

Dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

1. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.
2. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.
3. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.
4. Cover waste disposal containers at the end of every business day and during a rain event.
5. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.
6. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.
7. Implement procedures that effectively address hazardous and non-hazardous spills.
8. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require:
   a. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly.
   b. Appropriate spill response personnel are assigned and trained.
   c. LADWP has spill notification phone numbers (Bulletin 2010-38), which must be included as a part of spill response training.

9. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

D. Vehicle Storage and Maintenance
Dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

Vehicles and equipment may pose a threat to storm water quality if their fluids come into contact with storm water runoff. When stored, place drip pans under vehicles or equipment. Vehicles and equipment will be inspected regularly to minimize leaks and drips. Equipment with chronic leakage problems will be returned to the yard for repair prior to continuing its use at the site. Refueling and vehicle maintenance at the construction site will be conducted only when absolutely necessary. When maintenance and repair of vehicles or equipment is required, every effort will be made to prevent any motor related fluids or wastes from leaving the designated repair area, which shall be located in designated areas away from storm drains and drainage areas. When vehicles or equipment are immobilized and need repair, drip pans and oil-absorbing mats should be placed beneath the vehicle in order to capture spilled fluids. Absorbent materials and other wastes (used oil filters, oily rags, etc.) must be disposed of properly with other hazardous wastes from the site (See Section 5.5 Best Management Practices). Vehicle washing will not be conducted onsite.

1. Prevent oil, grease, or fuel to leak into the ground, storm drains or surface waters.
2. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.
3. Clean leaks immediately and disposing of leaked materials properly.

E. Landscape Materials
Dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

1. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.
2. Contain all fertilizers and other landscape materials when they are not actively being used.
3. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.
4. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.
5. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

F. Potential Pollutant Sources

Dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 2 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.
b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.
c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.
d. Ensure retention of sampling, visual observation, and inspection records.
e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

G. Aerial Deposition

Dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

5.5 (c) Non-Storm Water Management

A. Dischargers shall implement measures to control all non-storm water discharges during construction. This includes groundwater, water used for dust control, water used for washing or rinsing, water leaks, chemical leaks, solid and liquid chemicals that are exposed to the elements.

B. Vehicle washing shall be done in a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

5.5 (d) Erosion Control

Construction activities that include grading and soil disturbance require a concentrated effort to prevent and minimize the transport of sediments into nearby storm drain inlets. Sediment can flow into nearby storm drain inlets through storm water runoff and non-storm water runoff. When the use of water is required, every effort should be made to

contain that water and allow it to evaporate in a bermed area. Remaining sediment and debris must be swept and removed from the street.

A. Dischargers shall implement effective wind erosion control (CASQA BMP WE-1).

B. Dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots. One or more of the following temporary soil stabilization measures may be applied to disturbed areas that will be inactive for extended periods. These measures may be used in conjunction with temporary linear sediment barriers.

- Hydraulic Mulch (CASQA BMP EC-3)
- Hydroseeding (CASQA BMP EC-4)
- Soil binders (CASQA BMP EC-5)
- Straw mulch (CASQA BMP EC-6)
- Geotextiles and mats (CASQA BMP EC-7)
- Wood mulching (CASQA BMP EC-8)

C. Dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

5.5 (e) Sediment Control

A. Dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

B. On sites where sediment basins are to be used, Dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook (CASQA BMP SE-2).

C. Dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

D. Dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 3.

[1] Inactive areas of construction are areas of construction activity that have been disturbed and area not scheduled to be re-disturbed for at least 14 days

[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage.

[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

Table 3. Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	**20 feet**
25-50%	**15 feet**
Over 50%	**10 feet**

One or more of the following sediment barriers will be used around disturbed areas that will be inactive for extended periods. These measures may be used in conjunction with temporary soil stabilization measures.

- Silt fence (CASQA BMP SE-1)
- Fiber rolls (CASQA BMP SE-5)
- Gravel bag berm (CASQA BMP SE-6)
- Sandbag barrier (CASQA BMP SE-8)
- Straw bale barrier (CASQA BMP SE-9)
- Drainage ditch

E. Dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

F. Dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire wash off locations) are maintained and protected from activities that reduce their effectiveness.

G. Dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity related materials that are deposited on the roads (by vacuuming or sweeping).

5.5 (f) Run-on and Run-off Controls

Dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off-site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

5.5 (g) Inspection, Maintenance and Repair

A. Dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

B. Dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

C. Upon identifying failures or other shortcomings, as directed by the QSP, Dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

D. For each inspection required, Dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

E. Dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

1. Inspection date and date the inspection report was written.
2. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.
3. Site information, including stage of construction, activities completed, and approximate area of the site exposed.
4. A description of any BMPs evaluated and any deficiencies noted.
5. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.
6. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.
7. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.
8. Photographs taken during the inspection, if any.
9. Inspector’s name, title, and signature.

5.5(h) Hazardous Waste Management and Disposal

Hazardous waste will be stored and handled in separate collection and containment areas in accordance with state and federal standards. Hazardous waste can be generated from equipment maintenance and refueling activities (e.g., anti-freeze, hydraulic fluids, gasoline, diesel fuel, waste oil). Other hazardous wastes include: pesticides, paints, cleaners, epoxies and sandblast grit. Hazardous waste will be stored in covered, labeled containers and secondary containment will be provided for liquid hazardous wastes. Different types of hazardous wastes will not be mixed so as to promote recycling and prevent undesirable chemical reactions.

5.5(i) Spill Prevention and Control

Leaks and spills from construction machinery generally contain petroleum products and heavy metals. Drip pans or some type of impermeable material will be placed under equipment that has been known to leak when such equipment is stored outdoors and not in use. Spills of any type will be cleaned up immediately. Drip pans will be cleaned as necessary to maintain their effectiveness. If absorbent is used for spills, it must be removed promptly and in a proper manner.

5.5(j) Materials Handling and Storage

The primary goal of BMPs for on-site storage of potential pollutants is to minimize the opportunity for them to come into contact with storm water. Hazardous materials, plasters, solvents, paints and other compounds must be properly handled and stored in order to reduce the risk of pollution or contamination. There will be a designated area for all hazardous materials storage, and for any filling or dispensing activity. This area must be located away from drainage paths and should not be directly on the ground (i.e. use plastic liners or containment pallets). This storage area will be covered, or at a minimum, the hazardous materials will be covered in some fashion, either by a tarp, within a covered construction tool bin, or within a storage container. The storage area should be surrounded by berms to prevent any materials from leaving the area should a spill or leak occur. Consideration should be paid to keeping only the minimum amount of hazardous materials on site. Follow manufacturer's instructions regarding storage and use of materials. If any product should come into contact with the soil, that soil will be removed immediately and properly disposed of as hazardous waste.

5.5 (k) Stockpile Management

Stockpile Management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, paving materials such as Portland cement, concrete rubble, asphalt concrete, aggregate base, asphalt minder and pressure treated wood.

1. Locate stockpiles a minimum of 50 ft away from concentrated flows of stormwater, draining courses, and inlets.

2. Protect all stockpiles from stormwater runoff using a temporary perimeter sediment barrier such as berms, dikes, fiber rolls, silt fences, sandbag, gravel bags, or straw bale barriers

3. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

4. Contain fertilizers and other landscape materials when they are not actively being used.

5. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

6. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

7. Stack erodible landscape material on pallets and cover such materials when not being used or applied.

5.5 (l) Scheduling

Work will not be conducted during storm events. Prior to finishing work before a storm event, the work area will be stabilized to reduce the potential for pollutants to leave the area and enter the storm drain system.

5.5 (m) Vehicle ingress and egress

Vehicles and equipment shall pass over metal shaker plates to loosen and remediate soil and debris from ingress/egress access points. Inspect ingress/egress access points daily and sweep tracked sediment as needed.

5.5(n) Concrete Truck Washing Waste

Concrete truck wash out will only be conducted over the open trench so that all concrete waste is captured and buried in the trench. When that is not feasible and the truck must be washed out in the work area, a containment area will be created to capture the wash water. When dry, concrete waste and residue will be swept and removed. Only as much concrete as needed will be mixed or brought on site in order to reduce the amount of concrete waste. If concrete truck rinsing must occur, it will be done in a contained area. Concrete rinse water must not enter the storm drain system. The concrete containment area must be cleaned out and maintained periodically to minimize the potential of storm water contamination.

6.0 RAIN EVENT ACTION PLAN (REAP)

Dischargers shall document all housekeeping BMPs in the SWPPP in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

A. The discharger shall ensure that a Qualified SWPPP Practitioner (QSP) develops a Rain Event Action Plan (REAP) 48 hours prior to any likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The discharger shall

ensure a QSP obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

B. The discharger shall ensure that a QSP develops the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

C. The discharger shall ensure that the QSP ensures that the REAP include, at a minimum, the following site information:

1. Site Address
2. Calculated Risk Level 2
3. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
4. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
5. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number

D. The discharger shall ensure a QSP includes in the REAP, at a minimum, the following project phase information:

1. Activities associated with each construction phase
2. Trades active on the construction site during each construction phase
3. Trade contractor information
4. Suggested actions for each project phase

E. The discharger shall ensure a QSP develops additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

1. Site Address
2. Calculated Risk Level 2
3. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
4. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
5. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number
6. Trades active on site during Inactive Construction
7. Trade contractor information
8. Suggested actions for inactive construction sites

F. The discharger shall ensure a QSP begins implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

G. The discharger shall ensure a QSP maintains onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

7.0 Monitoring and Reporting Requirements

7.1 Introduction

This chapter addresses maintenance, inspection, and repair procedures for all construction-related BMPs to ensure that all graded surfaces, walls, berms, drainage structures, vegetation, erosion and sediment control measures, etc., are maintained in effective condition and are promptly repaired or restored. A properly trained person must be assigned the responsibility to conduct inspections. All completed inspection/ maintenance forms must be kept with this SWPPP. A written site- specific Construction Site Monitoring Program (CSMP) shall be developed and implemented prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required. Inspection forms are included in Appendix C.

The goals of the inspection program are:

1. To demonstrate that the site is in compliance with the Discharge Prohibitions;

2. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives;

3. To determine whether immediate corrective actions, additional BMP or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges; and

4. To determine whether BMPs included in the SWPPP are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

The inspector should keep in mind that construction activity that cause or contribute to an exceedance of water quality standards must be corrected immediately. If storm water runoff is visibly oily or greasy, turbid, has a strong odor, or if it is known to contain pollutants such as pesticides, debris, sediment, settleable material or suspended material (i.e. trash), then it has potentially exceeded water quality standards.

If a violation of water quality standards is suspected, or if additional guidance or information is necessary, call the LADWP Wastewater Quality and Compliance Group (WQG) as soon as possible at (213) 367-0436.

7.2 Monitoring and Reporting Requirements

Table 4. Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
2	X	X	X	X	X	X	

7.2 (a) Construction Site Monitoring Program (CSMP) Requirements

A. Dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Table 4 - Summary of Monitoring Requirements, are completed.

B. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of this Storm Water Pollution Prevention Plan (SWPPP), included in **.**

C. As stated in Section *5.5(b) Good Site Management "Housekeeping"*, Risk Level 2 dischargers shall conduct an assessment and create a list of potential pollutant sources and a potential pollutant list. The list shall be kept with the SWPPP in the CSMP and shall identify all non-visible pollutants which are known, or should be known, to occur at the construction site.

D. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ.

E. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

7.2 (b) CSMP Monitoring Description

Dischargers shall include a description of the following items in the CSMP:

1. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

2. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples. **Note: the pH test must be performed immediately in the field. Turbidity test may be performed in the field or shipped to a lab provided the test is performed on the same day.**

3. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Table 5.

Table 5. Risk Level 2 Test Methods, Detection Limits, Reporting Units and Applicable NALs/NELs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2 Discharges	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2 Discharges other than ATS	1	NTU	250 NTU
		For ATS discharges	1	NTU	N/A
Any other pollutants identified for non-visible pollutant monitoring – see CSMP					

ATS = Active Treatment System

7.2 (c) Objectives

The CSMP shall be developed and implemented to address the following objectives:

1. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs)/Numeric Effluent Limitations (NELs) of this General Permit.

2. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

3. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

4. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

7.2 (d) Visual Observation and Sample Collection Exemptions

Dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

1. During dangerous weather conditions such as flooding and electrical storms.

2. Outside of scheduled site business hours.

If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 2 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7.3 Visual Monitoring (Inspection) Requirements for Qualifying Rain Events

Use form in

A. Dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

B. Dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

C. Dischargers shall conduct visual observations (inspections) during business hours only.

D. Dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

E. Within 2 business days (48 hours) prior to each qualifying rain event, Dischargers shall visually observe (inspect):

1. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.
2. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP and REAP. If needed, the discharger shall implement appropriate corrective actions.

3. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

F. For the visual observations (inspections) described in this Section, dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

G. Within two business days (48 hours) after each qualifying rain event, Dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

H. Dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

7.4 Water Quality Sampling and Analysis

Dischargers shall collect storm water grab samples from sampling locations, as defined in Section 7.4 (d) Effluent Sampling Locations. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

7.4 (a) Effluent Analysis Requirements

A. Dischargers shall analyze their effluent samples for:

1. pH and turbidity.

7.4 (b)Effluent Sampling Schedule

Dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

7.4 (c) Number of Effluent Samples

At minimum, Dischargers shall collect **3 samples per day** of the qualifying event (1/2 inch or more of rain causing the discharge).

7.4 (d) Effluent Sampling Locations

A. Dischargers shall collect storm water grab samples from sampling locations found in Table 6. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

B. Dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

C. Dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

Table 6. Sample Locations.[4]

Location ID:		
Location Description		
Coordinates	Lat:	Long:
Location ID:		
Location Description		
Coordinates	Lat:	Long:
Location ID:		
Location Description		
Coordinates	Lat:	Long:

D. Dischargers shall ensure that storm water discharge collected and observed represents[5] the effluent in each drainage area based on visual observation of the water and upstream conditions.

E. Dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs or NELs.

F. Dischargers who deploy an Active Treatment System (ATS) on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

7.4 (e) Storm Water Sample Collection and Handling Instructions

A. Dischargers shall refer to Table 5 above for test methods, detection limits, and reporting units.

B. Dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

[4] To be determined.

[5] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment-laden water even if most water flowing through the fence is clear.

C. Dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP)[6].

7.4 (f)– Monitoring Methods

A. Dischargers shall include a description of the following items in the CSMP:

1. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

2. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples.

3. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Table 5 above.

B. Dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services. Dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

7.4 (g) Analytical Methods

A. Dischargers shall select analytical test methods from the list provided in Table 5 above for test methods, detection limits, and reporting units.

---

[6] Additional information regarding SWAMP's QAPrP and QAMP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/.
QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf.
QAMP:http://www.waterboards.ca.gov/water_issues/programs/swamp/qamp.shtml.

B. pH: Dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 2 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section 7.6 – Records below.

C. Turbidity: Dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

7.4 (h) Non-Storm Water Discharge Monitoring Requirements

Visual Monitoring Requirements:

A. Dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

B. Dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

C. Dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 2 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

Effluent Sampling Locations:

A. Dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

B. Dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

C. Dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

7.4 (i) Non-Visible Pollutant Monitoring Requirements

A. Dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

B. Dischargers shall ensure that water samples are large enough to characterize the site conditions.

C Dischargers shall collect samples at all discharge locations that can be safely accessed.

D. Dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

E. Dischargers shall analyze samples for all non-visible pollutant parameters listed in the CSMP (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 2 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

F. Dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

G. Dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[6]

[6] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices

H. Dischargers shall keep all field /or analytical data in the SWPPP document.

7.4 (j)– Watershed Monitoring Option

Dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in *7.4 (d) Effluent Sampling Locations* (Section I.5 of Attachment D of the Permit). The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

7.5 Particle Size Analysis for Project Risk Justification

Dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

7.6 – Records

Dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Dischargers shall retain all records on-site while construction is ongoing. These records include:

1. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

2. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

3. The date and approximate time of analyses.

4. The individual(s) who performed the analyses.

5. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

6 Rain gauge readings from site inspections;

7. Quality assurance/quality control records and results.

8. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections 7.4 (h) Non-

Storm Water Discharge Monitoring Requirements and 7.4 (i) Non-Visible Pollutant Monitoring Requirements above).

9. Visual observation and sample collection exception records (see Section 7.2 (d) above).

10. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

7.7 NAL Exceedance Report

A. In the event that any effluent sample exceeds an applicable NAL, Dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

B. Dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

C. Dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

D. Dischargers shall include in the NAL Exceedance Report:

1. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”).

2. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

3. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

8.0 GENERAL REQUIREMENTS

8.1 SWPPP Certification

This SWPPP must be certified in accordance with the signatory requirements described below. Use the Compliance Certification Form provided at the end of this section, and make additional copies as needed.

8.2 Annual Site Compliance Evaluation and Certification

This SWPPP must be certified annually to ensure that construction activities comply with the requirements of the General Construction Permit. The certification should be based upon the results of required site inspections. This certification must be completed by July 1 of each year until the construction project is completed and a Notice of Termination (NOT) has been submitted to the State Water Resources Control Board.

8.3 SWPPP Amendments

This SWPPP will be amended whenever:

A. There is a change in construction or operations which may affect the discharge of pollutants to surface waters, ground waters, or the municipal storm drain system (e.g. Additional soils will be stored onsite, or excavation outside of the project area will be necessary);

B. There is a violation of any condition of the General Permit; or

C. The SWPPP has not achieved the general objective of reducing or eliminating pollutants in storm water discharges.

Use Appendix G to document all changes made to the SWPPP. Make additional copies of Appendix G as needed. Each amendment should be signed by the site construction manager or site supervisor and include the date of initial preparation and the date of each amendment. All amendments should be directly attached to this SWPPP.

8.4 SWPPP Availability

This SWPPP must be kept on the site while the site is under construction, beginning with the initial mobilization and ending with the termination of coverage under the permit. It should be available to site employees at all times and provided upon request to the Los Angeles Regional Water Quality Control Board or local storm water agency.

9.0 POST-CONSTRUCTION STANDARDS

A. All dischargers shall comply with the following runoff reduction requirements unless they are located within an area subject to post construction standards of an active Phase I or II municipal separate storm sewer system (MS4) permit that has an approved Storm Water Management Plan.

1. This provision shall take effect three years from the adoption date of this permit, or later at the discretion of the Executive Officer of the Regional Board.

2. The discharger shall demonstrate compliance with the requirements of this section by submitting with their NOI a map and worksheets in accordance with the instructions in Appendix 2 of Order No. 2009-0009-DWQ.The discharger shall use non-structural controls unless the discharger demonstrates that non-structural controls are infeasible or that structural controls will produce greater reduction in water quality impacts.

3. The discharger shall, through the use of non-structural and structural measures as described in Appendix 2, of Order No. 2009-0009-DWQ replicate the pre-project water balance (for this permit, defined as the volume of rainfall that ends up as runoff) for the smallest storms up to the 85th percentile storm event (or the smallest storm event that generates runoff, whichever is larger). Dischargers shall inform Regional Water Board staff at least 30 days prior to the use of any structural control measure used to comply with this requirement. Volume that cannot be addressed using nonstructural practices shall be captured in structural practices and approved by the Regional Water Board. When seeking Regional Board approval for the use of structural practices, dischargers shall document the infeasibility of using non-structural practices on the project site, or document that there will be fewer water quality impacts

4. For sites whose disturbed area exceeds two acres, the discharger shall preserve the pre-construction drainage density (miles of stream length per square mile of drainage area) for all drainage areas within the area serving a first order stream[14] or larger stream and ensure that post project time of runoff concentration is equal or greater than pre-project time of concentration.

B. All dischargers shall implement BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed at the site (Post-construction BMPs).

.

10.0 CERTIFICATION STATEMENT

This SWPPP must be evaluated and re-certified using this form annually by July 1 until the construction project is complete and a Notice of Termination has been submitted to the Regional Board. Use this form for the initial certification, annual re-certification, and re-certification following revisions. Additional blank forms can be made by copying the form included in Appendix J.

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment for knowing violations."

YES	NO	
		Are the BMPs called for in the SWPPP installed in the proper location according to the specifications for the SWPPP?
		Are all operational storm drain inlets protected from sediment inflow?
		Do any structural BMPs require repair or clean out to maintain adequate function? If yes, indicate which ones:
		Is there evidence of equipment leakage/ spillage of equipment/vehicle maintenance fluids?
		Are construction on-site traffic routes, parking, and storage of equipment and supplies restricted to areas specifically designated for those uses?
		Do any seeded or landscaped areas require maintenance, irrigation, and fertilization, seeding or mulching?
		Is there any evidence that sediment is leaving the site?

BMP and Drainage Area Inspection Form for Haskell Switching Station observed on _____, continued

Yes	No	
		Is there any evidence of floating and suspended material, sheen, discoloration, turbidity, or odor?
		Is there any evidence of sediment, debris, or mud on public roads at intersections with site access roads?
		Is there any evidence of incorrect waste disposal (paints, concrete, solid wastes)?
		Is the overall housekeeping sufficiently maintained?
		Is the vehicle/ equipment maintenance and cleaning areas clean and free of oil, grease or potential pollutants?
		Is the construction area access point stabilized? Has potential for mud/ dirt tracking from the site been minimized?
		Are liquid transfer areas (equipment fueling) clean and protected from rain?
		Are there any visible non-storm water discharges? Is there evidence that non-storm water discharges occurred in the past? If so, describe the non-storm water discharge:
		Are trashcans covered?
		Are sanitary waste facilities in working order and not leaking?

Describe Corrective Actions Taken or Recommended:
Describe any necessary revisions to the SWPPP or REAP

Fill out as many forms as necessary to cover all observation locations in the entire project area.

Construction Site Monitoring Plan

Construction Site Monitoring Program

1. Purpose

This Construction Site Monitoring Program was developed to address the following objectives:

1. To demonstrate that the site is in compliance with the Discharge Prohibitions and Numeric Action Levels (NALs) of the Construction General Permit;
2. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives;
3. To determine whether immediate corrective actions, additional Best Management Practices (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in stormwater discharges and authorized non-stormwater discharges;
4. To determine whether BMPs included in the SWPPP and REAP are effective in preventing or reducing pollutants in stormwater discharges and authorized non-stormwater discharges.

2. Applicability of Permit Requirements

This project has been determined to be a Risk Level 2 project. The General Permit identifies the following types of monitoring as being applicable for a Risk Level 2 project.

Risk Level 2

- Visual inspections of BMPs;
- Visual monitoring of the site related to qualifying storm events;
- Visual monitoring of the site for non-stormwater discharges;
- Sampling and analysis of construction site runoff for pH and turbidity;
- Sampling and analysis of construction site runoff for non-visible pollutants when applicable; and
- Sampling and analysis of non-stormwater discharges when applicable.

3. Weather and Rain Event Tracking

Visual monitoring and inspections requirements of the General Permit are triggered by a qualifying rain event. The General Permit defines a qualifying rain event as any event that produces ½ inch of precipitation. A minimum of 48 hours of dry weather will be used to distinguish between separate qualifying storm events.

Visual monitoring, inspections, and sampling requirements of the General Permit are triggered by a qualifying rain event. The General Permit defines a qualifying rain event as any event that produces ½ inch of precipitation. A minimum of 48 hours of dry weather will be used to distinguish between separate qualifying storm events.

For the purposes of assessing exceptions to the Receiving Water Monitoring Triggers the General Permit establishes the compliance storm event at the 5-year, 24-hour event. Based on the Western Regional Climate Center, the 5-year, 24-hour event for this project is 4.5 inches.

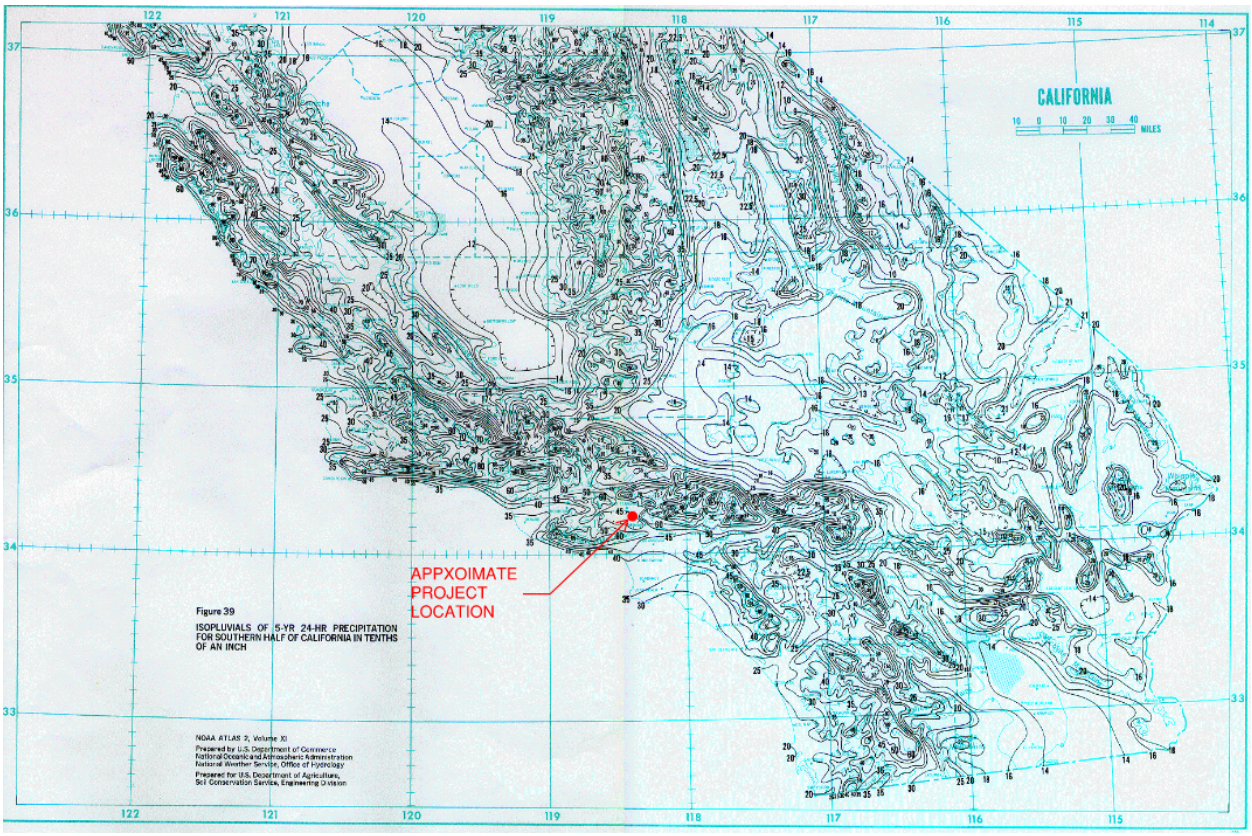

Figure 3.1 Western US Precipitation Frequency Map, Southern California

3.1. Weather Tracking

The QSP should daily consult the National Oceanographic and Atmospheric Administration (NOAA) for the Forecast Weather Table Interface. These forecasts can be obtained at http://forecast.weather.gov . Weather reports should be printed and maintained with the SWPPP in Appendix H "Weather Reports".

3.2. Rain Gauges

The QSP shall install 1 rain gauge on the project site. Locate the gauge in an open area away from obstructions such as trees or overhangs. Mount the gauge on a post at a height of 3 to 5 feet with the gauge extending several inches beyond the post. Make sure that the top of the gauge is level. Make sure the post is not in an area where rainwater can indirectly splash from sheds, equipment, trailers, etc.

The rain gauge(s) shall be read daily during normal site scheduled hours. The rain gauge should be read at approximately the same time every day and the date and time of each reading recorded. Log rain gauge readings in Appendix H "Weather Records". Follow the rain gauge instructions to obtain accurate measurements.

Once the rain gauge reading has been recorded, accumulated rain shall be emptied, and the gauge reset. Alternatively, include instructions for an automated recording rain gauge if used.

For comparison with the site rain gauge, the nearest appropriate governmental rain gauge(s) is located at Tujunga Spreading Grounds (https://dpw.lacounty.gov/wrd/rainfall/).

4. Monitoring Locations

Monitoring locations are shown on the Site Maps in Appendix B. Monitoring locations are described in the Sections 6 and 7.

Whenever changes in the construction site might affect the appropriateness of sampling locations, the sampling locations shall be revised accordingly. All such revisions shall be implemented as soon as feasible and the SWPPP amended. Temporary changes that result in a one-time additional sampling location do not require a SWPPP amendment.

5. Safety and Monitoring Exemptions

Safety practices for sample collection will be in accordance with the [ENTER TITLE AND PUBLICATION DATE OF CONTRACTOR'S HEALTH AND SAFETY PLAN FOR THE PROJECT OR PROVIDE SPECIFIC REQUIREMENTS IN THIS SECTION]. A summary of the safety requirements that apply to sampling personnel is provided below.

-
-
-
-

This project is not required to collect samples or conduct visual observations (inspections) under the following conditions:

- During dangerous weather conditions such as flooding and electrical storms.
- Outside of scheduled site business hours.

Scheduled site business hours are: [SPECIFY SITE BUSINESS DAYS AND HOURS].

If monitoring (visual monitoring or sample collection) of the site is unsafe because of the dangerous conditions noted above, then the QSP shall document the conditions for why an exception to performing the monitoring was necessary. The exemption documentation shall be filed in Appendix N "Monitoring Records".

6. Visual Monitoring

Visual monitoring includes observations and inspections. Inspections of BMPs are required to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Visual observations of the site are required to observe storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources.

Table 6.1 identifies the required frequency of visual observations and inspections. Inspections and observations will be conducted at the locations identified in Section 6.3.

Table 6.1 Summary of Visual Monitoring and Inspections

Type of Inspection	Frequency
Routine Inspections	
BMP Inspections	Weekly[1]
BMP Inspections – Tracking Control	Daily
[add rows for other BMPs as needed]	[Enter Frequency]

Table 6.1 Summary of Visual Monitoring and Inspections

Type of Inspection	Frequency
Non-Stormwater Discharge Observations	Quarterly during daylight hours
Rain Event Triggered Inspections	
Site Inspections Prior to a Qualifying Event	Within 48 hours of a qualifying event [2]
BMP Inspections During an Extended Storm Event	Every 24-hour period of a rain event[3]
Site Inspections Following a Qualifying Event	Within 48 hours of a qualifying event[2]

[1] Most BMPs must be inspected weekly; those identified below must be inspected more frequently.

[2] Inspections are required during scheduled site operating hours.

[3] Inspections are required during scheduled site operating hours regardless of the amount of precipitation on any given day.

6.1. Routine Observations and Inspections

Routine site inspections and visual monitoring are necessary to ensure that the project is in compliance with the requirements of the Construction General Permit.

6.1.1. Routine BMP Inspections

Inspections of BMPs are conducted to identify and record:

- BMPs that are properly installed;
- BMPs that need maintenance to operate effectively;
- BMPs that have failed; or
- BMPs that could fail to operate as intended.

6.1.2. Non-Stormwater Discharge Observations

Each drainage area will be inspected for the presence of or indications of prior unauthorized and authorized non-stormwater discharges. Inspections will record:

- Presence or evidence of any non-stormwater discharge (authorized or unauthorized);
- Pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.); and
- Source of discharge.

6.2. Rain-Event Triggered Observations and Inspections

Visual observations of the site and inspections of BMPs are required prior to a qualifying rain event; following a qualifying rain event, and every 24-hour period during a qualifying rain event. Pre-rain inspections will be conducted after consulting NOAA and determining that a precipitation event with a 50 percent or greater probability of precipitation has been predicted on the Forecast Weather Table Interface.

6.2.1. Visual Observations Prior to a Forecasted Qualifying Rain Event

Within 48 hours prior to a qualifying event, a stormwater visual monitoring site inspection will include observations of the following locations:

- Stormwater drainage areas to identify any spills, leaks, or uncontrolled pollutant sources;
- BMPs to identify if they have been properly implemented;
- Any stormwater storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

BMP inspections and visual monitoring will be triggered by a NOAA prediction of rain in the project area.

6.2.2. BMP Inspections During an Extended Storm Event

During an extended rain event BMP inspection will be conducted to identify and record:

- BMPs that are properly installed;
- BMPs that need maintenance to operate effectively;
- BMPs that have failed; or
- BMPs that could fail to operate as intended.

If the construction site is not accessible during the rain event, the visual inspections shall be performed at all relevant outfalls, discharge points, downstream locations. The inspections should record any projected maintenance activities.

6.2.3. Visual Observations Following a Qualifying Rain Event

Within 48 hours following a qualifying rain event (0.5 inches of rain), a stormwater visual monitoring site inspection is required to observe:

- Stormwater drainage areas to identify any spills, leaks, or uncontrolled pollutant sources;
- BMPs to identify if they have been properly designed, implemented, and effective;
- Need for additional BMPs;
- Any stormwater storage and containment areas to detect leaks and ensure maintenance of adequate freeboard; and
- Discharge of stored or contained rain water.

6.3. Visual Monitoring Procedures

Visual monitoring shall be conducted by the QSP or staff trained by and under the supervision of the QSP.

The name(s) and contact number(s) of the site visual monitoring personnel are listed below and their training qualifications are provided in Appendix F.

Assigned inspector: NAME OF INSPECTOR Contact phone: TELEPHONE NUMBER

Alternate inspector: NAME OF INSPECTOR Contact phone: TELEPHONE NUMBER

Stormwater observations shall be documented on the *Visual Inspection Field Log Sheet* (see Appendix O "Example Forms"). BMP inspections shall be documented on the site-specific BMP inspection checklist. Any photographs used to document observations will be referenced on stormwater site inspection report and maintained with the Monitoring Records in Appendix N.

The QSP shall within [Enter Number] days of the inspection submit copies of the completed inspection report to [Name].

The completed reports will be kept in Appendix N "Monitoring Records".

6.4. Visual Monitoring Follow-Up and Reporting

Correction of deficiencies identified by the observations or inspections, including required repairs or maintenance of BMPs, shall be initiated and completed as soon as possible.

If identified deficiencies require design changes, including additional BMPs, the implementation of changes will be initiated within 72 hours of identification and be completed as soon as possible. When design changes to BMPs are required, the SWPPP shall be amended to reflect the changes.

Deficiencies identified in site inspection reports and correction of deficiencies will be tracked on the *Inspection Field Log Sheet* or *BMP Inspection Report* and shall be submitted to the QSP and shall be kept in Appendix N "Monitoring Records".

The QSP shall within [Enter Number] days of the inspection submit copies of the completed *Inspection Field Log Sheet* or *BMP Inspection Report* with the corrective actions to [Name].

Results of visual monitoring must be summarized and reported in the Annual Report.

6.5. Visual Monitoring Locations

The inspections and observations identified in Sections 6.1 and 6.2 will be conducted at the locations identified in this section.

BMP locations are shown on the Site Maps in SWPPP Appendix B.

There are 5 drainage area(s) on the project site and the contractor's yard, staging areas, and storage areas. Drainage area(s) are shown on the Site Maps in Appendix B and Table 6.2 identifies each drainage area by location.

Table 6.2 Site Drainage Areas

Location No.	Location
1	David M. Gonzales Park southwest area of site
2	David M. Gonzales Park south area of site
3	David M. Gonzales Park southwest area of site
4	Van Nuys Blvd (Inlet Storm Drain No. 1 and Diversion Structure No. 1)

6	Herrick Ave (Inlet Storm Drain No. 2 and Diversion Structure No. 2)
7	Pierce Street (Inlet Storm Drain No. 2 and Diversion Structure No. 2)

There are no stormwater storage or containment area(s) are on the project site. Stormwater storage or containment area(s) are shown on the Site Maps in Appendix B and Table 6.3 identifies each stormwater storage or containment area by location.

Table 6.3 Stormwater Storage and Containment Areas

Location No.	Location
	Not applicable

There are three discharge location(s) on the project site. Site stormwater discharge location(s) are shown on the Site Maps in Appendix B and Table 6.4 identifies each stormwater discharge location.

Table 6.4 Site Stormwater Discharge Locations

Location No.	Location
1	David M. Gonzales Park southwest area of site
2	David M. Gonzales Park south area of site
3	David M. Gonzales Park southwest area of site

7. Water Quality Sampling and Analysis

7.1. Sampling and Analysis Plan for Non-Visible Pollutants in Stormwater Runoff Discharges

This Sampling and Analysis Plan for Non-Visible Pollutants describes the sampling and analysis strategy and schedule for monitoring non-visible pollutants in stormwater runoff discharges from the project site.

Sampling for non-visible pollutants will be conducted when (1) a breach, leakage, malfunction, or spill is observed; and (2) the leak or spill has not been cleaned up prior to the rain event; and (3) there is the potential for discharge of non-visible pollutants to surface waters or drainage system.

The following construction materials, wastes, or activities, as identified in Section 2.6, are potential sources of non-visible pollutants to stormwater discharges from the project. Storage, use, and operational locations are shown on the Site Maps in Appendix B.

- [LIST or State NONE]
- [LIST or State NONE]

The following existing site features, as identified in Section 2.6, are potential sources of non-visible pollutants to stormwater discharges from the project. Locations of existing site features contaminated with non-visible pollutants are shown on the Site Maps in Appendix B.

- NONE

The following soil amendments have the potential to change the chemical properties, engineering properties, or erosion resistance of the soil and will be used on the project site. Locations of soil amendment application are shown on the Site Maps in Appendix B.

- NONE

The project has the potential to receive stormwater run-on from the following locations with the potential to contribute non-visible pollutants to stormwater discharges from the project. Locations of such run-on to the project site are shown on the Site Maps in Appendix B.

- NONE

7.1.1. Sampling Schedule

Samples for the potential non-visible pollutant(s) and a sufficiently large unaffected background sample shall be collected during the first two hours of discharge from rain events that result in a sufficient discharge for sample collection. Samples shall be collected during the site's scheduled hours and shall be collected regardless of the time of year and phase of the construction.

Collection of discharge samples for non-visible pollutant monitoring will be triggered when any of the following conditions are observed during site inspections conducted prior to or during a rain event.

- Materials or wastes containing potential non-visible pollutants are not stored under watertight conditions. Watertight conditions are defined as (1) storage in a watertight container, (2) storage under a watertight roof or within a building, or (3) protected by temporary cover and containment that prevents stormwater contact and runoff from the storage area.
- Materials or wastes containing potential non-visible pollutants are stored under watertight conditions, but (1) a breach, malfunction, leakage, or spill is observed, (2) the leak or spill is not cleaned up prior to the rain event, and (3) there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.
- A construction activity, including but not limited to those in Section 2.6, with the potential to contribute non-visible pollutants (1) was occurring during or within 24 hours prior to the rain event, (2) BMPs were observed to be breached, malfunctioning, or improperly implemented, and (3) there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.
- Soil amendments that have the potential to change the chemical properties, engineering properties, or erosion resistance of the soil have been applied, and there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.
- Stormwater runoff from an area contaminated by historical usage of the site has been observed to combine with stormwater runoff from the site, and there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.

7.1.2. Sampling Locations

Sampling locations are based on proximity to planned non-visible pollutant storage, occurrence or use, accessibility for sampling, and personnel safety. Planned non-visible pollutant sampling locations are shown on the Site Maps in Appendix B and include the locations identified in Tables 7.5 through 7.9.

Three sampling location(s) on the project site and the contractor's yard have been identified for the collection of samples of runoff from planned material and waste storage areas and areas where non-visible pollutant producing construction activities are planned.

Table 7.5 Non-Visible Pollutant Sample Locations – Project Site

Sample Location Number	Sample Location Description	Sample Location Latitude and Longitude
1	SE to S of Site Adjacent to and North of Norris Avenue	
2	S of Site Adjacent and North of Norris Avenue	
3	SW Corner of Site Adjacent and North of Norris Avenue	

[Enter number of locations] sampling locations have been identified for the collection of samples of runoff from drainage areas where soil amendments will be applied that have the potential to affect water quality.

Table 7.6 Non-Visible Pollutant Sample Locations – Soil Amendment Areas

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

[Enter number of locations] sampling locations have been identified for the collection of samples of runoff from drainage areas contaminated by historical usage of the site.

Table 7.7 Non-Visible Pollutant Sample Locations – Areas of Historical Contamination

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

One sampling location(s) has been identified for the collection of an uncontaminated sample of runoff as a background sample for comparison with the samples being analyzed for non-visible pollutants. This location(s) was selected such that the sample will not have come in contact with the operations, activities, or areas identified in Section 7.1 or with disturbed soils areas.

Table 7.8 Non-Visible Pollutant Sample Locations – Background (Unaffected Sample)

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

One sampling location has been identified for the collection of samples of run-on to the project site. Run-on from these locations has the potential to combine with discharges from the site being sampled for non-visible pollutants. These samples are intended to identify potential sources of non-visible pollutants that originate off the project site.

Table 7.9 Non-Visible Pollutant Sample Locations – Site Run-On

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)

If a stormwater visual monitoring site inspection conducted prior to or during a storm event identifies the presence of a material storage, waste storage, operations area with spills, or the potential for the discharge of non-visible pollutants to surface waters or a storm drain system that is at a location not listed above and has not been identified on the Site Maps, sampling locations will be selected by the QSP using the same rationale as that used to identify planned locations. Non-visible pollutant sampling locations shall be identified by the QSP on the pre-rain event inspection form and/or Rain Event Action Plan prior to a forecasted qualifying rain event.

7.1.3. Monitoring Preparation

Non-visible pollutant samples will be collected by:

Contractor ☐ Yes ☐ No

Consultant ☐ Yes ☐ No

Laboratory ☐ Yes ☐ No

Samples on the project site will be collected by the following contractor sampling personnel:

Name/Telephone Number:

Alternate(s)/Telephone Number:

An adequate stock of monitoring supplies and equipment for monitoring non-visible pollutants will be available on the project site prior to a sampling event. Monitoring supplies and equipment will be stored in a cool temperature environment that will not come into contact with rain or direct sunlight. Sampling personnel will be available to collect samples in accordance with the sampling schedule. Supplies maintained at the project site will include, but are not limited to, clean powder-free nitrile gloves, sample collection equipment, coolers, appropriate number and volume of sample bottles, identification labels, re-sealable storage bags, paper

towels, personal rain gear, ice, and *Effluent Sampling Field Log Sheets* and Chain of Custody (CoC) forms, which are provided in Appendix O "Example Forms".

Samples on the project site will be collected by the following [specify laboratory or environmental consultant]:

Company Name:	TBD
Street Address:	
City, State Zip:	
Telephone Number:	
Point of Contact:	
Name of Sampler(s):	
Name of Alternate(s):	

The QSP or his/her designee will contact [specify name of laboratory or environmental consultant] 24 hours prior to a predicted rain event or for an unpredicted event, as soon as a rain event begins if one of the triggering conditions is identified during an inspection to ensure that adequate sample collection personnel and supplies for monitoring non-visible pollutants are available and will be mobilized to collect samples on the project site in accordance with the sampling schedule.

7.1.4. Analytical Constituents

Table 7.10 lists the specific sources and types of potential non-visible pollutants on the project site and the water quality indicator constituent(s) for that pollutant.

Table 7.10 Potential Non-Visible Pollutants and Water Quality Indicator Constituents

Pollutant Source	Pollutant	Water Quality Indicator Constituent
Asphalt Work	VOC	VOC
Concrete Work	pH	pH
Landscape Work	Pesticides/Herbicides	Product dependent, see label and check with laboratory

7.1.5. Sample Collection

Samples of discharge shall be collected at the designated non-visible pollutant sampling locations shown on the Site Maps in Appendix B or in the locations determined by observed breaches, malfunctions, leakages, spills, operational areas, soil amendment application areas, and historical site usage areas that triggered the sampling event.

Grab samples shall be collected and preserved in accordance with the methods identified in the Table 7.11, "Sample Collection, Preservation and Analysis for Monitoring Non-Visible

Pollutants" provided in Section 7.1.6. Only the QSP, or personnel trained in water quality sampling under the direction of the QSP shall collect samples.

Sample collection and handling requirements are described in Section 7.7.

7.1.6. Sample Analysis

Samples shall be analyzed using the analytical methods identified in the Table 7.11.

Samples will be analyzed by:

Laboratory Name:	TBD
Street Address:	
City, State Zip:	
Telephone Number:	
Point of Contact:	
ELAP Certification Number:	

Samples will be delivered to the laboratory by:

Driven by Contractor	☐ Yes	☐ No
Picked up by Laboratory Courier	☐ Yes	☐ No
Shipped	☐ Yes	☐ No

7.1.7. Data Evaluation and Reporting

The QSP shall complete an evaluation of the water quality sample analytical results.

Runoff/downgradient results shall be compared with the associated upgradient/unaffected results and any associated run-on results. Should the runoff/downgradient sample show an increased level of the tested analyte relative to the unaffected background sample, which cannot be explained by run-on results, the BMPs, site conditions, and surrounding influences shall be assessed to determine the probable cause for the increase.

As determined by the site and data evaluation, appropriate BMPs shall be repaired or modified to mitigate discharges of non-visible pollutant concentrations. Any revisions to the BMPs shall be recorded as an amendment to the SWPPP.

Table 7.11 Sample Collection, Preservation and Analysis for Monitoring Non-Visible Pollutants

Constituent	Analytical Method	Minimum Sample Volume	Sample Containers	Sample Preservation	Reporting Limit	Maximum Holding Time
Notes:						

The General Permit prohibits the storm water discharges that contain hazardous substances equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4. The results of any non-stormwater discharge results that indicate the presence of a hazardous substance in excess of established reportable quantities shall be immediately reported to the Regional Water Board and other agencies as required by 40 C.F.R. §§ 117.3 and 302.4.

Results of non-visible pollutant monitoring shall be reported in the Annual Report.

7.2. Sampling and Analysis Plan for pH and Turbidity in Stormwater Runoff Discharges

Sampling and analysis of runoff for pH and turbidity is required for this project. This Sampling and Analysis Plan describes the strategy for monitoring turbidity and pH levels of stormwater runoff discharges from the project site and run-on that may contribute to an exceedance of a Numeric Action Level (NAL) or the exceedance of a Receiving Water Monitoring Trigger.

Samples for pH and turbidity will be collected at all discharge points where stormwater is discharged off-site.

7.2.1. Sampling Schedule

Stormwater runoff samples shall be collected for pH and turbidity from each day of a qualifying rain event that results in a discharge from the project site. A minimum of three samples will be collected per day of discharge during a qualifying event. Samples should be representative of the total discharge from the project each day of discharge during the qualifying event. Typically, representative samples will be spaced in time throughout the daily discharge event.

Stored or collected water from a qualifying storm event when discharged shall be tested for turbidity and pH. Stored or collected water from a qualifying event may be sampled at the point it is released from the storage or containment area or at the site discharge location.

Run-on samples shall be collected whenever the QSP identifies that run-on has the potential to contribute to an exceedance of a NAL or the exceedance of a Receiving Water Monitoring Trigger.

7.2.2. Sampling Locations

Sampling locations are based on the site runoff discharge locations and locations where run-on enters the site, accessibility for sampling, and personnel safety. Planned pH and turbidity sampling locations are shown on the Site Maps in Appendix B and include the locations identified in Table 7.13 and Table 7-14.

[Enter Number] sampling location(s) on the project site and the contractor's yard have been identified for the collection of runoff samples. Table 7.12 also provides an estimate of the site's area that drains to each location.

Table 7.12 Turbidity and pH Runoff Sample Locations

Sample Location Number	Sample Location	Estimate of Site [Factor] (%)
1	SE to S of Site Adjacent to and North of Norris Avenue	25
2	S of Site Adjacent and North of Norris Avenue	25

Table 7.12 Turbidity and pH Runoff Sample Locations

Sample Location Number	Sample Location	Estimate of Site [Factor] (%)
3	SW Corner of Site Adjacent and North of Norris Avenue	50

[Enter number of locations] sampling locations have been identified for the collection of run-on samples where the run-on has the potential to contribute to an exceedance of an NAL or a Receiving Water Monitoring Trigger. Table 7.13 identifies the run-on sample locations.

Table 7.13 Turbidity and pH Run-On Sample Locations

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

The project does not receive run-on with the potential to exceed NALs or Receiving Water Monitoring Triggers.

7.2.3. Monitoring Preparation

Turbidity and pH samples will be collected and analyzed by:

Contractor ☐ Yes ☐ No

Consultant ☐ Yes ☐ No

Laboratory ☐ Yes ☐ No

Samples on the project site will be collected by the following contractor sampling personnel:

Name/Telephone Number:

Alternate(s)/Telephone Number:

An adequate stock of monitoring supplies and equipment for monitoring turbidity and will be available on the project site prior to a sampling event. Monitoring supplies and equipment will be stored in a cool temperature environment that will not come into contact with rain or direct sunlight. Sampling personnel will be available to collect samples in accordance with the sampling schedule. Supplies maintained at the project site will include, but are not limited to, field meters, extra batteries, clean powder-free nitrile gloves, sample collection equipment, appropriate sample containers, paper towels, personal rain gear, and *Effluent Sampling Field Log Sheets* and CoC forms provided in Appendix O "Example Forms".

The contractor will obtain and maintain the field-testing instruments, as identified in Section 7.2.6, for analyzing samples in the field by contractor sampling personnel.

Samples on the project site will be collected by the following [specify laboratory or environmental consultant]:

Company Name:	
Street Address:	
City, State, Zip:	
Telephone Number:	
Point of Contact:	
Name of Sampler(s):	
Name of Alternate(s):	

The QSP or his/her designee will contact [specify name of laboratory or environmental consultant] 24 hours prior to a predicted rain event or for an unpredicted event, as soon as a rain event begins to ensure that adequate sample collection personnel, supplies for monitoring pH and turbidity are available and will be mobilized to collect samples on the project site in accordance with the sampling schedule.

7.2.4. Field Parameters

Samples shall be analyzed for the constituents indicated in the Table 7.14.

Table 7.14 Sample Collection and Analysis for Monitoring Turbidity and pH

Parameter	Test Method	Minimum Sample Volume [1]	Sample Collection Container Type	Detection Limit (minimum)
Turbidity	Field meter/probe with calibrated portable instrument	500 mL	Polypropylene or glass (Do not collect in meter sample cells)	1 NTU
pH	Field meter/probe with calibrated portable instrument or calibrated pH test kit	100 mL	Polypropylene	0.2 pH units

Notes: [1] Minimum sample volume recommended. Specific volume requirements will vary by instrument; check instrument manufacturer instructions.

L – Liter
mL – Milliliter
NTU – Nephelometric Turbidity Unit

7.2.5. Sample Collection

Samples of discharge shall be collected at the designated runoff and run-on sampling locations shown on the Site Maps in Appendix B. Run-on samples shall be collected within close proximity of the point of run-on to the project.

Only personnel trained in water quality sampling and field measurements working under the direction of the QSP shall collect samples.

Sample collection and handling requirements are described in Section 7.7.

7.2.6. Field Measurements

Samples collected for field analysis, collection, analysis and equipment calibration shall be in accordance with the field instrument manufacturer's specifications.

Immediately following collection, samples for field analysis shall be tested in accordance with the field instrument manufacturer's instructions and results recorded on the *Effluent Sampling Field Log Sheet*.

The field instrument(s) listed in Table 7.15 will be used to analyze the following constituents:

Table 7.15 Field Instruments

Field Instrument (Manufacturer and Model)	Constituent
	pH
	Turbidity

The manufacturers' instructions are included in Appendix P "Field Meter Instructions". Field sampling staff shall review the instructions prior to each sampling event and follow the instructions in completing measurement of the samples.

- The instrument(s) shall be maintained in accordance with manufacturer's instructions.
- The instrument(s) shall be calibrated before each sampling and analysis event.
- Maintenance and calibration records shall be maintained with the SWPPP.

The QSP may authorize alternate equipment provided that the equipment meets the Construction General Permit's requirements and the manufacturers' instructions for calibration and use are added to Appendix P "Field Meter Instructions".

7.2.7. Data Evaluation and Reporting

Immediately upon completing the measurements for the sampling event, provide the *Effluent Sampling Field Log Sheets* to the QSP for evaluation.

Numeric Action Levels

This project is subject to NALs for pH and turbidity (Table 7.16). Compliance with the NAL for pH and turbidity is based on a weighted daily average. Upon receiving the field log sheets, the QSP shall immediately calculate the weighted arithmetic average of the turbidity samples, and the weighted logarithmic average of the pH samples to determine if the NALs, shown in the table below, have been exceeded.

Table 7.16 Numeric Action Levels

Parameter	Unit	Daily Average
pH	pH units	Lower NAL = 6.5 Upper NAL = 8.5
Turbidity	NTU	250 NTU

The QSP shall within [Enter Number] days of the sample collection submit copies of the completed *Effluent Sampling Field Log Sheets* to LADWP representative.

In the event that the pH or turbidity NAL is exceeded, the QSP shall immediately notify LADWP and investigate the cause of the exceedance and identify corrective actions.

Exceedances of NALs shall be electronically reported to the State Water Board by LADWP through the SMARTs system within 10 days of the conclusion of the storm event. If requested by the Regional Board, a NAL Exceedance report will be submitted. The NAL Exceedance Report must contain the following information:

- Analytical method(s), method reporting unit(s), and MDL(s) of each parameter;
- Date, place, time of sampling, visual observation, and/or measurements, including precipitation; and
- Description of the current BMPs associated with the sample that exceeded the NAL and the proposed corrective actions taken.

Receiving Water Monitoring Triggers

This project is not subject to Receiving Water Monitoring Triggers because it does not have a direct discharge to the receiving water.

7.3. Sampling and Analysis Plan for pH, Turbidity, and SSC in Receiving Water

This project is not subject to Receiving Water Monitoring.

7.4. Sampling and Analysis Plan for Non-Stormwater Discharges

The Regional Water Board has not specified monitoring for additional pollutants.

7.5. Training of Sampling Personnel

Sampling personnel shall be trained to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring program (SWAMP) 2008 Quality Assurance Program Plan (QAPrP). Training records of designated contractor sampling personnel are provided in Appendix F.

The stormwater sampler(s) and alternate(s) have received the following stormwater sampling training:

Name	Training
	INSERT LIST OF TRAINING COURSES
	INSERT LIST OF TRAINING COURSES

The stormwater sampler(s) and alternates have the following stormwater sampling experience:

Name	Experience
	INSERT LIST OF STORMWATER SAMPLING EXPERIENCE
	INSERT LIST OF STORMWATER SAMPLING EXPERIENCE

7.6. Sample Collection and Handling

7.6.1. Sample Collection

Samples shall be collected at the designated sampling locations shown on the Site Maps and listed in the preceding sections. Samples shall be collected, maintained and shipped in accordance with the SWAMP 2008 Quality Assurance Program Plan (QAPrP).

Grab samples shall be collected and preserved in accordance with the methods identified in preceding sections.

To maintain sample integrity and prevent cross-contamination, sample collection personnel shall follow the protocols below.

- Collect samples (for laboratory analysis) only in analytical laboratory-provided sample containers;
- Wear clean, powder-free nitrile gloves when collecting samples;
- Change gloves whenever something not known to be clean has been touched;
- Change gloves between sites;
- Decontaminate all equipment (e.g., bucket, tubing) prior to sample collection using a trisodium phosphate water wash, distilled water rinse, and final rinse with distilled water. (Dispose of wash and rinse water appropriately [i.e., do not discharge to storm drain or receiving water]). Do not decontaminate laboratory provided sample containers;
- Do not smoke during sampling events;
- Never sample near a running vehicle;
- Do not park vehicles in the immediate sample collection area (even non-running vehicles);
- Do not eat or drink during sample collection; and
- Do not breathe, sneeze, or cough in the direction of an open sample container.

The most important aspect of grab sampling is to collect a sample that represents the entire runoff stream. Typically, samples are collected by dipping the collection container in the runoff flow paths and streams as noted below.

i. For small streams and flow paths, simply dip the bottle facing upstream until full.
ii. For larger stream that can be safely accessed, collect a sample in the middle of the flow stream by directly dipping the mouth of the bottle. Once again making sure that the opening of the bottle is facing upstream as to avoid any contamination by the sampler.
iii. For larger streams that cannot be safely waded, pole-samplers may be needed to safely access the representative flow.
iv. Avoid collecting samples from ponded, sluggish or stagnant water.
v. Avoid collecting samples directly downstream from a bridge as the samples can be affected by the bridge structure or runoff from the road surface.

Note, that depending upon the specific analytical test, some containers may contain preservatives. These containers should **never** be dipped into the stream but filled indirectly from the collection container.

SSC samples should be taken as a normal grab sample, where the bottle is submerged facing upstream and filled. SSC samples need to be collected in a separate bottle because the analysis requires the entire volume of the bottle. Do not collect in a larger container and partition into the laboratory sample container.

7.6.2. Sample Handling

Turbidity and pH measurements must be conducted immediately. Do not store turbidity or pH samples for later measurement.

Samples for laboratory analysis must be handled as follows. Immediately following sample collection:

- Cap sample containers;
- Complete sample container labels;
- Sealed containers in a re-sealable storage bag;
- Place sample containers into an ice-chilled cooler;
- Document sample information on the *Effluent Sampling Field Log Sheet*; and
- Complete the CoC.

All samples for laboratory analysis must be maintained between 0-6 degrees Celsius during delivery to the laboratory. Samples must be kept on ice, or refrigerated, from sample collection through delivery to the laboratory. Place samples to be shipped inside coolers with ice. Make sure the sample bottles are well packaged to prevent breakage and secure cooler lids with packaging tape.

Ship samples that will be laboratory analyzed to the analytical laboratory right away. Hold times are measured from the time the sample is collected to the time the sample is analyzed. The General Permit requires that samples be received by the analytical laboratory within 48 hours of the physical sampling (unless required sooner by the analytical laboratory).

Laboratory Name:	
Address:	
City, State Zip:	
Telephone Number:	
Point of Contact:	

7.6.3. Sample Documentation Procedures

All original data documented on sample bottle identification labels, *Effluent Sampling Field Log Sheet*, and CoCs shall be recorded using waterproof ink. These shall be considered accountable documents. If an error is made on an accountable document, the individual shall make corrections by lining through the error and entering the correct information. The erroneous information shall not be obliterated. All corrections shall be initialed and dated.

Duplicate samples shall be identified consistent with the numbering system for other samples to prevent the laboratory from identifying duplicate samples. Duplicate samples shall be identified in the Effluent Sampling Field Log Sheet.

Sample documentation procedures include the following:

Sample Bottle Identification Labels: Sampling personnel shall attach an identification label to each sample bottle. Sample identification shall uniquely identify each sample location.

Field Log Sheets: Sampling personnel shall complete the *Effluent Sampling Field Log Sheet* and *Receiving Water Sampling Field Log Sheet* for each sampling event, as appropriate.

Chain of Custody: Sampling personnel shall complete the CoC for each sampling event for which samples are collected for laboratory analysis. The sampler will sign the CoC when the sample(s) is turned over to the testing laboratory or courier.

8. Active Treatment System Monitoring

An Active Treatment System (ATS) will be deployed on the site?

☐ Yes ☒ No

This project does not require a project specific Sampling and Analysis Plan for an ATS because deployment of an ATS is not planned.

9. Bioassessment Monitoring

This project is not subject to bioassessment monitoring because it is not a Risk Level 3 project.

This project is Risk Level 3	☐ Yes	☒ No
This project will disturb more than 30 acres	☐ Yes	☒ No
This project directly discharges runoff to a freshwater wadable stream (or streams) that is either:	☐ Yes	☒ No
a) Listed by the State Water Board or EPA as impaired due to sediment or is tributary to any downstream waterbody that is listed for sediment impairments		☐
or		
b) Has the beneficial uses of SPAWN and COLD and MIGRATORY		☐

This project is not subject to bioassessment monitoring because it does not meet both of the permit specified trigger requirements.

10. Watershed Monitoring Option

This project is not participating in a watershed monitoring option.

11. Quality Assurance and Quality Control

An effective Quality Assurance and Quality Control (QA/QC) plan shall be implemented as part of the CSMP to ensure that analytical data can be used with confidence. QA/QC procedures to be initiated include the following:

- Field logs;
- Clean sampling techniques;
- CoCs;
- QA/QC Samples; and
- Data verification.

Each of these procedures is discussed in more detail in the following sections.

11.1. Field Logs

The purpose of field logs is to record sampling information and field observations during monitoring that may explain any uncharacteristic analytical results. Sampling information to be included in the field log include the date and time of water quality sample collection, sampling personnel, sample container identification numbers, and types of samples that were collected. Field observations should be noted in the field log for any abnormalities at the sampling location (color, odor, BMPs, etc.). Field measurements for pH and turbidity should also be recorded in the field log. A Visual Inspection Field Log and an Effluent Sampling Field Log Sheet are included in Appendix O "Example Forms".

11.2. Clean Sampling Techniques

Clean sampling techniques involve the use of certified clean containers for sample collection and clean powder-free nitrile gloves during sample collection and handling. As discussed in Section 7.7, adoption of a clean sampling approach will minimize the chance of field contamination and questionable data results.

11.3. Chain of Custody

The sample CoC is an important documentation step that tracks samples from collection through analysis to ensure the validity of the sample. Sample CoC procedures include the following:

- Proper labeling of samples;
- Use of CoC forms for all samples; and
- Prompt sample delivery to the analytical laboratory.

Analytical laboratories usually provide CoC forms to be filled out for sample containers. An example CoC is included in Appendix O "Example Forms".

11.4. QA/QC Samples

QA/QC samples provide an indication of the accuracy and precision of the sample collection; sample handling; field measurements; and analytical laboratory methods. The following types of QA/QC will be conducted for this project:

☒ Field Duplicates at a frequency of 5 percent or 1 duplicate minimum per sampling event (Required for all sampling plans with field measurements or laboratory analysis)

☐ Equipment Blanks at a frequency of 1 minimum per sampling event
(Only needed if equipment used to collect samples could add the pollutants to sample)

☐ Field Blanks at a frequency of 1 minimum per sampling event (Only required if sampling method calls for field blanks)

☐ Travel Blanks at a frequency of 1 minimum per sampling event
(Required for sampling plans that include VOC laboratory analysis)

11.4.1. Field Duplicates

Field duplicates provide verification of laboratory or field analysis and sample collection. Duplicate samples shall be collected, handled, and analyzed using the same protocols as primary samples. The sample location where field duplicates are collected shall be randomly selected from the discharge locations. Duplicate samples shall be collected immediately after the primary sample has been collected. Duplicate samples must be collected in the same manner and as close

in time as possible to the original sample. Duplicate samples shall not influence any evaluations or conclusion.

11.4.2. Equipment Blanks

Equipment blanks provide verification that equipment has not introduced a pollutant into the sample. Equipment blanks are typically collected when:

- New equipment is used;
- Equipment that has been cleaned after use at a contaminated site;
- Equipment that is not dedicated for surface water sampling is used; or
- Whenever a new lot of filters is used when sampling metals.

11.4.3. Field Blanks

Field blanks assess potential sample contamination levels that occur during field sampling activities. De-ionized water field blanks are taken to the field, transferred to the appropriate container, and treated the same as the corresponding sample type during the course of a sampling event.

11.4.4. Travel Blanks

Travel blanks assess the potential for cross-contamination of volatile constituents between sample containers during shipment from the field to the laboratory. De-ionized water blanks are taken along for the trip and held unopened in the same cooler with the VOC samples.

11.5. Data Verification

After results are received from the analytical laboratory, the QSP shall verify the data to ensure that it is complete, accurate, and the appropriate QA/QC requirements were met. Data must be verified as soon as the data reports are received. Data verification shall include:

- Check the CoC and laboratory reports.
  Make sure all requested analyses were performed and all samples are accounted for in the reports.
- Check laboratory reports to make sure hold times were met and that the reporting levels meet or are lower than the reporting levels agreed to in the contract.
- Check data for outlier values and follow up with the laboratory.
  Occasionally typographical errors, unit reporting errors, or incomplete results are reported and should be easily detected. These errors need to be identified, clarified, and corrected quickly by the laboratory. The QSP should especially note data that is an order of magnitude or more different than similar locations or is inconsistent with previous data from the same location.
- Check laboratory QA/QC results.
  EPA establishes QA/QC checks and acceptable criteria for laboratory analyses. These data are typically reported along with the sample results. The QSP shall evaluate the reported QA/QC data to check for contamination (method, field, and equipment blanks), precision (laboratory matrix spike duplicates), and accuracy (matrix spikes and laboratory control samples). When QA/QC checks are outside acceptable ranges, the laboratory must flag the data, and usually provides an explanation of the potential impact to the sample results.
- Check the data set for outlier values and, accordingly, confirm results and re-analyze samples where appropriate.
  Sample re-analysis should only be undertaken when it appears that some part of the

QA/QC resulted in a value out of the accepted range. Sample results may not be discounted unless the analytical laboratory identifies the required QA/QC criteria were not met and confirms this in writing.

Field data including inspections and observations must be verified as soon as the field logs are received, typically at the end of the sampling event. Field data verification shall include:

- Check field logs to make sure all required measurements were completed and appropriately documented;
- Check reported values that appear out of the typical range or inconsistent; Follow-up immediately to identify potential reporting or equipment problems, if appropriate, recalibrate equipment after sampling;
- Verify equipment calibrations;
- Review observations noted on the field logs; and
- Review notations of any errors and actions taken to correct the equipment or recording errors.

12. Records Retention

All records of stormwater monitoring information and copies of reports (including Annual Reports) must be retained for a period of at least three years from date of submittal or longer if required by the Regional Water Board.

Results of visual monitoring, field measurements, and laboratory analyses must be kept in the SWPPP along with CoCs, and other documentation related to the monitoring.

Records are to be kept onsite while construction is ongoing. Records to be retained include:

- The date, place, and time of inspections, sampling, visual observations, and/or measurements, including precipitation;
- The individual(s) who performed the inspections, sampling, visual observation, and/or field measurements;
- The date and approximate time of field measurements and laboratory analyses;
- The individual(s) who performed the laboratory analyses;
- A summary of all analytical results, the method detection limits and reporting limits, and the analytical techniques or methods used;
- Rain gauge readings from site inspections;
- QA/QC records and results;
- Calibration records;
- Visual observation and sample collection exemption records;
- The records of any corrective actions and follow-up activities that resulted from analytical results, visual observations, or inspections; and
    - NAL Exceedance Reports.

Predicted Rain Event-Triggered Actions

Below is a list of suggested actions and items to review for this project. Each active Trade should check all material storage areas, stockpiles, waste management areas, vehicle and equipment storage and maintenance, areas of active soil disturbance, and areas of active work to ensure the proper implementation of BMPs. Project-wide BMPs should be checked and cross-referenced to the BMP progress map.

Trade or Activity	Suggested action(s) to perform / item(s) to review prior to rain event
☐ Information & Scheduling	☐ Inform trade supervisors of predicted rain
	☐ Check scheduled activities and reschedule as needed
	☐ Alert erosion/sediment control provider
	☐ Alert sample collection contractor (if applicable)
	☐ Schedule staff for extended rain inspections
	☐ Check Erosion and Sediment Control (ESC) material stock
	☐ Review BMP progress map
	☐ Hours of operation verified for upcoming storm event
	☐ Other:
☐ Material storage areas	☐ Material under cover or in sheds (e.g., treated woods and metals)
	☐ Perimeter control around stockpiles
	☐ Stockpiles covered (as applicable)
	☐ Other:
☐ Waste management areas	☐ Dumpsters closed and drain holes plugged
	☐ Recycling bins covered
	☐ Portable restrooms have secondary containment and protected from tipping over

REAP (Continued)

Trade or Activity, Continued	Suggested action(s) to perform / item(s) to review prior to rain event
☐ Trade operations	☐ Exterior operations shut down for event (e.g., no concrete pours or paving)
	☐ Soil treatments (e.g., fertilizer, soil binder) ceased within 24 hours of event
	☐ Materials and equipment (e.g., tools) properly stored and covered
	☐ Waste and debris disposed in covered dumpsters or removed from site
	☐ Trenches and excavations protected
	☐ Perimeter controls around disturbed areas
	☐ Fueling and repair areas covered and bermed
	☐ Other:
☐ Site ESC BMPs	☐ Adequate capacity in sediment basins and traps
	☐ Site perimeter and slope controls in place

Risk Determination

	A	B	C
1	**Sediment Risk Factor Worksheet**		**Entry**
2	**A) R Factor**		
3	Analyses of data indicated that when factors other than rainfall are held constant, soil loss is directly proportional to a rainfall factor composed of total storm kinetic energy (E) times the maximum 30-min intensity (I30) (Wischmeier and Smith, 1958). The numerical value of R is the average annual sum of EI30 for storm events during a rainfall record of at least 22 years. "Isoerodent" maps were developed based on R values calculated for more than 1000 locations in the Western U.S. Refer to the link below to determine the R factor for the project site.		
4	http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm		
5	**R Factor Value**		56
6	**B) K Factor (weighted average, by area, for all site soils)**		
7	The soil-erodibility factor K represents: (1) susceptibility of soil or surface material to erosion, (2) transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition. Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff even though these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high rates and large volumes of runoff. Use Site-specific data must be submitted.		
8	Site-specific K factor guidance		
9	**K Factor Value**		0.24
10	**C) LS Factor (weighted average, by area, for all slopes)**		
11	The effect of topography on erosion is accounted for by the LS factor, which combines the effects of a hillslope-length factor, L, and a hillslope-gradient factor, S. Generally speaking, as hillslope length and/or hillslope gradient increase, soil loss increases. As hillslope length increases, total soil loss and soil loss per unit area increase due to the progressive accumulation of runoff in the downslope direction. As the hillslope gradient increases, the velocity and erosivity of runoff increases. Use the LS table located in separate tab of this spreadsheet to determine LS factors. Estimate the weighted LS for the site prior to construction.		
12	LS Table		
13	**LS Factor Value**		0.96
14			
15	**Watershed Erosion Estimate (=RxKxLS) in tons/acre**		12.9024
16	**Site Sediment Risk Factor**		**Low**

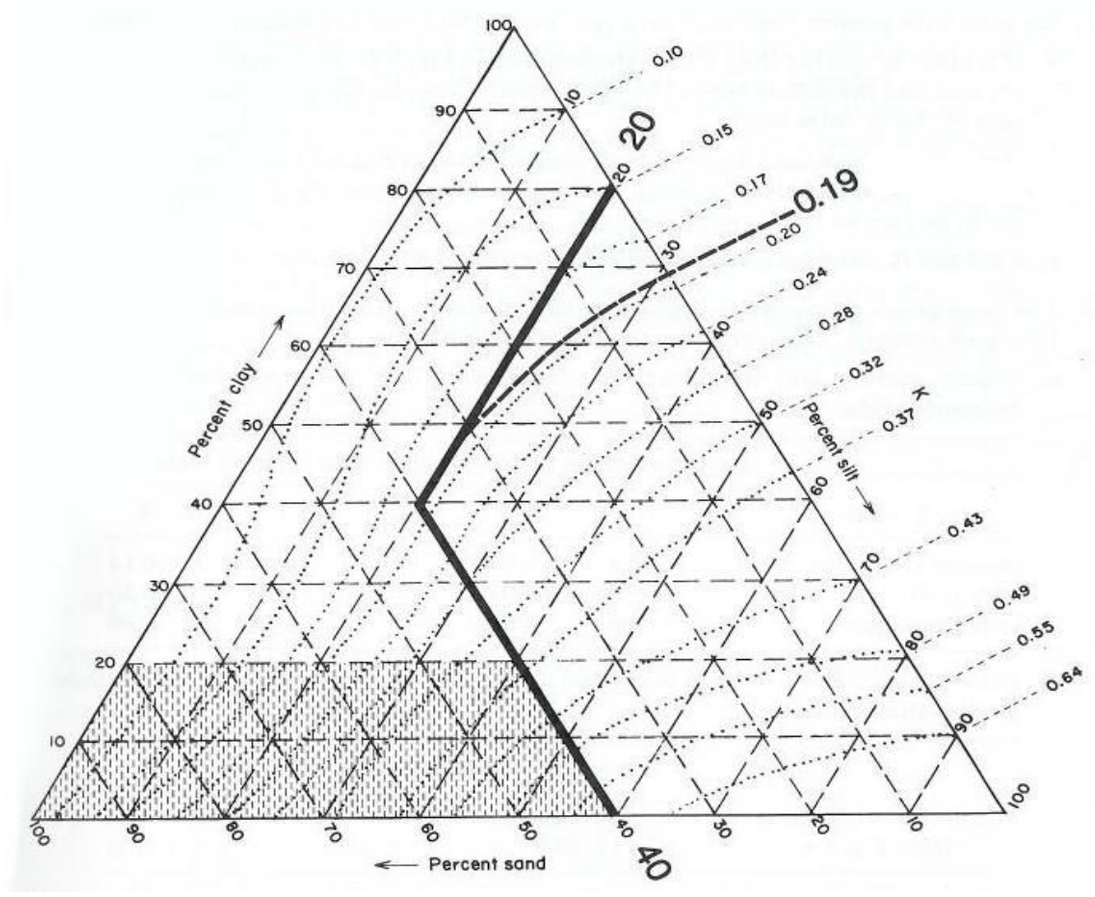
Soil Erodibility Factor (K)

The K factor can be determined by using the nomograph method, which requires that a particle size analysis (ASTM D-422) be done to determine the percentages of sand, very fine sand, silt and clay. Use the figure below to determine appropriate K value.



Erickson triangular nomograph used to estimate soil erodibility (K) factor.
The figure above is the USDA nomograph used to determine the K factor for a soil, based on its texture (% silt plus very fine sand, % sand, % organic matter, soil structure, and permeability). *Nomograph from Erickson 1977 as referenced in Goldman et. al., 1986.*

LS Factors for Construction Sites. *Table from Renard et. al., 1997.*

Appendix L
Glossary and Acronyms

Best Management Practices (BMPs):	**Any program, technology, process, siting criteria, operational methods or measures, or engineered systems, that when implemented, prevent, control, remove or reduce pollution.**
Clean Water Act:	**The Federal Water Pollution Control Act enacted by Public Law 92-500 as amended by 95-217, 95-576, 96-483, and 97-117; 33 USC. 1251 et seq. Enacted in 1977, the CWA gave EPA the authority to control point-source storm water discharges that convey pollutants to the waters of the United States. Congress amended the CWA in 1987 to create a new section devoted to storm water permitting. In accordance with the 1987 revisions, the EPA adopted regulations in 1990 that established requirements for National Pollutant Discharge Elimination System (NPDES) permits for discharge of storm water from industries and municipalities.**
Contamination:	**"An impairment of the quality of the waters of the state by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease...including any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected." [California Water Code Section 13050(k)].**
General Permit:	**The National Pollutant Discharge Elimination System General Permit for Storm Water Discharges Associated with Construction Activities, issued by the State of California Water Resources Control Board (Water Quality Order 99-08-DWQ, adopted August 1999).**
Good Housekeeping Practices:	**The act of maintaining clean, orderly site areas to prevent potential pollutants from contacting storm water.**
National Pollutant Discharge Elimination System (NPDES):	**A permitting process established pursuant to the Clean Water Act that regulates the release of pollutants to waters of the United States.**
Non-Storm Water Discharge:	**Any discharge to surface waters, to a storm drain, or to any other storm water drainage facility that is not composed entirely of storm water or landscape irrigation runoff.**
Notice of Intent (NOI):	**The NOI is the application form used to obtain the General Construction Permit. The NOI indicates the facility's intent to comply with the terms of the permit.**
Nuisance:	**"Anything which meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to**

	interfere with the comfortable enjoyment of life and property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during or as a result of the treatment or disposal of wastes." [California Water Code Section 13050(m)].
Pollution:	**The "man-made or man-induced alternation of the chemical, physical, biological, and radiological integrity of water." [Clean Water Act Section 502 (19)]. Pollution also means "an alternation of the quality of the waters of the state by waste to a degree which unreasonably affects either...the waters for beneficial uses...or facilities which serve these beneficial uses." [California Water Code Section 13050(l)].**
Regional Water Quality Control Board:	**State agency responsible for administration and enforcement of the municipal and industrial NPDES storm water permits.**
Sanitary Sewer System:	**A network of pipelines carrying sewage to a wastewater treatment facility. Storm drains are separate pipeline and are not connected to sanitary sewers.**
Significant Materials:	**Includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); any chemical the facility is required to report pursuant to Section 313 of Title III of Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharges.**
Significant Quantities:	**The volume, concentrations, or mass of a pollutant in storm water discharges that can cause or threaten to cause pollution, contamination, or nuisance; adversely impact human health or the environment; and cause or contribute to a violation of any applicable water quality standards for the receiving water.**
Storm Water:	**Storm water runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.**
Storm Water Discharge:	**Storm water at the point where it runs off private property onto adjacent property, the street, canals, creeks, the river, or into the municipal storm drain system.**
Storm Water Pollution Prevention Plan (SWPPP):	**The SWPPP is a document that identifies sources and activities at a particular construction site that may contribute pollutants to storm water, and commits the property owner**

	to implement specific control measures to prevent or treat such pollutants.
U.S. Environmental Protection Agency (EPA):	**The federal agency with authority for enacting and enforcing many environmental laws, including the Clean Water Act.**

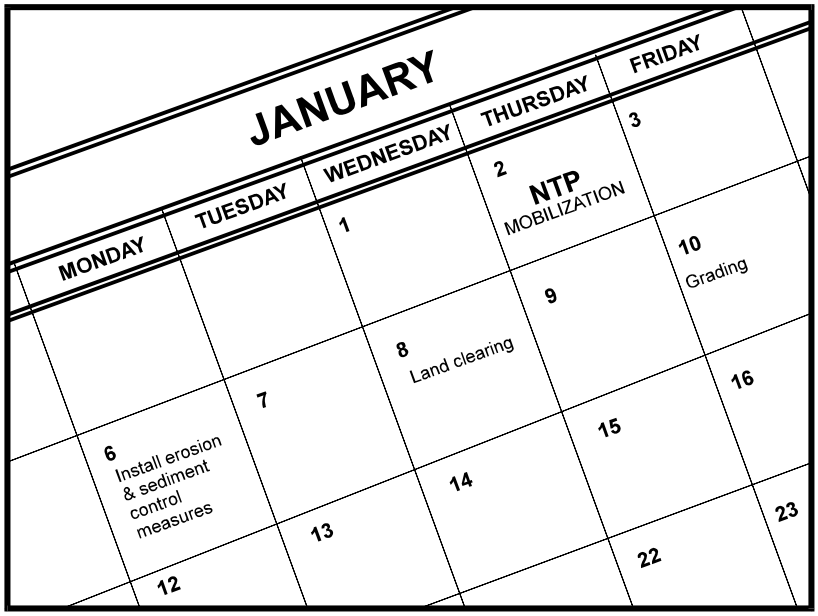
Scheduling EC-1



Description and Purpose

Scheduling is the development of a written plan that includes sequencing of construction activities and the implementation of BMPs such as erosion control and sediment control while taking local climate (rainfall, wind, etc.) into consideration. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project especially during rainy season. Use of other, more costly yet less effective, erosion and sediment control BMPs may often be reduced through proper construction sequencing.

Limitations

- Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Implementation

- Avoid rainy periods. Schedule major grading operations during dry months when practical. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means or to install sediment trapping devices.
- Plan the project and develop a schedule showing each phase of construction. Clearly show how the rainy season relates

to soil disturbing and re-stabilization activities. Incorporate the construction schedule into the SWPPP.

- Include on the schedule, details on the rainy season implementation and deployment of:
  - Erosion control BMPs
  - Sediment control BMPs
  - Tracking control BMPs
  - Wind erosion control BMPs
  - Non-stormwater BMPs
  - Waste management and materials pollution control BMPs
- Include dates for activities that may require non-stormwater discharges such as dewatering, sawcutting, grinding, drilling, boring, crushing, blasting, painting, hydro-demolition, mortar mixing, pavement cleaning, etc.
- Work out the sequencing and timetable for the start and completion of each item such as site clearing and grubbing, grading, excavation, paving, foundation pouring utilities installation, etc., to minimize the active construction area during the rainy season.
  - Sequence trenching activities so that most open portions are closed before new trenching begins.
  - Incorporate staged seeding and re-vegetation of graded slopes as work progresses.
  - Schedule establishment of permanent vegetation during appropriate planting time for specified vegetation.
- Non-active areas should be stabilized as soon as practical after the cessation of soil disturbing activities or one day prior to the onset of precipitation.
- Monitor the weather forecast for rainfall.
- When rainfall is predicted, adjust the construction schedule to allow the implementation of soil stabilization and sediment treatment controls on all disturbed areas prior to the onset of rain.
- Be prepared year-round to deploy erosion control and sediment control BMPs. Erosion may be caused during dry seasons by un-seasonal rainfall, wind, and vehicle tracking. Keep the site stabilized year-round and retain and maintain rainy season sediment trapping devices in operational condition.
- Apply permanent erosion control to areas deemed substantially complete during the project's defined seeding window.
- Avoid soil disturbance during periods with high wind velocities.

Costs

Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost effectiveness of scheduling techniques

should be compared with the other less effective erosion and sedimentation controls to achieve a cost-effective balance.

Inspection and Maintenance

- Verify that work is progressing in accordance with the schedule. If progress deviates, take corrective actions.
- Amend the schedule when changes are warranted.
- Amend the schedule prior to the rainy season to show updated information on the deployment and implementation of construction site BMPs.

Potential Alternatives

None

Description and Purpose

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs, and grasses that protect soil from erosion.

Suitable Applications

Preservation of existing vegetation is suitable for use on most projects. Large project sites often provide the greatest opportunity for use of this BMP. Suitable applications include the following:

- Areas within the site where no construction activity occurs or occurs at a later date. This BMP is especially suitable to multi year projects where grading can be phased.
- Areas where natural vegetation exists and is designated for preservation. Such areas often include steep slopes, watercourse, and building sites in wooded areas.
- Areas where local, state, and federal government require preservation, such as vernal pools, wetlands, marshes, certain oak trees, etc. These areas are usually designated on the plans, or in the specifications, permits, or environmental documents.
- Where vegetation designated for ultimate removal can be temporarily preserved and be utilized for erosion control and sediment control.
- Protecting existing vegetation buffers and swales.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Requires forward planning by the owner/developer, contractor, and design staff.
- Limited opportunities for use when project plans do not incorporate existing vegetation into the site design.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactory for the planned development.

Implementation

The best way to prevent erosion is to not disturb the land. In order to reduce the impacts of new development and redevelopment, projects may be designed to avoid disturbing land in sensitive areas of the site (e.g., natural watercourses, steep slopes), and to incorporate unique or desirable existing vegetation into the site's landscaping plan. Clearly marking and leaving a buffer area around these unique areas during construction will help to preserve these areas as well as take advantage of natural erosion prevention and sediment trapping.

Existing vegetation to be preserved on the site must be protected from mechanical and other injury while the land is being developed. The purpose of protecting existing vegetation is to ensure the survival of desirable vegetation for shade, beautification, and erosion control. Mature vegetation has extensive root systems that help to hold soil in place, thus reducing erosion. In addition, vegetation helps keep soil from drying rapidly and becoming susceptible to erosion. To effectively save existing vegetation, no disturbances of any kind should be allowed within a defined area around the vegetation. For trees, no construction activity should occur within the drip line of the tree.

Timing

- Provide for preservation of existing vegetation prior to the commencement of clearing and grubbing operations or other soil disturbing activities in areas where no construction activity is planned or will occur at a later date.

Design and Layout

- Mark areas to be preserved with temporary fencing. Include sufficient setback to protect roots.
  - Orange colored plastic mesh fencing works well.
  - Use appropriate fence posts and adequate post spacing and depth to completely support the fence in an upright position.
- Locate temporary roadways, stockpiles, and layout areas to avoid stands of trees, shrubs, and grass.
- Consider the impact of grade changes to existing vegetation and the root zone.
- Maintain existing irrigation systems where feasible. Temporary irrigation may be required.
- Instruct employees and subcontractors to honor protective devices. Prohibit heavy equipment, vehicular traffic, or storage of construction materials within the protected area.

- Consider pruning or mowing vegetation instead of removing it to allow for regrowth.
- If possible, retain vegetation buffer around the site and adjacent waterways.

Costs

There is little cost associated with preserving existing vegetation if properly planned during the project design, and these costs may be offset by aesthetic benefits that enhance property values. During construction, the cost for preserving existing vegetation will likely be less than the cost of applying erosion and sediment controls to the disturbed area. Replacing vegetation inadvertently destroyed during construction can be extremely expensive, sometimes in excess of $10,000 per tree.

Inspection and Maintenance

During construction, the limits of disturbance should remain clearly marked at all times. Irrigation or maintenance of existing vegetation should be described in the landscaping plan. If damage to protected trees still occurs, maintenance guidelines described below should be followed:

- Verify that protective measures remain in place. Restore damaged protection measures immediately.
- Serious tree injuries shall be attended to by an arborist.
- Damage to the crown, trunk, or root system of a retained tree shall be repaired immediately.
- Trench as far from tree trunks as possible, usually outside of the tree drip line or canopy. Curve trenches around trees to avoid large roots or root concentrations. If roots are encountered, consider tunneling under them. When trenching or tunneling near or under trees to be retained, place tunnels at least 18 in. below the ground surface, and not below the tree center to minimize impact on the roots.
- Do not leave tree roots exposed to air. Cover exposed roots with soil as soon as possible. If soil covering is not practical, protect exposed roots with wet burlap or peat moss until the tunnel or trench is ready for backfill.
- Cleanly remove the ends of damaged roots with a smooth cut.
- Fill trenches and tunnels as soon as possible. Careful filling and tamping will eliminate air spaces in the soil, which can damage roots.
- If bark damage occurs, cut back all loosened bark into the undamaged area, with the cut tapered at the top and bottom and drainage provided at the base of the wood. Limit cutting the undamaged area as much as possible.
- Aerate soil that has been compacted over a trees root zone by punching holes 12 in. deep with an iron bar and moving the bar back and forth until the soil is loosened. Place holes 18 in. apart throughout the area of compacted soil under the tree crown.
- Fertilization:

- Fertilize trees in the late fall or early spring. Although to note, many native species do not require fertilization.

- Apply fertilizer to the soil over the feeder roots and in accordance with label instructions, but never closer than 3 ft to the trunk. Increase the fertilized area by one-fourth of the crown area for conifers that have extended root systems.

- Retain protective measures until all other construction activity is complete to avoid damage during site cleanup and stabilization.

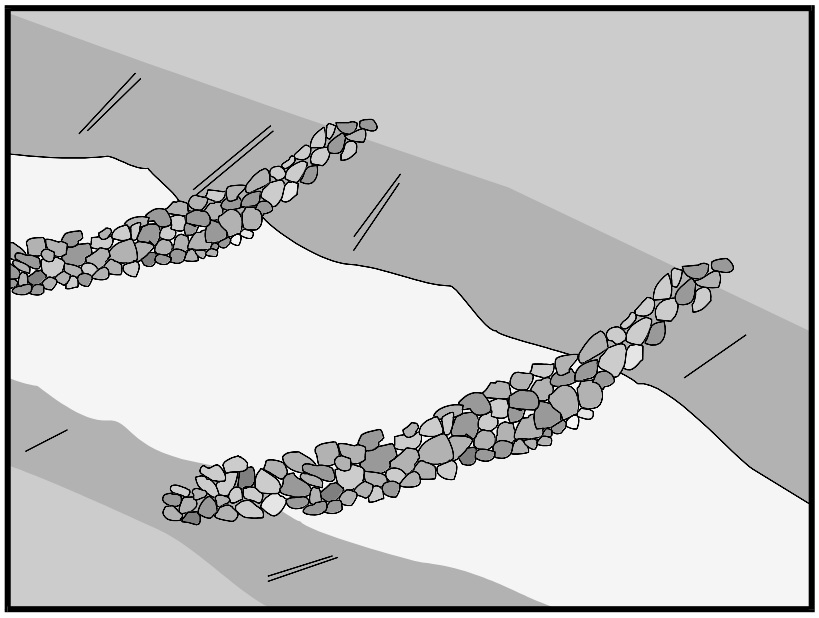
Check Dams SE-4



Description and Purpose

A check dam is a small barrier constructed of rock, gravel bags, sandbags, fiber rolls, or other proprietary products, placed across a constructed swale or drainage ditch. Check dams reduce the effective slope of the channel, thereby reducing scour and channel erosion by reducing flow velocity and increasing residence time within the channel, allowing sediment to settle.

Suitable Applications

Check dams may be appropriate in the following situations:

- To promote sedimentation behind the dam.
- To prevent erosion by reducing the velocity of channel flow in small intermittent channels and temporary swales.
- In small open channels that drain 10 acres or less.
- In steep channels where stormwater runoff velocities exceed 5 ft/s.
- During the establishment of grass linings in drainage ditches or channels.
- In temporary ditches where the short length of service does not warrant establishment of erosion-resistant linings.
- To act as a grade control structure.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Not to be used in live streams or in channels with extended base flows.
- Not appropriate in channels that drain areas greater than 10 acres.
- Not appropriate in channels that are already grass-lined unless erosion potential or sediment-laden flow is expected, as installation may damage vegetation.
- Require extensive maintenance following high velocity flows.
- Promotes sediment trapping which can be re-suspended during subsequent storms or removal of the check dam.
- Do not construct check dams with straw bales or silt fence.
- Water suitable for mosquito production may stand behind check dams, particularly if subjected to daily non-stormwater discharges.

Implementation

General

Check dams reduce the effective slope and create small pools in swales and ditches that drain 10 acres or less. Using check dams to reduce channel slope reduces the velocity of stormwater flows, thus reducing erosion of the swale or ditch and promoting sedimentation. Thus, check dams are dual-purpose and serve an important role as erosion controls as well as sediment controls. Note that use of 1-2 isolated check dams for sedimentation will likely result in little net removal of sediment because of the small detention time and probable scour during longer storms. Using a series of check dams will generally increase their effectiveness. A sediment trap (SE-3) may be placed immediately upstream of the check dam to increase sediment removal efficiency.

Design and Layout

Check dams work by decreasing the effective slope in ditches and swales. An important consequence of the reduced slope is a reduction in capacity of the ditch or swale. This reduction in capacity should be considered when using this BMP, as reduced capacity can result in overtopping of the ditch or swale and resultant consequences. In some cases, such as a "permanent" ditch or swale being constructed early and used as a "temporary" conveyance for construction flows, the ditch or swale may have sufficient capacity such that the temporary reduction in capacity due to check dams is acceptable. When check dams reduce capacities beyond acceptable limits, either:

- Don't use check dams. Consider alternative BMPs, or.
- Increase the size of the ditch or swale to restore capacity.

Maximum slope and velocity reduction is achieved when the toe of the upstream dam is at the same elevation as the top of the downstream dam (see "Spacing Between Check Dams" detail at the end of this fact sheet). The center section of the dam should be lower than the edge sections (at least 6 inches), acting as a spillway, so that the check dam will direct flows to the center of

the ditch or swale (see "Typical Rock Check Dam" detail at the end of this fact sheet). Bypass or side-cutting can occur if a sufficient spillway is not provided in the center of the dam.

Check dams are usually constructed of rock, gravel bags, sandbags, and fiber rolls. A number of products can also be used as check dams (e.g. HDPE check dams, temporary silt dikes (SE-12)), and some of these products can be removed and reused. Check dams can also be constructed of logs or lumber and have the advantage of a longer lifespan when compared to gravel bags, sandbags, and fiber rolls. Check dams should not be constructed from straw bales or silt fences, since concentrated flows quickly wash out these materials.

Rock check dams are usually constructed of 8 to 12 in. rock. The rock is placed either by hand or mechanically, but never just dumped into the channel. The dam should completely span the ditch or swale to prevent washout. The rock used should be large enough to stay in place given the expected design flow through the channel. It is recommended that abutments be extended 18 in. into the channel bank. Rock can be graded such that smaller diameter rock (e.g. 2-4 in) is located on the upstream side of larger rock (holding the smaller rock in place); increasing residence time.

Log check dams are usually constructed of 4 to 6 in. diameter logs, installed vertically. The logs should be embedded into the soil at least 18 in. Logs can be bolted or wired to vertical support logs that have been driven or buried into the soil.

See fiber rolls, SE-5, for installation of fiber roll check dams.

Gravel bag and sand bag check dams are constructed by stacking bags across the ditch or swale, shaped as shown in the drawings at the end of this fact sheet (see "Gravel Bag Check Dam" detail at the end of this fact sheet).

Manufactured products, such as temporary silt dikes (SE-12), should be installed in accordance with the manufacturer's instructions. Installation typically requires anchoring or trenching of products, as well as regular maintenance to remove accumulated sediment and debris.

If grass is planted to stabilize the ditch or swale, the check dam should be removed when the grass has matured (unless the slope of the swales is greater than 4%).

The following guidance should be followed for the design and layout of check dams:

- Install the first check dam approximately 16 ft from the outfall device and at regular intervals based on slope gradient and soil type.
- Check dams should be placed at a distance and height to allow small pools to form between each check dam.
- For multiple check dam installation, backwater from a downstream check dam should reach the toes of the upstream check dam.
- A sediment trap provided immediately upstream of the check dam will help capture sediment. Due to the potential for this sediment to be resuspended in subsequent storms, the sediment trap should be cleaned following each storm event.

- High flows (typically a 2-year storm or larger) should safely flow over the check dam without an increase in upstream flooding or damage to the check dam.
- Where grass is used to line ditches, check dams should be removed when grass has matured sufficiently to protect the ditch or swale.

Materials

- Rock used for check dams should typically be 8-12 in rock and be sufficiently sized to stay in place given expected design flows in the channel. Smaller diameter rock (e.g. 2 to 4 in) can be placed on the upstream side of larger rock to increase residence time.
- Gravel bags used for check dams should conform to the requirements of SE-6, Gravel Bag Berms.
- Sandbags used for check dams should conform to SE-8, Sandbag Barrier.
- Fiber rolls used for check dams should conform to SE-5, Fiber Rolls.
- Temporary silt dikes used for check dams should conform to SE-12, Temporary Silt Dikes.

Installation

- Rock should be placed individually by hand or by mechanical methods (no dumping of rock) to achieve complete ditch or swale coverage.
- Tightly abut bags and stack according to detail shown in the figure at the end of this section (pyramid approach). Gravel bags and sandbags should not be stacked any higher than 3 ft.
- Upper rows or gravel and sand bags shall overlap joints in lower rows.
- Fiber rolls should be trenched in, backfilled, and firmly staked in place.
- Install along a level contour.
- HDPE check dams, temporary silt dikes, and other manufactured products should be used and installed per manufacturer specifications.

Costs

Cost consists of labor costs if materials are readily available (such as gravel on-site). If material must be imported, costs will increase. For other material and installation costs, see SE-5, SE-6, SE-8, SE-12, and SE-14.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Replace missing rock, bags, rolls, etc. Replace bags or rolls that have degraded or have become damaged.

- If the check dam is used as a sediment capture device, sediment that accumulates behind the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- If the check dam is used as a grade control structure, sediment removal is not required as long as the system continues to control the grade.
- Inspect areas behind check dams for pools of standing water, especially if subjected to daily non-stormwater discharges.
- Remove accumulated sediment prior to permanent seeding or soil stabilization.
- Remove check dam and accumulated sediment when check dams are no longer needed.

☒ **Secondary Category**

Description and Purpose

A fiber roll (also known as wattles or logs) consists of straw, coir, curled wood fiber, or other biodegradable materials bound into a tight tubular roll wrapped by plastic netting, which can be photodegradable, or natural fiber, such as jute, cotton, or sisal. Additionally, gravel core fiber rolls are available, which contain an imbedded ballast material such as gravel or sand for additional weight when staking the rolls are not feasible (such as use as inlet protection). When fiber rolls are placed at the toe and on the face of slopes along the contours, they intercept runoff, reduce its flow velocity, release the runoff as sheet flow, and provide removal of sediment from the runoff (through sedimentation). By interrupting the length of a slope, fiber rolls can also reduce sheet and rill erosion until vegetation is established.

Suitable Applications

Fiber rolls may be suitable:

- Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- At the end of a downward slope where it transitions to a steeper slope.
- Along the perimeter of a project.
- As check dams in unlined ditches with minimal grade.
- Down-slope of exposed soil areas.

SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- At operational storm drains as a form of inlet protection.
- Around temporary stockpiles.

Limitations

- Fiber rolls should be used in conjunction with erosion control, such as hydroseed, RECPs, etc.
- Only biodegradable fiber rolls containing no plastic can remain on a site applying for a Notice of Termination due to plastic pollution and wildlife concerns (State Water Board, 2016). Fiber rolls containing plastic that are used on a site must be disposed of for final stabilization.
- Fiber rolls are not effective unless trenched in and staked. If not properly staked and trenched in, fiber rolls will not work as intended and could be transported by high flows.
- Not intended for use in high flow situations (i.e., for concentrated flows).
- Difficult to move once saturated.
- Fiber rolls have a limited sediment capture zone.
- Fiber rolls should not be used on slopes subject to creep, slumping, or landslide.
- Rolls typically function for 12-24 months, depending upon local conditions and roll material.

Implementation

Fiber Roll Materials

- Fiber rolls should be prefabricated.
- Fiber rolls may come manufactured containing polyacrylamide (PAM), a flocculating agent within the roll. Fiber rolls impregnated with PAM provide additional sediment removal capabilities and should be used in areas with fine, clayey or silty soils to provide additional sediment removal capabilities. Monitoring may be required for these installations.
- Fiber rolls are made from weed-free rice straw, flax, curled wood fiber, or coir bound into a tight tubular roll by netting or natural fiber (see *Limitations* above regarding plastic netting).
- Typical fiber rolls vary in diameter from 6 in. to 20 in. Larger diameter rolls are available as well. The larger the roll, the higher the sediment retention capacity.
- Typical fiber rolls lengths are 4, 10, 20 and 25 ft., although other lengths are likely available.

Installation

- Locate fiber rolls on level contours spaced as follows:
  - Slope inclination of 4:1 (H:V) or flatter: Fiber rolls should be placed at a maximum interval of 20 ft.

  - Slope inclination between 4:1 and 2:1 (H:V): Fiber Rolls should be placed at a maximum interval of 15 ft. (a closer spacing is more effective).

  - Slope inclination 2:1 (H:V) or greater: Fiber Rolls should be placed at a maximum interval of 10 ft. (a closer spacing is more effective).

- Prepare the slope before beginning installation.

- Dig small trenches across the slope on the contour. The trench depth should be ¼ to 1/3 of the thickness of the roll, and the width should equal the roll diameter, in order to provide area to backfill the trench.

- It is critical that rolls are installed perpendicular to water movement, and parallel to the slope contour.

- Start building trenches and installing rolls from the bottom of the slope and work up.

- It is recommended that pilot holes be driven through the fiber roll. Use a straight bar to drive holes through the roll and into the soil for the wooden stakes.

- Turn the ends of the fiber roll up slope to prevent runoff from going around the roll.

- Stake fiber rolls into the trench.

  - Drive stakes at the end of each fiber roll and spaced 4 ft maximum on center.

  - Use wood stakes with a nominal classification of 0.75 by 0.75 in. and minimum length of 24 in.

- If more than one fiber roll is placed in a row, the rolls should be overlapped, not abutted.

- See typical fiber roll installation details at the end of this fact sheet.

Removal

- Fiber rolls can be left in place or removed depending on the type of fiber roll and application (temporary vs. permanent installation). Fiber rolls encased with plastic netting or containing any plastic material will need to be removed from the site for final stabilization. Fiber rolls used in a permanent application are to be encased with a non-plastic material and are left in place. Removal of a fiber roll used in a permanent application can result in greater disturbance; therefore, during the BMP planning phase, the areas where fiber rolls will be used on final slopes, only fiber rolls wrapped in non-plastic material should be selected.

- Temporary installations should only be removed when up gradient areas are stabilized per General Permit requirements, and/or pollutant sources no longer present a hazard. But they should also be removed before vegetation becomes too mature so that the removal process does not disturb more soil and vegetation than is necessary.

Costs

Material costs for straw fiber rolls range from $26 - $38 per 25-ft. roll[1] and curled wood fiber rolls range from $30 - $40 per roll[2].

Material costs for PAM impregnated fiber rolls range between $9.00-$12.00 per linear foot, based upon vendor research[1] .

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Repair or replace split, torn, unraveling, or slumping fiber rolls.
- If the fiber roll is used as a sediment capture device, or as an erosion control device to maintain sheet flows, sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when sediment accumulation reaches one-third the designated sediment storage depth.
- If fiber rolls are used for erosion control, such as in a check dam, sediment removal should not be required as long as the system continues to control the grade. Sediment control BMPs will likely be required in conjunction with this type of application.
- Repair any rills or gullies promptly.

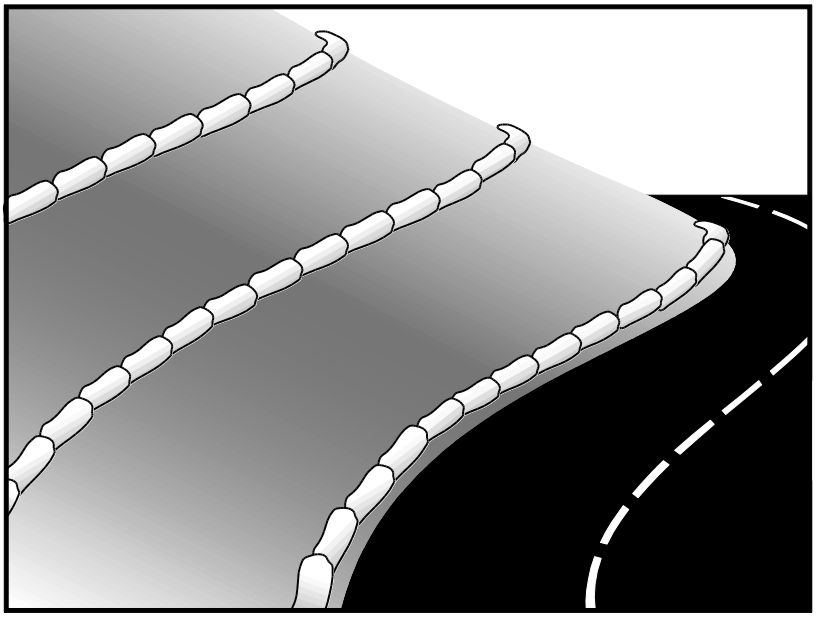
Gravel Bag Berm SE-6



Description and Purpose

A gravel bag berm is a series of gravel-filled bags placed on a level contour to intercept sheet flows. Gravel bags pond sheet flow runoff, allowing sediment to settle out, and release runoff slowly as sheet flow, preventing erosion.

Suitable Applications

Gravel bag berms may be suitable:

- As a linear sediment control measure:
  - Below the toe of slopes and erodible slopes
  - As sediment traps at culvert/pipe outlets
  - Below other small cleared areas
  - Along the perimeter of a site
  - Down slope of exposed soil areas
  - Around temporary stockpiles and spoil areas
  - Parallel to a roadway to keep sediment off paved areas
  - Along streams and channels
- As a linear erosion control measure:
  - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.

SE-8 Sandbag Barrier

SE-12 Temporary Silt Dike

SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- At the top of slopes to divert runoff away from disturbed slopes.
- As chevrons (small check dams) across mildly sloped construction roads. For use check dam use in channels, see SE-4, Check Dams.

Limitations

- Gravel berms may be difficult to remove.
- Removal problems limit their usefulness in landscaped areas.
- Gravel bag berm may not be appropriate for drainage areas greater than 5 acres.
- Runoff will pond upstream of the berm, possibly causing flooding if sufficient space does not exist.
- Degraded gravel bags may rupture when removed, spilling contents.
- Installation can be labor intensive.
- Durability of gravel bags is somewhat limited, and bags may need to be replaced when installation is required for longer than 6 months.
- Easily damaged by construction equipment.
- When used to detain concentrated flows, maintenance requirements increase.

Implementation

General

A gravel bag berm consists of a row of open graded gravel-filled bags placed on a level contour. When appropriately placed, a gravel bag berm intercepts and slows sheet flow runoff, causing temporary ponding. The temporary ponding allows sediment to settle. The open graded gravel in the bags is porous, which allows the ponded runoff to flow slowly through the bags, releasing the runoff as sheet flows. Gravel bag berms also interrupt the slope length and thereby reduce erosion by reducing the tendency of sheet flows to concentrate into rivulets, which erode rills, and ultimately gullies, into disturbed, sloped soils. Gravel bag berms are similar to sand bag barriers but are more porous. Generally, gravel bag berms should be used in conjunction with temporary soil stabilization controls up slope to provide effective erosion and sediment control.

Design and Layout

- Locate gravel bag berms on level contours.
- When used for slope interruption, the following slope/sheet flow length combinations apply:
  - Slope inclination of 4:1 (H:V) or flatter: Gravel bags should be placed at a maximum interval of 20 ft, with the first row near the slope toe.
  - Slope inclination between 4:1 and 2:1 (H:V): Gravel bags should be placed at a maximum interval of 15 ft. (a closer spacing is more effective), with the first row near the slope toe.

Slope inclination 2:1 (H:V) or greater: Gravel bags should be placed at a maximum interval of 10 ft. (a closer spacing is more effective), with the first row near the slope toe.

- Turn the ends of the gravel bag barriers up slope to prevent runoff from going around the berm.
- Allow sufficient space up slope from the gravel bag berm to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, gravel bag barriers should be set back from the slope toe to facilitate cleaning. Where specific site conditions do not allow for a set-back, the gravel bag barrier may be constructed on the toe of the slope. To prevent flows behind the barrier, bags can be placed perpendicular to a berm to serve as cross barriers.
- Drainage area should not exceed 5 acres.
- In Non-Traffic Areas:
  - Height = 18 in. maximum
  - Top width = 24 in. minimum for three or more-layer construction
  - Top width = 12 in. minimum for one- or two-layer construction
  - Side slopes = 2:1 (H:V) or flatter
- In Construction Traffic Areas:
  - Height = 12 in. maximum
  - Top width = 24 in. minimum for three or more-layer construction.
  - Top width = 12 in. minimum for one- or two-layer construction.
  - Side slopes = 2:1 (H:V) or flatter.
- Butt ends of bags tightly.
- On multiple row, or multiple layer construction, overlap butt joints of adjacent row and row beneath.
- Use a pyramid approach when stacking bags.

Materials

- ***Bag Material:*** Bags should be woven polypropylene, polyethylene or polyamide fabric or burlap, minimum unit weight of 4 ounces/yd^2, Mullen burst strength exceeding 300 lb/in^2 in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355.

- ***Bag Size:*** Each gravel-filled bag should have a length of 18 in., width of 12 in., thickness of 3 in., and mass of approximately 33 lbs. Bag dimensions are nominal and may vary based on locally available materials.

- ***Fill Material:*** Fill material should be 0.5 to 1 in. Crushed rock, clean and free from clay, organic matter, and other deleterious material, or other suitable open graded, non-cohesive, porous gravel.

Costs

Material costs for gravel bags are average and are dependent upon material availability. $3.20-$3.80 per filled gravel bag is standard based upon vendor research (Adjusted for inflation, 2016 dollars, by Tetra Tech, Inc.).

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Gravel bags exposed to sunlight will need to be replaced every two to three months due to degrading of the bags.

- Reshape or replace gravel bags as needed.

- Repair washouts or other damage as needed.

- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.

- Remove gravel bag berms when no longer needed and recycle gravel fill whenever possible and properly dispose of bag material. Remove sediment accumulation and clean, re-grade, and stabilize the area.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Street sweeping and vacuuming includes use of self-propelled and walk-behind equipment to remove sediment from streets and roadways and to clean paved surfaces in preparation for final paving. Sweeping and vacuuming prevents sediment from the project site from entering storm drains or receiving waters.

Suitable Applications

Sweeping and vacuuming are suitable anywhere sediment is tracked from the project site onto public or private paved streets and roads, typically at points of egress. Sweeping and vacuuming are also applicable during preparation of paved surfaces for final paving.

Limitations

- Sweeping and vacuuming may not be effective when sediment is wet or when tracked soil is caked (caked soil may need to be scraped loose).
- Sweeping may be less effective for fine particle soils (i.e., clay).

Implementation

- Controlling the number of points where vehicles can leave the site will allow sweeping and vacuuming efforts to be focused and perhaps save money.
- Inspect potential sediment tracking locations daily.

- Visible sediment tracking should be swept or vacuumed on a daily basis.
- Do not use kick brooms or sweeper attachments. These tend to spread the dirt rather than remove it.
- If not mixed with debris or trash, consider incorporating the removed sediment back into the project

Costs

Rental rates for self-propelled sweepers vary depending on hopper size and duration of rental. Expect rental rates from $ 650/day to $2,500/day[1], plus operator costs. Hourly production rates vary with the amount of area to be swept and amount of sediment. Match the hopper size to the area and expect sediment load to minimize time spent dumping.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- When actively in use, points of ingress and egress must be inspected daily.
- When tracked or spilled sediment is observed outside the construction limits, it must be removed at least daily. More frequent removal, even continuous removal, may be required in some jurisdictions.
- Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
- Adjust brooms frequently; maximize efficiency of sweeping operations.
- After sweeping is finished, properly dispose of sweeper wastes at an approved dumpsite.

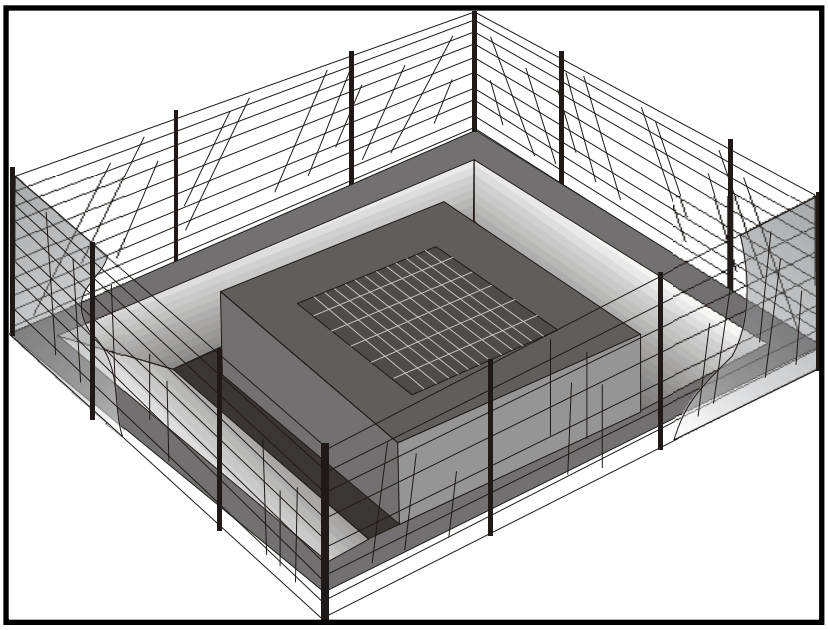
[1] Based on contractor query conducted by Tetra Tech, Inc. November 2016.

Storm Drain Inlet Protection SE-10



Description and Purpose

Storm drain inlet protection consists of a sediment filter or an impounding area in, around or upstream of a storm drain, drop inlet, or curb inlet. Storm drain inlet protection measures temporarily pond runoff before it enters the storm drain, allowing sediment to settle. Some filter configurations also remove sediment by filtering, but usually the ponding action results in the greatest sediment reduction. Temporary geotextile storm drain inserts attach underneath storm drain grates to capture and filter storm water.

Suitable Applications

- Every storm drain inlet receiving runoff from unstabilized or otherwise active work areas should be protected. Inlet protection should be used in conjunction with other erosion and sediment controls to prevent sediment-laden stormwater and non-stormwater discharges from entering the storm drain system.

Limitations

- Drainage area should not exceed 1 acre.
- In general straw bales should not be used as inlet protection.
- Requires an adequate area for water to pond without encroaching into portions of the roadway subject to traffic.
- Sediment removal may be inadequate to prevent sediment discharges in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

other onsite sediment trapping techniques in conjunction with inlet protection.

- Frequent maintenance is required.
- Limit drainage area to 1 acre maximum. For drainage areas larger than 1 acre, runoff should be routed to a sediment-trapping device designed for larger flows. See BMPs SE-2, Sediment Basin, and SE-3, Sediment Traps.
- Excavated drop inlet sediment traps are appropriate where relatively heavy flows are expected, and overflow capability is needed.

Implementation

General

Inlet control measures presented in this handbook should not be used for inlets draining more than one acre. Runoff from larger disturbed areas should be first routed through SE-2, Sediment Basin or SE-3, Sediment Trap and/or used in conjunction with other drainage control, erosion control, and sediment control BMPs to protect the site. Different types of inlet protection are appropriate for different applications depending on site conditions and the type of inlet. Alternative methods are available in addition to the methods described/shown herein such as prefabricated inlet insert devices, or gutter protection devices.

Design and Layout

Identify existing and planned storm drain inlets that have the potential to receive sediment-laden surface runoff. Determine if storm drain inlet protection is needed and which method to use.

- The key to successful and safe use of storm drain inlet protection devices is to know where runoff that is directed toward the inlet to be protected will pond or be diverted as a result of installing the protection device.
  - Determine the acceptable location and extent of ponding in the vicinity of the drain inlet. The acceptable location and extent of ponding will influence the type and design of the storm drain inlet protection device.
  - Determine the extent of potential runoff diversion caused by the storm drain inlet protection device. Runoff ponded by inlet protection devices may flow around the device and towards the next downstream inlet. In some cases, this is acceptable; in other cases, serious erosion or downstream property damage can be caused by these diversions. The possibility of runoff diversions will influence whether or not storm drain inlet protection is suitable; and, if suitable, the type and design of the device.
- The location and extent of ponding, and the extent of diversion, can usually be controlled through appropriate placement of the inlet protection device. In some cases, moving the inlet protection device a short distance upstream of the actual inlet can provide more efficient sediment control, limit ponding to desired areas, and prevent or control diversions.
- Seven types of inlet protection are presented below. However, it is recognized that other effective methods and proprietary devices exist and may be selected.

- Silt Fence: Appropriate for drainage basins with less than a 5% slope, sheet flows, and flows under 0.5 cfs.

- Excavated Drop Inlet Sediment Trap: An excavated area around the inlet to trap sediment (SE-3).

- Gravel bag barrier: Used to create a small sediment trap upstream of inlets on sloped, paved streets. Appropriate for sheet flow or when concentrated flow may exceed 0.5 cfs, and where overtopping is required to prevent flooding.

- Block and Gravel Filter: Appropriate for flows greater than 0.5 cfs.

- Temporary Geotextile Storm drain Inserts: Different products provide different features. Refer to manufacturer details for targeted pollutants and additional features.

- Biofilter Bag Barrier: Used to create a small retention area upstream of inlets and can be located on pavement or soil. Biofilter bags slowly filter runoff allowing sediment to settle out. Appropriate for flows under 0.5 cfs.

- Compost Socks: Allow filtered run-off to pass through the compost while retaining sediment and potentially other pollutants (SE-13). Appropriate for flows under 1.0 cfs.

- Select the appropriate type of inlet protection and design as referred to or as described in this fact sheet.

- Provide area around the inlet for water to pond without flooding structures and property.

- Grates and spaces around all inlets should be sealed to prevent seepage of sediment-laden water.

- Excavate sediment sumps (where needed) 1 to 2 ft with 2:1 side slopes around the inlet.

Installation

- ***DI Protection Type 1 - Silt Fence -*** Similar to constructing a silt fence; see BMP SE-1, Silt Fence. Do not place fabric underneath the inlet grate since the collected sediment may fall into the drain inlet when the fabric is removed or replaced and water flow through the grate will be blocked resulting in flooding. See typical Type 1 installation details at the end of this fact sheet.

  1. Excavate a trench approximately 6 in. wide and 6 in. deep along the line of the silt fence inlet protection device.

  2. Place 2 in. by 2 in. wooden stakes around the perimeter of the inlet a maximum of 3 ft apart and drive them at least 18 in. into the ground or 12 in. below the bottom of the trench. The stakes should be at least 48 in.

  3. Lay fabric along bottom of trench, up side of trench, and then up stakes. See SE-1, Silt Fence, for details. The maximum silt fence height around the inlet is 24 in.

  4. Staple the filter fabric (for materials and specifications, see SE-1, Silt Fence) to wooden stakes. Use heavy-duty wire staples at least 1 in. in length.

5. Backfill the trench with gravel or compacted earth all the way around.

- ***DI Protection Type 2 - Excavated Drop Inlet Sediment Trap -*** Install filter fabric fence in accordance with DI Protection Type 1. Size excavated trap to provide a minimum storage capacity calculated at the rate 67 yd^3/acre of drainage area. See typical Type 2 installation details at the end of this fact sheet.

- ***DI Protection Type 3 - Gravel bag -*** Flow from a severe storm should not overtop the curb. In areas of high clay and silts, use filter fabric and gravel as additional filter media. Construct gravel bags in accordance with SE-6, Gravel Bag Berm. Gravel bags should be used due to their high permeability. See typical Type 3 installation details at the end of this fact sheet.

  1. Construct on gently sloping street.

  2. Leave room upstream of barrier for water to pond and sediment to settle.

  3. Place several layers of gravel bags – overlapping the bags and packing them tightly together.

  4. Leave gap of one bag on the top row to serve as a spillway. Flow from a severe storm (e.g., 10-year storm) should not overtop the curb.

- ***DI Protection Type 4 – Block and Gravel Filter -*** Block and gravel filters are suitable for curb inlets commonly used in residential, commercial, and industrial construction. See typical Type 4 installation details at the end of this fact sheet.

  1. Place hardware cloth or comparable wire mesh with 0.5 in. openings over the drop inlet so that the wire extends a minimum of 1 ft beyond each side of the inlet structure. If more than one strip is necessary, overlap the strips. Place woven geotextile over the wire mesh.

  2. Place concrete blocks lengthwise on their sides in a single row around the perimeter of the inlet, so that the open ends face outward, not upward. The ends of adjacent blocks should abut. The height of the barrier can be varied, depending on design needs, by stacking combinations of blocks that are 4 in., 8 in., and 12 in. wide. The row of blocks should be at least 12 in. but no greater than 24 in. high.

  3. Place wire mesh over the outside vertical face (open end) of the concrete blocks to prevent stone from being washed through the blocks. Use hardware cloth or comparable wire mesh with 0.5 in. opening.

  4. Pile washed stone against the wire mesh to the top of the blocks. Use 0.75 to 3 in.

- ***DI Protection Type 5 – Temporary Geotextile Insert (proprietary) –*** Many types of temporary inserts are available. Most inserts fit underneath the grate of a drop inlet or inside of a curb inlet and are fastened to the outside of the grate or curb. These inserts are removable, and many can be cleaned and reused. Installation of these inserts differs between manufacturers. Please refer to manufacturer instruction for installation of proprietary devices.

- ***DI Protection Type 6 - Biofilter bags*** – Biofilter bags may be used as a substitute for gravel bags in low-flow situations. Biofilter bags should conform to specifications detailed in SE-14, Biofilter bags.

    1. Construct in a gently sloping area.
    2. Biofilter bags should be placed around inlets to intercept runoff flows.
    3. All bag joints should overlap by 6 in.
    4. Leave room upstream for water to pond and for sediment to settle out.
    5. Stake bags to the ground as described in the following detail. Stakes may be omitted if bags are placed on a paved surface.

- ***DI Protection Type 7 – Compost Socks*** – A compost sock can be assembled on site by filling a mesh sock (e.g., with a pneumatic blower). Compost socks do not require special trenching compared to other sediment control methods (e.g., silt fence). Compost socks should conform to specification detailed in SE-13, Compost Socks and Berms.

Costs

- Average annual cost for installation and maintenance of DI Type 1-4 and 6 (one-year useful life) is $200 per inlet.
- Temporary geotextile inserts are proprietary, and cost varies by region. These inserts can often be reused and may have greater than 1 year of use if maintained and kept undamaged. Average cost per insert ranges from $50-75 plus installation, but costs can exceed $100. This cost does not include maintenance.
- See SE-13 for Compost Sock cost information.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Silt Fences. If the fabric becomes clogged, torn, or degrades, it should be replaced. Make sure the stakes are securely driven in the ground and are in good shape (i.e., not bent, cracked, or splintered, and are reasonably perpendicular to the ground). Replace damaged stakes. At a minimum, remove the sediment behind the fabric fence when accumulation reaches one-third the height of the fence or barrier height.
- Gravel Filters. If the gravel becomes clogged with sediment, it should be carefully removed from the inlet and either cleaned or replaced. Since cleaning gravel at a construction site may be difficult, consider using the sediment-laden stone as fill material and put fresh stone around the inlet. Inspect bags for holes, gashes, and snags, and replace bags as needed. Check gravel bags for proper arrangement and displacement.

- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Inspect and maintain temporary geotextile insert devices according to manufacturer's specifications.
- Remove storm drain inlet protection once the drainage area is stabilized.
    - Clean and regrade area around the inlet and clean the inside of the storm drain inlet, as it should be free of sediment and debris at the time of final inspection.

EC-5 Soil Binders

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Wind erosion or dust control consists of applying water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.

California's Mediterranean climate, with a short "wet" season and a typically long, hot "dry" season, allows the soils to thoroughly dry out. During the dry season, construction activities are at their peak, and disturbed and exposed areas are increasingly subject to wind erosion, sediment tracking, and dust generated by construction equipment. Site conditions and climate can make dust control more of an erosion problem than water-based erosion. Additionally, many local agencies, including Air Quality Management Districts, require dust control and/or dust control permits in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. Wind erosion control is required to be implemented at all construction sites greater than 1 acre by the General Permit.

Suitable Applications

Most BMPs that provide protection against water-based erosion will also protect against wind-based erosion and dust control requirements required by other agencies will generally meet wind erosion control requirements for water quality protection. Wind erosion control BMPs are suitable during the following construction activities:

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Construction vehicle traffic on unpaved roads
- Drilling and blasting activities
- Soils and debris storage piles
- Batch drop from front-end loaders
- Areas with unstabilized soil
- Final grading/site stabilization

Limitations

- Watering prevents dust only for a short period (generally less than a few hours) and should be applied daily (or more often) to be effective.
- Over watering may cause erosion and track-out.
- Oil or oil-treated subgrade should not be used for dust control because the oil may migrate into drainageways and/or seep into the soil.
- Chemical dust suppression agents may have potential environmental impacts. Selected chemical dust control agents should be environmentally benign.
- Effectiveness of controls depends on soil, temperature, humidity, wind velocity and traffic.
- Chemical dust suppression agents should not be used within 100 feet of wetlands or water bodies.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.
- If the soil surface has minimal natural moisture, the affected area may need to be pre-wetted so that chemical dust control agents can uniformly penetrate the soil surface.

Implementation

Dust Control Practices

Dust control BMPs generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. The following table presents dust control practices that can be applied to varying site conditions that could potentially cause dust. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel asphalt surfacing, temporary gravel construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control applications. Permanent or temporary vegetation and mulching can be employed for areas of occasional or no construction traffic. Preventive measures include minimizing surface areas to be disturbed, limiting onsite vehicle traffic to 15 mph or less, and controlling the number and activity of vehicles on a site at any given time.

Chemical dust suppressants include: mulch and fiber based dust palliatives (e.g. paper mulch with gypsum binder), salts and brines (e.g. calcium chloride, magnesium chloride), non-petroleum based organics (e.g. vegetable oil, lignosulfonate), petroleum based organics (e.g. asphalt emulsion, dust oils, petroleum resins), synthetic polymers (e.g. polyvinyl acetate, vinyl, acrylic), clay additives (e.g. bentonite, montmorillonite) and electrochemical products (e.g. enzymes, ionic products).

Site Condition	Dust Control Practices							
	Permanent Vegetation	Mulching	Wet Suppression (Watering)	Chemical Dust Suppression	Gravel or Asphalt	Temporary Gravel Construction Entrances/Equipment Wash Down	Synthetic Covers	Minimize Extent of Disturbed Area
Disturbed Areas not Subject to Traffic	x	x	x	x	x			x
Disturbed Areas Subject to Traffic			x	x	x	x		x
Material Stockpiles		x	x	x			x	x
Demolition			x			x	x	
Clearing/ Excavation			x	x				x
Truck Traffic on Unpaved Roads			x	x	x	x	x	
Tracking					x	x		

Additional preventive measures include:

- Schedule construction activities to minimize exposed area (see EC-1, Scheduling).
- Quickly treat exposed soils using water, mulching, chemical dust suppressants, or stone/gravel layering.
- Identify and stabilize key access points prior to commencement of construction.
- Minimize the impact of dust by anticipating the direction of prevailing winds.
- Restrict construction traffic to stabilized roadways within the project site, as practicable.
- Water should be applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles that will ensure even distribution.
- All distribution equipment should be equipped with a positive means of shutoff.
- Unless water is applied by means of pipelines, at least one mobile unit should be available at all times to apply water or dust palliative to the project.
- If reclaimed waste water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the Regional Water Quality

Control Board (RWQCB) requirements. Non-potable water should not be conveyed in tanks or drain pipes that will be used to convey potable water and there should be no connection between potable and non-potable supplies. Non-potable tanks, pipes, and other conveyances should be marked, "NON-POTABLE WATER - DO NOT DRINK."

- Pave or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads.
- Provide covers for haul trucks transporting materials that contribute to dust.
- Provide for rapid clean up of sediments deposited on paved roads. Furnish stabilized construction road entrances and wheel wash areas.
- Stabilize inactive areas of construction sites using temporary vegetation or chemical stabilization methods.

For chemical stabilization, there are many products available for chemically stabilizing gravel roadways and stockpiles. If chemical stabilization is used, the chemicals should not create any adverse effects on stormwater, plant life, or groundwater and should meet all applicable regulatory requirements.

Costs

Installation costs for water and chemical dust suppression vary based on the method used and the length of effectiveness. Annual costs may be high since some of these measures are effective for only a few hours to a few days.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Check areas protected to ensure coverage.
- Most water-based dust control measures require frequent application, often daily or even multiple times per day. Obtain vendor or independent information on longevity of chemical dust suppressants.

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

Suitable Applications

Use at construction sites:

- Where dirt or mud can be tracked onto public roads.
- Adjacent to water bodies.
- Where poor soils are encountered.
- Where dust is a problem during dry weather conditions.

Limitations

- Entrances and exits require periodic top dressing with additional stones.
- This BMP should be used in conjunction with street sweeping on adjacent public right of way.
- Entrances and exits should be constructed on level ground only.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

Implementation

General

A stabilized construction entrance is a pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right of way, street, alley, sidewalk, or parking area. The purpose of a stabilized construction entrance is to reduce or eliminate the tracking of sediment onto public rights of way or streets. Reducing tracking of sediments and other pollutants onto paved roads helps prevent deposition of sediments into local storm drains and production of airborne dust.

Where traffic will be entering or leaving the construction site, a stabilized construction entrance should be used. NPDES permits require that appropriate measures be implemented to prevent tracking of sediments onto paved roadways, where a significant source of sediments is derived from mud and dirt carried out from unpaved roads and construction sites.

Stabilized construction entrances are moderately effective in removing sediment from equipment leaving a construction site. The entrance should be built on level ground. Advantages of the Stabilized Construction Entrance/Exit is that it does remove some sediment from equipment and serves to channel construction traffic in and out of the site at specified locations. Efficiency is greatly increased when a washing rack is included as part of a stabilized construction entrance/exit.

Design and Layout

- Construct on level ground where possible.
- Select 3 to 6 in. diameter stones.
- Use minimum depth of stones of 12 in. or as recommended by soils engineer.
- Construct length of 50 ft or maximum site will allow, and 10 ft minimum width or to accommodate traffic.
- Rumble racks constructed of steel panels with ridges and installed in the stabilized entrance/exit will help remove additional sediment and to keep adjacent streets clean.
- Provide ample turning radii as part of the entrance.
- Limit the points of entrance/exit to the construction site.
- Limit speed of vehicles to control dust.
- Properly grade each construction entrance/exit to prevent runoff from leaving the construction site.
- Route runoff from stabilized entrances/exits through a sediment trapping device before discharge.
- Design stabilized entrance/exit to support heaviest vehicles and equipment that will use it.

Stabilized Construction Entrance/Exit TC-1

- Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions. Do not use asphalt concrete (AC) grindings for stabilized construction access/roadway.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 in. depth, or place aggregate to a depth recommended by a geotechnical engineer. A crushed aggregate greater than 3 in. but smaller than 6 in. should be used.
- Designate combination or single purpose entrances and exits to the construction site.
- Require that all employees, subcontractors, and suppliers utilize the stabilized construction access.
- Implement SE-7, Street Sweeping and Vacuuming, as needed.
- All exit locations intended to be used for more than a two-week period should have stabilized construction entrance/exit BMPs.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMPs are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect local roads adjacent to the site daily. Sweep or vacuum to remove visible accumulated sediment.
- Remove aggregate, separate and dispose of sediment if construction entrance/exit is clogged with sediment.
- Keep all temporary roadway ditches clear.
- Check for damage and repair as needed.
- Replace gravel material when surface voids are visible.
- Remove all sediment deposited on paved roadways within 24 hours.
- Remove gravel and filter fabric at completion of construction

Costs

Average annual cost for installation and maintenance may vary from $1,500 to $6,100 each, averaging $3,100 per entrance. Costs will increase with addition of washing rack and sediment trap. With wash rack, costs range from $1,500 - $7,700 each, averaging $4,600 per entrance (All costs adjusted for inflation, 2016 dollars, by Tetra Tech Inc.

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and the transport of pollutants offsite. These practices can reduce or eliminate non-stormwater discharges.

Suitable Applications

Water conservation practices are suitable for all construction sites where water is used, including piped water, metered water, trucked water, and water from a reservoir.

Limitations

- None identified.

Implementation

- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Washing of vehicles and equipment on the construction site is discouraged.
- Avoid using water to clean construction areas. If water must be used for cleaning or surface preparation, surface should be swept and vacuumed first to remove dirt. This will minimize amount of water required.

- Direct construction water runoff to areas where it can soak into the ground or be collected and used.
- Authorized non-stormwater discharges to the storm drain system, channels, or receiving waters are acceptable with the implementation of appropriate BMPs.
- Lock water tank valves to prevent unauthorized use.

Costs

The cost is small to none compared to the benefits of conserving water.

Inspection and Maintenance

- Inspect and verify that activity based BMPs are in place prior to the commencement of authorized non-stormwater discharges.
- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges are occuring.
- Repair water equipment as needed to prevent unintended discharges.
  - Water trucks
  - Water reservoirs (water buffalos)
  - Irrigation systems
  - Hydrant connections

SE-5: Fiber Roll

SE-6: Gravel Bag Berm

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Dewatering operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location to proceed with construction work or to provide vector control.

The General Permit incorporates Numeric Action Levels (NAL) for turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Discharges from dewatering operations can contain high levels of fine sediment that, if not properly treated, could lead to exceedances of the General Permit requirements or Basin Plan standards.

The dewatering operations described in this fact sheet are not Active Treatment Systems (ATS) and do not include the use of chemical coagulations, chemical flocculation or electrocoagulation.

Suitable Applications

These practices are implemented for discharges of non-stormwater from construction sites. Non-stormwaters include, but are not limited to, groundwater, water from cofferdams, water diversions, and waters used during construction activities that must be removed from a work area to facilitate construction.

Practices identified in this section are also appropriate for implementation when managing the removal of accumulated

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

precipitation (stormwater) from depressed areas at a construction site.

Stormwater mixed with non-stormwater should be managed as non-stormwater.

Limitations

- Dewatering operations will require and should comply with applicable local and project-specific permits and regulations. In some areas, all dewatering activities, regardless of the discharge volume, require a dewatering permit.
- Site conditions will dictate design and use of dewatering operations.
- The controls discussed in this fact sheet primarily address sediment. Other secondary pollutant removal benefits are discussed where applicable.
- The controls detailed in this fact sheet only allow for minimal settling time for sediment particles. Use only when site conditions restrict the use of the other control methods.
- Avoid dewatering discharges where possible by using the water for dust control.

Implementation

- A Construction Site Monitoring Plan (CSMP) should be included in the project Stormwater Pollution Prevention Plan (SWPPP).
- Regional Water Quality Control Board (RWQCB) Regions may require notification and approval prior to any discharge of water from construction sites.
- The destination of discharge from dewatering activities will typically determine the type of permit required for the discharge. For example, when discharging to a water of the U.S., a dewatering permit may be required through the site's governing RWQCB. When discharging to a sanitary sewer or Municipal Separate Storm Sewer System (MS4), a permit may need to be obtained from the owner of the sanitary sewer or MS4 in addition to obtaining an RWQCB dewatering permit. Additional permits or permissions from other agencies may be required for dewatering cofferdams or diversions.
- Dewatering discharges should not cause erosion at the discharge point. Appropriate BMPs should be implemented to maintain compliance with all applicable permits.
- Maintain dewatering records in accordance with all local and project-specific permits and regulations.

Sediment Treatment

A variety of methods can be used to treat water during dewatering operations. Several devices are presented below and provide options to achieve sediment removal. The sediment particle size and permit or receiving water limitations on sediment or turbidity are key considerations for selecting sediment treatment option(s); in some cases, the use of multiple devices may be appropriate. Use of other enhanced treatment methods (i.e., introduction of chemicals or electric current to enhance flocculation and removal of sediment) must comply with: 1) for storm drain or surface water discharges, the requirements for Active Treatment Systems (see SE-11); or 2) for sanitary sewer discharges, the requirements of applicable sanitary sewer discharge permits.

Sediment Basin (see also SE-2)

Description:

- A sediment basin is a temporary basin with a controlled release structure that is formed by excavation or construction of an embankment to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment basins are generally larger than Sediment Traps (SE-3) and have a designed outlet structure.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, silt, some metals that settle out with the sediment.

Implementation:

- Excavation and construction of related facilities is required.
- Temporary sediment basins should be fenced if safety is a concern.
- Outlet protection is required to prevent erosion at the outfall location.

Maintenance:

- Maintenance is required for safety fencing, vegetation, embankment, inlet and outlet, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Sediment Trap (See also SE-3)

Description:

- A sediment trap is a temporary basin formed by excavation and/or construction of an earthen embankment across a waterway or low drainage area to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment traps are generally smaller than Sediment Basins (SE-2) and do not have a designed outlet (but do have a spillway or overflow).

Appropriate Applications:

Effective for the removal of large and medium sized particles (sand and gravel) and some metals that settle out with the sediment.

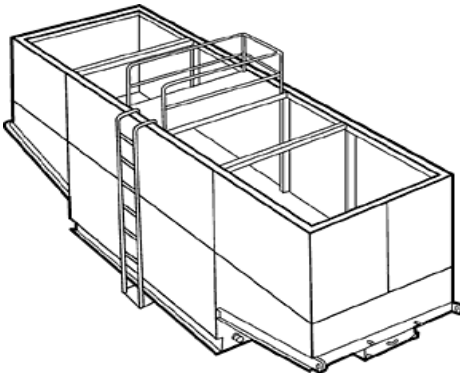
Implementation:

- Excavation and construction of related facilities is required.
- Trap inlets should be located to maximize the travel distance to the trap outlet.
- Use rock or vegetation to protect the trap outlets against erosion.

Maintenance:

- Maintenance is required for vegetation, embankment, inlet and outfall structures, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Weir Tanks



Description:

- A weir tank separates water and waste by using weirs. The configuration of the weirs (over and under weirs) maximizes the residence time in the tank and determines the waste to be removed from the water, such as oil, grease, and sediments.

Appropriate Applications:

- The tank removes trash, some settleable solids (gravel, sand, and silt), some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.
- Treatment capacity (i.e., volume and number of tanks) should provide at a minimum the required volume for discrete particle settling for treatment design flows.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by a licensed waste disposal company.

Dewatering Tanks

Description:

- A dewatering tank removes debris and sediment. Flow enters the tank through the top, passes through a fabric filter, and is discharged through the bottom of the tank. The filter separates the solids from the liquids.

Appropriate Applications:

- The tank removes trash, gravel, sand, and silt, some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

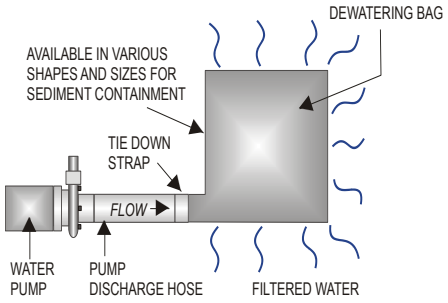
Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by licensed waste disposal company.

Gravity Bag Filter



Description:

- A gravity bag filter, also referred to as a dewatering bag, is a square or rectangular bag made of non-woven geotextile fabric that collects gravel, sand, silt, and fines.

Appropriate Applications:

- Effective for the removal of sediments (gravel, sand, silt, and fines). Some metals are removed with the sediment.

Implementation:

- Water is pumped into one side of the bag and seeps through the top, bottom, and sides of the bag.
- Place filter bag on pavement or a gravel bed or paved surface. Avoid placing a dewatering bag on unprotected bare soil. If placing the bag on bare soil is unavoidable, a secondary barrier should be used, such as a rock filter bed placed beneath and beyond the edges of the bag to, prevent erosion and capture sediments that escape the bag.
- Perimeter control around the downstream end of the bag should be implemented. Secondary sediment controls are important especially in the initial stages of discharge, which tend to allow fines to pass through the bag.

Maintenance:

- Inspection of the flow conditions, bag condition, bag capacity, and the secondary barrier (as applicable) is required.
- Replace the bag when it no longer filters sediment or passes water at a reasonable rate.
- Caution should be taken when removing and disposing of the bag, to prevent the release of captured sediment
- Properly dispose of the bag offsite. If sediment is removed from the bag prior to disposal (bags can potentially be reused depending upon their condition), dispose of sediment in accordance with the general maintenance procedures described at the end of this BMP Fact Sheet.

Sand Media Particulate Filter

Description:

- Water is treated by passing it through canisters filled with sand media. Generally, sand filters provide a final level of treatment. They are often used as a secondary or higher level of treatment after a significant amount of sediment and other pollutants have been removed using other methods.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, and silt and some metals, as well as the reduction of biochemical oxygen demand (BOD) and turbidity.
- Sand filters can be used for stand-alone treatment or in conjunction with bag and cartridge filtration if further treatment is required.
- Sand filters can also be used to provide additional treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filters require regular service to monitor and maintain the level of the sand media. If subjected to high loading rates, filters can plug quickly.
- Venders generally provide data on maximum head loss through the filter. The filter should be monitored daily while in use and cleaned when head loss reaches target levels.
- If cleaned by backwashing, the backwash water may need to be hauled away for disposal or returned to the upper end of the treatment train for another pass through the series of dewatering BMPs.

Pressurized Bag Filter

Description:

- A pressurized bag filter is a unit composed of single filter bags made from polyester felt material. The water filters through the unit and is discharged through a header. Vendors provide bag filters in a variety of configurations. Some units include a combination of bag filters and cartridge filters for enhanced contaminant removal.

Appropriate Applications:

- Effective for the removal of sediment (sand and silt) and some metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Oil absorbent bags are available for hydrocarbon removal.

- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filter bags require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Cartridge Filter

Description:

- Cartridge filters provide a high degree of pollutant removal by utilizing a number of individual cartridges as part of a larger filtering unit. They are often used as a secondary or higher (polishing) level of treatment after a significant amount of sediment and other pollutants are removed. Units come with various cartridge configurations (for use in series with bag filters) or with a larger single cartridge filtration unit (with multiple filters within).

Appropriate Applications:

- Effective for the removal of sediment (sand, silt, and some clays) and metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Hydrocarbons can effectively be removed with special resin cartridges.

- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance.

Maintenance:

- The cartridges require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Costs

- Sediment control costs vary considerably depending on the dewatering and sediment treatment system that is selected. Pressurized filters tend to be more expensive than gravity settling but are often more effective. Simple tanks are generally rented on a long-term basis (one or more months) and can range from $460 per month for a 1,000-gallon tank to $3,400 per month for a 10,000-gallon tank (adjusted for inflation, 2016 dollars, by Tetra Tech Inc.). Mobilization and demobilization costs vary considerably.

Inspection and Maintenance

- Inspect and verify that dewatering BMPs are in place and functioning prior to the commencement of activities requiring dewatering.

- Inspect dewatering BMPs daily while dewatering activities are being conducted.

- Inspect all equipment before use. Monitor dewatering operations to ensure they do not cause offsite discharge or erosion.
- Sample dewatering discharges as required by the General Permit.
- Unit-specific maintenance requirements are included with the description of each unit.
- Sediment removed during the maintenance of a dewatering device may be either spread onsite and stabilized or disposed of at a disposal site as approved by the owner.
- Sediment that is commingled with other pollutants should be disposed of in accordance with all applicable laws and regulations and as approved by the owner.

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runon and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

The General Permit incorporates Numeric Action Levels (NAL) for pH and turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials associated with paving and grinding operations, including mortar, concrete, and cement and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures are implemented where paving, surfacing, resurfacing, or sawcutting, may pollute stormwater runoff or discharge to the storm drain system or watercourses.

Limitations

- Paving opportunities may be limited during wet weather.

  Discharges of freshly paved surfaces may raise pH to environmentally harmful levels and trigger permit violations.

Implementation

General

- Avoid paving during the wet season when feasible.
- Reschedule paving and grinding activities if rain is forecasted.
- Train employees and sub-contractors in pollution prevention and reduction.
- Store materials away from drainage courses to prevent stormwater runon (see WM-1, Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or to trap and filter sediment.
- Stockpile material removed from roadways away from drain inlets, drainage ditches, and watercourses. These materials should be stored consistent with WM-3, Stockpile Management.
- Disposal of PCC (Portland cement concrete) and AC (asphalt concrete) waste should be in conformance with WM-8, Concrete Waste Management.

Saw Cutting, Grinding, and Pavement Removal

- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- When paving involves AC, the following steps should be implemented to prevent the discharge of grinding residue, uncompacted or loose AC, tack coats, equipment cleaners, or unrelated paving materials:
  - AC grindings, pieces, or chunks used in embankments or shoulder backing should not be allowed to enter any storm drains or watercourses. Install inlet protection and perimeter controls until area is stabilized (i.e. cutting, grinding or other removal activities are complete and loose material has been properly removed and disposed of)or permanent controls are in place. Examples of temporary perimeter controls can be found in EC-9, Earth Dikes and Drainage Swales; SE-1, Silt Fence; SE-5, Fiber Rolls, or SE-13 Compost Socks and Berms
  - Collect and remove all broken asphalt and recycle when practical. Old or spilled asphalt should be recycled or disposed of properly.
- Do not allow saw-cut slurry to enter storm drains or watercourses. Residue from grinding operations should be picked up by a vacuum attachment to the grinding machine, or by sweeping, should not be allowed to flow across the pavement, and should not be left on the surface of the pavement. See also WM-8, Concrete Waste Management, and WM-10, Liquid Waste Management.
- Pavement removal activities should not be conducted in the rain.
- Collect removed pavement material by mechanical or manual methods. This material may be recycled for use as shoulder backing or base material.

- If removed pavement material cannot be recycled, transport the material back to an approved storage site.

Asphaltic Concrete Paving

- If paving involves asphaltic cement concrete, follow these steps:

  - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks. Vacuum or sweep loose sand and gravel and properly dispose of this waste by referring to WM-5, Solid Waste Management.

  - Old asphalt should be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.

Portland Cement Concrete Paving

- Do not wash sweepings from exposed aggregate concrete into a storm drain system. Collect waste materials by dry methods, such as sweeping or shoveling, and return to aggregate base stockpile or dispose of properly. Allow aggregate rinse to settle. Then, either allow rinse water to dry in a temporary pit as described in WM-8, Concrete Waste Management, or pump the water to the sanitary sewer if authorized by the local wastewater authority.

Sealing Operations

- During chip seal application and sweeping operations, petroleum or petroleum covered aggregate should not be allowed to enter any storm drain or water courses. Apply temporary perimeter controls until structure is stabilized (i.e. all sealing operations are complete and cured and loose materials have been properly removed and disposed).

- Inlet protection (SE-10, Storm Drain Inlet Protection) should be used during application of seal coat, tack coat, slurry seal, and fog seal.

- Seal coat, tack coat, slurry seal, or fog seal should not be applied if rainfall is predicted to occur during the application or curing period.

Paving Equipment

- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials and dispose of in accordance with the applicable regulations. See NS-10, Vehicle and Equipment Maintenance, WM-4, Spill Prevention and Control, and WM-10, Liquid Waste Management.

- Substances used to coat asphalt transport trucks and asphalt spreading equipment should not contain soap and should be non-foaming and non-toxic.

- Paving equipment parked onsite should be parked over plastic to prevent soil contamination.

- Clean asphalt coated equipment offsite whenever possible. When cleaning dry, hardened asphalt from equipment, manage hardened asphalt debris as described in WM-5, Solid Waste Management. Any cleaning onsite should follow NS-8, Vehicle and Equipment Cleaning.

Thermoplastic Striping

- Thermoplastic striper and pre-heater equipment shutoff valves should be inspected to ensure that they are working properly to prevent leaking thermoplastic from entering drain inlets, the stormwater drainage system, or watercourses.
- Pre-heaters should be filled carefully to prevent splashing or spilling of hot thermoplastic. Leave six inches of space at the top of the pre-heater container when filling thermoplastic to allow room for material to move.
- Do not pre-heat, transfer, or load thermoplastic near drain inlets or watercourses.
- Clean truck beds daily of loose debris and melted thermoplastic. When possible, recycle thermoplastic material.

Raised/Recessed Pavement Marker Application and Removal

- Do not transfer or load bituminous material near drain inlets, the stormwater drainage system, or watercourses.
- Melting tanks should be loaded with care and not filled to beyond six inches from the top to leave room for splashing.
- When servicing or filling melting tanks, ensure all pressure is released before removing lids to avoid spills.
- On large-scale projects, use mechanical or manual methods to collect excess bituminous material from the roadway after removal of markers.

Costs

- All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of paving and grinding operations.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Sample stormwater runoff required by the General Permit.
- Keep ample supplies of drip pans or absorbent materials onsite.
- Inspect and maintain machinery regularly to minimize leaks and drips.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Procedures and practices designed for construction contractors to recognize illicit connections or illegally dumped or discharged materials on a construction site and report incidents.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Illicit connection/discharge and reporting is applicable anytime an illicit connection or discharge is discovered, or illegally dumped material is found on the construction site.

Limitations

Illicit connections and illegal discharges or dumping, for the purposes of this BMP, refer to discharges and dumping caused by parties other than the contractor. If pre-existing hazardous materials or wastes are known to exist onsite, they should be identified in the SWPPP and handled as set forth in the SWPPP.

Implementation

Planning

- Review the SWPPP. Pre-existing areas of contamination should be identified and documented in the SWPPP.
- Inspect site before beginning the job for evidence of illicit connections, illegal dumping or discharges. Document any pre-existing conditions and notify the owner.

- Inspect site regularly during project execution for evidence of illicit connections, illegal dumping or discharges.
- Observe site perimeter for evidence for potential of illicitly discharged or illegally dumped material, which may enter the job site.

Identification of Illicit Connections and Illegal Dumping or Discharges

- **General –** unlabeled and unidentifiable material should be treated as hazardous.
- **Solids** - Look for debris, or rubbish piles. Solid waste dumping often occurs on roadways with light traffic loads or in areas not easily visible from the traveled way.
- **Liquids** - signs of illegal liquid dumping or discharge can include:
  - Visible signs of staining or unusual colors to the pavement or surrounding adjacent soils
  - Pungent odors coming from the drainage systems
  - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
  - Abnormal water flow during the dry weather season
- **Urban Areas** - Evidence of illicit connections or illegal discharges is typically detected at storm drain outfall locations or at manholes. Signs of an illicit connection or illegal discharge can include:
  - Abnormal water flow during the dry weather season
  - Unusual flows in sub drain systems used for dewatering
  - Pungent odors coming from the drainage systems
  - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
  - Excessive sediment deposits, particularly adjacent to or near active offsite construction projects
- **Rural Areas** - Illicit connections or illegal discharges involving irrigation drainage ditches are detected by visual inspections. Signs of an illicit discharge can include:
  - Abnormal water flow during the non-irrigation season
  - Non-standard junction structures
  - Broken concrete or other disturbances at or near junction structures

Reporting

Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery. For illicit connections or discharges to the storm drain system, notify the local stormwater management agency. For illegal dumping, notify the local law enforcement agency.

Cleanup and Removal

The responsibility for cleanup and removal of illicit or illegal dumping or discharges will vary by location. Contact the local stormwater management agency for further information.

Costs

Costs to look for and report illicit connections and illegal discharges and dumping are low. The best way to avoid costs associated with illicit connections and illegal discharges and dumping is to keep the project perimeters secure to prevent access to the site, to observe the site for vehicles that should not be there, and to document any waste or hazardous materials that exist onsite before taking possession of the site.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect the site regularly to check for any illegal dumping or discharge.
- Prohibit employees and subcontractors from disposing of non-job-related debris or materials at the construction site.
- Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery.

Trash	
Metals	
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning onsite. Steam cleaning can generate significant pollutant concentrates.
- Cleaning of vehicles and equipment with soap, solvents or steam should not occur on the project site unless resulting wastes are fully contained and disposed of. Resulting wastes should not be discharged or buried and must be captured and recycled or disposed according to the requirements of WM-10, Liquid Waste Management or WM-6, Hazardous Waste Management, depending on the waste characteristics. Minimize use of solvents. Use of diesel for vehicle and equipment cleaning is prohibited.
- All vehicles and equipment that regularly enter and leave the construction site must be cleaned offsite.
- When vehicle and equipment washing and cleaning must occur onsite, and the operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area should have the following characteristics:
  - Located away from storm drain inlets, drainage facilities, or watercourses
  - Paved with concrete or asphalt and bermed to contain wash waters and to prevent runon and runoff
  - Configured with a sump to allow collection and disposal of wash water
  - No discharge of wash waters to storm drains or watercourses
  - Used only when necessary
- When cleaning vehicles and equipment with water:
  - Use as little water as possible. High-pressure sprayers may use less water than a hose and should be considered
  - Use positive shutoff valve to minimize water usage
  - Facility wash racks should discharge to a sanitary sewer, recycle system or other approved discharge system and must not discharge to the storm drainage system, watercourses, or to groundwater

Costs

Cleaning vehicles and equipment at an offsite facility may reduce overall costs for vehicle and equipment cleaning by eliminating the need to provide similar services onsite. When onsite cleaning is needed, the cost to establish appropriate facilities is relatively low on larger, long-duration projects, and moderate to high on small, short-duration projects.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspection and maintenance is minimal, although some berm repair may be necessary.
- Monitor employees and subcontractors throughout the duration of the construction project to ensure appropriate practices are being implemented.
- Inspect sump regularly and remove liquids and sediment as needed.
- Prohibit employees and subcontractors from washing personal vehicles and equipment on the construction site.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Vehicle equipment fueling procedures and practices are designed to prevent fuel spills and leaks and reduce or eliminate contamination of stormwater. This can be accomplished by using offsite facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors in proper fueling procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment fueling takes place.

Limitations

Onsite vehicle and equipment fueling should only be used where it is impractical to send vehicles and equipment offsite for fueling. Sending vehicles and equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/ Exit.

Implementation

- Use offsite fueling stations as much as possible. These businesses are better equipped to handle fuel and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate fueling area at a site.
- Discourage "topping-off" of fuel tanks.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Absorbent spill cleanup materials and spill kits should be available in fueling areas and on fueling trucks and should be disposed of properly after use.
- Drip pans or absorbent pads should be used during vehicle and equipment fueling, unless the fueling is performed over an impermeable surface in a dedicated fueling area.
- Use absorbent materials on small spills. Do not hose down or bury the spill. Remove the adsorbent materials promptly and dispose of properly.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and large excavators, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- When fueling must take place onsite, designate an area away from drainage courses to be used. Fueling areas should be identified in the SWPPP.
- Dedicated fueling areas should be protected from stormwater runon and runoff and should be located at least 50 ft away from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
- Protect fueling areas with berms and dikes to prevent runon, runoff, and to contain spills.
- Nozzles used in vehicle and equipment fueling should be equipped with an automatic shutoff to control drips. Fueling operations should not be left unattended.
- Use vapor recovery nozzles to help control drips as well as air pollution where required by Air Quality Management Districts (AQMD).
- Federal, state, and local requirements should be observed for any stationary above ground storage tanks.

Costs

- All of the above measures are low cost except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Vehicles and equipment should be inspected each day of use for leaks. Leaks should be repaired immediately, or problem vehicles or equipment should be removed from the project site.
- Keep ample supplies of spill cleanup materials onsite.

- Immediately clean up spills and properly dispose of contaminated soil and cleanup materials.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the contamination of stormwater resulting from vehicle and equipment maintenance by running a "dry and clean site". The best option would be to perform maintenance activities at an offsite facility. If this option is not available then work should be performed in designated areas only, while providing cover for materials stored outside, checking for leaks and spills, and containing and cleaning up spills immediately. Employees and subcontractors must be trained in proper procedures.

Suitable Applications

These procedures are suitable on all construction projects where an onsite yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

Onsite vehicle and equipment maintenance should only be used where it is impractical to send vehicles and equipment offsite for maintenance and repair. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Outdoor vehicle or equipment maintenance is a potentially significant source of stormwater pollution. Activities that can contaminate stormwater include engine repair and service, changing or replacement of fluids, and outdoor equipment storage and parking (engine fluid leaks). For further information on vehicle or equipment servicing, see NS-8,

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Vehicle and Equipment Cleaning, and NS-9, Vehicle and Equipment Fueling.

Implementation

- Use offsite repair shops as much as possible. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur onsite, use designated areas, located away from drainage courses. Dedicated maintenance areas should be protected from stormwater runon and runoff and should be located at least 50 ft from downstream drainage facilities and watercourses.
- Drip pans or absorbent pads should be used during vehicle and equipment maintenance work that involves fluids, unless the maintenance work is performed over an impermeable surface in a dedicated maintenance area.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- All fueling trucks and fueling areas are required to have spill kits and/or use other spill protection devices.
- Use adsorbent materials on small spills. Remove the absorbent materials promptly and dispose of properly.
- Inspect onsite vehicles and equipment daily at startup for leaks, and repair immediately.
- Keep vehicles and equipment clean; do not allow excessive build-up of oil and grease.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic and transmission fluids. Provide secondary containment and covers for these materials if stored onsite.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- Drip pans or plastic sheeting should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than 1 hour.
- For long-term projects, consider using portable tents or covers over maintenance areas if maintenance cannot be performed offsite.
- Consider use of new, alternative greases and lubricants, such as adhesive greases, for chassis lubrication and fifth-wheel lubrication.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Properly dispose of or recycle used batteries.
- Do not bury used tires.

- Repair leaks of fluids and oil immediately.

Listed below is further information if you must perform vehicle or equipment maintenance onsite.

Safer Alternative Products

- Consider products that are less toxic or hazardous than regular products. These products are often sold under an "environmentally friendly" label.
- Consider use of grease substitutes for lubrication of truck fifth-wheels. Follow manufacturers label for details on specific uses.
- Consider use of plastic friction plates on truck fifth-wheels in lieu of grease. Follow manufacturers label for details on specific uses.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, trichloroethane, or methylene chloride. Many of these cleaners are listed in California Toxic Rule as priority pollutants. These materials are harmful and must not contaminate stormwater. They must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check the list of active ingredients to see whether it contains chlorinated solvents. The "chlor" term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling and Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous wastes separate, do not mix used oil solvents, and keep chlorinated solvents (like,-trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around. Provide cover and secondary containment until these materials can be removed from the site.

Oil filters can be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Costs

All of the above are low cost measures. Higher costs are incurred to setup and maintain onsite maintenance areas.

Vehicle & Equipment Maintenance NS-10

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Keep ample supplies of spill cleanup materials onsite.
- Maintain waste fluid containers in leak proof condition.
- Vehicles and equipment should be inspected on each day of use. Leaks should be repaired immediately, or the problem vehicle(s) or equipment should be removed from the project site.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.

Sediment	☑
Nutrients	
Trash	
Metals	
Bacteria	
Oil and Grease	☑
Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

The construction and retrofit of bridges and retaining walls often include driving piles for foundation support and shoring operations. Driven piles are typically constructed of precast concrete, steel, or timber. Driven sheet piles are also used for shoring and cofferdam construction. Proper control and use of equipment, materials, and waste products from pile driving operations will reduce or eliminate the discharge of potential pollutants to the storm drain system, watercourses, and waters of the United States.

Suitable Applications

These procedures apply to all construction sites near or adjacent to a watercourse or groundwater where permanent and temporary pile driving (impact and vibratory) takes place, including operations using pile shells as well as construction of cast-in-steel-shell and cast-in-drilled-hole piles.

Limitations

None identified.

Implementation

- Use drip pans or absorbent pads during vehicle and equipment operation, maintenance, cleaning, fueling, and storage. Refer to NS-8, Vehicle and Equipment Cleaning, NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.

- Have spill kits and cleanup materials available at all locations of pile driving. Refer to WM-4, Spill Prevention and Control.
- Equipment that is stored or in use in streambeds, or on docks, barges, or other structures over water bodies should be kept leak free.
- Park equipment over plastic sheeting or equivalent where possible. Plastic is not a substitute for drip pans or absorbent pads. The storage or use of equipment in streambeds or other bodies of water must comply with all applicable permits.
- Implement other BMPs as applicable, such as NS-2, Dewatering Operations, WM-5, Solid Waste Management, WM-6, Hazardous Waste Management, and WM-10, Liquid Waste Management.
- When not in use, store pile-driving equipment away from concentrated flows of stormwater, drainage courses, and inlets. Protect hammers and other hydraulic attachments from runon and runoff by placing them on plywood and covering them with plastic or a comparable material prior to the onset of rain.
- Use less hazardous products, e.g., vegetable oil, when practicable.

Costs

All of the above measures can be low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspect equipment every day at startup and repair equipment as needed (i.e., worn or damaged hoses, fittings, and gaskets). Recheck equipment at shift changes or at the end of the day and scheduled repairs as needed.

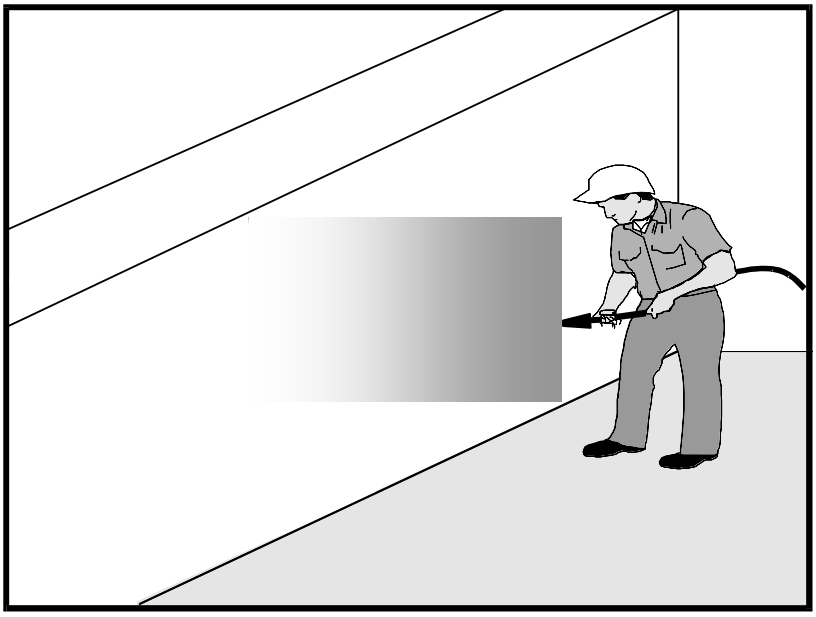
Concrete Curing NS-12



Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☑
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Targeted Constituents	
Sediment	☑
Nutrients	
Trash	
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, pump houses, large slabs, and structured foundations. Concrete curing includes the use of both chemical and water methods.

Concrete and its associated curing materials have basic chemical properties that can raise the pH of water to levels outside of the permitted range. Discharges of stormwater and non-stormwater exposed to concrete during curing may have a high pH and may contain chemicals, metals, and fines. The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Proper procedures and care should be taken when managing concrete curing materials to prevent them from coming into contact with stormwater flows, which could result in a high pH discharge.

Suitable Applications

Suitable applications include all projects where Portland Cement Concrete (PCC) and concrete curing chemicals are placed where they can be exposed to rainfall, runoff from other areas, or where runoff from the PCC will leave the site.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Implementation

Chemical Curing

- Avoid over spray of curing compounds.
- Minimize the drift by applying the curing compound close to the concrete surface. Apply an amount of compound that covers the surface but does not allow any runoff of the compound.
- Use proper storage and handling techniques for concrete curing compounds. Refer to WM-1, Material Delivery and Storage.
- Protect drain inlets prior to the application of curing compounds.
- Refer to WM-4, Spill Prevention and Control.

Water Curing for Bridge Decks, Retaining Walls, and other Structures

- Direct cure water away from inlets and watercourses to collection areas for evaporation or other means of removal in accordance with all applicable permits. See WM-8 Concrete Waste Management.
- Collect cure water at the top of slopes and transport to a concrete waste management area in a non-erosive manner. See EC-9 Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Utilize wet blankets or a similar method that maintains moisture while minimizing the use and possible discharge of water.

Education

- Educate employees, subcontractors, and suppliers on proper concrete curing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete curing procedures.

Costs

All of the above measures are generally low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts uncured and partially cured concrete as required by the General Permit.

- Ensure that employees and subcontractors implement appropriate measures for storage, handling, and use of curing compounds.
- Inspect cure containers and spraying equipment for leaks.

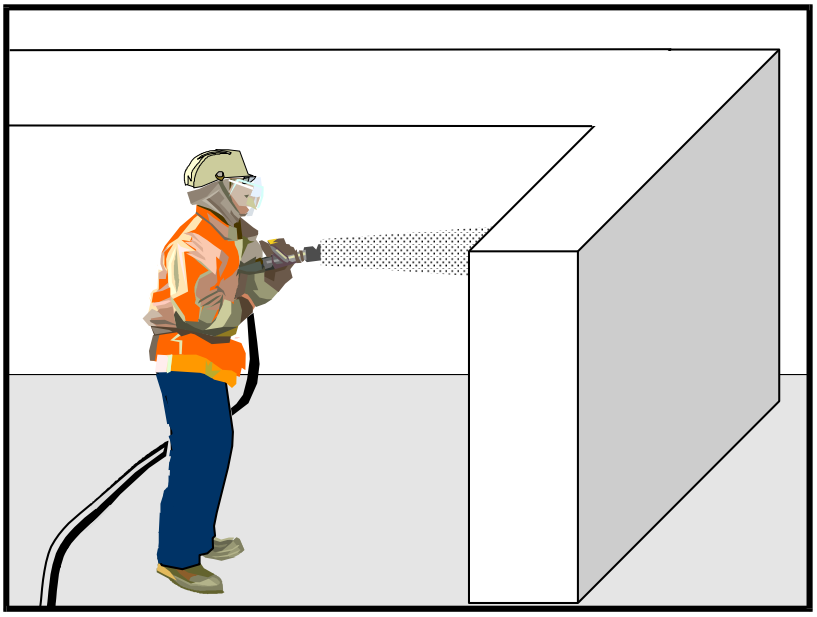
Concrete Finishing NS-13



Categories

EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☑
WM	Waste Management and Materials Pollution Control	☑

Legend:

☑ **Primary Category**

☒ **Secondary Category**

Targeted Constituents

Sediment	☑
Nutrients	
Trash	
Metals	☑
Bacteria	
Oil and Grease	
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high-pressure water blasting. Stormwater and non-stormwater exposed to concrete finishing by-products may have a high pH and may contain chemicals, metals, and fines. Proper procedures and implementation of appropriate BMPs can minimize the impact that concrete-finishing methods may have on stormwater and non-stormwater discharges.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Concrete and its associated curing materials have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures apply to all construction locations where concrete finishing operations are performed.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Implementation

- Collect and properly dispose of water from high-pressure water blasting operations.
- Collect contaminated water from blasting operations at the top of slopes. Transport or dispose of contaminated water while using BMPs such as those for erosion control. Refer to EC-9, Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Direct water from blasting operations away from inlets and watercourses to collection areas for infiltration or other means of removal (dewatering). Refer to NS-2 Dewatering Operations.
- Protect inlets during sandblasting operations. Refer to SE-10, Storm Drain Inlet Protection.
- Refer to WM-8, Concrete Waste Management for disposal of concrete debris.
- Minimize the drift of dust and blast material as much as possible by keeping the blasting nozzle close to the surface.
- When blast residue contains a potentially hazardous waste, refer to WM-6, Hazardous Waste Management.

Education

- Educate employees, subcontractors, and suppliers on proper concrete finishing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete finishing procedures.

Costs

These measures are generally of low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts concrete dust and debris as required by the General Permit.

- Sweep or vacuum up debris from sandblasting at the end of each shift.
- At the end of each work shift, remove and contain liquid and solid waste from containment structures, if any, and from the general work area.
- Inspect containment structures for damage prior to use and prior to onset of forecasted rain.

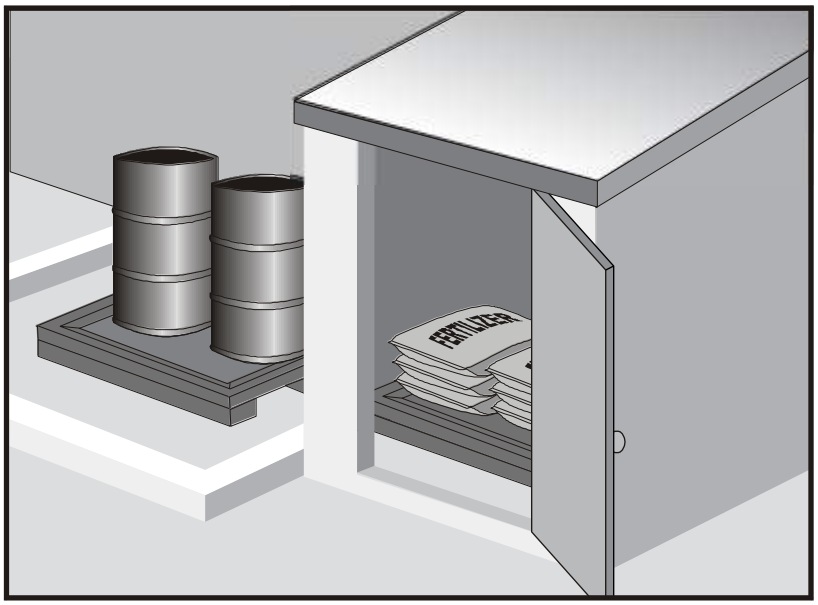
Material Delivery and Storage WM-1



Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

Prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials onsite, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see WM-2, Material Use, or WM-4, Spill Prevention and Control. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

These procedures are suitable for use at all construction sites with delivery and storage of the following materials:

- Soil stabilizers and binders
- Pesticides and herbicides
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease

Targeted Constituents	
Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Asphalt and concrete components
- Hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Concrete compounds
- Other materials that may be detrimental if released to the environment

Limitations

- Space limitation may preclude indoor storage.
- Storage sheds often must meet building and fire code requirements.

Implementation

The following steps should be taken to minimize risk:

- Chemicals must be stored in water tight containers with appropriate secondary containment or in a storage shed.
- When a material storage area is located on bare soil, the area should be lined and bermed.
- Use containment pallets or other practical and available solutions, such as storing materials within newly constructed buildings or garages, to meet material storage requirements.
- Stack erodible landscape material on pallets and cover when not in use.
- Contain all fertilizers and other landscape materials when not in use.
- Temporary storage areas should be located away from vehicular traffic.
- Material Safety Data Sheets (MSDS) should be available on-site for all materials stored that have the potential to effect water quality.
- Construction site areas should be designated for material delivery and storage.
- Material delivery and storage areas should be located away from waterways, if possible.
    - Avoid transport near drainage paths or waterways.
    - Surround with earth berms or other appropriate containment BMP. See EC-9, Earth Dikes and Drainage Swales.
    - Place in an area that will be paved.
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- An up to date inventory of materials delivered and stored onsite should be kept.

- Hazardous materials storage onsite should be minimized.
- Hazardous materials should be handled as infrequently as possible.
- Keep ample spill cleanup supplies appropriate for the materials being stored. Ensure that cleanup supplies are in a conspicuous, labeled area.
- Employees and subcontractors should be trained on the proper material delivery and storage practices.
- Employees trained in emergency spill cleanup procedures must be present when dangerous materials or liquid chemicals are unloaded.
- If significant residual materials remain on the ground after construction is complete, properly remove and dispose of materials and any contaminated soil. See WM-7, Contaminated Soil Management. If the area is to be paved, pave as soon as materials are removed to stabilize the soil.

Material Storage Areas and Practices

- Liquids, petroleum products, and substances listed in 40 CFR Parts 110, 117, or 302 should be stored in approved containers and drums and should not be overfilled. Containers and drums should be placed in temporary containment facilities for storage.
- A temporary containment facility should provide for a spill containment volume able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest container within its boundary, whichever is greater.
- A temporary containment facility should be impervious to the materials stored therein for a minimum contact time of 72 hours.
- A temporary containment facility should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be collected and placed into drums. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. All collected liquids or non-hazardous liquids should be sent to an approved disposal site.
- Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.
- Materials should be covered prior to, and during rain events.
- Materials should be stored in their original containers and the original product labels should be maintained in place in a legible condition. Damaged or otherwise illegible labels should be replaced immediately.

- Bagged and boxed materials should be stored on pallets and should not be allowed to accumulate on the ground. To provide protection from wind and rain throughout the rainy season, bagged and boxed materials should be covered during non-working days and prior to and during rain events.
- Stockpiles should be protected in accordance with WM-3, Stockpile Management.
- Materials should be stored indoors within existing structures or completely enclosed storage sheds when available.
- Proper storage instructions should be posted at all times in an open and conspicuous location.
- An ample supply of appropriate spill clean up material should be kept near storage areas.
- Also see WM-6, Hazardous Waste Management, for storing of hazardous wastes.

Material Delivery Practices

- Keep an accurate, up-to-date inventory of material delivered and stored onsite.
- Arrange for employees trained in emergency spill cleanup procedures to be present when dangerous materials or liquid chemicals are unloaded.

Spill Cleanup

- Contain and clean up any spill immediately.
- Properly remove and dispose of any hazardous materials or contaminated soil if significant residual materials remain on the ground after construction is complete. See WM-7, Contaminated Soil Management.
- See WM-4, Spill Prevention and Control, for spills of chemicals and/or hazardous materials.
- If spills or leaks of materials occur that are not contained and could discharge to surface waters, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

Cost

- The largest cost of implementation may be in the construction of a materials storage area that is covered and provides secondary containment.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Keep storage areas clean and well organized, including a current list of all materials onsite.
- Inspect labels on containers for legibility and accuracy.

- Repair or replace perimeter controls, containment structures, covers, and liners as needed to maintain proper function.

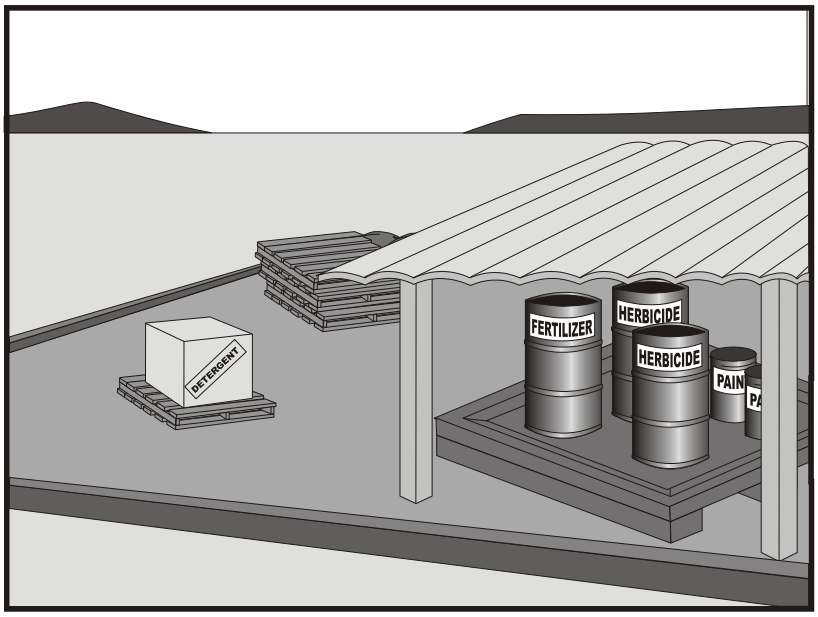
Material Use WM-2



Description and Purpose

Prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use onsite, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for use at all construction projects. These procedures apply when the following materials are used or prepared onsite:

- Pesticides and herbicides
- Fertilizers
- Detergents
- Petroleum products such as fuel, oil, and grease
- Asphalt and other concrete components
- Other hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Other materials that may be detrimental if released to the environment

Legend:

☑ **Primary Category**

☒ **Secondary Category**

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

Safer alternative building and construction products may not be available or suitable in every instance.

Implementation

The following steps should be taken to minimize risk:

- Minimize use of hazardous materials onsite.
- Follow manufacturer instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Train personnel who use pesticides. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct onsite inspections.
- The preferred method of termiticide application is soil injection near the existing or proposed structure foundation/slab; however, if not feasible, soil drench application of termiticides should follow EPA label guidelines and the following recommendations (most of which are applicable to most pesticide applications):
  - Do not treat soil that is water-saturated or frozen.
  - Application shall not commence within 24-hours of a predicted precipitation event with a 40% or greater probability. Weather tracking must be performed on a daily basis prior to termiticide application and during the period of termiticide application.
  - Do not allow treatment chemicals to runoff from the target area. Apply proper quantity to prevent excess runoff. Provide containment for and divert stormwater from application areas using berms or diversion ditches during application.
  - Dry season: Do not apply within 10 feet of storm drains. Do not apply within 25 feet of aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds).
  - Wet season: Do not apply within 50 feet of storm drains or aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds) unless a vegetative buffer is present (if so, refer to dry season requirements).
  - Do not make on-grade applications when sustained wind speeds are above 10 mph (at application site) at nozzle end height.
  - Cover treatment site prior to a rain event in order to prevent run-off of the pesticide into non-target areas. The treated area should be limited to a size that can be backfilled and/or covered by the end of the work shift. Backfilling or covering of the treated area shall be done by the end of the same work shift in which the application is made.
  - The applicator must either cover the soil him/herself or provide written notification of the above requirement to the contractor on site and to the person commissioning the

application (if different than the contractor). If notice is provided to the contractor or the person commissioning the application, then they are responsible under the Federal Insecticide Fungicide, and Rodenticide Act (FIFRA) to ensure that: 1) if the concrete slab cannot be poured over the treated soil within 24 hours of application, the treated soil is covered with a waterproof covering (such as polyethylene sheeting), and 2) the treated soil is covered if precipitation is predicted to occur before the concrete slab is scheduled to be poured.

- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydraulic application. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried offsite by runoff. Do not apply these chemicals before predicted rainfall.
- Train employees and subcontractors in proper material use.
- Supply Material Safety Data Sheets (MSDS) for all materials.
- Dispose of latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths, when thoroughly dry and are no longer hazardous, with other construction debris.
- Do not remove the original product label; it contains important safety and disposal information. Use the entire product before disposing of the container.
- Mix paint indoors or in a containment area. Never clean paintbrushes or rinse paint containers into a street, gutter, storm drain, or watercourse. Dispose of any paint thinners, residue, and sludge(s) that cannot be recycled, as hazardous waste.
- For water-based paint, clean brushes to the extent practicable, and rinse to a drain leading to a sanitary sewer where permitted or contain for proper disposal off site. For oil-based paints, clean brushes to the extent practicable, and filter and reuse thinners and solvents.
- Use recycled and less hazardous products when practical. Recycle residual paints, solvents, non-treated lumber, and other materials.
- Use materials only where and when needed to complete the construction activity. Use safer alternative materials as much as possible. Reduce or eliminate use of hazardous materials onsite when practical.
- Document the location, time, chemicals applied, and applicator's name and qualifications.
- Keep an ample supply of spill clean up material near use areas. Train employees in spill clean up procedures.
- Avoid exposing applied materials to rainfall and runoff unless sufficient time has been allowed for them to dry.
- Discontinue use of erodible landscape material within 2 days prior to a forecasted rain event and materials should be covered and/or bermed.

- Provide containment for material use areas such as masons' areas or paint mixing/preparation areas to prevent materials/pollutants from entering stormwater.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Ensure employees and subcontractors throughout the job are using appropriate practices.

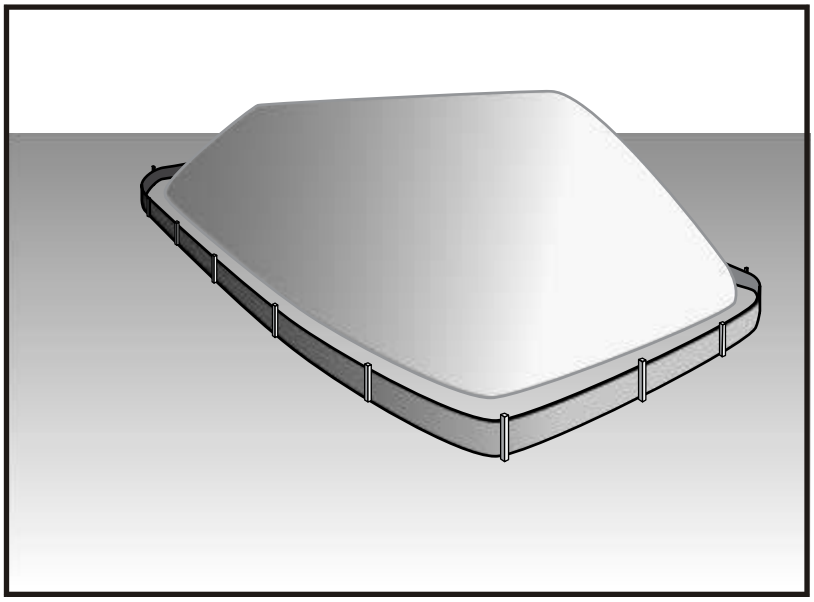
Stockpile Management WM-3



Treat Categories		
EC	Erosion Control	
SE	Sediment Control	☒
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☒
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as Portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called "cold mix" asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of Plastic materials and photodegradable plastics should be avoided.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

Targeted Constituents	
Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- On larger sites, a minimum of 50 ft separation from concentrated flows of stormwater, drainage courses, and inlets is recommended.
- After 14 days of inactivity, a stockpile is non-active and requires further protection described below. All stockpiles are required to be protected as non-active stockpiles immediately if they are not scheduled to be used within 14 days.
- Protect all stockpiles from stormwater run-on using temporary perimeter sediment barriers such as compost berms (SE-13), temporary silt dikes (SE-12), fiber rolls (SE-5), silt fences (SE-1), sandbags (SE-8), gravel bags (SE-6), or biofilter bags (SE-14). Refer to the individual fact sheet for each of these controls for installation information.
- Implement wind erosion control practices as appropriate on all stockpiled material. For specific information, see WE-1, Wind Erosion Control.
- Manage stockpiles of contaminated soil in accordance with WM-7, Contaminated Soil Management.
- Place bagged materials on pallets and under cover.
- Ensure that stockpile coverings are installed securely to protect from wind and rain.
- Some plastic covers withstand weather and sunlight better than others. Select cover materials or methods based on anticipated duration of use.

Protection of Non-Active Stockpiles

A stockpile is considered non-active if it either is not used for 14 days or if it is scheduled not to be used for 14 days or more. Stockpiles need to be protected immediately if they are not scheduled to be used within 14 days. Non-active stockpiles of the identified materials should be protected as follows:

Soil stockpiles

- Soil stockpiles should be covered or protected with soil stabilization measures and a temporary perimeter sediment barrier at all times.
- Temporary vegetation should be considered for topsoil piles that will be stockpiled for extended periods.

Stockpiles of Portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate sub base

- Stockpiles should be covered and protected with a temporary perimeter sediment barrier at all times.

Stockpiles of "cold mix"

- Cold mix stockpiles should be placed on and covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Stockpiles of fly ash, stucco, hydrated lime

- Stockpiles of materials that may raise the pH of runoff (i.e., basic materials) should be covered with plastic and surrounded by a berm.

Stockpiles/Storage of treated wood

- Treated wood should be covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Protection of Active Stockpiles

A stockpile is active when it is being used or is scheduled to be used within 14 days of the previous use. Active stockpiles of the identified materials should be protected as follows:

- All stockpiles should be covered and protected with a temporary linear sediment barrier prior to the onset of precipitation.
- Stockpiles of "cold mix" and treated wood, and basic materials should be placed on and covered with plastic sheeting or comparable material and surrounded by a berm prior to the onset of precipitation.
- The downstream perimeter of an active stockpile should be protected with a linear sediment barrier or berm and runoff should be diverted around or away from the stockpile on the upstream perimeter.

Costs

For cost information associated with stockpile protection refer to the individual erosion or sediment control BMP fact sheet considered for implementation (For example, refer to SE-1 Silt Fence for installation of silt fence around the perimeter of a stockpile.)

Inspection and Maintenance

- Stockpiles must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- It may be necessary to inspect stockpiles covered with plastic sheeting more frequently during certain conditions (for example, high winds or extreme heat).
- Repair and/or replace perimeter controls and covers as needed to keep them functioning properly.
- Sediment shall be removed when it reaches one-third of the barrier height.

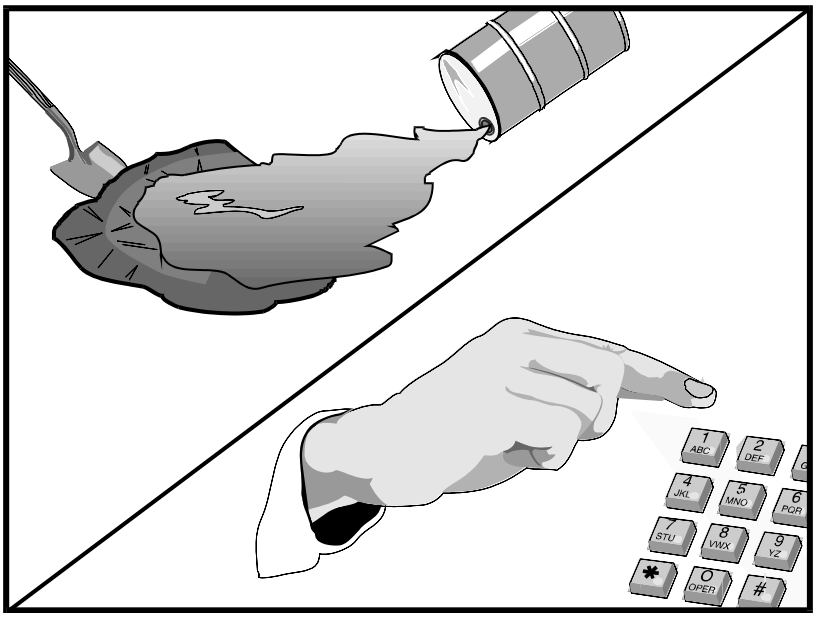
Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), March 2003.

Spill Prevention and Control WM-4



Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Fuels
- Lubricants
- Other petroleum distillates

Limitations

- In some cases, it may be necessary to use a private spill cleanup company.
- This BMP applies to spills caused by the contractor and subcontractors.
- Procedures and practices presented in this BMP are general. Contractor should identify appropriate practices for the specific materials used or stored onsite

Implementation

The following steps will help reduce the stormwater impacts of leaks and spills:

Education

- Be aware that different materials pollute in different amounts. Make sure that each employee knows what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.
- Have contractor's superintendent or representative oversee and enforce proper spill prevention and control measures.

General Measures

- To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110,117, and 302, and sanitary and septic wastes should be contained and cleaned up immediately.
- Store hazardous materials and wastes in covered containers and protect from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals to oversee and enforce control measures.
- Spills should be covered and protected from stormwater runon during rainfall to the extent that it doesn't compromise clean up activities.
- Do not bury or wash spills with water.

- Store and dispose of used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose in conformance with the provisions in applicable BMPs.
- Do not allow water used for cleaning and decontamination to enter storm drains or watercourses. Collect and dispose of contaminated water in accordance with WM-10, Liquid Waste Management.
- Contain water overflow or minor water spillage and do not allow it to discharge into drainage facilities or watercourses.
- Place proper storage, cleanup, and spill reporting instructions for hazardous materials stored or used on the project site in an open, conspicuous, and accessible location.
- Keep waste storage areas clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

Cleanup

- Clean up leaks and spills immediately.
- Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this section for specific information.

Minor Spills

- Minor spills typically involve small quantities of oil, gasoline, paint, etc. which can be controlled by the first responder at the discovery of the spill.
- Use absorbent materials on small spills rather than hosing down or burying the spill.
- Absorbent materials should be promptly removed and disposed of properly.
- Follow the practice below for a minor spill:
  - Contain the spread of the spill.
  - Recover spilled materials.
  - Clean the contaminated area and properly dispose of contaminated materials.

Semi-Significant Spills

- Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.

- Spills should be cleaned up immediately:
  - Contain spread of the spill.
  - Notify the project foreman immediately.
  - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials and do not let the spill spread widely.
  - If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
  - If the spill occurs during rain, cover spill with tarps or other material to prevent contaminating runoff.

Significant/Hazardous Spills

- For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps should be taken:
  - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
  - Notify the Governor's Office of Emergency Services Warning Center, (916) 845-8911.
  - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor should notify the National Response Center at (800) 424-8802.
  - Notification should first be made by telephone and followed up with a written report.
  - The services of a spill's contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staffs have arrived at the job site.
  - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, etc.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hours).

Use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- If maintenance must occur onsite, use a designated area and a secondary containment, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
- Regularly inspect onsite vehicles and equipment for leaks and repair immediately
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under paving equipment when not in use.
- Use absorbent materials on small spills rather than hosing down or burying the spill. Remove the absorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around
- Oil filters disposed of in trashcans or dumpsters can leak oil and pollute stormwater. Place the oil filter in a funnel over a waste oil-recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask the oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur onsite, use designate areas, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
- Discourage "topping off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/ leaks.

Costs

Prevention of leaks and spills is inexpensive. Treatment and/ or disposal of contaminated soil or water can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Keep ample supplies of spill control and cleanup materials onsite, near storage, unloading, and maintenance areas.
- Update your spill prevention and control plan and stock cleanup materials as changes occur in the types of chemicals onsite.

Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Highway planting wastes, including vegetative material, plant containers, and packaging materials

Limitations

Temporary stockpiling of certain construction wastes may not necessitate stringent drainage related controls during the non-rainy season or in desert areas with low rainfall.

Implementation

The following steps will help keep a clean site and reduce stormwater pollution:

- Select designated waste collection areas onsite.
- Inform trash-hauling contractors that you will accept only watertight dumpsters for onsite use. Inspect dumpsters for leaks and repair any dumpster that is not watertight.
- Locate containers in a covered area or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it is windy.
- Cover waste containers at the end of each work day and when it is raining.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Remove this solid waste promptly since erosion and sediment control devices tend to collect litter.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to the trash hauling contractor.
- Arrange for regular waste collection before containers overflow.
- Clean up immediately if a container does spill.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.

Education

- Have the contractor's superintendent or representative oversee and enforce proper solid waste management procedures and practices.
- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.

- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Minimize production of solid waste materials wherever possible.

Collection, Storage, and Disposal

- Littering on the project site should be prohibited.
- To prevent clogging of the storm drainage system, litter and debris removal from drainage grates, trash racks, and ditch lines should be a priority.
- Trash receptacles should be provided in the contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Litter from work areas within the construction limits of the project site should be collected and placed in watertight dumpsters at least weekly, regardless of whether the litter was generated by the contractor, the public, or others. Collected litter and debris should not be placed in or next to drain inlets, stormwater drainage systems, or watercourses.
- Dumpsters of sufficient size and number should be provided to contain the solid waste generated by the project.
- Full dumpsters should be removed from the project site and the contents should be disposed of by the trash hauling contractor.
- Construction debris and waste should be removed from the site biweekly or more frequently as needed.
- Construction material visible to the public should be stored or stacked in an orderly manner.
- Stormwater runon should be prevented from contacting stored solid waste through the use of berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
- Solid waste storage areas should be located at least 50 ft from drainage facilities and watercourses and should not be located in areas prone to flooding or ponding.
- Except during fair weather, construction and highway planting waste not stored in watertight dumpsters should be securely covered from wind and rain by covering the waste with tarps or plastic.
- Segregate potentially hazardous waste from non-hazardous construction site waste.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management. Have hazardous waste hauled to an appropriate disposal and/or recycling facility.
- Salvage or recycle useful vegetation debris, packaging and surplus building materials when practical. For example, trees and shrubs from land clearing can be used as a brush barrier, or converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Inspect construction waste area regularly.
- Arrange for regular waste collection.

Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Hazardous waste management practices are implemented on construction projects that generate waste from the use of:

- Petroleum Products
- Asphalt Products
- Concrete Curing Compounds
- Pesticides
- Palliatives
- Acids
- Septic Wastes
- Paints
- Stains
- Solvents
- Wood Preservatives
- Roofing Tar
- Any materials deemed a hazardous waste in California, Title 22 Division 4.5, or listed in 40 CFR Parts 110, 117, 261, or 302

In addition, sites with existing structures may contain wastes, which must be disposed of in accordance with federal, state, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints
- Asbestos
- PCBs (particularly in older transformers)

Limitations

- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
- Nothing in this BMP relieves the contractor from responsibility for compliance with federal, state, and local laws regarding storage, handling, transportation, and disposal of hazardous wastes.
- This BMP does not cover aerially deposited lead (ADL) soils. For ADL soils refer to WM-7, Contaminated Soil Management.

Implementation

The following steps will help reduce stormwater pollution from hazardous wastes:

Material Use

- Wastes should be stored in sealed containers constructed of a suitable material and should be labeled as required by Title 22 CCR, Division 4.5 and 49 CFR Parts 172, 173, 178, and 179.
- All hazardous waste should be stored, transported, and disposed as required in Title 22 CCR, Division 4.5 and 49 CFR 261-263.
- Waste containers should be stored in temporary containment facilities that should comply with the following requirements:
    - Temporary containment facility should provide for a spill containment volume equal to 1.5 times the volume of all containers able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest tank within its boundary, whichever is greater.
    - Temporary containment facility should be impervious to the materials stored there for a minimum contact time of 72 hours.
    - Temporary containment facilities should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be placed into drums after each rainfall. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. Non-hazardous liquids should be sent to an approved disposal site.
    - Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.

  - Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.

  - Throughout the rainy season, temporary containment facilities should be covered during non-working days, and prior to rain events. Covered facilities may include use of plastic tarps for small facilities or constructed roofs with overhangs.

- Drums should not be overfilled, and wastes should not be mixed.

- Unless watertight, containers of dry waste should be stored on pallets.

- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application. Allow time for infiltration and avoid excess material being carried offsite by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with federal and state regulations.

- Paint brushes and equipment for water and oil-based paints should be cleaned within a contained area and should not be allowed to contaminate site soils, watercourses, or drainage systems. Waste paints, thinners, solvents, residues, and sludges that cannot be recycled or reused should be disposed of as hazardous waste. When thoroughly dry, latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths should be disposed of as solid waste.

- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. “Paint out” brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and reuse thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.

- The following actions should be taken with respect to temporary contaminant:

  - Ensure that adequate hazardous waste storage volume is available.

  - Ensure that hazardous waste collection containers are conveniently located.

  - Designate hazardous waste storage areas onsite away from storm drains or watercourses and away from moving vehicles and equipment to prevent accidental spills.

  - Minimize production or generation of hazardous materials and hazardous waste on the job site.

  - Use containment berms in fueling and maintenance areas and where the potential for spills is high.

  - Segregate potentially hazardous waste from non-hazardous construction site debris.

  - Keep liquid or semi-liquid hazardous waste in appropriate containers (closed drums or similar) and under cover.

- Clearly label all hazardous waste containers with the waste being stored and the date of accumulation.
- Place hazardous waste containers in secondary containment.
- Do not allow potentially hazardous waste materials to accumulate on the ground.
- Do not mix wastes.
- Use all of the product before disposing of the container.
- Do not remove the original product label; it contains important safety and disposal information.

Waste Recycling Disposal

- Select designated hazardous waste collection areas onsite.
- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place hazardous waste containers in secondary containment.
- Do not mix wastes, this can cause chemical reactions, making recycling impossible and complicating disposal.
- Recycle any useful materials such as used oil or water-based paint.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Make sure that hazardous waste (e.g., excess oil-based paint and sludge) is collected, removed, and disposed of only at authorized disposal areas.

Disposal Procedures

- Waste should be disposed of by a licensed hazardous waste transporter at an authorized and licensed disposal facility or recycling facility utilizing properly completed Uniform Hazardous Waste Manifest forms.
- A Department of Health Services certified laboratory should sample waste to determine the appropriate disposal facility.
- Properly dispose of rainwater in secondary containment that may have mixed with hazardous waste.
- Attention is directed to "Hazardous Material", "Contaminated Material", and "Aerially Deposited Lead" of the contract documents regarding the handling and disposal of hazardous materials.

Education

- Educate employees and subcontractors on hazardous waste storage and disposal procedures.
- Educate employees and subcontractors on potential dangers to humans and the environment from hazardous wastes.
- Instruct employees and subcontractors on safety procedures for common construction site hazardous wastes.
- Instruct employees and subcontractors in identification of hazardous and solid waste.
- Hold regular meetings to discuss and reinforce hazardous waste management procedures (incorporate into regular safety meetings).
- The contractor's superintendent or representative should oversee and enforce proper hazardous waste management procedures and practices.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.
- Warning signs should be placed in areas recently treated with chemicals.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- If a container does spill, clean up immediately.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Hazardous waste should be regularly collected.
- A foreman or construction supervisor should monitor onsite hazardous waste storage and disposal procedures.
- Waste storage areas should be kept clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored.
- Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

- Hazardous spills should be cleaned up and reported in conformance with the applicable Material Safety Data Sheet (MSDS) and the instructions posted at the project site.
- The National Response Center, at (800) 424-8802, should be notified of spills of federal reportable quantities in conformance with the requirements in 40 CFR parts 110, 117, and 302. Also notify the Governors Office of Emergency Services Warning Center at (916) 845-8911.
- A copy of the hazardous waste manifests should be provided.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent the discharge of pollutants to stormwater from concrete waste by conducting washout onsite or offsite in a designated area, and by employee and subcontractor training.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials, including mortar, concrete, stucco, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows and raising pH to levels outside the accepted range.

Suitable Applications

Concrete waste management procedures and practices are implemented on construction projects where:

- Concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Slurries containing Portland cement concrete (PCC) are generated, such as from saw cutting, coring, grinding, grooving, and hydro-concrete demolition.
- Concrete trucks and other concrete-coated equipment are washed onsite.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Mortar-mixing stations exist.
- Stucco mixing and spraying.
- See also NS-8, Vehicle and Equipment Cleaning.

Limitations

- Offsite washout of concrete wastes may not always be possible.
- Multiple washouts may be needed to assure adequate capacity and to allow for evaporation.

Implementation

The following steps will help reduce stormwater pollution from concrete wastes:

- Incorporate requirements for concrete waste management into material supplier and subcontractor agreements.
- Store dry and wet materials under cover, away from drainage areas. Refer to WM-1, Material Delivery and Storage for more information.
- Avoid mixing excess amounts of concrete.
- Perform washout of concrete trucks in designated areas only, where washout will not reach stormwater.
- Do not wash out concrete trucks into storm drains, open ditches, streets, streams or onto the ground. Trucks should always be washed out into designated facilities.
- Do not allow excess concrete to be dumped onsite, except in designated areas.
- For onsite washout:
  - On larger sites, it is recommended to locate washout areas at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste.
  - Washout wastes into the temporary washout where the concrete can set, be broken up, and then disposed properly.
  - Washouts shall be implemented in a manner that prevents leaching to underlying soils. Washout containers must be water tight and washouts on or in the ground must be lined with a suitable impervious liner, typically a plastic type material.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stockpile or dispose in the trash.
- See typical concrete washout installation details at the end of this fact sheet.

Education

- Educate employees, subcontractors, and suppliers on the concrete waste management techniques described herein.

- Arrange for contractor's superintendent or representative to oversee and enforce concrete waste management procedures.
- Discuss the concrete management techniques described in this BMP (such as handling of concrete waste and washout) with the ready-mix concrete supplier before any deliveries are made.

Concrete Demolition Wastes

- Stockpile concrete demolition waste in accordance with BMP WM-3, Stockpile Management.
- Dispose of or recycle hardened concrete waste in accordance with applicable federal, state or local regulations.

Concrete Slurry Wastes

- PCC and AC waste should not be allowed to enter storm drains or watercourses.
- PCC and AC waste should be collected and disposed of or placed in a temporary concrete washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below).
- A foreman or construction supervisor should monitor onsite concrete working tasks, such as saw cutting, coring, grinding and grooving to ensure proper methods are implemented.
- Saw-cut concrete slurry should not be allowed to enter storm drains or watercourses. Residue from grinding operations should be picked up by means of a vacuum attachment to the grinding machine or by sweeping. Saw cutting residue should not be allowed to flow across the pavement and should not be left on the surface of the pavement. See also NS-3, Paving and Grinding Operations; and WM-10, Liquid Waste Management.
- Concrete slurry residue should be disposed in a temporary washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below) and allowed to dry. Dispose of dry slurry residue in accordance with WM-5, Solid Waste Management.

Onsite Temporary Concrete Washout Facility, Transit Truck Washout Procedures

- Temporary concrete washout facilities should be located a minimum of 50 ft from storm drain inlets, open drainage facilities, and watercourses. Each facility should be located away from construction traffic or access areas to prevent disturbance or tracking.
- A sign should be installed adjacent to each washout facility to inform concrete equipment operators to utilize the proper facilities.
- Temporary concrete washout facilities should be constructed above grade or below grade at the option of the contractor. Temporary concrete washout facilities should be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations.

- Temporary washout facilities should have a temporary pit or bermed areas of sufficient volume to completely contain all liquid and waste concrete materials generated during washout procedures.
- Temporary washout facilities should be lined to prevent discharge to the underlying ground or surrounding area.
- Washout of concrete trucks should be performed in designated areas only.
- Only concrete from mixer truck chutes should be washed into concrete wash out.
- Concrete washout from concrete pumper bins can be washed into concrete pumper trucks and discharged into designated washout area or properly disposed of or recycled offsite.
- Once concrete wastes are washed into the designated area and allowed to harden, the concrete should be broken up, removed, and disposed of per WM-5, Solid Waste Management. Dispose of or recycle hardened concrete on a regular basis.
- Temporary Concrete Washout Facility (Type Above Grade)
    - Temporary concrete washout facility (type above grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft; however, smaller sites or jobs may only need a smaller washout facility. With any washout, always maintain a sufficient quantity and volume to contain all liquid and concrete waste generated by washout operations.
    - Materials used to construct the washout area should conform to the provisions detailed in their respective BMPs (e.g., SE-8 Sandbag Barrier).
    - Plastic lining material should be a minimum of 10 mil in polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.
    - Alternatively, portable removable containers can be used as above grade concrete washouts. Also called a “roll-off”; this concrete washout facility should be properly sealed to prevent leakage and should be removed from the site and replaced when the container reaches 75% capacity.
- Temporary Concrete Washout Facility (Type Below Grade)
    - Temporary concrete washout facilities (type below grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft. The quantity and volume should be sufficient to contain all liquid and concrete waste generated by washout operations.
    - Lath and flagging should be commercial type.
    - Plastic lining material should be a minimum of 10 mil polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.

- The base of a washout facility should be free of rock or debris that may damage a plastic liner.

Removal of Temporary Concrete Washout Facilities

- When temporary concrete washout facilities are no longer required for the work, the hardened concrete should be removed and properly disposed or recycled in accordance with federal, state or local regulations. Materials used to construct temporary concrete washout facilities should be removed from the site of the work and properly disposed or recycled in accordance with federal, state or local regulations.

- Holes, depressions or other ground disturbance caused by the removal of the temporary concrete washout facilities should be backfilled and repaired.

Costs

All of the above are low cost measures. Roll-off concrete washout facilities can be more costly than other measures due to removal and replacement; however, provide a cleaner alternative to traditional washouts. The type of washout facility, size, and availability of materials will determine the cost of the washout.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Temporary concrete washout facilities should be maintained to provide adequate holding capacity with a minimum freeboard of 4 in. for above grade facilities and 12 in. for below grade facilities. Maintaining temporary concrete washout facilities should include removing and disposing of hardened concrete and returning the facilities to a functional condition. Hardened concrete materials should be removed and properly disposed or recycled in accordance with federal, state or local regulations.

- Washout facilities must be cleaned, or new facilities must be constructed and ready for use once the washout is 75% full.

- Inspect washout facilities for damage (e.g. torn liner, evidence of leaks, signage, etc.). Repair all identified damage.

Description and Purpose

Proper sanitary and septic waste management prevent the discharge of pollutants to stormwater from sanitary and septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

Suitable Applications

Sanitary septic waste management practices are suitable for use at all construction sites that use temporary or portable sanitary and septic waste systems.

Limitations

None identified.

Implementation

Sanitary or septic wastes should be treated or disposed of in accordance with state and local requirements. In many cases, one contract with a local facility supplier will be all that it takes to make sure sanitary wastes are properly disposed.

Storage and Disposal Procedures

- Temporary sanitary facilities should be located away from drainage facilities, watercourses, and from traffic circulation. If site conditions allow, place portable facilities a minimum of 50 feet from drainage conveyances and traffic areas. When subjected to high winds or risk of high winds, temporary sanitary facilities should be secured to prevent overturning.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Temporary sanitary facilities must be equipped with containment to prevent discharge of pollutants to the stormwater drainage system of the receiving water.
- Consider safety as well as environmental implications before placing temporary sanitary facilities.
- Wastewater should not be discharged or buried within the project site.
- Sanitary and septic systems that discharge directly into sanitary sewer systems, where permissible, should comply with the local health agency, city, county, and sewer district requirements.
- Only reputable, licensed sanitary and septic waste haulers should be used.
- Sanitary facilities should be located in a convenient location.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an onsite disposal system (OSDS), such as a septic system, local health agency requirements must be followed.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- Sanitary and septic facilities should be maintained in good working order by a licensed service.
- Regular waste collection by a licensed hauler should be arranged before facilities overflow.
- If a spill does occur from a temporary sanitary facility, follow federal, state and local regulations for containment and clean-up.

Education

- Educate employees, subcontractors, and suppliers on sanitary and septic waste storage and disposal procedures.
- Educate employees, subcontractors, and suppliers of potential dangers to humans and the environment from sanitary and septic wastes.
- Instruct employees, subcontractors, and suppliers in identification of sanitary and septic waste.
- Hold regular meetings to discuss and reinforce the use of sanitary facilities (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.

Costs

All of the above are low cost measures.

Sanitary/Septic Waste Management WM-9

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for regular waste collection.
- If high winds are expected, portable sanitary facilities must be secured with spikes or weighed down to prevent over turning.
- If spills or leaks from sanitary or septic facilities occur that are not contained and discharge from the site, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

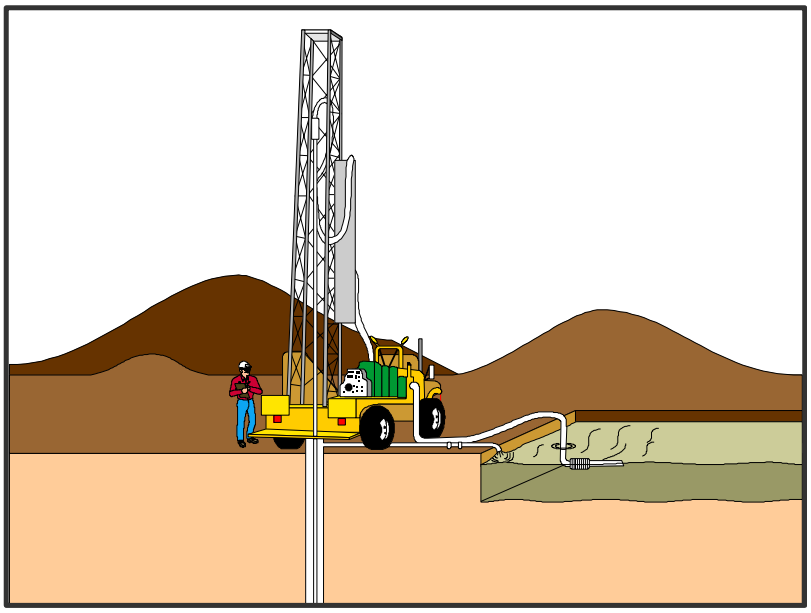
Liquid Waste Management WM-10



Description and Purpose

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Suitable Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous by-products, residuals, or wastes:

- Drilling slurries and drilling fluids
- Grease-free and oil-free wastewater and rinse water
- Dredgings
- Other non-stormwater liquid discharges not permitted by separate permits

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Liquid waste management does not apply to dewatering operations (NS-2 Dewatering Operations), solid waste management (WM-5, Solid Waste Management), hazardous wastes (WM-6, Hazardous Waste Management), or

concrete slurry residue (WM-8, Concrete Waste Management).

- Typical permitted non-stormwater discharges can include: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; flows from riparian habitats and wetlands; and discharges or flows from emergency fire fighting activities.

Implementation

General Practices

- Instruct employees and subcontractors how to safely differentiate between non-hazardous liquid waste and potential or known hazardous liquid waste.
- Instruct employees, subcontractors, and suppliers that it is unacceptable for any liquid waste to enter any storm drainage device, waterway, or receiving water.
- Educate employees and subcontractors on liquid waste generating activities and liquid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Verify which non-stormwater discharges are permitted by the statewide NPDES permit; different regions might have different requirements not outlined in this permit.
- Apply NS-8, Vehicle and Equipment Cleaning for managing wash water and rinse water from vehicle and equipment cleaning operations.

Containing Liquid Wastes

- Drilling residue and drilling fluids should not be allowed to enter storm drains and watercourses and should be disposed of.
- If an appropriate location is available, drilling residue and drilling fluids that are exempt under Title 23, CCR § 2511(g) may be dried by infiltration and evaporation in a containment facility constructed in conformance with the provisions concerning the Temporary Concrete Washout Facilities detailed in WM-8, Concrete Waste Management.
- Liquid wastes generated as part of an operational procedure, such as water-laden dredged material and drilling mud, should be contained and not allowed to flow into drainage channels or receiving waters prior to treatment.
- Liquid wastes should be contained in a controlled area such as a holding pit, sediment basin, roll-off bin, or portable tank.
- Containment devices must be structurally sound and leak free.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated.

- Precautions should be taken to avoid spills or accidental releases of contained liquid wastes. Apply the education measures and spill response procedures outlined in WM-4, Spill Prevention and Control.

- Containment areas or devices should not be located where accidental release of the contained liquid can threaten health or safety or discharge to water bodies, channels, or storm drains.

Capturing Liquid Wastes

- Capture all liquid wastes that have the potential to affect the storm drainage system (such as wash water and rinse water from cleaning walls or pavement), before they run off a surface.

- Do not allow liquid wastes to flow or discharge uncontrolled. Use temporary dikes or berms to intercept flows and direct them to a containment area or device for capture.

- Use a sediment trap (SE-3, Sediment Trap) for capturing and treating sediment laden liquid waste or capture in a containment device and allow sediment to settle.

Disposing of Liquid Wastes

- A typical method to handle liquid waste is to dewater the contained liquid waste, using procedures such as described in NS-2, Dewatering Operations, and SE-2, Sediment Basin, and dispose of resulting solids per WM-5, Solid Waste Management.

- Methods of disposal for some liquid wastes may be prescribed in Water Quality Reports, NPDES permits, Environmental Impact Reports, 401 or 404 permits, and local agency discharge permits, etc. Review the SWPPP to see if disposal methods are identified.

- Liquid wastes, such as from dredged material, may require testing and certification whether it is hazardous or not before a disposal method can be determined.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management.

- If necessary, further treat liquid wastes prior to disposal. Treatment may include, though is not limited to, sedimentation, filtration, and chemical neutralization.

Costs

Prevention costs for liquid waste management are minimal. Costs increase if cleanup or fines are involved.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect weekly during the rainy season and of two-week intervals in the non-rainy season to verify continued BMP implementation.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.

- Remove deposited solids in containment areas and capturing devices as needed and at the completion of the task. Dispose of any solids as described in WM-5, Solid Waste Management.
- Inspect containment areas and capturing devices and repair as needed.

I. BACKGROUND

A. History

In 1972, the Federal Water Pollution Control Act (also referred to as the Clean Water Act [CWA]) was amended to provide that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 amendments to the CWA added Section 402(p), which establishes a framework for regulating municipal and industrial storm water discharges under the NPDES Program. On November 16, 1990, the U.S. Environmental Protection Agency (USEPA) published final regulations that established storm water permit application requirements for specified categories of industries. The regulations provide that discharges of storm water to waters of the United States from construction projects that encompass five or more acres of soil disturbance are effectively prohibited unless the discharge is in compliance with an NPDES Permit. Regulations (Phase II Rule) that became final on December 8, 1999 lowered the permitting threshold from five acres to one acre.

While federal regulations allow two permitting options for storm water discharges (Individual Permits and General Permits), the State Water Board has elected to adopt only one statewide General Permit at this time that will apply to most storm water discharges associated with construction activity.

On August 19, 1999, the State Water Board reissued the General Construction Storm Water Permit (Water Quality Order 99-08-DWQ). On December 8, 1999 the State Water Board amended Order 99-08-DWQ to apply to sites as small as one acre.

The General Permit accompanying this fact sheet regulates storm water runoff from construction sites. Regulating many storm water discharges under one permit will greatly reduce the administrative burden associated with permitting individual storm water discharges. To obtain coverage under this General Permit, dischargers shall electronically file the Permit Registration Documents (PRDs), which includes a Notice of Intent (NOI), Storm Water Pollution Prevention Plan (SWPPP), and other compliance related documents required by this General Permit and mail the appropriate permit fee to the State Water Board. It is expected that as the storm water program develops, the Regional Water Quality Control Boards (Regional Water Boards) may issue General Permits or Individual Permits containing more specific permit provisions. When this occurs, this General Permit will no longer regulate those dischargers.

B. Legal Challenges and Court Decisions

1. Early Court Decisions

Shortly after the passage of the CWA, the USEPA promulgated regulations exempting most storm water discharges from the NPDES permit requirements. (See 40 C.F.R. § 125.4 (1975); see also *Natural Resources Defense Council v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1372 (*Costle*); *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1163 (*Defenders of Wildlife*).) When environmental groups challenged this exemption in federal court, the District of Columbia Court of Appeals invalidated the regulation, holding that the USEPA "does not have authority to exempt categories of point sources from the permit requirements of [CWA] § 402." (*Costle*, 568 F.2d at 1377.) The *Costle* court rejected the USEPA's argument that effluent-based storm sewer regulation was administratively infeasible because of the variable nature of storm water pollution and the number of affected storm sewers throughout the country. (*Id.* at 1377-82.) Although the court acknowledged the practical problems relating to storm sewer regulation, the court found the USEPA had the flexibility under the CWA to design regulations that would overcome these problems. (*Id.* at 1379-83.) In particular, the court pointed to general permits and permits based on requiring best management practices (BMPs).

During the next 15 years, the USEPA made numerous attempts to reconcile the statutory requirement of point source regulation with the practical problem of regulating possibly millions of diverse point source discharges of storm water. (See *Defenders of Wildlife*, 191 F.3d at 1163; see also Gallagher, Clean Water Act in Environmental Law Handbook (Sullivan, edit., 2003)
p. 300 (Environmental Law Handbook); Eisen, *Toward a Sustainable Urbanism: Lessons from Federal Regulation of Urban Storm Water Runoff* (1995) 48 Wash. U.J. Urb. & Contemp. L.1, 40-41 [Regulation of Urban Storm Water Runoff].)

In 1987, Congress amended the CWA to require NPDES permits for storm water discharges. (See CWA § 402(p), 33 U.S.C. § 1342(p); *Defenders of Wildlife,* 191 F.3d at 1163; *Natural Resources Defense Council v. USEPA* (9th Cir. 1992) 966 F.2d 1292, 1296.) In these amendments, enacted as part of the Water Quality Act of 1987, Congress distinguished between industrial and municipal storm water discharges. With respect to industrial storm water discharges, Congress provided that NPDES permits "shall meet all applicable provisions of this section and section 1311 [requiring the USEPA to establish effluent limitations under specific timetables]." (CWA § 402(p)(3)(A), 33 U.S.C. § 1342(p)(3)(A); see also *Defenders of Wildlife,* 191 F.3d at 1163-64.)

In 1990, USEPA adopted regulations specifying what activities were considered "industrial" and thus required discharges of storm water associated with those activities to obtain coverage under NPDES permits. (55 Fed. Reg. 47,990 (1990); 40 C.F.R. § 122.26(b)(14).) Construction activities, deemed a subset of the industrial activities category, must also be regulated by an NPDES permit. (40 C.F.R. § 122.26(b)(14)(x)). In 1999, USEPA issued regulations for "Phase II" of storm water regulation, which required most small construction sites (1-5 acres) to be regulated under the NPDES program. (64 Fed. Reg. 68,722; 40 C.F.R. § 122.26(b)(15)(i).)

2. Court Decisions on Public Participation

Two recent federal court opinions have vacated USEPA rules that denied meaningful public review of NPDES permit conditions. On January 14, 2003, the Ninth Circuit Court of Appeals held that certain aspects of USEPA's Phase II regulations governing MS4s were invalid primarily because the general permit did not contain express requirements for public participation. (*Environmental Defense Center v. USEPA* (9th Cir. 2003) 344 F.3d 832.) Specifically, the court determined that applications for general permit coverage (including the Notice of Intent (NOI) and Storm Water Management Program (SWMP)) must be made available to the public, the applications must be reviewed and determined to meet the applicable standard by the permitting authority before coverage commences, and there must be a process to accommodate public hearings. (*Id.* at 852-54.) Similarly, on February 28, 2005, the Second Circuit Court of Appeals held that the USEPA's confined animal feeding operation (CAFO) rule violated the CWA because it allowed dischargers to write their own nutrient management plans without public review. (*Waterkeeper Alliance v. USEPA* (2d Cir. 2005) 399 F.3d 486.) Although neither decision involved the issuance of construction storm water permits, the State Water Board's Office of Chief Counsel has recommended that the new General Permit address the courts' rulings where feasible[1].

[1] In *Texas Independent Producers and Royalty Owners Assn. v. USEPA* (7th Cir. 2005) 410 F.3d 964, the Seventh Circuit Court of Appeals held that the USEPA's construction general permit was not required to provide the public with the opportunity for a public hearing on the Notice of Intent or Storm Water Pollution Prevention Plan. The Seventh Circuit briefly discussed why it agreed with the Ninth Circuit's dissent in *Environmental Defense Center*, but

The CWA and the USEPA's regulations provide states with the discretion to formulate permit terms, including specifying best management practices (BMPs), to achieve strict compliance with federal technology-based and water quality-based standards. (*Natural Resources Defense Council v. USEPA* (9th Cir. 1992) 966 F.2d 1292, 1308.) Accordingly, this General Permit has developed specific BMPs as well as numeric action levels (NALs) in order to achieve these minimum federal standards. In addition, the General Permit requires a SWPPP and REAP (another dynamic, site-specific plan) to be developed but has removed all language requiring the discharger to implement these plans – instead, the discharger is required to comply with specific requirements. By requiring the dischargers to implement these specific BMPs and NALs, this General Permit ensures that the dischargers do not "write their own permits." As a result this General Permit does not require each discharger's SWPPP and REAP to be reviewed and approved by the Regional Water Boards.

This General Permit also requires dischargers to electronically file all permit-related compliance documents. These documents include, but are not limited to, NOIs, SWPPPs, annual reports, Notice of Terminations (NOTs), and numeric action level (NAL) exceedance reports. Electronically submitted compliance information is immediately available to the public, as well as the Regional Water Quality Control Board (Regional Water Board) offices, via the Internet. In addition, this General Permit enables public review and hearings on permit applications when appropriate. Under this General Permit, the public clearly has a meaningful opportunity to participate in the permitting process.

---

generally did not discuss the substantive holdings in *Environmental Defense Center* and *Waterkeeper Alliance*, because neither court addressed the initial question of whether the plaintiffs had standing to challenge the permits at issue. However, notwithstanding the Seventh Circuit's decision, it is not binding or controlling on the State Water Board because California is located within the Ninth Circuit.

C. Blue Ribbon Panel of Experts and Feasibility of Numeric Effluent Limitations

In 2005 and 2006, the State Water Board convened an expert panel (panel) to address the feasibility of numeric effluent limitations (NELs) in California's storm water permits. Specifically, the panel was asked to address:

"Is it technically feasible to establish numeric effluent limitations, or some other quantifiable limit, for inclusion in storm water permits? How would such limitations or criteria be established, and what information and data would be required?"

"The answers should address industrial general permits, construction general permits, and area-wide municipal permits. The answers should also address both technology-based limitations or criteria and water quality-based limitations or criteria. In evaluating establishment of any objective criteria, the panel should address all of the following:

The ability of the State Water Board to establish appropriate objective limitations or criteria;

How compliance determinations would be made;

The ability of dischargers and inspectors to monitor for compliance; and

The technical and financial ability of dischargers to comply with the limitations or criteria."

Through a series of public participation processes (State Water Board meetings, State Water Board workshops, and the solicitation of written comments), a number of water quality, public process and overall program effectiveness problems were identified. Some of these problems are addressed through this General Permit.

D. Summary of Panel Findings on Construction Activities

The panel's final report can be downloaded and viewed through links at www.waterboards.ca.gov or by clicking here[2].

The panel made the following observations:

"Limited field studies indicate that traditional erosion and sediment controls are highly variable in performance, resulting in highly variable turbidity levels in the site discharge."

"Site-to-site variability in runoff turbidity from undeveloped sites can also be quite large in many areas of California, particularly in more arid regions with less natural vegetative cover and steep slopes."

[2] http://www.waterboards.ca.gov/stormwtr/docs/numeric/swpanel_final_report.pdf

"Active treatment technologies involving the use of polymers with relatively large storage systems now exist that can provide much more consistent and very low discharge turbidity. However, these technologies have as yet only been applied to larger construction sites, generally five acres or greater. Furthermore, toxicity has been observed at some locations, although at the vast majority of sites, toxicity has not occurred. There is also the potential for an accidental large release of such chemicals with their use."

"To date most of the construction permits have focused on TSS and turbidity, but have not addressed other, potentially significant pollutants such as phosphorus and an assortment of chemicals used at construction sites."

"Currently, there is no required training or certification program for contractors, preparers of soil erosion and sediment control Storm Water Pollution Prevention Plans, or field inspectors."

"The quality of storm water discharges from construction sites that effectively employ BMPs likely varies due to site conditions such as climate, soil, and topography."

"The States of Oregon and Washington have recently adopted similar concepts to the Action Levels described earlier."

In addition, the panel made the following conclusions:

"It is the consensus of the Panel that active treatment technologies make Numeric Limits technically feasible for pollutants commonly associated with storm water discharges from construction sites (e.g. TSS and turbidity) for larger construction sites. Technical practicalities and cost-effectiveness may make these technologies less feasible for smaller sites, including small drainages within a larger site, as these technologies have seen limited use at small construction sites. If chemical addition is not permitted, then Numeric Limits are not likely feasible."

"The Board should consider Numeric Limits or Action Levels for other pollutants of relevance to construction sites, but in particular pH. It is of particular concern where fresh concrete or wash water from cement mixers/equipment is exposed to storm water."

"The Board should consider the phased implementation of Numeric Limits and Action Levels, commensurate with the capacity of the dischargers and support industry to respond."

E. How the Panel's Findings are Used in this General Permit

The State Water Board carefully considered the findings of the panel and related public comments. The State Water Board also reviewed and considered the comments regarding statewide storm water policy and the reissuance of the Industrial General Permit. From the input received the State Water Board identified some permit and program performance gaps that are addressed in this General Permit. The Summary of Significant Changes (below) in this General Permit are a direct result of this process.

F. Summary of Significant Changes in This General Permit

The State Water Board has significant changes to Order 99-08-DWQ. This General Permit differs from Order 99-08-DWQ in the following significant ways:

Rainfall Erosivity Waiver: this General Permit includes the option allowing a small construction site (>1 and <5 acres) to self-certify if the rainfall erosivity value (R value) for their site's given location and time frame compute to be less than or equal to 5.

Technology-Based Numeric Action Levels: this General Permit includes NALs for pH and turbidity.

Risk-Based Permitting Approach: this General Permit establishes three levels of risk possible for a construction site. Risk is calculated in two parts: 1) Project Sediment Risk, and 2) Receiving Water Risk.

Minimum Requirements Specified: this General Permit imposes more minimum BMPs and requirements that were previously only required as elements of the SWPPP or were suggested by guidance.

Project Site Soil Characteristics Monitoring and Reporting: this General Permit provides the option for dischargers to monitor and report the soil characteristics at their project location. The primary purpose of this requirement is to provide better risk determination and eventually better program evaluation.

Effluent Monitoring and Reporting: this General Permit requires effluent monitoring and reporting for pH and turbidity in storm water discharges. The purpose of this monitoring is to evaluate whether NALs and NELs for Active Treatment Systems included in this General Permit are exceeded.

Receiving Water Monitoring and Reporting: this General Permit requires some Risk Level 3 and LUP Type 3 dischargers to monitor receiving waters and conduct bioassessments.

Post-Construction Storm Water Performance Standards: this General Permit specifies runoff reduction requirements for all sites not covered by a Phase I or Phase II MS4 NPDES permit, to avoid, minimize and/or mitigate post-construction storm water runoff impacts.

Rain Event Action Plan: this General Permit requires certain sites to develop and implement a Rain Event Action Plan (REAP) that must be designed to protect all exposed portions of the site within 48 hours prior to any likely precipitation event.

Annual Reporting: this General Permit requires all projects that are enrolled for more than one continuous three-month period to submit information and annually certify that their site is in compliance with these requirements. The primary purpose of this requirement is to provide information needed for overall program evaluation and pubic information.

Certification/Training Requirements for Key Project Personnel: this General Permit requires that key personnel (e.g., SWPPP preparers, inspectors, etc.) have specific training or certifications to ensure their level of knowledge and skills are adequate to ensure their ability to design and evaluate project specifications that will comply with General Permit requirements.

Linear Underground/Overhead Projects: this General Permit includes requirements for all Linear Underground/Overhead Projects (LUPs).

II. RATIONALE

A. General Permit Approach

A general permit for construction activities is an appropriate permitting approach for the following reasons:

1. A general permit is an efficient method to establish the essential regulatory requirements for a broad range of construction activities under differing site conditions;

2. A general permit is the most efficient method to handle the large number of construction storm water permit applications;

3. The application process for coverage under a general permit is far less onerous than that for individual permit and hence more cost effective;

4. A general permit is consistent with USEPA's four-tier permitting strategy, the purpose of which is to use the flexibility provided by the CWA in designing a workable and efficient permitting system; and

5. A general permit is designed to provide coverage for a group of related facilities or operations of a specific industry type or group of industries. It is appropriate when the discharge characteristics are sufficiently similar, and a standard set of permit requirements can effectively provide environmental protection and comply with water quality standards for discharges. In most cases, the general permit will provide sufficient and appropriate management requirements to protect the quality of receiving waters from discharges of storm water from construction sites.

There may be instances where a general permit is not appropriate for a specific construction project. A Regional Water Board may require any discharger otherwise covered under the General Permit to apply for and obtain an Individual Permit or apply for coverage under a more specific General Permit. The Regional Water Board must determine that this General Permit does not provide adequate assurance that water quality will be protected, or that there is a site-specific reason why an individual permit should be required.

B. Construction Activities Covered

1. **Construction activity subject to this General Permit:**

Any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre.

Construction activity that results in land surface disturbances of less than one acre if the construction activity is part of a larger common plan of development or sale of one or more acres of disturbed land surface.

Construction activity related to residential, commercial, or industrial development on lands currently used for agriculture including, but not limited to, the construction of buildings related to agriculture that are considered industrial pursuant to USEPA regulations, such as dairy barns or food processing facilities.

Construction activity associated with LUPs including, but not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete

and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

Discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.[3]

Storm water discharges from dredge spoil placement that occur outside of U.S. Army Corps of Engineers jurisdiction[4] (upland sites) and that disturb one or more acres of land surface from construction activity are covered by this General Permit. Construction projects that intend to disturb one or more acres of land within the jurisdictional boundaries of a CWA § 404 permit should contact the appropriate Regional Water Board to determine whether this permit applies to the project.

2. Linear Underground/Overhead Projects (LUPs) subject to this General Permit:

Underground/overhead facilities typically constructed as LUPs include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water, wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g., telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

Water Quality Order 2003-0007-DWQ regulated construction activities associated with small LUPs that resulted in land disturbances greater than one acre, but less than five acres. These projects were considered non-traditional construction projects. Attachment A of this Order now regulates all construction activities from LUPs resulting in land disturbances greater than one acre.

3. Common Plan of Development or Sale

USEPA regulations include the term “common plan of development or sale” to ensure that acreage within a common project does not artificially escape the permit requirements because construction activities are phased, split among smaller parcels, or completed by different owners/developers. In the absence of an

---

[3] Pursuant to the Ninth Circuit Court of Appeals’ decision in *NRDC v. EPA* (9th Cir. 2008) 526 F.3d 591, and subsequent denial of the USEPA’s petition for reconsideration in November 2008, oil and gas construction activities discharging storm water contaminated only with sediment are no longer exempt from the NPDES program.

[4] A construction site that includes a dredge and/or fill discharge to any water of the United States (e.g., wetland, channel, pond, or marine water) requires a CWA Section 404 permit from the U.S. Army Corps of Engineers and a CWA Section 401 Water Quality Certification from the Regional Water Board or State Water Board.

exact definition of “common plan of development or sale,” the State Water Board is required to exercise its regulatory discretion in providing a common sense interpretation of the term as it applies to construction projects and permit coverage. An overbroad interpretation of the term would render meaningless the clear “one acre” federal permitting threshold and would potentially trigger permitting of almost any construction activity that occurs within an area that had previously received area-wide utility or road improvements.

Construction projects generally receive grading and/or building permits (Local Permits) from local authorities prior to initiating construction activity. These Local Permits spell out the scope of the project, the parcels involved, the type of construction approved, etc. Referring to the Local Permit helps define “common plan of development or sale.” In cases such as tract home development, a Local Permit will include all phases of the construction project including rough grading, utility and road installation, and vertical construction. All construction activities approved in the Local Permit are part of the common plan and must remain under the General Permit until construction is completed. For custom home construction, Local Permits typically only approve vertical construction as the rough grading, utilities, and road improvements were already independently completed under the a previous Local Permit. In the case of a custom home site, the homeowner must submit plans and obtain a distinct and separate Local Permit from the local authority in order to proceed. It is not the intent of the State Water Board to require permitting for an individual homeowner building a custom home on a private lot of less than one acre if it is subject to a separate Local Permit. Similarly, the installation of a swimming pool, deck, or landscaping that disturbs less than one acre that was not part of any previous Local Permit are not required to be permitted.

The following are several examples of construction activity of less than one acre that would require permit coverage:

a. A landowner receives a building permit(s) to build tract homes on a 100-acre site split into 200 one-third acre parcels, (the remaining acreage consists of streets and parkways) which are sold to individual homeowners as they are completed. The landowner completes and sells all the parcels except for two. Although the remaining two parcels combined are less than one acre, the landowner must continue permit coverage for the two parcels.

b. One of the parcels discussed above is sold to another owner who intends to complete the construction as already approved in the Local Permit. The new landowner must file Permit Registration Documents (PRDs) to complete the construction even if the new landowner is required to obtain a separate Local Permit.

c. Landowner in (1) above purchases 50 additional one half-acre parcels adjacent to the original 200-acre project. The landowner seeks a Local Permit (or amendment to existing Local permit) to build on 20 parcels while leaving the remaining 30 parcels for future development. The landowner must amend PRDs to include the 20 parcels 14 days prior to commencement of construction activity on those parcels.

C. Construction Activities Not Covered

1. Traditional Construction Projects Not Covered

This General Permit does not apply to the following construction activity:

a. Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility.

b. Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation.

c. Discharges of storm water from areas on tribal lands; construction on tribal lands is regulated by a federal permit.

d. Discharges of storm water within the Lake Tahoe Hydrologic Unit. The Lahontan Regional Water Board has adopted its own permit to regulate storm water discharges from construction activity in the Lake Tahoe Hydrologic Unit (Regional Water Board 6SLT). Owners of construction projects in this watershed must apply for the Lahontan Regional Water Board permit rather than the statewide Construction General Permit. Construction projects within the Lahontan region must also comply with the Lahontan Region Project Guideline for Erosion Control (R6T-2005-0007 Section), which can be found at **http://www.waterboards.ca.gov/lahontan/Adopted_Orders/2005/r6t_2005_0007.pdf**

e. Construction activity that disturbs less than one acre of land surface, unless part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

f. Construction activity covered by an individual NPDES Permit for storm water discharges.

g. Landfill construction activity that is subject to the Industrial General Permit.

h. Construction activity that discharges to Combined Sewer Systems.

i. Conveyances that discharge storm water runoff combined with municipal sewage.

j. Discharges of storm water identified in CWA § 402(*l*)(2), 33 U.S.C. § 1342(*l*)(2).

2. **Linear Projects Not Covered**

a. LUP construction activity does not include linear routine maintenance projects. Routine maintenance projects are projects associated with operations and maintenance activities that are conducted on existing lines and facilities and within existing right-of-way, easements, franchise agreements, or other legally binding agreements of the discharger. Routine maintenance projects include, but are not limited to projects that are conducted to:

i. Maintain the original purpose of the facility or hydraulic capacity.

ii. Update existing lines[5] and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

iii. Repairing leaks.

[5]Update existing lines includes replacing existing lines with new materials or pipes.

Routine maintenance does not include construction of new[6] lines or facilities resulting from compliance with applicable codes, standards, and regulations.

Routine maintenance projects do not include those areas of maintenance projects that are outside of an existing right-of-way, franchise, easements, or agreements. When a project must secure new areas, those areas may be subject to this General Permit based on the area of disturbed land outside the original right-of-way, easement, or agreement.

b. LUP construction activity does not include field activities associated with the planning and design of a project (e.g., activities associated with route selection).

c. Tie-ins conducted immediately adjacent to "energized" or "pressurized" facilities by the discharger are not considered construction activities where all other LUP construction activities associated with the tie-in are covered by an NOI and SWPPP of a third party or municipal agency.

3. **EPA's Small Construction Rainfall Erosivity Waiver**

EPA's Storm Water Phase II Final Rule provides the option for a Small Construction Rainfall Erosivity Waiver. This waiver applies to small construction sites between 1 and 5 acres, and allows permitting authorities to waive those sites that do not have adverse water quality impacts.

Dischargers eligible for this waiver are exempt from Construction General Permit Coverage. In order to obtain the waiver, the discharger must certify to the State Water Board that small construction activity will occur only when the rainfall erosivity factor is less than 5 ("R" in the Revised Universal Soil Loss Equation). The period of construction activity begins at initial earth disturbance and ends with final stabilization. Where vegetation will be used for final stabilization, the date of installation of a practice that provides interim non-vegetative stabilization can be used for the end of the construction period. The operator must agree (as a condition waiver eligibility) to periodically inspect and properly maintain the area until the criteria for final stabilization as defined in the General Permit have been met. If use of this interim stabilization eligibility condition was relied on to qualify for the waiver, signature on the waiver with a certification statement constitutes acceptance of and commitment to complete the final stabilization process. The discharger must submit a waiver certification to the State Board prior to commencing construction activities.

USEPA funded a cooperative agreement with Texas A&M University to develop an online rainfall erosivity calculator. Dischargers can access the calculator from EPA's website at: www.epa.gov/npdes/stormwater/cgp. Use of the calculator allows the discharger to determine potential eligibility for the rainfall erosivity waiver. It may also be useful in determining the time periods during which construction activity could be waived from permit coverage.

[6]New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

D. Obtaining and Terminating Permit Coverage

The appropriate Legally Responsible Person (LRP) must obtain coverage under this General Permit. To obtain coverage, the LRP or the LRP's Approved Signatory must file Permit Registration Documents (PRDs) prior to the commencement of construction activity. Failure to obtain coverage under this General Permit for storm water discharges to waters of the United States is a violation of the CWA and the California Water Code.

To obtain coverage under this General Permit, LRPs must electronically file the PRDs, which include a Notice of Intent (NOI), Storm Water Pollution Prevention Plan (SWPPP), and other documents required by this General Permit, and mail the appropriate permit fee to the State Water Board. It is expected that as the storm water program develops, the Regional Water Boards may issue General Permits or Individual Permits that contain more specific permit provisions. When this occurs, this General Permit will no longer regulate those dischargers that obtain coverage under Individual Permits.

Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

The application requirements of the General Permit establish a mechanism to clearly identify the responsible parties, locations, and scope of operations of dischargers covered by the General Permit and to document the discharger's knowledge of the General Permit's requirements.

This General Permit provides a grandfathering exception to existing dischargers subject to Water Quality Order No. 99-08-DWQ. Construction projects covered under Water Quality Order No. 99-08-DWQ shall obtain permit coverage at Risk Level 1. LUP projects covered under Water Quality Order No. 2003-0007-DWQ shall obtain permit coverage at LUP Type 1. The Regional Water Boards have the authority to require Risk Determination to be performed on projects currently covered under Water Quality Order No. 99-08-DWQ and 2003-0007-DWQ where they deem necessary.

LRPs must file a Notice of Termination (NOT) with the Regional Water Board when construction is complete and final stabilization has been reached or ownership has been transferred. The discharger must certify that all State and local requirements have been met in accordance with this General Permit. In order for construction to be found complete, the discharger must install post-construction storm water management measures and establish a long-term maintenance plan. This requirement is intended to ensure that the post-construction conditions at the project site do not cause or contribute to direct or indirect water quality impacts (i.e., pollution and/or hydromodification) upstream and downstream. Specifically, the discharger must demonstrate compliance with the post-construction standards set forth in this General Permit (Section XIII). The discharger is responsible for all compliance issues including all annual fees until the NOT has been filed and approved by the local Regional Water Board.

E. Discharge Prohibitions

This General Permit authorizes the discharge of storm water to surface waters from construction activities that result in the disturbance of one or more acres of land, provided that the discharger satisfies all permit conditions set forth in the Order. This General Permit prohibits the discharge of pollutants other than storm water and non-storm water discharges authorized by this General Permit or another NPDES permit. This General Permit also prohibits all discharges which contain a hazardous substance in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges. In addition, this General Permit incorporates discharge prohibitions contained in water quality control plans, as implemented by the nine Regional Water Boards. Discharges to Areas of Special Biological Significance (ASBS) are prohibited unless covered by an exception that the State Water Board has approved.

Non-storm water discharges include a wide variety of sources, including improper dumping, spills, or leakage from storage tanks or transfer areas. Non-storm water discharges may contribute significant pollutant loads to receiving waters. Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural BMPs. The State Water Board recognizes, however, that certain non-storm water discharges may be necessary for the completion of construction projects. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water dewatering, and other discharges not subject to a separate general NPDES permit adopted by a region. Therefore this General Permit authorizes such discharges provided they meet the following conditions.

These authorized non-storm water discharges must:

1. be infeasible to eliminate;
2. comply with BMPs as described in the SWPPP;
3. filter or treat, using appropriate technology, all dewatering discharges from sedimentation basins;
4. meet the NALs for pH and turbidity; and
5. not cause or contribute to a violation of water quality standards.

Additionally, authorized non-storm water discharges must not be used to clean up failed or inadequate construction or post-construction BMPs designed to keep materials onsite. Authorized non-storm water dewatering discharges may require a permit because some Regional Water Boards have adopted General Permits for dewatering discharges.

This General Permit prohibits the discharge of storm water that causes or threatens to cause pollution, contamination, or nuisance.

F. Effluent Standards for All Types of Discharges

1. Technology-Based Effluent Limitations

Permits for storm water discharges associated with construction activity must meet all applicable provisions of Sections 301 and 402 of the CWA. These provisions require controls of pollutant discharges that utilize best available technology economically achievable (BAT) for toxic pollutants and non conventional pollutants and best conventional pollutant control technology (BCT) for conventional pollutants. Additionally, these provisions require controls of pollutant discharges to reduce pollutants and any more stringent controls necessary to meet water quality standards. The USEPA has already established such limitations, known as effluent limitation guidelines (ELGs), for some industrial categories. This is not the case with construction discharges. In instances where there are no ELGs the permit writer is to use best professional judgment (BPJ) to establish requirements that the discharger must meet using BAT/BCT technology. This General Permit contains only narrative effluent limitations and does not contain numeric effluent limitations, except for Active Treatment Systems (ATS).

Order No. 2009-0009-DWQ, as originally adopted by the State Water Board on September 2, 2009, contained numeric effluent limitations for pH (within the range of 6.0 and 9.0 pH units) and turbidity (500 NTU) that applied only to Risk Level 3 and LUP Type 3 construction sites. The State Water Board adopted the numeric effluent limitations as technology-based effluent limitations based upon its best professional judgment. The California Building Industry Association, the Building Industry Legal Defense

Foundation, and the California Business Properties Association (petitioners) challenged Order No. 2009-0009-DWQ in *California Building Industry Association et al. v. State Water Resources Control Board*. On December 27, 2011, the Superior Court issued a judgment and writ of mandamus. The Superior Court ruled in favor of the State Water Board on almost all of the issues the petitioners raised, but the Superior Court invalidated the numeric effluent limitations for pH and turbidity for Risk Level 3 and LUP Type 3 sites because it determined that the State Water Board did not have sufficient BMP performance data to support those numeric effluent limitations. Therefore, the Superior Court concluded that the State Water Board did not comply with the federal regulations that apply to the use of best professional judgment. In invalidating the numeric effluent limitations, the Superior Court also suspended two ancillary requirements (a compliance storm event provision and receiving water monitoring at Risk Level 3 and LUP Type 3 sites that violated the numeric effluent limitations) that related solely to the invalidated numeric effluent limitations.

As a result of the Superior Court's writ of mandamus, this Order no longer contains numeric effluent limitations for pH and turbidity, except for ATS. In addition, as a result of the Superior Court's writ of mandamus, the receiving water monitoring requirements for Risk Level 3 and LUP Type 3 sites were suspended until the State Water Board amended this Order to restore the receiving water monitoring requirements. As amended, this Order now requires Risk Level 3 and LUP Type 3 Dischargers with direct discharges to surface waters to conduct receiving water monitoring whenever their effluent exceeds specified receiving water monitoring triggers. The receiving water monitoring triggers were established at the same levels as the previous numeric effluent limitations (effluent pH outside the range of 6.0 and 9.0 pH units or turbidity exceeding 500 NTU). In restoring the receiving water monitoring requirements, the State Water Board determined that it was appropriate to require receiving water monitoring for these types of sites with direct discharges to surface waters that exceeded the receiving water monitoring triggers under any storm event scenarios, because these sites represent the highest threat to receiving water quality. An exceedance of a receiving water monitoring trigger does not constitute a violation of this General Permit. These receiving water monitoring requirements take effect on the effective date of the amendment to this Order.

BAT/BCT technologies not only include passive systems such as conventional runoff and sediment control, but also treatment systems such as coagulation/flocculation using sand filtration, when appropriate. Such technologies allow for effective treatment of soil particles less 0.02 mm (medium silt) in diameter. The discharger must install structural controls, as necessary, such as erosion and sediment controls that meet BAT and BCT to achieve compliance with water quality standards. The narrative effluent limitations constitute compliance with the requirements of the CWA.

Because the permit is an NPDES permit, there is no legal requirement to address the factors set forth in Water Code sections 13241 and 13263, unless the permit is more stringent than what federal law requires. (See *City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 618, 627.) None of the requirements in this permit are more stringent than the minimum federal requirements, which include technology-based requirements achieving BAT/BCT and strict compliance with water quality standards. The inclusion of numeric effluent limitations (NELs) in the permit for Active Treatment Systems does not cause the permit to be more stringent than current federal law. NELs and best management practices are simply two different methods of achieving the same federal requirement: strict compliance with state water quality standards. Federal law authorizes both narrative and numeric effluent limitations to meet state water quality standards. The use of NELs to achieve compliance with water quality standards is not a more stringent requirement than the use of BMPs. (State Water Board Order No. WQ 2006-0012 (*Boeing*).) Accordingly, the State Water Board does not need to take into account the factors in Water Code sections 13241 and 13263.

The State Water Board has concluded that the establishment of BAT/BCT will not create or aggravate other environmental problems through increases in air pollution, solid waste generation, or energy consumption. While there may be a slight increase in non-water quality impacts due to the implementation of additional monitoring or the construction of additional BMPs, these impacts will be negligible in comparison with the construction activities taking place on site and would be justified by the water quality benefits associated with compliance.

pH Receiving Water Monitoring Trigger

Given the potential contaminants, the minimum standard method for control of pH in runoff requires the use of preventive measures such as avoiding concrete pours during rainy weather, covering concrete and directing flow away from fresh concrete if a pour occurs during rain, covering scrap drywall and stucco materials when stored outside and potentially exposed to rain, and other housekeeping measures. If necessary, pH-impaired storm water from construction sites can be treated in a filter or settling pond or basin, with additional natural or chemical treatment required to meet pH limits set forth in this permit. The basin or pond acts as a collection point and holds storm water for a sufficient period for the contaminants to be settled out, either naturally or artificially, and allows any additional treatment to take place. The State Water Board considers these techniques to be equivalent to BCT. In determining the pH concentration trigger for discharges, the State Water Board used BPJ to set these limitations.

The chosen trigger was established by calculating three standard deviations above and below the mean pH of runoff from highway construction sites[7] in California. Proper implementation of BMPs should result in discharges that are within the range of 6.0 to 9.0 pH Units.

Turbidity Receiving Water Monitoring Trigger

The Turbidity receiving water monitoring trigger of 500 NTU is a technology-based trigger and was developed using three different analyses aimed at finding the appropriate threshold to set the technology-based limit to ensure environmental protection, effluent quality and cost-effectiveness. The analyses fell into three, main types: (1) an ecoregion-specific dataset developed by Simon et. al. (2004) [8]; (2) Statewide Regional Water Quality Control Board enforcement data; and (3) published, peer-reviewed studies and reports on in-situ performance of best management practices in terms of erosion and sediment control on active construction sites.

A 1:3 relationship between turbidity (expressed as NTU) and suspended sediment concentration (expressed as mg/L) is assumed based on a review of suspended sediment and turbidity data from three gages used in the USGS National Water Quality Assessment Program:

USGS 11074000 SANTA ANA R BL PRADO DAM CA
USGS 11447650 SACRAMENTO R A FREEPORT CA
USGS 11303500 SAN JOAQUIN R NR VERNALIS CA

The receiving water monitoring trigger represents staff determination that the trigger value is the most practicable based on available data. The turbidity receiving water monitoring trigger represents a bridge between the narrative effluent limitations and receiving water limitations. To support this receiving water monitoring trigger, State Water Board staff analyzed construction site discharge information (monitoring data, estimates) and receiving water monitoring information.

Since the turbidity receiving water monitoring trigger represents an appropriate threshold level expected at a site, compliance with this value does not necessarily represent compliance with either the narrative effluent limitations (as enforced through the BAT/BCT standard) or the receiving water limitations. In the San Diego region, some inland surface waters have a receiving water objective for turbidity equal to 20 NTU. Obviously a discharge up to, but not exceeding, the turbidity receiving water monitoring trigger of

[7] Caltrans Construction Sites Runoff Characterization Study, 2002. Available at: http://www.dot.ca.gov/hq/env/stormwater/pdf/CTSW-RT-02-055.pdf.

500 NTU may still cause or contribute to the exceedance of the 20 NTU standard. Most of the waters of the State are protected by turbidity objectives based on background conditions**.**

Table 1 - Regional Water Board Basin Plans, Water Quality Objectives for Turbidity

REGIONAL WATER BOARD	WQ Objective	Background/Natural Turbidity	Maximum Increase
1	Based on background	All levels	20%
2	Based on background	> 50 NTU	10%
3	Based on background	0-50 JTU 50-100 JTU > 100 JTU	20% 10 NTU 10%
4	Based on background	0-50 NTU > 50 NTU	20% 10%
5	Based on background	0-5 NTU 5-50 NTU 50-100 NTU >100 NTU	1 NTU 20% 10 NTU 10%
6	Based on background	All levels	10%
7	Based on background	N/A	N/A
8	Based on background	0-50 NTU 50-100 NTU >100 NTU	20% 10 NTU 10%
9	Inland Surface Waters, 20 NTU All others, based on background	 0-50 NTU 50-100 NTU >100 NTU	 20% 10 NTU 10%

Table 2 shows the suspended sediment concentrations at the 1.5 year flow recurrence interval for the 12 ecoregions in California from Simon et. al (2004).

Table 2 - Results of Ecoregion Analysis

Ecoregion	Percent of California Land Area	Median Suspended Sediment Concentration (mg/L)
1	9.1	874
4	0.2	120
5	8.8	35.6
6	20.7	1530
7	7.7	122
8	3.0	47.4
9	9.4	284
13	5.2	143
14	21.7	5150
78	8.1	581
80	2.4	199
81	3.7	503
Area-weighted average		1633

If a 1:3 relationship between turbidity and suspended sediment is assumed, the median turbidity is 544 NTU.

The following table is composed of turbidity readings measured in NTUs from administrative civil liability (ACL) actions for construction sites from 2003 - 2009. This data was derived from the complete listing of construction-related ACLs for the six year period. All ACLs were reviewed and those that included turbidimeter readings at the point of storm water discharge were selected for this dataset.

Table 3 – ACL Sampling Data taken by Regional Water Board Staff

WDID#	Region	Discharger	Turbidity (NTU)
5S34C331884	5S	Bradshaw Interceptor Section 6B	1800
5S05C325110	5S	Bridalwood Subdivision	1670
5S48C336297	5S	Cheyenne at Browns Valley	1629
5R32C314271	5R	Grizzly Ranch Construction	1400
6A090406008	6T	El Dorado County Department of Transportation, Angora Creek	97.4

6A31C325917	6T	Northstar Village	See Subdata Set

Subdata Set - Turbidity for point of storm water runoff discharge at Northstar Village

Date	Turbidity (NTU)	Location
10/5/2006	900	Middle Martis Creek
11/2/2006	190	Middle Martis Creek
01/04/2007	36	West Fork, West Martis Creek
02/08/2007	180	Middle Martis Creek
02/09/2007	130	Middle Martis Creek
02/09/2007	290	Middle Martis Creek
02/09/2007	100	West Fork, West Martis Creek
02/10/2007	28	Middle Martis Creek
02/10/2007	23	Middle Martis Creek
02/10/2007	32	Middle Martis Creek
02/10/2007	12	Middle Martis Creek
02/10/2007	60	West Fork, West Martis Creek
02/10/2007	34	West Fork, West Martis Creek

A 95% confidence interval for mean turbidity in an ACL order was constructed. The data set used was a small sample size, so the 500 NTU (the value derived as the receiving water monitoring trigger for this General Permit) needed to be verified as a possible population mean. In this case, the population refers to a hypothetical population of turbidity measurements of which our sample of 20 represents. A t-distribution was assumed due to the small sample size:

Mean: 512.23 NTU
Standard Deviation: 686.85
Margin of Error: 321.45
Confidence Interval: 190.78 NTU (Low)
833.68 NTU (High)

Based on a constructed 95% confidence interval, an ACL order turbidity measurement will be between 190.78 – 833.68 NTU. 500 NTU falls within this range. Using the same data set, a small-sample hypothesis test was also performed to test if the ACL turbidity data set contains enough information to cast doubt on choosing a 500 NTU as a mean. 500 NTU was again chosen due to its proposed use as an acceptable value. The test was carried out using a 95% confidence interval. Results indicated that the ACL turbidity data set *does not* contain significant sample evidence to reject the claim of 500 NTU as an acceptable mean for the ACL turbidity population.

There are not many published, peer-reviewed studies and reports on in-situ performance of best management practices in terms of erosion and sediment control on active construction sites. The most often cited study is a report titled, "Improving the Cost Effectiveness of Highway Construction Site Erosion and Pollution Control" (Horner, Guedry, and Kortenhof 1990, http://www.wsdot.wa.gov/Research/Reports/200/200.1.htm). In a comment letter summarizing this report sent to the State Water Board, the primary author, Dr. Horner, states:

"The most effective erosion control product was wood fiber mulch applied at two different rates along with a bonding agent and grass seed in sufficient time before the tests to achieve germination. Plots treated in this way reduced influent turbidity by more than 97 percent and discharged effluent exhibiting mean and maximum turbidity values of 21 and 73 NTU, respectively. Some other mulch and blanket materials performed nearly as well. These tests demonstrated the control ability of widely available BMPs over a very broad range of erosion potential."

Other technologies studied in this report produced effluent quality at or near 100 NTU. It is the BPJ of the State Water Board staff that erosion control, while preferred, is not always an option on construction sites and that technology performance in a controlled study showing effluent quality directly leaving a BMP is always easier and cheaper to control than effluent being discharged from the project (edge of property, etc.). As a result, it is the BPJ of the State Water Board staff that it is not cost effective or feasible, at this time, for all risk level and type 3 sites in California to achieve effluent discharges with turbidity values that are less than 100 NTU.

To summarize, the analysis showed that: (1) results of the Simon et. al dataset reveals turbidity values in background receiving water in California's ecoregions range from 16 NTU to 1716 NTU (with a mean of 544 NTU); (2) based on a constructed 95% confidence interval, construction sites will be subject to administrative civil liability (ACL) when their turbidity measurement falls between 190.78 – 833.68 NTU; and (3) sites with highly controlled discharges employing and maintaining good erosion control practices can discharge effluent from the BMP with turbidity values less than 100 NTU. State Water Board staff has determined, using its BPJ, that it is most cost effective to set the receiving water monitoring trigger for turbidity at 500 NTU.

i. *Compliance Storm Event*

While this General Permit no longer contains "compliance storm event" exceptions from technology-based NELs, the "compliance storm event" exception from the ATS NELs remain in effect. See Section K of this Fact Sheet, and Attachment F of this General Permit for more information.

a. TMDLs and Waste Load Allocations

Dischargers located within the watershed of a CWA § 303(d) impaired water body, for which a TMDL for sediment has been adopted by the Regional Water Board or USEPA, must comply with the approved TMDL if it identifies "construction activity" or land disturbance as a source of sediment. If it does, the

TMDL should include a specific waste load allocation for this activity/source. The discharger, in this case, may be required by a separate Regional Water Board order to implement additional BMPs, conduct additional monitoring activities, and/or comply with an applicable waste load allocation and implementation schedule. If a specific waste load allocation has been established that would apply to a specific discharge, the Regional Water Board may adopt an order requiring specific implementation actions necessary to meet that allocation. In the instance where an approved TMDL has specified a general waste load allocation to construction storm water discharges, but no specific requirements for construction sites have been identified in the TMDL, dischargers must consult with the state TMDL authority[9] to confirm that adherence to a SWPPP that meets the requirements of the General Permit will be consistent with the approved TMDL.

2. Determining Compliance with Effluent Standards

a. Technology-Based Numeric Action Levels (NALs)

This General Permit contains technology-based NALs for pH and turbidity, and requirements for effluent monitoring at all Risk level 2 & 3, and LUP Type 2 & 3 sites. Numeric action levels are essentially numeric benchmark values for certain parameters that, if exceeded in effluent sampling, trigger the discharger to take actions. Exceedance of an NAL does not itself constitute a violation of the General Permit. If the discharger fails to take the corrective action required by the General Permit, though, that may consititute a violation.

The primary purpose of NALs is to assist dischargers in evaluating the effectiveness of their on-site measures. Construction sites need to employ many different systems that must work together to achieve compliance with the permit's requirements. The NALs chosen should indicate whether the systems are working as intended.

Another purpose of NALs is to provide information regarding construction activities and water quality impacts. This data will provide the State and Regional Water Boards and the rest of the storm water community with more information about levels and types of pollutants present in runoff and how effective the dischargers BMPs are at reducing pollutants in effluent. The State Water Board also hopes to learn more about the linkage between effluent and receiving water quality. In addition, these requirements will provide information on the mechanics needed to establish compliance monitoring programs at construction sites in future permit deliberations.

i. *pH*

The chosen limits were established by calculating one standard deviation above and below the mean pH of runoff from highway construction sites[10] in California. Proper implementation of BMPs should result in discharges that are within the range of 6.5 to 8.5 pH Units.

---

[9] http://www.waterboards.ca.gov/tmdl/tmdl.html.

[10] Caltrans Construction Sites Runoff Characterization Study, 2002. Available at: http://www.dot.ca.gov/hq/env/stormwater/pdf/CTSW-RT-02-055.pdf.

The Caltrans study included 33 highway construction sites throughout California over a period of four years, which included 120 storm events. All of these sites had BMPs in place that would be generally implemented at all types of construction sites in California.

ii. ***Turbidity***

BPJ was used to develop an NAL that can be used as a learning tool to help dischargers improve their site controls, and to provide meaningful information on the effectiveness of storm water controls. A statewide turbidity NAL has been set at 250 NTU.

G. Receiving Water Limitations

Construction-related activities that cause or contribute to an exceedance of water quality standards must be addressed. The dynamic nature of construction activity gives the discharger the ability to quickly identify and monitor the source of the exceedances. This is because when storm water mobilizes sediment, it provides visual cues as to where corrective actions should take place and how effective they are once implemented.

This General Permit requires that storm water discharges and authorized non-storm water discharges must not contain pollutants that cause or contribute to an exceedance of any applicable water quality objective or water quality standards. The monitoring requirements in this General Permit for sampling and analysis procedures will help determine whether BMPs installed and maintained are preventing pollutants in discharges from the construction site that may cause or contribute to an exceedance of water quality standards.

Water quality standards consist of designated beneficial uses of surface waters and the adoption of ambient criteria necessary to protect those uses. When adopted by the State Water Board or a Regional Water Board, the ambient criteria are termed "water quality objectives." If storm water runoff from construction sites contains pollutants, there is a risk that those pollutants could enter surface waters and cause or contribute to an exceedance of water quality standards. For that reason, dischargers should be aware of the applicable water quality standards in their receiving waters. (The best method to ensure compliance with receiving water limitations is to implement BMPs that prevent pollutants from contact with storm water or from leaving the construction site in runoff.)

In California, water quality standards are published in the Basin Plans adopted by each Regional Water Board, the California Toxics Rule (CTR), the National Toxics Rule (NTR), and the Ocean Plan.

Dischargers can determine the applicable water quality standards by contacting Regional Water Board staff or by consulting one of the following sources. The actual Basin Plans that contain the water quality standards can be viewed at the website of the appropriate Regional Water Board. (http://www.waterboards.ca.gov/regions.html), the State Water Board site for statewide plans (http://www.waterboards.ca.gov/plnspols/index.html), or the USEPA regulations for the NTR and CTR (40 C.F.R. §§ 131.36-38). Basin Plans and statewide plans are also available by mail from the appropriate Regional Water Board or the State Water Board. The USEPA regulations are available at http://www.epa.gov/. Additional information concerning water quality standards can be accessed through http://www.waterboards.ca.gov/stormwtr/gen_const.html.

H. Training Qualifications and Requirements

The Blue Ribbon Panel (BRP) made the following observation about the lack of industry-specific training requirements:

"Currently, there is no required training or certification program for contractors, preparers of soil erosion and sediment control Storm Water Pollution Prevention Plans, or field inspectors."

Order 99-08-DWQ required that all dischargers train their employees on how to comply with the permit, but it did not specificy a curriculum or certification program. This has resulted in inconsistent implementation by all affected parties - the dischargers, the local governments where the construction activity occurs, and the regulators required to enforce 99-08-DWQ. This General Permit requires Qualified SWPPP Developers and practitioners to obtain appropriate training, and makes this curriculum mandatory two years after adoption, to allow time for course completion. The State and Regional Water Board are working with many stakeholders to develop the curriculum and mechanisms needed to develop and deliver the courses.

To ensure that the preparation, implementation, and oversight of the SWPPP is sufficient for effective pollution prevention, the Qualified SWPPP Developer and Qualified SWPPP Practitioners responsible for creating, revising, overseeing, and implementing the SWPPP must attend a State Water Board-sponsored or approved Qualified SWPPP Developer and Qualified SWPPP Practitioner training course.

I. Sampling, Monitoring, Reporting and Record Keeping

1. Traditional Construction Monitoring Requirements

This General Permit requires visual monitoring at all sites, and effluent water quality at all Risk Level 2 & 3 sites. It requires receiving water monitoring at some Risk Level 3 sites. All sites are required to submit annual reports, which contain various types of information, depending on the site characteristics and events. A summary of the monitoring and reporting requirements is found in Table 4.

Table 4 - Required Monitoring Elements for Risk Levels

	Visual	Non-visible Pollutant	Effluent	Receiving Water
Risk Level 1	three types required for all Risk Levels: non-storm water, pre-rain and post-rain	As needed for all Risk Levels (see below)	where applicable	not required
Risk Level 2			pH, turbidity	not required
Risk Level 3			pH, turbidity	(if Receiving Water Monitoring Trigger exceeded) pH, turbidity and SSC. Bioassessment for sites 30 acres or larger.

a. Visual

All dischargers are required to conduct quarterly, non-storm water visual inspections. For these inspections, the discharger must visually observe each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources. For storm-related inspections, dischargers must visually observe storm water discharges at all discharge locations within two business days after a qualifying event. For this requirement, a qualifying rain event is one producing precipitation of ½ inch or more of discharge. Dischargers must conduct a post-storm event inspection to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify any additional BMPs necessary and revise the SWPPP accordingly. Dischargers must maintain on-site records of all visual observations, personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

b. Non-Visible Pollutant Monitoring

This General Permit requires that all dischargers develop a sampling and analysis strategy for monitoring pollutants that are not visually detectable in storm water. Monitoring for non-visible pollutants must be required at any construction site when the exposure of construction materials occurs and where a discharge can cause or contribute to an exceedance of a water quality objective.

Of significant concern for construction discharges are the pollutants found in materials used in large quantities at construction sites throughout California and exposed throughout the rainy season, such as cement, flyash, and other recycled materials or by-products of combustion. The water quality standards that apply to these materials will depend on their composition. Some of the more common storm water pollutants from construction activity are not CTR pollutants. Examples of non-visible pollutants include glyphosate (herbicides), diazinon and chlorpyrifos (pesticides), nutrients (fertilizers), and molybdenum (lubricants). The use of diazinon and chlorpyrifos is a common practice among landscaping professionals and may trigger sampling and analysis requirements if these materials come into contact with storm water. High pH values from cement and gypsum, high pH and SSC from wash waters, and chemical/fecal contamination from portable toilets, also are not CTR pollutants. Although some of these constituents do have numeric water quality objectives in individual Basin Plans, many do not and are subject only to narrative water quality standards (i.e. not causing toxicity). Dischargers are encouraged to discuss these issues with Regional Water Board staff and other storm water quality professionals.

The most effective way to avoid the sampling and analysis requirements, and to ensure permit compliance, is to avoid the exposure of construction materials to precipitation and storm water runoff. Materials that are not exposed do not have the potential to enter storm water runoff, and therefore receiving waters sampling is not required. Preventing contact between storm water and construction materials is one of the most important BMPs at any construction site.

Preventing or eliminating the exposure of pollutants at construction sites is not always possible. Some materials, such as soil amendments, are designed to be used in a manner that will result in exposure to storm water. In these cases, it is important to make sure that these materials are applied according to the manufacturer's instructions and at a time when they are unlikely to be washed away. Other construction materials can be exposed when storage, waste disposal or the application of the material is done in a manner not protective of water quality. For these situations, sampling is required unless there is capture and containment of all storm water that has been exposed. In cases where construction materials may be exposed to storm water, but the storm water is contained and is not allowed to run off the site, sampling will only be required when inspections show that the containment failed or is breached, resulting in potential exposure or discharge to receiving waters.

The discharger must develop a list of potential pollutants based on a review of potential sources, which will include construction materials soil amendments, soil treatments, and historic contamination at the site. The discharger must review existing environmental and real estate documentation to determine the potential for pollutants that could be present on the construction site as a result of past land use activities.

Good sources of information on previously existing pollution and past land uses include:

i. Environmental Assessments;

ii. Initial Studies;

iii. Phase 1 Assessments prepared for property transfers; and

iv. Environmental Impact Reports or Environmental Impact Statements prepared under the requirements of the National Environmental Policy Act or the California Environmental Quality Act.

In some instances, the results of soil chemical analyses may be available and can provide additional information on potential contamination.

The potential pollutant list must include all non-visible pollutants that are known or should be known to occur on the construction site including, but not limited to, materials that:

i. are being used in construction activities;

ii. are stored on the construction site;

iii. were spilled during construction operations and not cleaned up;

iv. were stored (or used) in a manner that created the potential for a release of the materials during past land use activities;

v. were spilled during previous land use activities and not cleaned up; or

vi. were applied to the soil as part of past land use activities.

C. Effluent Monitoring

Federal regulations[11] require effluent monitoring for discharges subject to NALs. Subsequently, all Risk Level 2 and 3 dischargers must perform sampling and analysis of effluent discharges to characterize discharges associated with construction activity from the entire area disturbed by the project. Dischargers must collect samples of stored or contained storm water that is discharged subsequent to a storm event producing precipitation of ½ inch or more at the time of discharge.

Table 5 - Storm Water Effluent Monitoring Requirements by Risk Level

	Frequency	Effluent Monitoring (Section E, below)
Risk Level 1	when applicable	non-visible pollutant parameters (if applicable)
Risk Level 2	Minimum of 3 samples per day during qualifying rain event characterizing discharges associated with construction activity from the entire project disturbed area.	pH, turbidity, and non-visible pollutant parameters (if applicable)
Risk Level 3	Minimum of 3 samples per day during qualifying rain event characterizing discharges associated with construction activity from the entire project disturbed area.	pH, turbidity, and non-visible pollutant parameters if applicable

Risk Level 1 dischargers must analyze samples for:

i. any parameters indicating the presence of pollutants identified in the pollutant source assessment required in Attachment C contained in the General Permit.

[11] 40 C.F.R. § 122.44.

Risk Level 2 dischargers must analyze samples for:

i. pH and turbidity;

ii. any parameters indicating the presence of pollutants identified in the pollutant source assessment required in Attachment D contained in the General Permit, and

iii. any additional parameters for which monitoring is required by the Regional Water Board.

Risk Level 3 dischargers must analyze samples for:

i. pH, turbidity;

ii. any parameters indicating the presence of pollutants identified in the pollutant source assessment required in Attachment E contained in the General Permit, and

iii. any additional parameters for which monitoring is required by the Regional Water Board.

2. Linear Monitoring and Sampling Requirements

Attachment A, establishes minimum monitoring and reporting requirements for all LUPs. It establishes different monitoring requirements depending on project complexity and risk to water quality. The monitoring requirements for Type 1 LUPs are less than Type 2 & 3 projects because Type 1 projects have a lower potential to impact water quality.

A discharger shall prepare a monitoring program prior to the start of construction and immediately implement the program at the start of construction for LUPs. The monitoring program must be implemented at the appropriate level to protect water quality at all times throughout the life of the project.

a. Type 1 LUP Monitoring Requirements

A discharger must conduct daily visual inspections of Type 1 LUPs during working hours while construction activities are occurring. Inspections are to be conducted by qualified personnel and can be conducted in conjunction with other daily activities. Inspections will be conducted to ensure the BMPs are adequate, maintained, and in place at the end of the construction day. The discharger will revise the SWPPP, as appropriate, based on the results of the daily inspections. Inspections can be discontinued in non-active construction areas where soil disturbing activities have been completed and final stabilization has been achieved (e.g., trench has been paved, substructures have been installed, and successful final vegetative cover or other stabilization criteria have been met).

A discharger shall implement the monitoring program for inspecting Type 1 LUPs. This program requires temporary and permanent stabilization BMPs after active construction is completed. Inspection activities will continue until adequate permanent stabilization has been established and will continue in areas where re-vegetation is chosen until minimum vegetative coverage has been established. Photographs shall be taken during site inspections and submitted to the State Water Board.

b. Type 2 & 3 LUP Monitoring Requirements

A discharger must conduct daily visual inspections of Type 2 & 3 LUPs during working hours while construction activities are occurring. Inspections are to be conducted by qualified personnel and can be in conjunction with other daily activities.

All dischargers of Type 2 & 3 LUPs are required to conduct inspections by qualified personnel of the construction site during normal working hours prior to all anticipated storm events and after actual storm events. During extended storm events, the discharger shall conduct inspections during normal working hours for each 24-hour period. Inspections can be discontinued in non-active construction areas where soil disturbing activities have been completed and final stabilization has been achieved (e.g., trench has been paved, substructures installed, and successful vegetative cover or other stabilization criteria have been met).

The goals of these inspections are (1) to identify areas contributing to a storm water discharge; (2) to evaluate whether measures to reduce pollutant loadings identified in the SWPPP are adequate and properly installed and functioning in accordance with the terms of the General Permit; and (3) to determine whether additional control practices or corrective maintenance activities are needed. Equipment, materials, and workers must be available for rapid response to failures and emergencies. All corrective maintenance to BMPs shall be performed as soon as possible, depending upon worker safety.

All dischargers shall develop and implement a monitoring program for inspecting Type 2 & 3 LUPs that require temporary and permanent stabilization BMPs after active construction is completed. Inspections will be conducted to ensure the BMPs are adequate and maintained. Inspection activities will continue until adequate permanent stabilization has been established and will continue in areas where revegetation is chosen until minimum vegetative coverage has been established.

A log of inspections conducted before, during, and after the storm events must be maintained in the SWPPP. The log will provide the date and time of the inspection and who conducted the inspection. Photographs must be taken during site inspections and submitted to the State Water Board.

C. Sampling Requirements for all LUP Project Types

LUPs are also subject to sampling and analysis requirements for visible pollutants (i.e., sedimentation/siltation, turbidity) and for non-visible pollutants.

Sampling for visible pollutants is required for Type 2 & 3 LUPs.

Non-visible pollutant monitoring is required for pollutants associated with construction sites and activities that (1) are not visually detectable in storm water discharges, and (2) are known or should be known to occur on the construction site, and (3) could cause or contribute to an exceedance of water quality objectives in the receiving waters. Sample collection for non-visible pollutants must only be required (1) during a storm event when pollutants associated with construction activities may be discharged with storm water runoff due to a spill, or in the event there was a breach, malfunction, failure, and/or leak of any BMP, and (2) when the discharger has failed to adequately clean the area of material and pollutants. Failure to implement appropriate BMPs will trigger the same sampling requirements as those required for a breach, malfunction and/or leak, or when the discharger has failed to implement appropriate BMPs prior to the next storm event.

Additional monitoring parameters may be required by the Regional Water Boards.

It is not anticipated that many LUPs will be required to collect samples for pollutants not visually detected in runoff due to the nature and character of the construction site and activities as previously described in this fact sheet. Most LUPs are constructed in urban areas with public access (e.g., existing roadways, road shoulders, parking areas, etc.). This raises a concern regarding the potential contribution of pollutants from vehicle use and/or from normal activities of the public (e.g., vehicle washing, landscape fertilization, pest spraying, etc.) in runoff from the project site. Since the dischargers are not the land owners of the project area and are not able to control the presence of these pollutants in the storm water that runs through their projects, it is not the intent of this General Permit to require dischargers to sample for these pollutants. This General Permit does not require the discharger to sample for these types of pollutants except where the discharger has brought materials onsite that contain these pollutants and when a condition (e.g., breach, failure, etc.) described above occurs.

3. Receiving Water Monitoring

In order to ensure that receiving water limitations are met, discharges subject to receiving water monitoring triggers (i.e., Risk Level 3 and LUP Type 3 sites) or numeric effluent limitations (i.e., Risk Level 3 and LUP Type 3 sites utilizing ATS with direct discharges into receiving waters) must also monitor the downstream receiving water(s) for turbidity, SSC, and pH (if applicable) when a receiving water monitoring trigger or NEL is exceeded.

a. Bioassessment Monitoring

This General Permit requires a bioassessment of receiving waters for dischargers of Risk Level 3 or LUP Type 3 construction projects equal to or larger than 30 acres with direct discharges into receiving waters. Benthic macroinvertebrate samples will be taken upstream and downstream of the site's discharge point in the receiving water. Bioassessments measure the quality of the stream by analyzing the aquatic life present. Higher levels of appropriate aquatic species tend to indicate a healthy stream; whereas low levels of organisms can indicate stream degradation. Active construction sites have the potential to discharge large amounts of sediment and pollutants into receiving waters. Requiring a bioassessment for large project sites, with the most potential to impact water quality, provides a snapshot of the health of the receiving water prior to initiation of construction activities. This snapshot can be used in comparison to the health of the receiving water after construction has commenced.

Each ecoregion (biologically and geographically related area) in the State has a specific yearly peak time where stream biota is in a stable and abundant state. This time of year is called an Index Period. The bioassessment requirements in this General Permit, requires benthic macroinvertebrate sampling within a sites index period. The State Water Board has developed a map designating index periods for the ecoregions in the State (see State Water Board Website).

This General Permit requires the bioassessment methods to be in accordance with the Surface Water Ambient Monitoring Program (SWAMP) in order to provide data consistency within the state as well as generate useable biological stream data.

Table 6 - Receiving Water Monitoring Requirements

	Receiving Water Monitoring Parameters
Risk Level 1 /LUP Type 1	not required
Risk Level 2 / LUP Type 2	not required
Risk Level 3 / LUP Type 3	If Receiving Water Monitoring Trigger exceeded: pH (if applicable), turbidity, and SSC. Bioassessment for sites 30 acres or larger.

4. Reporting Requirements

a. NAL Exceedance Report

All Risk Level 3 and LUP Type 3 dischargers must electronically submit all storm event sampling results to the State And Regional Boards, via the electronic data system, no later than 10 days after the conclusion of the storm event.

b. Annual Report

All dischargers must prepare and electronically submit an annual report no later than September 1 of each year using the Storm water Multi-Application Reporting and Tracking System (SMARTS). The

Annual Report must include a summary and evaluation of all sampling and analysis results, original laboratory reports, chain of custody forms, a summary of all corrective actions taken during the compliance year, and identification of any compliance activities or corrective actions that were not implemented.

5. Record Keeping

According to 40 C.F.R. Parts 122.21(p) and 122.41(j), the discharger is required to retain paper or electronic copies of all records required by this General Permit for a period of at least three years from the date generated or the date submitted to the State Water Board or Regional Water Boards. A discharger must retain records for a period beyond three years as directed by Regional Water Board.

J. Risk Determination

1. Traditional Projects

a. Overall Risk Determination

There are two major requirements related to site planning and risk determination in this General Permit. The project's overall risk is broken up into two elements – (1) project sediment risk (the relative amount of sediment that can be discharged, given the project and location details) and (2) receiving water risk (the risk sediment discharges pose to the receiving waters).

Project Sediment Risk:
Project Sediment Risk is determined by multiplying the R, K, and LS factors from the Revised Universal Soil Loss Equation (RUSLE) to obtain an estimate of project-related bare ground soil loss expressed in tons/acre. The RUSLE equation is as follows:

A = (R)(K)(LS)(C)(P)

Where: A = the rate of sheet and rill erosion
R = rainfall-runoff erosivity factor
K = soil erodibility factor
LS = length-slope factor
C = cover factor (erosion controls)
P = management operations and support practices (sediment controls)

The C and P factors are given values of 1.0 to simulate bare ground conditions.

There is a map option and a manual calculation option for determining soil loss. For the map option, the R factor for the project is calculated using the online calculator at http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm. The product of K and LS are shown on Figure 1. To determine soil loss in tons per acre, the discharger multiplies the R factor times the value for K times LS from the map.

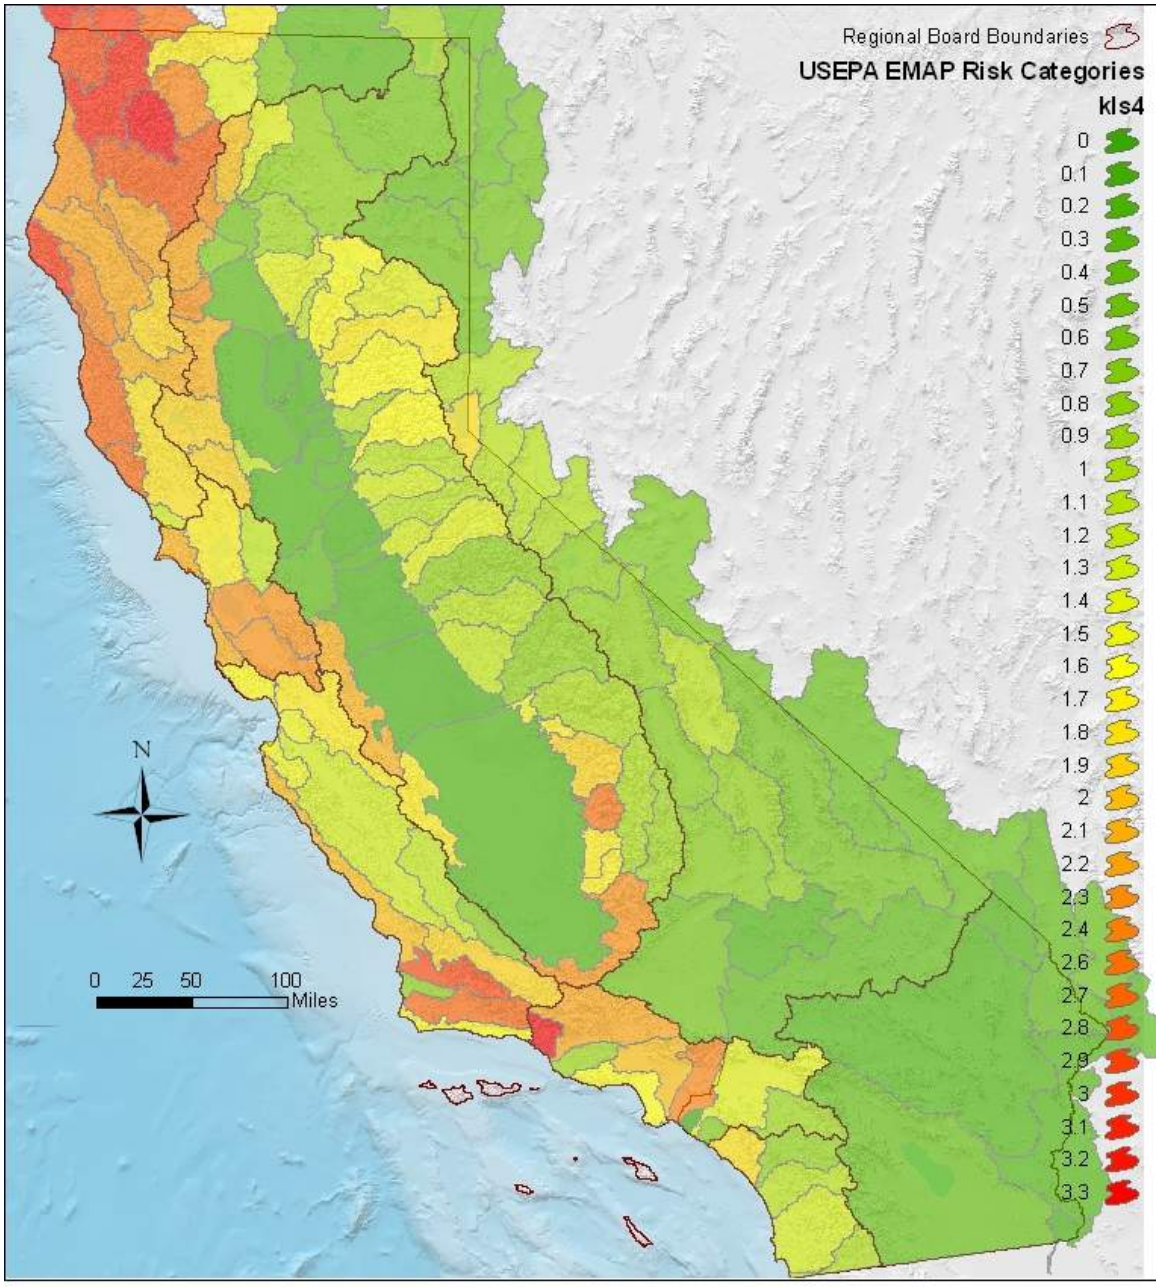

Figure 1 -Statewide Map of K * LS

For the manual calculation option, the R factor for the project is calculated using the online calculator at http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm. The K and LS factors are determined using Appendix 1.

Soil loss of less than 15 tons/acre is considered **low** sediment risk.
Soil loss between 15 and 75 tons/acre is **medium** sediment risk.
Soil loss over 75 tons/acre is considered **high** sediment risk.

The soil loss values and risk categories were obtained from mean and standard deviation RKLS values from the USEPA EMAP program. High risk is the mean RKLS value plus two standard deviations. Low risk is the mean RKLS value minus two standard deviations.

Receiving Water Risk:
Receiving water risk is based on whether a project drains to a sediment-sensitive waterbody. A sediment-sensitive waterbody is either

on the most recent 303d list for waterbodies impaired for sediment;
has a USEPA-approved Total Maximum Daily Load implementation plan for sediment; **or**
has the beneficial uses of COLD, SPAWN, and MIGRATORY.

A project that meets at least one of the three criteria has a high receiving water risk. A list of sediment-sensitive waterbodies will be posted on the State Water Board's website. It is anticipated that an interactive map of sediment sensitive water bodies in California will be available in the future.

The Risk Levels have been altered by eliminating the possibility of a Risk Level 4, and expanding the constraints for Risk Levels 1, 2, and 3. Therefore, projects with high receiving water risk and high sediment risk will be considered a Risk Level 3 risk to water quality.

In response to public comments, the Risk Level requirements have also been changed such that Risk Level 1 projects will be subject to minimum BMP and visual monitoring requirements, Risk Level 2 projects will be subject to NALs and some additional monitoring requirements, and Risk Level 3 projects will be subject to NALs, and more rigorous monitoring requirements such as receiving water monitoring and in some cases bioassessment.

Table 7 - Combined Risk Level Matrix

Combined Risk Level Matrix				
Receiving Water Risk		Sediment Risk		
		Low	Medium	High
	Low	Level 1	Level 2	
	High	Level 2		Level 3

b. Effluent Standards

All dischargers are subject to the narrative effluent limitations specified in the General Permit. The narrative effluent limitations require storm water discharges associated with construction activity to meet all applicable provisions of Sections 301 and 402 of the CWA. These provisions require controls of pollutant discharges that utilize BAT and BCT to reduce pollutants and any more stringent controls necessary to meet water quality standards.

Risk Level 2 dischargers that pose a medium risk to water quality are subject to technology-based NALs for pH and turbidity. Risk Level 3 dischargers that pose a high risk to water quality are also subject to technology-based NALs for pH and turbidity.

c. Good Housekeeping

Proper handling and managing of construction materials can help minimize threats to water quality. The discharger must consider good housekeeping measures for: construction materials, waste management, vehicle storage & maintenance, landscape materials, and potential pollutant sources. Examples include; conducting an inventory of products used, implementing proper storage & containment, and properly cleaning all leaks from equipment and vehicles.

d. Non-Storm Water Management

Non-storm water discharges directly connected to receiving waters or the storm drain system have the potential to negatively impact water quality. The discharger must implement measures to control all non-storm water discharges during construction, and from dewatering activities associated with construction. Examples include; properly washing vehicles in contained areas, cleaning streets, and minimizing irrigation runoff.

e. Erosion Control

The best way to minimize the risk of creating erosion and sedimentation problems during construction is to disturb as little of the land surface as possible by fitting the development to the terrain. When development is tailored to the natural contours of the land, little grading is necessary and, consequently, erosion potential is lower.[14] Other effective erosion control measures include: preserving existing vegetation where feasible, limiting disturbance, and stabilizing and re-vegetating disturbed areas as soon as possible after grading or construction activities. Particular attention must be paid to large, mass-graded sites where the potential for soil exposure to the erosive effects of rainfall and wind is great and where there is potential for significant sediment discharge from the site to surface waters. Until permanent vegetation is established, soil cover is the most cost-effective and expeditious method to protect soil particles from detachment and transport by rainfall. Temporary soil stabilization can be the single most important factor in reducing erosion at construction sites. The discharger is required to consider measures such as: covering disturbed areas with mulch, temporary seeding, soil stabilizers, binders, fiber rolls or blankets, temporary vegetation, and permanent seeding. These erosion control measures are only examples of what should be considered and should not preclude new or innovative approaches currently available or being developed. Erosion control BMPs should be the primary means of preventing storm water contamination, and sediment control techniques should be used to capture any soil that becomes eroded.[12]

Risk Level 3 dischargers pose a higher risk to water quality and are therefore additionally required to ensure that post-construction soil loss is equivalent to or less than the pre-construction levels.

f. Sediment Control

Sediment control BMPs should be the secondary means of preventing storm water contamination. When erosion control techniques are ineffective, sediment control techniques should be used to capture any soil that becomes eroded. The discharger is required to consider perimeter control measures such as: installing silt fences or placing straw wattles below slopes. These sediment control measures are only

[12] U.S. Environmental Protection Agency. 2007. Developing Your Storm Water Pollution Prevention Plan: A Guide for Construction Sites.

examples of what should be considered and should not preclude new or innovative approaches currently available or being developed.

Because Risk Level 2 and 3 dischargers pose a higher risk to water quality, additional requirements for the application of sediment controls are imposed on these projects. This General Permit also authorizes the Regional Water Boards to require Risk Level 3 dischargers to implement additional site-specific sediment control requirements if the implementation of other erosion or sediment controls are not adequately protecting the receiving waters.

g. Run-on and Runoff Control

Inappropriate management of run-on and runoff can result in excessive physical impacts to receiving waters from sediment and increased flows. The discharger is required to manage all run-on and runoff from a project site. Examples include: installing berms and other temporary run-on and runoff diversions.

Risk Level 1 dischargers with lower risks to impact water quality are not subject to the run-on and runoff control requirements unless an evaluation deems them necessary or visual inspections show that such controls are required.

h. Inspection, Maintenance and Repair

All measures must be periodically inspected, maintained and repaired to ensure that receiving water quality is protected. Frequent inspections coupled with thorough documentation and timely repair is necessary to ensure that all measures are functioning as intended.

i. Rain Event Action Plan (REAP)

A Rain Event Action Plan (REAP) is a written document, specific for each rain event. A REAP should be designed that when implemented it protects all exposed portions of the site within 48 hours of any likely precipitation event forecast of 50% or greater probability.

This General Permit requires Risk Level 2 and 3 dischargers to develop and implement a REAP designed to protect all exposed portions of their sites within 48 hours prior to any likely precipitation event. The REAP requirement is designed to ensure that the discharger has adequate materials, staff, and time to implement erosion and sediment control measures that are intended to reduce the amount of sediment and other pollutants generated from the active site. A REAP must be developed when there is likely a forecast of 50% or greater probability of precipitation in the project area. (The National Oceanic and Atmospheric Administration (NOAA) defines a chance of precipitation as a probability of precipitation of 30% to 50% chance of producing precipitation in the project area.[13] NOAA defines the probability of precipitation (PoP) as the likelihood of occurrence (expressed as a percent) of a measurable amount (0.01 inch or more) of liquid precipitation (or the water equivalent of frozen precipitation) during a specified period of time at any given point in the forecast area.) Forecasts are normally issued for 12-hour time periods. Descriptive terms for uncertainty and aerial coverage are used as follows:

Table 8 -National Oceanic and Atmospheric Administration (NOAA) Definition of Probability of Precipitation (PoP)

[13] http://www.crh.noaa.gov/lot/severe/wxterms.php.

PoP	Expressions of Uncertainty	Aerial Coverage
0%	none used	none used
10%	none used	isolated
20%	slight chance	isolated
30-50%	chance	scattered
60-70%	likely	numerous
80-100%	none used	none used

The discharger must obtain the precipitation forecast information from the National Weather Service Forecast Office (http://www.srh.noaa.gov/).

2. **Linear Projects**

a. **Linear Risk Determination**

LUPs vary in complexity and water quality concerns based on the type of project. This General Permit has varying application requirements based on the project's risk to water quality. Factors that lead to the characterization of the project include location, sediment risk, and receiving water risk.

Based on the location and complexity of a project area or project section area, LUPs are separated into project types. As described below, LUPs have been categorized into three project types.

i. ***Type 1 LUPs***

Type 1 LUPs are those construction projects where:

(1) 70 percent or more of the construction activity occurs on a paved surface and where areas disturbed during construction will be returned to preconstruction conditions or equivalent protection established at the end of the construction activities for the day, or

(2) greater than 30 percent of construction activities occur within the non-paved shoulders or land immediately adjacent to paved surfaces, or where construction occurs on unpaved improved roads, including their shoulders or land immediately adjacent to them where:

Areas disturbed during construction will be returned to pre-construction conditions or equivalent protection established at the end of the construction activities for the day to minimize the potential for erosion and sediment deposition, and

Areas where established vegetation was disturbed during construction will be stabilized and re-vegetated by the end of project. When required, adequate temporary stabilization Best Management Practices (BMPs) will be installed and maintained until vegetation is established to meet minimum cover requirements established in this General Permit for final stabilization.

Type 1 LUPs typically do not have a high potential to impact storm water quality because (1) these construction activities are not typically conducted during a rain event, (2) these projects are normally constructed over a short period of time[14], minimizing the duration that pollutants could potentially be exposed to rainfall; and (3) disturbed soils such as those from trench excavation are required to be hauled away, backfilled into the trench, and/or covered (e.g., metal plates, pavement, plastic covers over spoil piles) at the end of the construction day.

Type 1 LUPs are determined during the risk assessment found in Attachment A.1 to be 1) low sediment risk and low receiving water risk; 2) low sediment risk and medium receiving water risk; and 3) medium sediment risk and low receiving water risk.

This General Permit requires the discharger to ensure a SWPPP is developed for these construction activities that is specific to project type, location and characteristics.

ii. ***Type 2 LUPs:***

Type 2 projects are determined to have a combination of High, Medium, and Low project sediment risk along with High, Medium, and Low receiving water risk. Like Type 1 projects, Type 2 projects are typically constructed over a short period of time. However, these projects have a higher potential to impact water quality because they:

(1) typically occur outside the more urban/developed areas;

(2) have larger areas of soil disturbance that are not closed or restored at the end of the day;

(3) may have onsite stockpiles of soil, spoil and other materials;

(4) cross or occur in close proximity to a wide variety of sensitive resources that may include, but are not limited to, steep topography and/or water bodies; and

(5) have larger areas of disturbed soils that may be exposed for a longer time interval before final stabilization, cleanup and/or reclamation occurs.

This General Permit requires the discharger to develop and implement a SWPPP for these construction activities that are specific for project type, location and characteristics.

iii. ***Type 3 LUPs:***

[14] Short period of time refers to a project duration of weeks to months, but typically less than one year in duration.

Type 3 projects are determined to have a combination of High and Medium project sediment risk along with High and Medium receiving water risk. Similar to Type 2 projects, Type 3 projects have a higher potential to impact water quality because they:

(1) typically occur outside of the more urban/developed areas;

(2) have larger areas of soil disturbance that are not closed or restored at the end of the day;

(3) may have onsite stockpiles of soil, spoil and other materials;

(4) cross or occur in close proximity to a wide variety of sensitive resources that may include, but are not limited to, steep topography and/or water bodies; and

(5) have larger areas of disturbed soils that may be exposed for a longer time interval before final stabilization, cleanup and/or reclamation occurs.

This General Permit requires the discharger to develop and implement a SWPPP for these construction activities that are specific for project type, location, and characteristics.

b. Linear Effluent Standards

All LUPs are subject to the narrative effluent limitations specified in the General Permit.

Type 2 and Type 3 projects are subject to technology-based NALs for pH and turbidity.

c. Linear Good Housekeeping

Improper use and handling of construction materials could potentially cause a threat to water quality. In order to ensure proper site management of these construction materials, all LUP dischargers must comply with a minimum set of Good Housekeeping measures specified in Attachment A of this General Permit.

d. Linear Non-Storm Water Management

In order to ensure control of all non-storm water discharges during construction, all LUP dischargers must comply with the Non-Storm Water Management measures specified in Attachment A of this General Permit.

e. Linear Erosion Control

This General Permit requires all LUP dischargers to implement effective wind erosion control measures, and soil cover for inactive areas. Type 3 LUPs posing a higher risk to water quality are additionally required to ensure the post-construction soil loss is equivalent to or less than the pre-construction levels.

f. Linear Sediment Control

In order to ensure control and containment of all sediment discharges, all LUP dischargers must comply with the general Sediment Control measures specified in Attachment A or this General Permit. Additional requirements for sediment controls are imposed on Type 2 & 3 LUPs due to their higher risk to water quality.

g. Linear Run-on and Runoff Control

Discharges originating outside of a project's perimeter and flowing onto the property can adversely affect the quantity and quality of discharges originating from a project site. In order to ensure proper management of run-on and runoff, all LUPs must comply with the run-on and runoff control measures specified in Attachment A of this General Permit. Due to the lower risk of impacting water quality, Type 1 LUPs are not required to implement run-on and runoff controls unless deemed necessary by the discharger.

h. Linear Inspection, Maintenance and Repair

Proper inspection, maintenance, and repair activities are important to ensure the effectiveness of on-site measures to control water quality. In order to ensure that inspection, maintenance, and repair activities are adequately performed, the all LUP dischargers a re required to comply with the Inspection, Maintenance, and Repair requirements specified in Attachment A of this General Permit.

K. ATS[15] Requirements

There are instances on construction sites where traditional erosion and sediment controls do not effectively control accelerated erosion. Under such circumstances, or under circumstances where storm water discharges leaving the site may cause or contribute to an exceedance of a water quality standard, the use of an Active Treatment System (ATS) may be necessary. Additionally, it may be appropriate to use an ATS when site constraints inhibit the ability to construct a correctly sized sediment basin, when clay and/or highly erosive soils are present, or when the site has very steep or long slope lengths.[16]

Although treatment systems have been in use in some form since the mid-1990s, the ATS industry in California is relatively young, and detailed regulatory standards have not yet been developed. Many developers are using these systems to treat storm water discharges from their construction sites. The new ATS requirements set forth in this General Permit are based on those in place for small wastewater treatment systems, ATS regulations from the Central Valley Regional Water Quality Control Board (September 2005 memorandum "2005/2006 Rainy Season – Monitoring Requirements for Storm Water Treatment Systems that Utilize Chemical Additives to Enhance Sedimentation"), the Construction Storm Water Program at the State of Washington's Department of Ecology, as well as recent advances in technology and knowledge of coagulant performance and aquatic safety.

The effective design of an ATS requires a detailed survey and analysis of site conditions. With proper planning, ATS performance can provide exceptional water quality discharge and prevent significant impacts to surface water quality, even under extreme environmental conditions.

These systems can be very effective in reducing the sediment in storm water runoff, but the systems that use additives/polymers to enhance sedimentation also pose a potential risk to water quality (e.g., operational failure, equipment failure, additive/polymer release, etc.). The State Water Board is concerned about the potential acute and chronic impacts that the polymers and other chemical additives may have on fish and aquatic organisms if released in sufficient quantities or concentrations. In addition

[15] An ATS is a treatment system that employs chemical coagulation, chemical flocculation, or electrocoagulation in order to reduce turbidity caused by fine suspended sediment.
[16] Pitt, R., S. Clark, and D. Lake. 2006. Construction Site Erosion and Sediment Controls: Planning, Design, and Performance. DEStech Publications. Lancaster, PA. 370pp.

to anecdotal evidence of polymer releases causing aquatic toxicity in California, the literature supports this concern.[17] For example, cationic polymers have been shown to bind with the negatively charged gills of fish, resulting in mechanical suffocation.[18] Due to the potential toxicity impacts, which may be caused by the release of additives/polymers into receiving waters, this General Permit establishes residual polymer monitoring and toxicity testing requirements have been established in this General Permit for discharges from construction sites that utilize an ATS in order to protect receiving water quality and beneficial uses.

The primary treatment process in an ATS is coagulation/flocculation. ATS's operate on the principle that the added coagulant is bound to suspended sediment, forming floc, which is gravitationally settled in tanks or a basin, or removed by sand filters. A typical installation utilizes an injection pump upstream from the clarifier tank, basin, or sand filters, which is electronically metered to both flow rate and suspended solids level of the influent, assuring a constant dose. The coagulant mixes and reacts with the influent, forming a dense floc. The floc may be removed by gravitational setting in a clarifier tank or basin, or by filtration. Water from the clarifier tank, basin, or sand filters may be routed through cartridge(s) and/or bag filters for final polishing. Vendor-specific systems use various methods of dose control, sediment/floc removal, filtration, etc., that are detailed in project-specific documentation. The particular coagulant/flocculant to be used for a given project is determined based on the water chemistry of the site because the coagulants are specific in their reactions with various types of sediments. Appropriate selection of dosage must be carefully matched to the characteristics of each site.

ATS's are operated in two differing modes, either Batch or Flow-Through. Batch treatment can be defined as Pump-Treat-Hold-Test-Release. In Batch treatment, water is held in a basin or tank, and is not discharged until treatment is complete. Batch treatment involves holding or recirculating the treated water in a holding basin or tank(s) until treatment is complete or the basin or storage tank(s) is full. In Flow-Through treatment, water is pumped into the ATS directly from the runoff collection system or storm water holding pond, where it is treated and filtered as it flows through the system, and is then directly discharged. "Flow-Through Treatment" is also referred to as "Continuous Treatment."

1. Effluent Standards

This General Permit establishes NELs for discharges from construction sites that utilize an ATS. These systems lend themselves to NELs for turbidity and pH because of their known reliable treatment. Advanced systems have been in use in some form since the mid-1990s. An ATS is considered reliable, can consistently produce a discharge of less than 10 NTU, and has been used successfully at many sites in several states since 1995 to reduce turbidity to very low levels.[19]

This General Permit contains "compliance storm event" exceptions from the technology-based NELs for ATS discharges. The rationale is that technology-based requirements are developed assuming a certain design storm. In the case of ATS the industry-standard design storm is 10-year, 24-hour (as stated in

[17] RomØen, K., B. Thu, and Ø. Evensen. 2002. Immersion delivery of plasmid DNA II. A study of the potentials of a chitosan based delivery system in rainbow trout (*Oncorhynchus mykiss*) fry. *Journal of Controlled Release* **85**: 215-225.
[18] Bullock, G., V. Blazer, S. Tsukuda, and S. Summerfelt. 2000. Toxicity of acidified chitosan for cultured rainbow trout (*Oncorhynchus mykiss*). *Aquaculture* **185**:273-280.
[19] Currier, B., G. Minton, R. Pitt, L. Roesner, K. Schiff, M. Stenstrom, E. Strassler, and E. Strecker. 2006. The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.

Attachment F of this General Permit), so the compliance storm event has been established as the 10-year 24-hour event as well to provide consistency.

2. **Training**

Operator training is critical to the safe and efficient operation and maintenance of the ATS, and to ensure that all State Water Board monitoring and sampling requirements are met. The General Permit requires that all ATS operators have training specific to using ATS's liquid coagulants.

L. Post-Construction Requirements

Under past practices, new and redevelopment construction activities have resulted in modified natural watershed and stream processes. This is caused by altering the terrain, modifying the vegetation and soil characteristics, introducing impervious surfaces such as pavement and buildings, increasing drainage density through pipes and channels, and altering the condition of stream channels through straightening, deepening, and armoring. These changes result in a drainage system where sediment transport capacity is increased and sediment supply is decreased. A receiving channel's response is dependent on dominant channel materials and its stage of adjustment.

Construction activity can lead to impairment of beneficial uses in two main ways. First, during the actual construction process, storm water discharges can negatively affect the chemical, biological, and physical properties of downstream receiving waters. Due to the disturbance of the landscape, the most likely pollutant is sediment, however pH and other non-visible pollutants are also of great concern. Second, after most construction activities are completed at a construction site, the finished project may result in significant modification of the site's response to precipitation. New development and redevelopment projects have almost always resulted in permanent post-construction water quality impacts because more precipitation ends up as runoff and less precipitation is intercepted, evapotranspired, and infiltrated.

General Permit 99-08-DWQ required the SWPPP to include a description of all post-construction BMPs on a site and a maintenance schedule. An effective storm water management strategy must address the full suite of storm events (water quality, channel protection, overbank flood protection, extreme flood protection) (Figure 2).

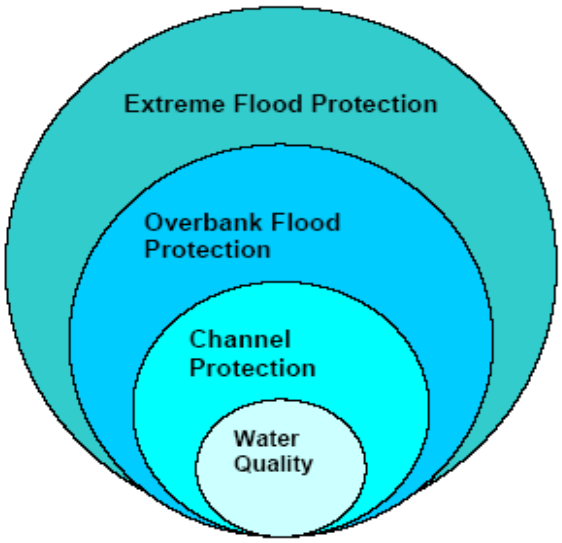

Figure 2 - Suite of Storm Events

The post-construction storm water performance standards in this General Permit specifically address water quality and channel protection events. Overbank flood protection and extreme flood protection events are traditionally dealt with in local drainage and flood protection ordinances. However, measures in this General Permit to address water quality and channel protection also reduce overbank and extreme flooding impacts. This General Permit aims to match post-construction runoff to pre-construction runoff for the 85th percentile storm event, which not only reduces the risk of impact to the receiving water's channel morphology but also provides some protection of water quality.

This General Permit clarifies that its runoff reduction requirements only apply to projects that lie outside of jurisdictions covered by a Standard Urban Storm water Management Plan (SUSMP) (or other more protective) post-construction requirements in either Phase I or Phase II permits.

Figures 3 and 4, below, show the General Permit enrollees (to Order 99-08-DWQ, as of March 10, 2008) overlaid upon a map with SUSMP (or more protective) areas in blue and purple. Areas without blue or purple indicate where the General Permit's runoff reduction requirements would actually apply.

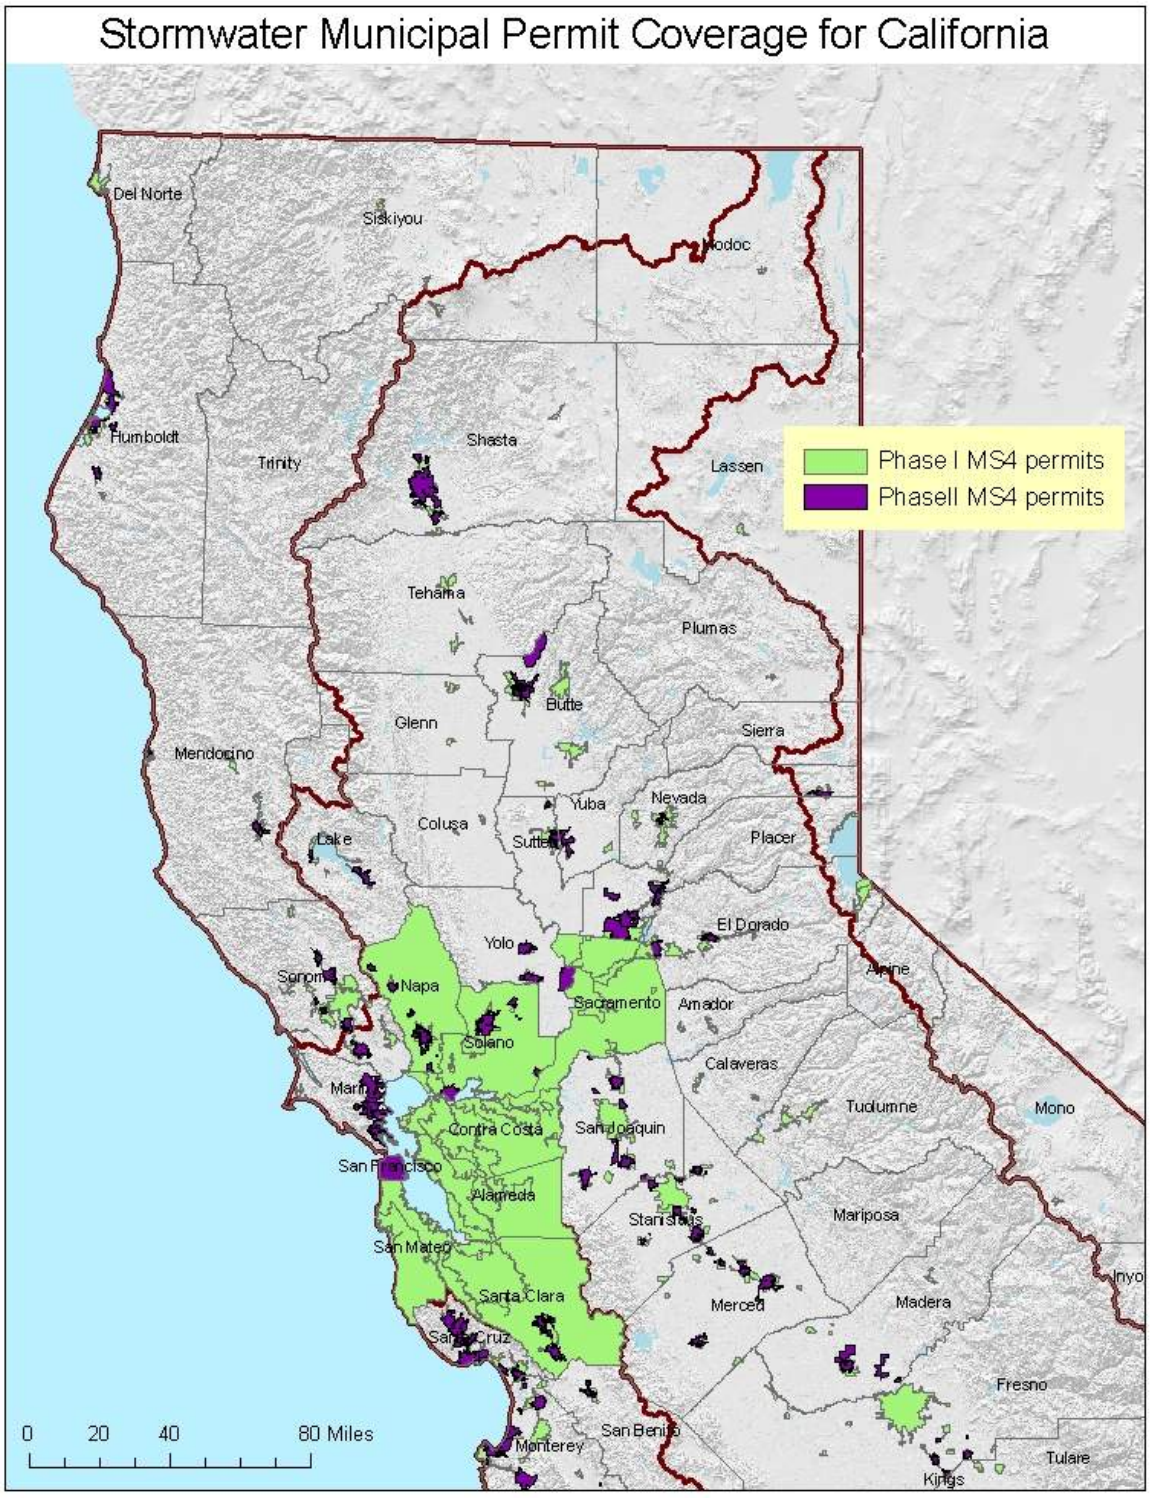

Figure 3 - Northern CA (2009) Counties / Cities With SUSMP-Plus Coverage

Figure 4 - Southern CA (2009) Counties / Cities With SUSMP-Plus Coverage

Water Quality:
This General Permit requires dischargers to replicate the pre-project runoff water balance (defined as the amount of rainfall that ends up as runoff) for the smallest storms up to the 85th percentile storm event, or the smallest storm event that generates runoff, whichever is larger. Contemporary storm water management generally routes these flows directly to the drainage system, increasing pollutant loads and potentially causing adverse effects on receiving waters. These smaller water quality events happen much more frequently than larger events and generate much higher pollutant loads on an annual basis. There are other adverse hydrological impacts that result from not designing according to the site's pre-construction water balance. In Maryland, Klein[20] noted that baseflow decreases as the extent of urbanization increases. Ferguson and Suckling[21] noted a similar relation in watersheds in Georgia. On Long Island, Spinello and Simmons[22] noted substantial decreases in base flow in intensely urbanized watersheds.

The permit emphasizes runoff reduction through on-site storm water reuse, interception, evapo-transpiration and infiltration through non-structural controls and conservation design measures (e.g., downspout disconnection, soil quality preservation/enhancement, interceptor trees). Employing these measures close to the source of runoff generation is the easiest and most cost-effective way to comply with the pre-construction water balance standard. Using low-tech runoff reduction techniques close to the source is consistent with a number of recommendations in the literature.[23] In many cases, BMPs implemented close to the source of runoff generation cost less than end-of the pipe measures.[24] Dischargers are given the option of using Appendix 2 to calculate the required runoff volume or a watershed process-based, continuous simulation model such as the EPA's Storm Water Management Model (SWMMM) or Hydrologic Simulation Program Fortran (HSPF). Such methods used by the discharger will be reviewed by the Regional Water Board upon NOT application.

Channel Protection:
In order to address channel protection, a basic understanding of fluvial geomorphic concepts is necessary. A dominant paradigm in fluvial geomorphology holds that streams adjust their channel dimensions (width and depth) in response to long-term changes in sediment supply and bankfull discharge (1.5 to 2 year recurrence interval). The bankfull stage corresponds to the discharge at which channel maintenance is the most effective, that is, the discharge at which the moving sediment, forming or removing bars, forming or changing bends and meanders, and generally doing work that results in the average morphologic characteristics of channels.[25] Lane (1955 as cited in Rosgen 1996[26]) showed the generalized relationship between sediment load, sediment size, stream discharge and stream slope in

Figure 5. A change in any one of these variables sets up a series of mutual adjustments in the companion variables with a resulting direct change in the physical characteristics of the stream channel.

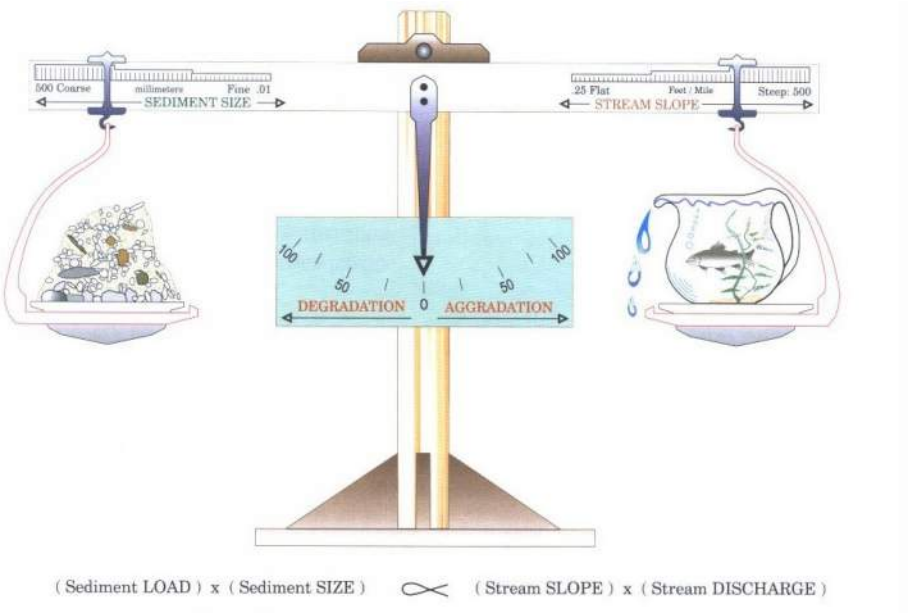

Figure 5 - Schematic of the Lane Relationship

After Lane (1955) as cited in Rosgen (1996)

Stream slope multiplied by stream discharge (the right side of the scale) is essentially an approximation of stream power, a unifying concept in fluvial geomorphology (Bledsoe 1999). Urbanization generally increases stream power and affects the resisting forces in a channel (sediment load and sediment size represented on the left side of the scale).

During construction, sediment loads can increase from 2 to 40,000 times over pre-construction levels.[27] Most of this sediment is delivered to stream channels during large, episodic rain events.[28] This increased sediment load leads to an initial aggradation phase where stream depths may decrease as sediment fills the channel, leading to a decrease in channel capacity and increase in flooding and overbank deposition. A degradation phase initiates after construction is completed.

Schumm et. al (1984) developed a channel evolution model that describes the series of adjustments from initial downcutting, to widening, to establishing new floodplains at lower elevations (Figure 6).

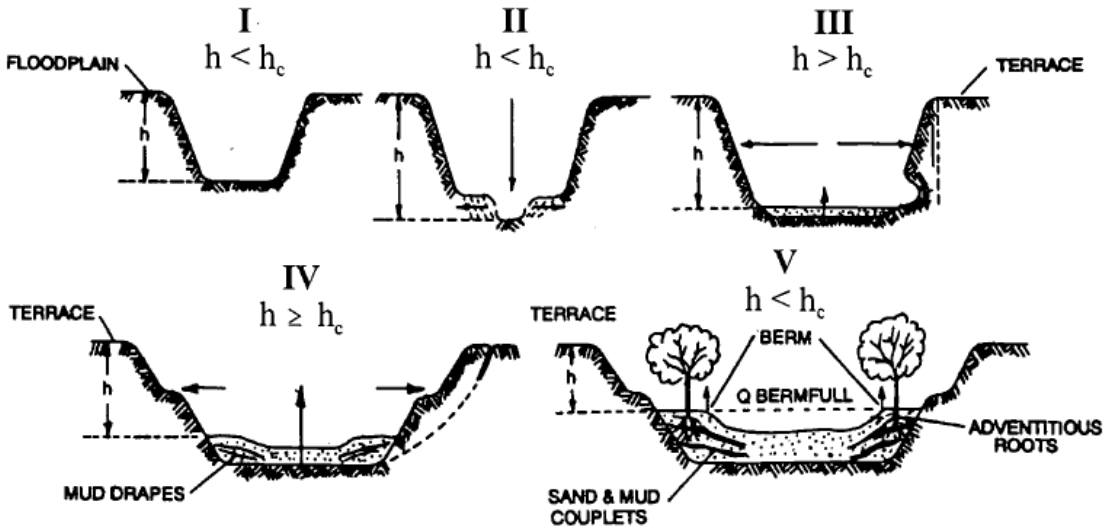

Figure 6 - Channel Changes Associated with Urbanization

After Incised Channel Evolution Sequence in Schumm et. al 1984

Channel incision (Stage II) and widening (Stages III and to a lesser degree, Stage IV) are due to a number of fundamental changes on the landscape. Connected impervious area and compaction of pervious surfaces increase the frequency and volume of bankfull discharges.[29] Increased drainage density (miles of stream length per square mile of watershed) also negatively impacts receiving stream channels.[30] Increased drainage density and hydraulic efficiency leads to an increase in the frequency and volume of bankfull discharges because the time of concentration is shortened. Flows from engineered pipes and channels are also often "sediment starved" and seek to replenish their sediment supply from the channel.

Encroachment of stream channels can also lead to an increase in stream slope, which leads to an increase in stream power. In addition, watershed sediment loads and sediment size (with size generally represented as the median bed and bank particle size, or d_{50}) decrease during urbanization.[31] This means

[29] Booth, D. B. and C. R. Jackson. 1997. Urbanization of Aquatic Systems: Degradation Thresholds, Storm Water Detection, and the Limits of Mitigation. Journal of the American Water Resources Association Vol. 33, No.5, pp. 1077-1089.

that even if pre- and post-development stream power are the same, more erosion will occur in the post-development stage because the smaller particles are less resistant (provided they are non-cohesive).

As shown in Stages II and III, the channel deepens and widens to accommodate the increased stream power [32]and decrease in sediment load and sediment size. Channels may actually narrow as entrained sediment from incision is deposited laterally in the channel. After incised channels begin to migrate laterally (Stage III), bank erosion begins, which leads to general channel widening.[33] At this point, a majority of the sediment that leaves a drainage area comes from within the channel, as opposed to the background and construction related hillslope contribution. Stage IV is characterized by more aggradation and localized bank instability. Stage V represents a new quasi-equilibrium channel morphology in balance with the new flow and sediment supply regime. In other words, stream power is in balance with sediment load and sediment size.

The magnitude of the channel morphology changes discussed above varies along a stream network as well as with the age of development, slope, geology (sand-bedded channels may cycle through the evolution sequence in a matter of decades whereas clay-dominated channels may take much longer), watershed sediment load and size, type of urbanization, and land use history. It is also dependent on a channel's stage in the channel evolution sequence when urbanization occurs. Management strategies

must take into account a channel's stage of adjustment and account for future changes in the evolution of channel form (Stein and Zaleski 2005). [34]

Traditional structural water quality BMPs (e.g. detention basins and other devices used to store volumes of runoff) unless they are highly engineered to provide adequate flow duration control, do not adequately protect receiving waters from accelerated channel bed and bank erosion, do not address post-development increases in runoff volume, and do not mitigate the decline in benthic macroinvertebrate communities in the receiving waters[35] suggest that structural BMPs are not as effective in protecting aquatic communities as a continuous riparian buffer of native vegetation. This is supported by the findings of Zucker and White[36], where instream biological metrics were correlated with the extent of forested buffers.

This General Permit requires dischargers to maintain pre-development drainage densities and times of concentration in order to protect channels and encourages dischargers to implement setbacks to reduce channel slope and velocity changes that can lead to aquatic habitat degradation.

There are a number of other approaches for modeling fluvial systems, including statistical and physical models and simpler stream power models.[37] The use of these models in California is described in Stein and Zaleski (2005).[38] Rather than prescribe a specific one-size-fits-all modeling method in this permit, the State Water Board intends to develop a stream power and channel evolution model-based framework to assess channels and develop a hierarchy of suitable analysis methods and management strategies. In time, this framework may become a State Water Board water quality control policy.

Permit Linkage to Overbank and Extreme Flood Protection
Site design BMPs (e.g. rooftop and impervious disconnection, vegetated swales, setbacks and buffers) filter and settle out pollutants and provide for more infiltration than is possible for traditional centralized structural BMPs placed at the lowest point in a site. They provide source control for runoff and lead to a reduction in pollutant loads. When implemented, they also help reduce the magnitude and volume of larger, less frequent storm events (e.g., 10-yr, 24-hour storm and larger), thereby reducing the need for expensive flood control infrastructure. Nonstructural BMPs can also be a landscape amenity, instead of a large isolated structure requiring substantial area for ancillary access, buffering, screening and maintenance facilities.[25] The multiple benefits of using non-structural benefits will be critically important as the state's population increases and imposes strains upon our existing water resources.

Maintaining predevelopment drainage densities and times of concentration will help reduce post-development peak flows and volumes in areas not covered under a municipal permit. The most effective way to preserve drainage areas and maximize time of concentration is to implement landform grading,

incorporate site design BMPs and implement distributed structural BMPs (e.g., bioretention cells, rain gardens, rain cisterns).

M. Storm Water Pollution Prevention Plans

USEPA's Construction General Permit requires that qualified personnel conduct inspections. USEPA defines qualified personnel as "a person knowledgeable in the principles and practice of erosion and sediment controls who possesses the skills to assess conditions at the construction site that could impact storm water quality and to assess the effectiveness of any sediment and erosion control measures selected to control the quality of storm water discharges from the construction activity."[39] USEPA also suggests that qualified personnel prepare SWPPPs and points to numerous states that require certified professionals to be on construction sites at all times. States that currently have certification programs are Washington, Georgia, Florida, Delaware, Maryland, and New Jersey. The Permit 99-08-DWQ did not require that qualified personnel prepare SWPPPs or conduct inspections. However, to ensure that water quality is being protected, this General Permit requires that all SWPPPs be written, amended, and certified by a Qualified SWPPP Developer. A Qualified SWPPP Developer must possess one of the eight certifications and or registrations specified in this General Permit and effective two years after the adoption date of this General Permit, must have attended a State Water Board-sponsored or approved Qualified SWPPP Developer training course. Table 9 provides an overview of the criteria used in determining qualified certification titles for a QSD and QSP.

The previous versions of the General Permit required development and implementation of a SWPPP as the primary compliance mechanism. The SWPPP has two major objectives: (1) to help identify the sources of sediment and other pollutants that affect the quality of storm water discharges; and (2) to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in storm water and non-storm water discharges. The SWPPP must include BMPs that address source control, BMPs that address pollutant control, and BMPs that address treatment control.

This General Permit shifts some of the measures that were covered by this general requirement to specific permit requirements, each individually enforceable as a permit term. This General Permit emphasizes the use of appropriately selected, correctly installed and maintained pollution reduction BMPs. This approach provides the flexibility necessary to establish BMPs that can effectively address source control of pollutants during changing construction activities. These specific requirements also improve both the clarity and the enforceability of the General Permit so that the dischargers understand, and the public can determine whether the discharges are in compliance with, permit requirements.

The SWPPP must be implemented at the appropriate level to protect water quality at all times throughout the life of the project. The SWPPP must remain on the site during construction activities, commencing with the initial mobilization and ending with the termination of coverage under the General Permit. For LUPs the discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio or telephone. Once construction activities are complete, until stabilization is achieved, the SWPPP shall be available from the SWPPP contact listed in the PRDs

A SWPPP must be appropriate for the type and complexity of a project and will be developed and implemented to address project specific conditions. Some projects may have similarities or complexities, yet each project is unique in its progressive state that requires specific description and selection of BMPs needed to address all possible generated pollutants

N. Regional Water Board Authorities

Because this General Permit will be issued to thousands of construction sites across the State, the Regional Water Boards retain discretionary authority over certain issues that may arise from the discharges in their respective regions. This General Permit does not grant the Regional Water Boards any authority they do not otherwise have; rather, it merely emphasizes that the Regional Water Boards can take specific actions related to this General Permit. For example, the Regional Water Boards will be enforcing this General Permit and may need to adjust some requirements for a discharger based on the discharger's compliance history.

STATE WATER RESOURCES CONTROL BOARD
ORDER NO. 2009-0009-DWQ
[AS AMENDED BY ORDER NO. 2010-0014-DWQ]
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM
GENERAL PERMIT NO. CAS000002

WASTE DISCHARGE REQUIREMENTS
FOR
DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION AND LAND DISTURBANCE ACTIVITIES

I. FINDINGS

A. General Findings

The State Water Resources Control Board (State Water Board) finds that:

1. The federal Clean Water Act (CWA) prohibits certain discharges of storm water containing pollutants except in compliance with a National Pollutant Discharge Elimination System (NPDES) permit (Title 33 United States Code (U.S.C.) §§ 1311 and 1342(p); also referred to as Clean Water Act (CWA) §§ 301 and 402(p)). The U.S. Environmental Protection Agency (U.S. EPA) promulgates federal regulations to implement the CWA's mandate to control pollutants in storm water runoff discharges. (Title 40 Code of Federal Regulations (C.F.R.) Parts 122, 123, and 124). The federal statutes and regulations require discharges to surface waters comprised of storm water associated with construction activity, including demolition, clearing, grading, and excavation, and other land disturbance activities (except operations that result in disturbance of less than one acre of total land area and which are not part of a larger common plan of development or sale), to obtain coverage under an NPDES permit. The NPDES permit must require implementation of Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to reduce or eliminate pollutants in storm water runoff. The NPDES permit must also include additional requirements necessary to implement applicable water quality standards.

2. This General Permit authorizes discharges of storm water associated with construction activity so long as the dischargers comply with all requirements, provisions, limitations and prohibitions in the permit. In addition, this General Permit regulates the discharges of storm water associated with construction activities from all Linear

Underground/Overhead Projects resulting in the disturbance of greater than or equal to one acre (Attachment A).

3. This General Permit regulates discharges of pollutants in storm water associated with construction activity (storm water discharges) to waters of the United States from construction sites that disturb one or more acres of land surface, or that are part of a common plan of development or sale that disturbs more than one acre of land surface.

4. This General Permit does not preempt or supersede the authority of local storm water management agencies to prohibit, restrict, or control storm water discharges to municipal separate storm sewer systems or other watercourses within their jurisdictions.

5. This action to adopt a general NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21100, et seq.), pursuant to Section 13389 of the California Water Code.

6. Pursuant to 40 C.F.R. § 131.12 and State Water Board Resolution No. 68-16,[1] which incorporates the requirements of § 131.12 where applicable, the State Water Board finds that discharges in compliance with this General Permit will not result in the lowering of water quality standards, and are therefore consistent with those provisions. Compliance with this General Permit will result in improvements in water quality.

7. This General Permit serves as an NPDES permit in compliance with CWA § 402 and will take effect on July 1, 2010 by the State Water Board provided the Regional Administrator of the U.S. EPA has no objection. If the U.S. EPA Regional Administrator objects to its issuance, the General Permit will not become effective until such objection is withdrawn.

8. Following adoption and upon the effective date of this General Permit, the Regional Water Quality Control Boards (Regional Water Boards) shall enforce the provisions herein.

9. Regional Water Boards establish water quality standards in Basin Plans. The State Water Board establishes water quality standards in various statewide plans, including the California Ocean Plan. U.S. EPA establishes water quality standards in the National Toxic Rule (NTR) and the California Toxic Rule (CTR).

[1] Resolution No. 68-16 generally requires that existing water quality be maintained unless degradation is justified based on specific findings.

10. This General Permit does not authorize discharges of fill or dredged material regulated by the U.S. Army Corps of Engineers under CWA § 404 and does not constitute a waiver of water quality certification under CWA § 401.

11. The primary storm water pollutant at construction sites is excess sediment. Excess sediment can cloud the water, which reduces the amount of sunlight reaching aquatic plants, clog fish gills, smother aquatic habitat and spawning areas, and impede navigation in our waterways. Sediment also transports other pollutants such as nutrients, metals, and oils and greases.

12. Construction activities can impact a construction site's runoff sediment supply and transport characteristics. These modifications, which can occur both during and after the construction phase, are a significant cause of degradation of the beneficial uses established for water bodies in California. Dischargers can avoid these effects through better construction site design and activity practices.

13. This General Permit recognizes four distinct phases of construction activities. The phases are Grading and Land Development Phase, Streets and Utilities Phase, Vertical Construction Phase, and Final Landscaping and Site Stabilization Phase. Each phase has activities that can result in different water quality effects from different water quality pollutants. This General Permit also recognizes inactive construction as a category of construction site type.

14. Compliance with any specific limits or requirements contained in this General Permit does not constitute compliance with any other applicable requirements.

15. Following public notice in accordance with State and Federal laws and regulations, the State Water Board heard and considered all comments and testimony in a public hearing on 06/03/2009. The State Water Board has prepared written responses to all significant comments.

16. Construction activities obtaining coverage under the General Permit may have multiple discharges subject to requirements that are specific to general, linear, and/or active treatment system discharge types.

17. The State Water Board may reopen the permit if the U.S. EPA adopts a final effluent limitation guideline for construction activities.

B. Activities Covered Under the General Permit

18. Any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre.

19. Construction activity that results in land surface disturbances of less than one acre if the construction activity is part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

20. Construction activity related to residential, commercial, or industrial development on lands currently used for agriculture including, but not limited to, the construction of buildings related to agriculture that are considered industrial pursuant to U.S. EPA regulations, such as dairy barns or food processing facilities.

21. Construction activity associated with Linear Underground/Overhead Utility Projects (LUPs) including, but not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

22. Discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.[2]

23. Storm water discharges from dredge spoil placement that occur outside of U.S. Army Corps of Engineers jurisdiction (upland sites) and that disturb one or more acres of land surface from construction activity are covered by this General Permit. Construction sites that intend to disturb one or more acres of land within the jurisdictional boundaries of

[2] Pursuant to the Ninth Circuit Court of Appeals' decision in *NRDC v. EPA* (9th Cir. 2008) 526 F.3d 591, and subsequent denial of the U.S. EPA's petition for reconsideration in November 2008, oil and gas construction activities discharging storm water contaminated only with sediment are no longer exempt from the NPDES program.

a CWA § 404 permit should contact the appropriate Regional Water Board to determine whether this permit applies to the site.

C. Activities Not Covered Under the General Permit

24. Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility.

25. Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation.

26. Discharges of storm water from areas on tribal lands; construction on tribal lands is regulated by a federal permit.

27. Construction activity and land disturbance involving discharges of storm water within the Lake Tahoe Hydrologic Unit. The Lahontan Regional Water Board has adopted its own permit to regulate storm water discharges from construction activity in the Lake Tahoe Hydrologic Unit (Regional Water Board 6SLT). Owners of construction sites in this watershed must apply for the Lahontan Regional Water Board permit rather than the statewide Construction General Permit.

28. Construction activity that disturbs less than one acre of land surface, and that is not part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

29. Construction activity covered by an individual NPDES Permit for storm water discharges.

30. Discharges from small (1 to 5 acre) construction activities with an approved Rainfall Erosivity Waiver authorized by U.S. EPA Phase II regulations certifying to the State Board that small construction activity will occur only when the Rainfall Erosivity Factor is less than 5 (“R” in the Revised Universal Soil Loss Equation).

31. Landfill construction activity that is subject to the Industrial General Permit.

32. Construction activity that discharges to Combined Sewer Systems.

33. Conveyances that discharge storm water runoff combined with municipal sewage.

34. Discharges of storm water identified in CWA § 402(*l*)(2), 33 U.S.C. § 1342(*l*)(2).

35. Discharges occurring in basins that are not tributary or hydrologically connected to waters of the United States (for more information contact your Regional Water Board).

D. Obtaining and Modifying General Permit Coverage

36. This General Permit requires all dischargers to electronically file all Permit Registration Documents (PRDs), Notices of Termination (NOT), changes of information, annual reporting, and other compliance documents required by this General Permit through the State Water Board's Storm water Multi-Application and Report Tracking System (SMARTS) website.

37. Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

38. This General Permit grants an exception from the Risk Determination requirements for existing sites covered under Water Quality Orders No. 99-08-DWQ, and No. 2003-0007-DWQ. For certain sites, adding additional requirements may not be cost effective. Construction sites covered under Water Quality Order No. 99-08-DWQ shall obtain permit coverage at the Risk Level 1. LUPs covered under Water Quality Order No. 2003-0007-DWQ shall obtain permit coverage as a Type 1 LUP. The Regional Water Boards have the authority to require Risk Determination to be performed on sites currently covered under Water Quality Orders No. 99-08-DWQ and No. 2003-0007-DWQ where they deem it necessary. The State Water Board finds that there are two circumstances when it may be appropriate for the Regional Water Boards to require a discharger that had filed an NOI under State Water Board Order No. 99-08-DWQ to recalculate the site's risk level. These circumstances are: (1) when the discharger has a demonstrated history of noncompliance with State Water Board Order No. 99-08-DWQ or; (2) when the discharger's site poses a significant risk of causing or contributing to an exceedance of a water quality standard without the implementation of the additional Risk Level 2 or 3 requirements.

E. Prohibitions

39. All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit. Non-storm water discharges include a wide variety of sources, including improper dumping, spills, or leakage from storage tanks or transfer areas. Non-storm water discharges may

contribute significant pollutant loads to receiving waters. Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural Best Management Practices (BMPs)[3]. The State Water Board recognizes, however, that certain non-storm water discharges may be necessary for the completion of construction.

40. This General Permit prohibits all discharges which contain a hazardous substance in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

41. This General Permit incorporates discharge prohibitions contained in water quality control plans, as implemented by the State Water Board and the nine Regional Water Boards.

42. Pursuant to the Ocean Plan, discharges to Areas of Special Biological Significance (ASBS) are prohibited unless covered by an exception that the State Water Board has approved.

43. This General Permit prohibits the discharge of any debris[4] from construction sites. Plastic and other trash materials can cause negative impacts to receiving water beneficial uses. The State Water Board encourages the use of more environmentally safe, biodegradable materials on construction sites to minimize the potential risk to water quality.

F. Training

44. In order to improve compliance with and to maintain consistent enforcement of this General Permit, all dischargers are required to appoint two positions - the Qualified SWPPP Developer (QSD) and the Qualified SWPPP Practitioner (QSP) - who must obtain appropriate training. Together with the key stakeholders, the State and Regional Water Boards are leading the development of this curriculum through a collaborative organization called The Construction General Permit (CGP) Training Team.

45. The Professional Engineers Act (Bus. & Prof. Code section 6700, et seq.) requires that all engineering work must be performed by a California licensed engineer.

[3] BMPs are scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants to waters of the United States. BMPs also include treatment requirements, operating procedures, and practice to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

[4] Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

G. Determining and Reducing Risk

46. The risk of accelerated erosion and sedimentation from wind and water depends on a number of factors, including proximity to receiving water bodies, climate, topography, and soil type.

47. This General Permit requires dischargers to assess the risk level of a site based on both sediment transport and receiving water risk. This General Permit contains requirements for Risk Levels 1, 2 and 3, and LUP Risk Type 1, 2, and 3 (Attachment A). Risk levels are established by determining two factors: first, calculating the site's sediment risk; and second, receiving water risk during periods of soil exposure (i.e. grading and site stabilization). Both factors are used to determine the site-specific Risk Level(s). LUPs can be determined to be Type 1 based on the flowchart in Attachment A.1.

48. Although this General Permit does not mandate specific setback distances, dischargers are encouraged to set back their construction activities from streams and wetlands whenever feasible to reduce the risk of impacting water quality (e.g., natural stream stability and habitat function). Because there is a reduced risk to receiving waters when setbacks are used, this General Permit gives credit to setbacks in the risk determination and post-construction storm water performance standards. The risk calculation and runoff reduction mechanisms in this General Permit are expected to facilitate compliance with any Regional Water Board and local agency setback requirements, and to encourage voluntary setbacks wherever practicable.

49. Rain events can occur at any time of the year in California. Therefore, a Rain Event Action Plan (REAP) is necessary for Risk Level 2 and 3 traditional construction projects (LUPs exempt) to ensure that active construction sites have adequate erosion and sediment controls implemented prior to the onset of a storm event, even if construction is planned only during the dry season.

50. Soil particles smaller than 0.02 millimeters (mm) (i.e., finer than medium silt) do not settle easily using conventional measures for sediment control (i.e., sediment basins). Given their long settling time, dislodging these soils results in a significant risk that fine particles will be released into surface waters and cause unacceptable downstream impacts. If operated correctly, an Active Treatment System (ATS[5]) can prevent or reduce the release of fine particles from construction sites.

[5] An ATS is a treatment system that employs chemical coagulation, chemical flocculation, or electro coagulation in order to reduce turbidity caused by fine suspended sediment.

Use of an ATS can effectively reduce a site's risk of impacting receiving waters.

51. Dischargers located in a watershed area where a Total Maximum Daily Load (TMDL) has been adopted or approved by the Regional Water Board or U.S. EPA may be required by a separate Regional Water Board action to implement additional BMPs, conduct additional monitoring activities, and/or comply with an applicable waste load allocation and implementation schedule. Such dischargers may also be required to obtain an individual Regional Water Board permit specific to the area.

H. Effluent Standards

52. The State Water Board convened a blue ribbon panel of storm water experts that submitted a report entitled, "The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities," dated June 19, 2006. The panel concluded that numeric limits or action levels are technically feasible to control construction storm water discharges, provided that certain conditions are considered. The panel also concluded that numeric effluent limitations (NELs) are feasible for discharges from construction sites that utilize an ATS. The State Water Board has incorporated the expert panel's suggestions into this General Permit, which includes numeric action levels (NALs) for pH and turbidity, and special numeric limits for ATS discharges.

Determining Compliance with Numeric Limitations

53. This General Permit sets a pH NAL of 6.5 to 8.5, and a turbidity NAL of 250 NTU. The purpose of the NAL and its associated monitoring requirement is to provide operational information regarding the performance of the measures used at the site to minimize the discharge of pollutants and to protect beneficial uses and receiving waters from the adverse effects of construction-related storm water discharges. An exceedance of a NAL does not constitute a violation of this General Permit.

54. This General Permit requires dischargers with NAL exceedances to immediately implement additional BMPs and revise their Storm Water Pollution Prevention Plans (SWPPPs) accordingly to either prevent pollutants and authorized non-storm water discharges from contaminating storm water, or to substantially reduce the pollutants to levels consistently below the NALs. NAL exceedances are reported in the State Water Boards SMARTS system, and the discharger is

required to provide an NAL Exceedance Report when requested by a Regional Water Board.

I. Receiving Water Limitations

55. This General Permit requires all enrolled dischargers to determine the receiving waters potentially affected by their discharges and to comply with all applicable water quality standards, including any more stringent standards applicable to a water body.

J. Sampling, Monitoring, Reporting and Record Keeping

56. Visual monitoring of storm water and non-storm water discharges is required for all sites subject to this General Permit.

57. Records of all visual monitoring inspections are required to remain on-site during the construction period and for a minimum of three years.

58. For all Risk Level 3/LUP Type 3 and Risk Level 2/LUP Type 2 sites, this General Permit requires effluent monitoring for pH and turbidity. Sampling, analysis and monitoring requirements for effluent monitoring for pH and turbidity are contained in this General Permit.

59. Risk Level 3 and LUP Type 3 sites with effluent that exceeds the Receiving Water Monitoring Triggers contained in this General Permit and with direct discharges to receiving water are required to conduct receiving water monitoring. An exceedance of a Receiving Water Monitoring Trigger does not constitute a violation of this General Permit.

60. This General Permit establishes a 5 year, 24 hour (expressed in inches of rainfall) as an exemptions to the receiving water monitoring requirements for Risk Level 3 and LUP Type 3 dischargers.

61. If run-on is caused by a forest fire or any other natural disaster, then receiving water monitoring triggers do not apply.

62. For Risk Level 3 and LUP Type 3 sites larger than 30 acres and with direct discharges to receiving waters, this General Permit requires bioassessment sampling before and after site completion to determine if significant degradation to the receiving water's biota has occurred. Bioassessment sampling guidelines are contained in this General Permit.

63. A summary and evaluation of the sampling and analysis results will be submitted in the Annual Reports.

64. This General Permit contains sampling, analysis and monitoring requirements for non-visible pollutants at all sites subject to this General Permit.

65. Compliance with the General Permit relies upon dischargers to electronically self-report any discharge violations and to comply with any Regional Water Board enforcement actions.

66. This General Permit requires that all dischargers maintain a paper or electronic copy of all required records for three years from the date generated or date submitted, whichever is last. These records must be available at the construction site until construction is completed. For LUPs, these documents may be retained in a crew member's vehicle and made available upon request.

K. Active Treatment System (ATS) Requirements

67. Active treatment systems add chemicals to facilitate flocculation, coagulation and filtration of suspended sediment particles. The uncontrolled release of these chemicals to the environment can negatively affect the beneficial uses of receiving waters and/or degrade water quality (e.g., acute and chronic toxicity). Additionally, the batch storage and treatment of storm water through an ATS' can potentially cause physical impacts on receiving waters if storage volume is inadequate or due to sudden releases of the ATS batches and improperly designed outfalls.

68. If designed, operated and maintained properly an ATS can achieve very high removal rates of suspended sediment (measured as turbidity), albeit at sometimes significantly higher costs than traditional erosion/sediment control practices. As a result, this General Permit establishes NELs consistent with the expected level of typical ATS performance.

69. This General Permit requires discharges of storm water associated with construction activity that undergo active treatment to comply with special operational and effluent limitations to ensure that these discharges do not adversely affect the beneficial uses of the receiving waters or cause degradation of their water quality.

70. For ATS discharges, this General Permit establishes technology-based NELs for turbidity.

71. This General Permit establishes a 10 year, 24 hour (expressed in inches of rainfall) Compliance Storm Event exemption from the technology-based numeric effluent limitations for ATS discharges. Exceedances of the ATS turbidity NEL constitutes a violation of this General Permit.

L. Post-Construction Requirements

72. This General Permit includes performance standards for post-construction that are consistent with State Water Board Resolution No. 2005-0006, "Resolution Adopting the Concept of Sustainability as a Core Value for State Water Board Programs and Directing Its Incorporation," and 2008-0030, "Requiring Sustainable Water Resources Management." The requirement for all construction sites to match pre-project hydrology will help ensure that the physical and biological integrity of aquatic ecosystems are sustained. This "runoff reduction" approach is analogous in principle to Low Impact Development (LID) and will serve to protect related watersheds and waterbodies from both hydrologic-based and pollution impacts associated with the post-construction landscape.

73. LUP projects are not subject to post-construction requirements due to the nature of their construction to return project sites to pre-construction conditions.

M. Storm Water Pollution Prevention Plan Requirements

74. This General Permit requires the development of a site-specific SWPPP. The SWPPP must include the information needed to demonstrate compliance with all requirements of this General Permit, and must be kept on the construction site and be available for review. The discharger shall ensure that a QSD develops the SWPPP.

75. To ensure proper site oversight, this General Permit requires a Qualified SWPPP Practitioner to oversee implementation of the BMPs required to comply with this General Permit.

N. Regional Water Board Authorities

76. Regional Water Boards are responsible for implementation and enforcement of this General Permit. A general approach to permitting is not always suitable for every construction site and environmental circumstances. Therefore, this General Permit recognizes that Regional Water Boards must have some flexibility and authority to alter, approve, exempt, or rescind permit authority granted under this

General Permit in order to protect the beneficial uses of our receiving waters and prevent degradation of water quality.

IT IS HEREBY ORDERED that all dischargers subject to this General Permit shall comply with the following conditions and requirements (including all conditions and requirements as set forth in Attachments A, B, C, D, E and F)[6]:

II. CONDITIONS FOR PERMIT COVERAGE

A. Linear Underground/Overhead Projects (LUPs)

1. Linear Underground/Overhead Projects (LUPs) include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water and wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g. telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, (a) those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment, and associated ancillary facilities); and include, but are not limited to, (b) underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/ or pavement repair or replacement, and stockpile/borrow locations.

2. The Legally Responsible Person is responsible for obtaining coverage under the General Permit where the construction of pipelines, utility lines, fiber-optic cables, or other linear underground/overhead projects will occur across several properties unless the LUP construction activities are covered under another construction storm water permit.

3. Only LUPs shall comply with the conditions and requirements in Attachment A, A.1 & A.2 of this Order. The balance of this Order is not applicable to LUPs except as indicated in Attachment A.

[6] These attachments are part of the General Permit itself and are not separate documents that are capable of being updated independently by the State Water Board.

B. Obtaining Permit Coverage Traditional Construction Sites

1. The Legally Responsible Person (LRP) (see Special Provisions, Electronic Signature and Certification Requirements, Section IV.I.1) must obtain coverage under this General Permit.

2. To obtain coverage, the LRP must electronically file Permit Registration Documents (PRDs) prior to the commencement of construction activity. Failure to obtain coverage under this General Permit for storm water discharges to waters of the United States is a violation of the CWA and the California Water Code.

3. PRDs shall consist of:

   a. Notice of Intent (NOI)
   b. Risk Assessment (Section VIII)
   c. Site Map
   d. Storm Water Pollution Prevention Plan (Section XIV)
   e. Annual Fee
   f. Signed Certification Statement

   Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

   Attachment B contains additional PRD information. Dischargers must electronically file the PRDs, and mail the appropriate annual fee to the State Water Board.

4. This permit is effective on July 1, 2010.

   a. **Dischargers Obtaining Coverage On or After July 1, 2010:** All dischargers requiring coverage on or after July 1, 2010, shall electronically file their PRDs prior to the commencement of construction activities, and mail the appropriate annual fee no later than seven days prior to the commencement of construction activities. Permit coverage shall not commence until the PRDs and the annual fee are received by the State Water Board, and a WDID number is assigned and sent by SMARTS.

   b. **Dischargers Covered Under 99-08-DWQ and 2003-0007-DWQ:** Existing dischargers subject to State Water Board Order No. 99-08-DWQ (existing dischargers) will continue coverage under 99-08-DWQ until July 1, 2010. After July 1, 2010, all NOIs subject to State Water Board Order No. 99-08-DWQ will be terminated.

Existing dischargers shall electronically file their PRDs no later than July 1, 2010. If an existing discharger's site acreage subject to the annual fee has changed, it shall mail a revised annual fee no less than seven days after receiving the revised annual fee notification, **or else lose permit coverage**. All existing dischargers shall be exempt from the risk determination requirements in Section VIII of this General Permit until two years after permit adoption. All existing dischargers are therefore subject to Risk Level 1 requirements regardless of their site's sediment and receiving water risks. However, a Regional Board retains the authority to require an existing discharger to comply with the Section VIII risk determination requirements.

5. The discharger is only considered covered by this General Permit upon receipt of a Waste Discharger Identification (WDID) number assigned and sent by the State Water Board Storm water Multi-Application and Report Tracking System (SMARTS). In order to demonstrate compliance with this General Permit, the discharger must obtain a WDID number and must present documentation of a valid WDID upon demand.

6. During the period this permit is subject to review by the U.S. EPA, the prior permit (State Water Board Order No. 99-08-DWQ) remains in effect. Existing dischargers under the prior permit will continue to have coverage under State Water Board Order No. 99-08-DWQ until this General Permit takes effect on July 1, 2010. Dischargers who complete their projects and electronically file an NOT prior to July 1, 2010, are not required to obtain coverage under this General Permit.

7. Small Construction Rainfall Erosivity Waiver

   EPA's Small Construction Erosivity Waiver applies to sites between one and five acres demonstrating that there are no adverse water quality impacts.

   Dischargers eligible for a Rainfall Erosivity Waiver based on low erosivity potential shall complete the electronic Notice of Intent (NOI) and Sediment Risk form through the State Water Board's SMARTS system, certifying that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five. Where the LRP changes or another LRP is added during construction, the new LRP must also submit a waiver certification through the SMARTS system.

   If a small construction site continues beyond the projected completion date given on the waiver certification, the LRP shall recalculate the

rainfall erosivity factor for the new project duration and submit this information through the SMARTS system. If the new R factor is below five (5), the discharger shall update through SMARTS all applicable information on the waiver certification and retain a copy of the revised waiver onsite. The LRP shall submit the new waiver certification 30 days prior to the projected completion date listed on the original waiver form to assure exemption from permitting requirements is uninterrupted. If the new R factor is five (5) or above, the LRP shall be required to apply for coverage under this Order.

8. In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

C. Revising Permit Coverage for Change of Acreage or New Ownership

1. The discharger may reduce or increase the total acreage covered under this General Permit when a portion of the site is complete and/or conditions for termination of coverage have been met (See Section II.D Conditions for Termination of Coverage); when ownership of a portion of the site is sold to a different entity; or when new acreage, subject to this General Permit, is added to the site.

2. Within 30 days of a reduction or increase in total disturbed acreage, the discharger shall electronically file revisions to the PRDs that include:

   a. A revised NOI indicating the new project size;

   b. A revised site map showing the acreage of the site completed, acreage currently under construction, acreage sold/transferred or added, and acreage currently stabilized in accordance with the Conditions for Termination of Coverage in Section II.D below.

   c. SWPPP revisions, as appropriate; and

   d. Certification that any new landowners have been notified of applicable requirements to obtain General Permit coverage. The certification shall include the name, address, telephone number, and e-mail address of the new landowner.

   e. If the project acreage has increased, dischargers shall mail payment of revised annual fees within 14 days of receiving the revised annual fee notification.

3. The discharger shall continue coverage under the General Permit for any parcel that has not achieved "Final Stabilization" as defined in Section II.D.

4. When an LRP with active General Permit coverage transfers its LRP status to another person or entity that qualifies as an LRP, the existing LRP shall inform the new LRP of the General Permit's requirements. In order for the new LRP to continue the construction activity on its parcel of property, the new LRP, or the new LRP's approved signatory, must submit PRDs in accordance with this General Permit's requirements.

D. Conditions for Termination of Coverage

1. Within 90 days of when construction is complete or ownership has been transferred, the discharger shall electronically file a Notice of Termination (NOT), a final site map, and photos through the State Water Boards SMARTS system. Filing a NOT certifies that all General Permit requirements have been met. The Regional Water Board will consider a construction site complete only when all portions of the site have been transferred to a new owner, or all of the following conditions have been met:

   a. For purposes of "final stabilization," the site will not pose any additional sediment discharge risk than it did prior to the commencement of construction activity;

   b. There is no potential for construction-related storm water pollutants to be discharged into site runoff;

   c. Final stabilization has been reached;

   d. Construction materials and wastes have been disposed of properly;

   e. Compliance with the Post-Construction Standards in Section XIII of this General Permit has been demonstrated;

   f. Post-construction storm water management measures have been installed and a long-term maintenance plan[7] has been established; and

   g. All construction-related equipment, materials and any temporary BMPs no longer needed are removed from the site.

[7] For the purposes of this requirement a long-term maintenance plan will be designed for a minimum of five years, and will describe the procedures to ensure that the post-construction storm water management measures are adequately maintained.

2. The discharger shall certify that final stabilization conditions are satisfied in their NOT. Failure to certify shall result in continuation of permit coverage and annual billing.

3. The NOT must demonstrate through photos, RUSLE or RUSLE2, or results of testing and analysis that the site meets all of the conditions above (Section II.D.1) and the final stabilization condition (Section II.D.1.a) is attained by one of the following methods:

   a. "70% final cover method," no computational proof required

      OR:

   b. "RUSLE or RUSLE2 method," computational proof required

      OR:

   c. "Custom method", the discharger shall demonstrate in some other manner than a or b, above, that the site complies with the "final stabilization" requirement in Section II.D.1.a.

III. DISCHARGE PROHIBITIONS

A. Dischargers shall not violate any discharge prohibitions contained in applicable Basin Plans or statewide water quality control plans. Waste discharges to Areas of Special Biological Significance (ASBS) are prohibited by the California Ocean Plan, unless granted an exception issued by the State Water Board.

B. All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit.

C. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water from dewatering, and other discharges not subject to a separate general NPDES permit adopted by a Regional Water Board. The discharge of non-storm water is authorized under the following conditions:

1. The discharge does not cause or contribute to a violation of any water quality standard;

2. The discharge does not violate any other provision of this General Permit;

3. The discharge is not prohibited by the applicable Basin Plan;

4. The discharger has included and implemented specific BMPs required by this General Permit to prevent or reduce the contact of the non-storm water discharge with construction materials or equipment.

5. The discharge does not contain toxic constituents in toxic amounts or (other) significant quantities of pollutants;

6. The discharge is monitored and meets the applicable NALs; and

7. The discharger reports the sampling information in the Annual Report.

If any of the above conditions are not satisfied, the discharge is not authorized by this General Permit. The discharger shall notify the Regional Water Board of any anticipated non-storm water discharges not already authorized by this General Permit or another NPDES permit, to determine whether a separate NPDES permit is necessary.

D. Debris resulting from construction activities are prohibited from being discharged from construction sites.

E. When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the discharger shall have those soils sampled and tested to ensure proper handling and public safety measures are implemented. The discharger shall notify the appropriate local, State, and federal agency(ies) when contaminated soil is found at a construction site, and will notify the appropriate Regional Water Board.

IV. SPECIAL PROVISIONS

A. Duty to Comply

1. The discharger shall comply with all of the conditions of this General Permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act and is grounds for enforcement action and/or removal from General Permit coverage.

2. The discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this General Permit has not yet been modified to incorporate the requirement.

B. General Permit Actions

1. This General Permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the discharger for a General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

2. If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the dischargers so notified.

C. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

D. Duty to Mitigate

The discharger shall take all responsible steps to minimize or prevent any discharge in violation of this General Permit, which has a reasonable likelihood of adversely affecting human health or the environment.

E. Proper Operation and Maintenance

The discharger shall at all times properly operate and maintain any facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this General Permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a discharger when necessary to achieve compliance with the conditions of this General Permit.

F. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor does it authorize any infringement of Federal, State, or local laws or regulations.

G. Duty to Maintain Records and Provide Information

1. The discharger shall maintain a paper or electronic copy of all required records, including a copy of this General Permit, for three years from the date generated or date submitted, whichever is last. These records shall be available at the construction site until construction is completed.

2. The discharger shall furnish the Regional Water Board, State Water Board, or U.S. EPA, within a reasonable time, any requested information to determine compliance with this General Permit. The discharger shall also furnish, upon request, copies of records that are required to be kept by this General Permit.

H. Inspection and Entry

The discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, and/or, in the case of construction sites which discharge through a municipal separate storm sewer, an authorized representative of the municipal operator of the separate storm sewer system receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the discharger's premises at reasonable times where a regulated construction activity is being conducted or where records must be kept under the conditions of this General Permit;

2. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

3. Inspect at reasonable times the complete construction site, including any off-site staging areas or material storage areas, and the erosion/sediment controls; and

4. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

I. Electronic Signature and Certification Requirements

1. All Permit Registration Documents (PRDs) and Notices of Termination (NOTs) shall be electronically signed, certified, and submitted via SMARTS to the State Water Board. Either the Legally Responsible Person (LRP), as defined in Appendix 5 – Glossary, or a person legally authorized to sign and certify PRDs and NOTs on behalf of the LRP (the LRP's Approved Signatory, as defined in Appendix 5 - Glossary) must submit all information electronically via SMARTS.

2. Changes to Authorization. If an Approved Signatory's authorization is no longer accurate, a new authorization satisfying the requirements of paragraph (a) of this section must be submitted via SMARTS prior to or together with any reports, information or applications to be signed by an Approved Signatory.

3. All Annual Reports, or other information required by the General Permit (other than PRDs and NOTs) or requested by the Regional Water Board, State Water Board, U.S. EPA, or local storm water management agency shall be certified and submitted by the LRP or the LRP's Approved Signatory.

J. Certification

Any person signing documents under Section IV.I above, shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

K. Anticipated Noncompliance

The discharger shall give advance notice to the Regional Water Board and local storm water management agency of any planned changes in the construction activity, which may result in noncompliance with General Permit requirements.

L. Bypass

Bypass[8] is prohibited. The Regional Water Board may take enforcement action against the discharger for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage;[9]

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventative maintenance;

3. The discharger submitted a notice at least ten days in advance of the need for a bypass to the Regional Water Board; or

4. The discharger may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The discharger shall submit notice of an unanticipated bypass as required.

M. Upset

1. A discharger that wishes to establish the affirmative defense of an upset[10] in an action brought for noncompliance shall demonstrate,

[8] The intentional diversion of waste streams from any portion of a treatment facility

[9] Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

[10] An exceptional incident in which there is unintentional and temporary noncompliance the technology based numeric effluent limitations because of factors beyond the reasonable control of the discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventative maintenance, or careless or improper operation.

through properly signed, contemporaneous operating logs, or other relevant evidence that:

a. An upset occurred and that the discharger can identify the cause(s) of the upset

b. The treatment facility was being properly operated by the time of the upset

c. The discharger submitted notice of the upset as required; and

d. The discharger complied with any remedial measures required

2. No determination made before an action of noncompliance occurs, such as during administrative review of claims that noncompliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the discharger seeking to establish the occurrence of an upset has the burden of proof

N. Penalties for Falsification of Reports

Section 309(c)(4) of the CWA provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

O. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the discharger is or may be subject to under Section 311 of the CWA.

P. Severability

The provisions of this General Permit are severable; and, if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

Q. Reopener Clause

This General Permit may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of U.S. EPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

R. Penalties for Violations of Permit Conditions

1. Section 309 of the CWA provides significant penalties for any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA or any permit condition or limitation implementing any such section in a permit issued under Section 402. Any person who violates any permit condition of this General Permit is subject to a civil penalty not to exceed $37,500[11] per calendar day of such violation, as well as any other appropriate sanction provided by Section 309 of the CWA.

2. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties, which in some cases are greater than those under the CWA.

S. Transfers

This General Permit is not transferable.

T. Continuation of Expired Permit

This General Permit continues in force and effect until a new General Permit is issued or the SWRCB rescinds this General Permit. Only those dischargers authorized to discharge under the expiring General Permit are covered by the continued General Permit.

[11] May be further adjusted in accordance with the Federal Civil Penalties Inflation Adjustment Act.

V. EFFLUENT STANDARDS & RECEIVING WATER MONITORING

A. Narrative Effluent Limitations

1. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

2. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

Table 1- Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
		Risk Level 3			lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2	1	NTU	250 NTU
		Risk Level 3			250 NTU

B. Numeric Action Levels (NALs)

1. For Risk Level 2 and 3 dischargers, the lower storm event average NAL for pH is 6.5 pH units and the upper storm event average NAL for

pH is 8.5 pH units. The discharger shall take actions as described below if the discharge is outside of this range of pH values.

2. For Risk Level 2 and 3 dischargers, the NAL storm event daily average for turbidity is 250 NTU. The discharger shall take actions as described below if the discharge is outside of this range of turbidity values.

3. Whenever the results from a storm event daily average indicate that the discharge is below the lower NAL for pH, exceeds the upper NAL for pH, or exceeds the turbidity NAL (as listed in Table 1), the discharger shall conduct a construction site and run-on evaluation to determine whether pollutant source(s) associated with the site's construction activity may have caused or contributed to the NAL exceedance and shall immediately implement corrective actions if they are needed.

4. The site evaluation shall be documented in the SWPPP and specifically address whether the source(s) of the pollutants causing the exceedance of the NAL:

   a. Are related to the construction activities and whether additional BMPs are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) determine what corrective action(s) were taken or will be taken and with a description of the schedule for completion.

      AND/OR:

   b. Are related to the run-on associated with the construction site location and whether additional BMPs measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) what corrective action(s) were taken or will be taken with a description of the schedule for completion.

C. Receiving Water Monitoring Triggers

1. The receiving water monitoring triggers for Risk Level 3 dischargers with direct discharges to surface waters are triggered when the daily average effluent pH values during any site phase when there is a high risk of pH discharge[12] fall outside of the range of 6.0 and 9.0 pH units, or when the daily average effluent turbidity exceeds 500 NTU.

2. Risk Level 3 dischargers with with direct discharges to surface waters shall conduct receiving water monitoring whenever their effluent monitoring results exceed the receiving water monitoring triggers. If the pH trigger is exceeded, the receiving water shall be monitored for pH for the duration of coverage under this General Permit. If the turbidity trigger is exceeded, the receiving water shall be monitored for turbidity and SSC for the duration of coverage under this general permit.

3. Risk Level 3 dischargers with direct discharges to surfaces waters shall initiate receiving water monitoring when the triggers are exceeded unless the storm event causing the exceedance is determined after the fact to equal to or greater than the 5-year 24-hour storm (expressed in inches of rainfall) as determined by using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca5y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca5y24.gif

   Verification of the 5-year 24-hour storm event shall be done by reporting on-site rain gauge readings as well as nearby governmental rain gauge readings.

4. If run-on is caused by a forest fire or any other natural disaster, then receiving water monitoring triggers do not apply.

[12] A period of high risk of pH discharge is defined as a project's complete utilities phase, complete vertical build phase, and any portion of any phase where significant amounts of materials are placed directly on the land at the site in a manner that could result in significant alterations of the background pH of the discharges.

VI. RECEIVING WATER LIMITATIONS

A. The discharger shall ensure that storm water discharges and authorized non-storm water discharges to any surface or ground water will not adversely affect human health or the environment.

B. The discharger shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants in quantities that threaten to cause pollution or a public nuisance.

C. The discharger shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants that cause or contribute to an exceedance of any applicable water quality objectives or water quality standards (collectively, WQS) contained in a Statewide Water Quality Control Plan, the California Toxics Rule, the National Toxics Rule, or the applicable Regional Water Board's Water Quality Control Plan (Basin Plan).

D. Dischargers located within the watershed of a CWA § 303(d) impaired water body, for which a TMDL has been approved by the U.S. EPA, shall comply with the approved TMDL if it identifies "construction activity" or land disturbance as a source of the pollution.

VII. TRAINING QUALIFICATIONS AND CERTIFICATION REQUIREMENTS

A. General

The discharger shall ensure that all persons responsible for implementing requirements of this General Permit shall be appropriately trained in accordance with this Section. Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Those responsible for preparing and amending SWPPPs shall comply with the requirements in this Section VII.

The discharger shall provide documentation of all training for persons responsible for implementing the requirements of this General Permit in the Annual Reports.

B. SWPPP Certification Requirements

1. **Qualified SWPPP Developer:** The discharger shall ensure that SWPPPs are written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

   a. A California registered professional civil engineer;

   b. A California registered professional geologist or engineering geologist;

   c. A California registered landscape architect;

   d. A professional hydrologist registered through the American Institute of Hydrology;

   e. A Certified Professional in Erosion and Sediment Control (CPESC) ™ registered through Enviro Cert International, Inc.;

   f. A Certified Professional in Storm Water Quality (CPSWQ) ™ registered through Enviro Cert International, Inc.; or

   g. A professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET).

Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

2. The discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

3. **Qualified SWPPP Practitioner:** The discharger shall ensure that all BMPs required by this General Permit are implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   a. A certified erosion, sediment and storm water inspector registered through Enviro Cert International, Inc.; or

   b. A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc.

   Effective two years after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

4. The LRP shall list in the SWPPP, the name of any Approved Signatory, and provide a copy of the written agreement or other mechanism that provides this authority from the LRP in the SWPPP.

5. The discharger shall include, in the SWPPP, a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

6. The discharger shall ensure that the SWPPP and each amendment will be signed by the Qualified SWPPP Developer. The discharger shall include a listing of the date of initial preparation and the date of each amendment in the SWPPP.

VIII. RISK DETERMINATION

The discharger shall calculate the site's sediment risk and receiving water risk during periods of soil exposure (i.e. grading and site stabilization) and use the calculated risks to determine a Risk Level(s) using the methodology in

Appendix 1. For any site that spans two or more planning watersheds,[13] the discharger shall calculate a separate Risk Level for each planning watershed. The discharger shall notify the State Water Board of the site's Risk Level determination(s) and shall include this determination as a part of submitting the PRDs. If a discharger ends up with more than one Risk Level determination, the Regional Water Board may choose to break the project into separate levels of implementation.

IX. RISK LEVEL 1 REQUIREMENTS

Risk Level 1 Dischargers shall comply with the requirements included in Attachment C of this General Permit.

X. RISK LEVEL 2 REQUIREMENTS

Risk Level 2 Dischargers shall comply with the requirements included in Attachment D of this General Permit.

XI. RISK LEVEL 3 REQUIREMENTS

Risk Level 3 Dischargers shall comply with the requirements included in Attachment E of this General Permit.

XII. ACTIVE TREATMENT SYSTEMS (ATS)

Dischargers choosing to implement an ATS on their site shall comply with all of the requirements in Attachment F of this General Permit.

[13] Planning watershed: defined by the Calwater Watershed documents as a watershed that ranges in size from approximately 3,000 to 10,000 acres http://cain.ice.ucdavis.edu/calwater/calwfaq.html, http://gis.ca.gov/catalog/BrowseRecord.epl?id=22175 .

XIII. POST-CONSTRUCTION STANDARDS

A. All dischargers shall comply with the following runoff reduction requirements unless they are located within an area subject to post-construction standards of an active Phase I or II municipal separate storm sewer system (MS4) permit that has an approved Storm Water Management Plan.

1. This provision shall take effect three years from the adoption date of this permit, or later at the discretion of the Executive Officer of the Regional Board.

2. The discharger shall demonstrate compliance with the requirements of this section by submitting with their NOI a map and worksheets in accordance with the instructions in Appendix 2. The discharger shall use non-structural controls unless the discharger demonstrates that non-structural controls are infeasible or that structural controls will produce greater reduction in water quality impacts.

3. The discharger shall, through the use of non-structural and structural measures as described in Appendix 2, replicate the pre-project water balance (for this permit, defined as the volume of rainfall that ends up as runoff) for the smallest storms up to the 85th percentile storm event (or the smallest storm event that generates runoff, whichever is larger). Dischargers shall inform Regional Water Board staff at least 30 days prior to the use of any structural control measure used to comply with this requirement. Volume that cannot be addressed using non-structural practices shall be captured in structural practices and approved by the Regional Water Board. When seeking Regional Board approval for the use of structural practices, dischargers shall document the infeasibility of using non-structural practices on the project site, or document that there will be fewer water quality impacts through the use of structural practices.

4. For sites whose disturbed area exceeds two acres, the discharger shall preserve the pre-construction drainage density (miles of stream length per square mile of drainage area) for all drainage areas within the area serving a first order stream[14] or larger stream and ensure that post-project time of runoff concentration is equal or greater than pre-project time of concentration.

[14] A first order stream is defined as a stream with no tributaries.

B. All dischargers shall implement BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed at the site (Post-construction BMPs).

XIV. SWPPP REQUIREMENTS

A. The discharger shall ensure that the Storm Water Pollution Prevention Plans (SWPPPs) for all traditional project sites are developed and amended or revised by a QSD. The SWPPP shall be designed to address the following objectives:

1. All pollutants and their sources, including sources of sediment associated with construction, construction site erosion and all other activities associated with construction activity are controlled;

2. Where not otherwise required to be under a Regional Water Board permit, all non-storm water discharges are identified and either eliminated, controlled, or treated;

3. Site BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the BAT/BCT standard;

4. Calculations and design details as well as BMP controls for site run-on are complete and correct, and

5. Stabilization BMPs installed to reduce or eliminate pollutants after construction are completed.

B. To demonstrate compliance with requirements of this General Permit, the QSD shall include information in the SWPPP that supports the conclusions, selections, use, and maintenance of BMPs.

C. The discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone.

XV. REGIONAL WATER BOARD AUTHORITIES

A. In the case where the Regional Water Board does not agree with the discharger's self-reported risk level (e.g., they determine themselves to be a Level 1 Risk when they are actually a Level 2 Risk site), Regional Water Boards may either direct the discharger to reevaluate the Risk Level(s) for their site or terminate coverage under this General Permit.

B. Regional Water Boards may terminate coverage under this General Permit for dischargers who fail to comply with its requirements or where they determine that an individual NPDES permit is appropriate.

C. Regional Water Boards may require dischargers to submit a Report of Waste Discharge / NPDES permit application for Regional Water Board consideration of individual requirements.

D. Regional Water Boards may require additional Monitoring and Reporting Program Requirements, including sampling and analysis of discharges to sediment-impaired water bodies.

E. Regional Water Boards may require dischargers to retain records for more than the three years required by this General Permit.

XVI. ANNUAL REPORTING REQUIREMENTS

A. All dischargers shall prepare and electronically submit an Annual Report no later than September 1 of each year.

B. The discharger shall certify each Annual Report in accordance with the Special Provisions.

C. The discharger shall retain an electronic or paper copy of each Annual Report for a minimum of three years after the date the annual report is filed.

D. The discharger shall include storm water monitoring information in the Annual Report consisting of:

1. a summary and evaluation of all sampling and analysis results, including copies of laboratory reports;

2. the analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit");

3. a summary of all corrective actions taken during the compliance year;

4. identification of any compliance activities or corrective actions that were not implemented;

5. a summary of all violations of the General Permit;

6. the names of individual(s) who performed the facility inspections, sampling, visual observation (inspections), and/or measurements;

7. the date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation (rain gauge); and

8. the visual observation and sample collection exception records and reports specified in Attachments C, D, and E.

E. The discharger shall provide training information in the Annual Report consisting of:

1. documentation of all training for individuals responsible for all activities associated with compliance with this General Permit;

2. documentation of all training for individuals responsible for BMP installation, inspection, maintenance, and repair; and

3. documentation of all training for individuals responsible for overseeing, revising, and amending the SWPPP.

ATTACHMENT A
Linear Underground/ Overhead Requirements

A. DEFINITION OF LINEAR UNDERGROUND/OVERHEAD PROJECTS 1
B. LINEAR PROJECT PERMIT REGISTRATION DOCUMENTS (PRDs) 3
C. LINEAR PROJECT TERMINATION OF COVERAGE REQUIREMENTS..4
D. DISCHARGE PROHIBITIONS 6
E. SPECIAL PROVISIONS.....8
F. EFFLUENT STANDARDS & RECEIVING WATER MONITORING 13
G. RECEIVING WATER LIMITATIONS 16
H. TRAINING QUALIFICATIONS 17
I. TYPES OF LINEAR PROJECTS 19
J. LUP TYPE-SPECIFIC REQUIREMENTS 20
K. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) REQUIREMENTS 28
L. REGIONAL WATER BOARD AUTHORITIES.....29
M. MONITORING AND REPORTING REQUIREMENTS 31

All Linear Underground/Overhead project dischargers who submit permit registration documents (PRDs) indicating their intention to be regulated under the provisions of this General Permit shall comply with the following:

A. DEFINITION OF LINEAR UNDERGROUND/OVERHEAD PROJECTS

1. Linear Underground/Overhead Projects (LUPs) include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water and wastewater for domestic municipal services), liquiescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g., telephone, telegraph, radio, or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, (a) those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment, and associated ancillary facilities); and include, but are not limited to, (b) underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/ or pavement repair or replacement, and stockpile/borrow locations.

2. LUP evaluation shall consist of two tasks:

a. Confirm that the project or project section(s) qualifies as an LUP. The State Water Board website contains a project determination guidance flowchart. http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

b. Identify which Type(s) (1, 2 or 3 described in Section I below) are applicable to the project or project sections based on project sediment and receiving water risk. (See Attachment A.1)

3. A Legally Responsible Person (LRP) for a Linear Underground/Overhead project is required to obtain CGP coverage under one or more permit registration document (PRD) electronic submittals to the State Water Board's Storm Water Multi-Application and Report Tracking (SMARTs) system. Attachment A.1 contains a flow chart to be used when determining if a linear project qualifies for coverage and to determine LUP Types. Since a LUP may be constructed within both developed and undeveloped locations and portions of LUPs may be constructed by different contractors, LUPs may be broken into logical permit sections. Sections may be determined based on portions of a project conducted by one contractor. Other situations may also occur, such as the time period in which the sections of a project will be constructed (e.g. project phases), for which separate permit coverage is possible. For projects that are broken into separate sections, a description of how each section relates to the overall project and the definition of the boundaries between sections shall be clearly stated.

4. Where construction activities transverse or enter into different Regional Water Board jurisdictions, LRPs shall obtain permit coverage for each Regional Water Board area involved prior to the commencement of construction activities.

5. Small Construction Rainfall Erosivity Waiver

EPA's Small Construction Erosivity Waiver applies to sites between one and five acres demonstrating that there are no adverse water quality impacts.

Dischargers eligible for a Rainfall Erosivity Waiver based on low erosivity potential shall complete the electronic Notice of Intent (NOI) and Sediment Risk form through the State Water Board's SMARTS system, certifying that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five. Where the LRP changes or another LRP is added during construction, the new LRP must also submit a waiver certification through the SMARTS system.

If a small linear construction site continues beyond the projected completion date given on the waiver certification, the LRP shall recalculate the rainfall erosivity factor for the new project duration and submit this information through the SMARTS system. If the new R factor is below five (5), the discharger shall update through SMARTS all applicable information on the waiver certification and retain a copy of the revised waiver onsite. The LRP shall submit the new waiver certification 30 days prior to the projected completion date listed on the original waiver form to assure exemption from permitting requirements is uninterrupted. If the new R factor is five (5) or above, the LRP shall be required to apply for coverage under this Order.

B. LINEAR PROJECT PERMIT REGISTRATION DOCUMENTS (PRDs)

Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted. PRDs shall consist of the following:

1. Notice of Intent (NOI)

Prior to construction activities, the LRP of a proposed linear underground/overhead project shall utilize the processes and methods provided in Attachment A.2, Permit Registration Documents (PRDs) – General Instructions for Linear Underground/Overhead Projects to comply with the Construction General Permit.

2. Site Maps

LRPs submitting PRDs shall include at least 3 maps. The first map will be a zoomed[1] 1000-1500 ft vicinity map that shows the starting point of the project. The second will be a zoomed map of 1000-1500 ft showing the ending location of the project. The third will be a larger view vicinity map, 1000 ft to 2000 ft, displaying the entire project location depending on the project size, and indicating the LUP type (1, 2 or 3) areas within the total project footprint.

3. Drawings

LRPs submitting PRDs shall include a construction drawing(s) or other appropriate drawing(s) or map(s) that shows the locations of storm drain

[1] An image with a close-up/enhanced detailed view of site features that show minute details such as streets and neighboring structures.
Or: An image with a close-up/enhanced detailed view of the site's surrounding infrastructure.
Or: An image with a close up detailed view of the project and its surroundings.

inlets and waterbodies[2] that may receive discharges from the construction activities and that shows the locations of BMPs to be installed for all those BMPs that can be illustrated on the revisable drawing(s) or map(s). If storm drain inlets, waterbodies, and/or BMPs cannot be adequately shown on the drawing(s) or map(s) they should be described in detail within the SWPPP.

4. Storm Water Pollution Prevention Plan (SWPPP)

LUP dischargers shall comply with the SWPPP Preparation, Implementation, and Oversight requirements in Section K of this Attachment.

5. Contact information

LUP dischargers shall include contact information for all contractors (or subcontractors) responsible for each area of an LUP project. This should include the names, telephone numbers, and addresses of contact personnel. Specific areas of responsibility of each contact, and emergency contact numbers should also be included.

6. In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

C. LINEAR PROJECT TERMINATION OF COVERAGE REQUIREMENTS

The LRP may terminate coverage of an LUP when construction activities are completed by submitting an electronic notice of termination (NOT) through the State Water Board's SMARTS system. Termination requirements are different depending on the complexity of the LUP. An LUP is considered complete when: (a) there is no potential for construction-related storm water pollution; (b) all elements of the SWPPP have been completed; (c) construction materials and waste have been disposed of properly; (d) the site is in compliance with all local storm water management requirements; and (e) the LRP submits a notice of termination (NOT) and has received approval for termination from the appropriate Regional Water Board office.

1. LUP Stabilization Requirements

The LUP discharger shall ensure that all disturbed areas of the construction site are stabilized prior to termination of coverage under this General Permit. Final stabilization for the purposes of submitting an NOT

[2] Includes basin(s) that the MS4 storm sewer systems may drain to for Hydromodification or Hydrological Conditional of Concerns under the MS4 permits.

is satisfied when all soil disturbing activities are completed and one of the following criteria is met:

a. In disturbed areas that were vegetated prior to construction activities of the LUP, the area disturbed must be re-established to a uniform vegetative cover equivalent to 70 percent coverage of the preconstruction vegetative conditions. Where preconstruction vegetation covers less than 100 percent of the surface, such as in arid areas, the 70 percent coverage criteria is adjusted as follows: if the preconstruction vegetation covers 50 percent of the ground surface, 70 percent of 50 percent (.70 X .50=.35) would require 35 percent total uniform surface coverage; or

b. Where no vegetation is present prior to construction, the site is returned to its original line and grade and/or compacted to achieve stabilization; or

c. Equivalent stabilization measures have been employed. These measures include, but are not limited to, the use of such BMPs as blankets, reinforced channel liners, soil cement, fiber matrices, geotextiles, or other erosion resistant soil coverings or treatments.

2. LUP Termination of Coverage Requirements

The LRP shall file an NOT through the State Water Board's SMARTS system. By submitting an NOT, the LRP is certifying that construction activities for an LUP are complete and that the project is in full compliance with requirements of this General Permit and that it is now compliant with soil stabilization requirements where appropriate. Upon approval by the appropriate Regional Water Board office, permit coverage will be terminated.

3. Revising Coverage for Change of Acreage

When the LRP of a portion of an LUP construction project changes, or when a phase within a multi-phase project is completed, the LRP may reduce the total acreage covered by this General Permit. In reducing the acreage covered by this General Permit, the LRP shall electronically file revisions to the PRDs that include:

a. a revised NOI indicating the new project size;

b. a revised site map showing the acreage of the project completed, acreage currently under construction, acreage sold, transferred or added, and acreage currently stabilized.

c. SWPPP revisions, as appropriate; and

d. certification that any new LRPs have been notified of applicable requirements to obtain General Permit coverage. The certification shall include the name, address, telephone number, and e-mail address (if known) of the new LRP.

If the project acreage has increased, dischargers shall mail payment of revised annual fees within 14 days of receiving the revised annual fee notification.

D. DISCHARGE PROHIBITIONS

1. LUP dischargers shall not violate any discharge prohibitions contained in applicable Basin Plans or statewide water quality control plans. Waste discharges to Areas of Special Biological Significance (ASBS) are prohibited by the California Ocean Plan, unless granted an exception issued by the State Water Board.

2. LUP dischargers are prohibited from discharging non-storm water that is not otherwise authorized by this General Permit. Non-storm water discharges authorized by this General Permit[3] may include, fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, street cleaning, dewatering,[4] uncontaminated groundwater from dewatering, and other discharges not subject to a separate general NPDES permit adopted by a Regional Water Board. Such discharges are allowed by this General Permit provided they are not relied upon to clean up failed or inadequate construction or post-construction BMPs designed to keep materials on site. These authorized non-storm water discharges:

[3] Dischargers must identify all authorized non-storm water discharges in the LUP's SWPPP and identify BMPs that will be implemented to either eliminate or reduce pollutants in non-storm water discharges. Regional Water Boards may direct the discharger to discontinue discharging such non-storm water discharges if determined that such discharges discharge significant pollutants or threaten water quality.
[4] Dewatering activities may be prohibited or need coverage under a separate permit issued by the Regional Water Boards. Dischargers shall check with the appropriate Regional Water Boards for any required permit or basin plan conditions prior to initial dewatering activities to land, storm drains, or waterbodies.

a. Shall not cause or contribute to a violation of any water quality standard;

b. Shall not violate any other provision of this General Permit;

c. Shall not violate any applicable Basin Plan;

d. Shall comply with BMPs as described in the SWPPP;

e. Shall not contain toxic constituents in toxic amounts or (other) significant quantities of pollutants;

f. Shall be monitored and meets the applicable NALs; and

g. Shall be reported by the discharger in the Annual Report.

If any of the above conditions are not satisfied, the discharge is not authorized by this General Permit. The discharger shall notify the Regional Water Board of any anticipated non-storm water discharges not authorized by this General Permit to determine the need for a separate NPDES permit.

Additionally, some LUP dischargers may be required to obtain a separate permit if the applicable Regional Water Board has adopted a General Permit for dewatering discharges. Wherever feasible, alternatives, that do not result in the discharge of non-storm water, shall be implemented in accordance with this Attachment's Section K.2 - SWPPP Implementation Schedule.

3. LUP dischargers shall ensure that trench spoils or any other soils disturbed during construction activities that are contaminated[5] are not discharged with storm water or non-storm water discharges into any storm drain or water body except pursuant to an NPDES permit.

When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the LUP discharger shall have those soils sampled and tested to ensure that proper handling and public safety measures are

[5] Contaminated soil contains pollutants in concentrations that exceed the appropriate thresholds that various regulatory agencies set for those substances. Preliminary testing of potentially contaminated soils will be based on odor, soil discoloration, or prior history of the site's chemical use and storage and other similar factors. When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the discharger shall have those soils sampled and tested to ensure proper handling and public safety measures are implemented. The legally responsible person will notify the appropriate local, State, or federal agency(ies) when contaminated soil is found at a construction site, and will notify the Regional Water Board by submitting an NOT at the completion of the project.

implemented. The LUP discharger shall notify the appropriate local, State, and federal agency(ies) when contaminated soil is found at a construction site, and will notify the appropriate Regional Water Board.

4. Discharging any pollutant-laden water that will cause or contribute to an exceedance of the applicable Regional Water Board's Basin Plan from a dewatering site or sediment basin into any receiving water or storm drain is prohibited.

5. Debris[6] resulting from construction activities are prohibited from being discharged from construction project sites.

E. SPECIAL PROVISIONS

1. Duty to Comply

a. The LUP discharger must comply with all of the conditions of this General Permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act and is grounds for enforcement action and/or removal from General Permit coverage.

b. The LUP discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this General Permit has not yet been modified to incorporate the requirement.

2. General Permit Actions

a. This General Permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the discharger for a General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

[6] Litter, rubble, discarded refuse, and remains of something destroyed.

b. If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the dischargers so notified.

3. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for an LUP discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

4. Duty to Mitigate

The LUP discharger shall take all responsible steps to minimize or prevent any discharge in violation of this General Permit, which has a reasonable likelihood of adversely affecting human health or the environment.

5. Proper Operation and Maintenance

The LUP discharger shall at all times properly operate and maintain any facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this General Permit and with the requirements of the Storm Water Pollution Prevention Plan (SWPPP). Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a discharger when necessary to achieve compliance with the conditions of this General Permit.

6. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor does it authorize any infringement of Federal, State, or local laws or regulations.

7. Duty to Maintain Records and Provide Information

a. The LUP discharger shall maintain a paper or electronic copy of all required records, including a copy of this General Permit, for three years from the date generated or date submitted, whichever is last. These records shall be kept at the construction site or in a crew

member's vehicle until construction is completed, and shall be made available upon request.

b. The LUP discharger shall furnish the Regional Water Board, State Water Board, or USEPA, within a reasonable time, any requested information to determine compliance with this General Permit. The LUP discharger shall also furnish, upon request, copies of records that are required to be kept by this General Permit.

8. Inspection and Entry

The LUP discharger shall allow the Regional Water Board, State Water Board, USEPA, and/or, in the case of construction sites which discharge through a municipal separate storm sewer, an authorized representative of the municipal operator of the separate storm sewer system receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

a. Enter upon the discharger's premises at reasonable times where a regulated construction activity is being conducted or where records must be kept under the conditions of this General Permit;

b. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

c. Inspect at reasonable times the complete construction site, including any off-site staging areas or material storage areas, and the erosion/sediment controls; and

d. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

9. Electronic Signature and Certification Requirements

a. All Permit Registration Documents (PRDs) and Notices of Termination (NOTs) shall be electronically signed, certified, and submitted via SMARTS to the State Water Board. Either the Legally Responsible Person (LRP), as defined in Appendix 5 – Glossary, or a person legally authorized to sign and certify PRDs and NOTs on behalf of the LRP (the LRP's Approved Signatory, as defined in Appendix 5 - Glossary) must submit all information electronically via SMARTS.

b. Changes to Authorization. If an Approved Signatory's authorization is no longer accurate, a new authorization satisfying the requirements of paragraph (a) of this section must be submitted via SMARTS prior to or

together with any reports, information or applications to be signed by an Approved Signatory.

c. All SWPPP revisions, annual reports, or other information required by the General Permit (other than PRDs and NOTs) or requested by the Regional Water Board, State Water Board, USEPA, or local storm water management agency shall be certified and submitted by the LRP or the LRP's Approved Signatory.

10. Certification

Any person signing documents under Section E.9 above, shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

11. Anticipated Noncompliance

The LUP discharger shall give advance notice to the Regional Water Board and local storm water management agency of any planned changes in the construction activity, which may result in noncompliance with General Permit requirements.

12. Penalties for Falsification of Reports

Section 309(c)(4) of the CWA provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

13. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the LUP discharger is or may be subject to under Section 311 of the CWA.

14. Severability

The provisions of this General Permit are severable; and, if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

15. Reopener Clause

This General Permit may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of USEPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

16. Penalties for Violations of Permit Conditions

a. Section 309 of the CWA provides significant penalties for any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA or any permit condition or limitation implementing any such section in a permit issued under Section 402. Any person who violates any permit condition of this General Permit is subject to a civil penalty not to exceed $37,500[7] per calendar day of such violation, as well as any other appropriate sanction provided by Section 309 of the CWA.

b. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties, which in some cases are greater than those under the CWA.

17. Transfers

This General Permit is not transferable. A new LRP of an ongoing construction activity must submit PRDs in accordance with the requirements of this General Permit to be authorized to discharge under this General Permit. An LRP who is a property owner with active General Permit coverage who sells a fraction or all the land shall inform the new property owner(s) of the requirements of this General Permit.

18. Continuation of Expired Permit

This General Permit continues in force and effect until a new General Permit is issued or the SWRCB rescinds this General Permit. Only those

[7] May be further adjusted in accordance with the Federal Civil Penalties Inflation Adjustment Act

dischargers authorized to discharge under the expiring General Permit are covered by the continued General Permit.

F. EFFLUENT STANDARDS & RECEIVING WATER MONITORING

1. Narrative Effluent Limitations

a. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges regulated by this General Permit do not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

b. LUP dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of structural or non-structural controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

Table 1. Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level
pH	Field test with calibrated portable instrument	LUP Type 2	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
		LUP Type 3			lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	LUP Type 2	1	NTU	250 NTU
		LUP Type 3			250 NTU

2. Numeric Action Levels (NALs)

a. For LUP Type 2 and 3 dischargers, the lower storm event daily average NAL for pH is 6.5 pH units and the upper storm event daily average NAL for pH is 8.5 pH units. The LUP discharger shall take actions as described below if the storm event daily average discharge is outside of this range of pH values.

b. For LUP Type 2 and 3 dischargers, the storm event daily average NAL for turbidity is 250 NTU. The discharger shall take actions as described below if the storm event daily average discharge is outside of this range of turbidity values.

c. Whenever daily average analytical effluent monitoring results indicate that the discharge is below the lower NAL for pH, exceeds the upper NAL for pH, or exceeds the turbidity NAL (as listed in Table 1), the LUP discharger shall conduct a construction site and run-on evaluation to determine whether pollutant source(s) associated with the site's construction activity may have caused or contributed to the NAL exceedance and shall immediately implement corrective actions if they are needed.

d. The site evaluation will be documented in the SWPPP and specifically address whether the source(s) of the pollutants causing the exceedance of the NAL:

i Are related to the construction activities and whether additional BMPs or SWPPP implementation measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) determine what corrective action(s) were taken or will be taken and with a description of the schedule for completion.

AND/OR:

ii Are related to the run-on associated with the construction site location and whether additional BMPs or SWPPP implementation measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) decide what corrective action(s) were taken or will be taken, including a description of the schedule for completion.

3. Receiving Water Monitoring Triggers

a. The receiving water monitoring triggers for LUP Type 3 dischargers with direct discharges to surface waters are triggered when the daily average effluent pH values during any site phase when there is a high risk of pH discharge[8] fall outside of the range of 6.0 and 9.0 pH units, or when the daily average effluent turbidity exceeds 500 NTU.

b. LUP Type 3 dischargers with direct discharges to surface waters shall conduct receiving water monitoring whenever their effluent monitoring results exceed the receiving water monitoring triggers. If the pH trigger is exceeded, the receiving water shall be monitored for pH for the duration of coverage under this General Permit. If the turbidity trigger is exceeded, the receiving water shall be monitored for turbidity and SSC for the duration of coverage under this General Permit.

c. LUP Type 3 dischargers with direct discharges to surfaces waters shall initiate receiving water monitoring when the triggers are exceeded unless the storm event causing the exceedance is determined after the fact to equal to or greater than the 5-year 24-hour storm (expressed in inches of rainfall) as determined by using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca5y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca5y24.gif

   Verification of the 5-year 24-hour storm event shall be done by reporting on-site rain gauge readings as well as nearby governmental rain gauge readings.

d. If run-on is caused by a forest fire or any other natural disaster, then receiving water monitoring triggers do not apply.

G. RECEIVING WATER LIMITATIONS

1. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges to any surface or ground water will not adversely affect human health or the environment.

2. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants in quantities that threaten to cause pollution or a public nuisance.

3. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants that cause or

[8] A period of high risk of pH discharge is defined as a project's complete utilities phase, complete vertical build phase, and any portion of any phase where significant amounts of materials are placed directly on the land at the site in a manner that could result in significant alterations of the background pH of the discharges.

contribute to an exceedance of any applicable water quality objectives or water quality standards (collectively, WQS) contained in a Statewide Water Quality Control Plan, the California Toxics Rule, the National Toxics Rule, or the applicable Regional Water Board's Water Quality Control Plan (Basin Plan).

H. TRAINING QUALIFICATIONS

1. General

All persons responsible for implementing requirements of this General Permit shall be appropriately trained. Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Persons responsible for preparing, amending and certifying SWPPPs shall comply with the requirements in this Section H.

2. SWPPP Certification Requirements

a. **Qualified SWPPP Developer:** The LUP discharger shall ensure that all SWPPPs be written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

i A California registered professional civil engineer;

ii A California registered professional geologist or engineering geologist;

iii A California registered landscape architect;

iv A professional hydrologist registered through the American Institute of Hydrology;

v A certified professional in erosion and sediment control (CPESC) ™ registered through Enviro Cert International, Inc;

vi A certified professional in storm water quality (CPSWQ)™ registered through Enviro Cert International, Inc.; or

vii A certified professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET).

Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

b. The LUP discharger shall ensure that the SWPPP is written and amended, as needed, to address the specific circumstances for each construction site covered by this General Permit prior to commencement of construction activity for any stage.

c. The LUP discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

d. **Qualified SWPPP Practitioner:** The LUP discharger shall ensure that all elements of any SWPPP for each project will be implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis, and for ensuring full compliance with the permit and implementation of all elements of the SWPPP. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   i A certified erosion, sediment and storm water inspector registered through Certified Professional in Erosion and Sediment Control, Inc.; or

   ii A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc.

   Effective two years after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

e. The LUP discharger shall ensure that the SWPPP include a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner, and who is ultimately responsible for implementation of the SWPPP. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

f. The LUP discharger shall ensure that the SWPPP and each amendment be signed by the Qualified SWPPP Developer. The LUP discharger shall include a listing of the date of initial preparation and the dates of each amendment in the SWPPP.

I. TYPES OF LINEAR PROJECTS

This attachment establishes three types (Type 1, 2 & 3) of complexity for areas within an LUP or project section based on threat to water quality. Project area Types are determined through Attachment A.1.

The Type 1 requirements below establish the baseline requirements for all LUPs subject to this General Permit. Additional requirements for Type 2 and Type 3 LUPs are labeled.

1. Type 1 LUPs*:*

LUP dischargers with areas of a LUP designated as Type 1 shall comply with the requirements in this Attachment. Type 1 LUPs are:

a. Those construction areas where 70 percent or more of the construction activity occurs on a paved surface and where areas disturbed during construction will be returned to preconstruction conditions or equivalent protection established at the end of the construction activities for the day; or

b. Where greater than 30 percent of construction activities occur within the non-paved shoulders or land immediately adjacent to paved surfaces, or where construction occurs on unpaved improved roads, including their shoulders or land immediately adjacent to them where:

   i Areas disturbed during construction will be returned to preconstruction conditions or equivalent protection is established at the end of the construction activities for the day to minimize the potential for erosion and sediment deposition, and

   ii Areas where established vegetation was disturbed during construction will be stabilized and re-vegetated by the end of project. When required, adequate temporary stabilization BMPs will be installed and maintained until vegetation is established to meet minimum cover requirements established in this General Permit for final stabilization.

c. Where the risk determination is as follows:

   i Low sediment risk, low receiving water risk, or

   ii Low sediment risk, medium receiving water risk, or

   iii Medium sediment risk, low receiving water risk

2. Type 2 LUPs:

Type 2 LUPs are determined by the Combined Risk Matrix in Attachment A.1. Type 2 LUPs have the specified combination of risk:

d. High sediment risk, low receiving water risk, or

e. Medium sediment risk, medium receiving water risk, or

f. Low sediment risk, high receiving water risk

Receiving water risk is either considered "Low" for those areas of the project that are not in close proximity to a sensitive receiving watershed, "Medium" for those areas of the project within a sensitive receiving watershed yet outside of the flood plain of a sensitive receiving water body, and "High" where the soil disturbance is within close proximity to a sensitive receiving water body. Project sediment risk is calculated based on the Risk Factor Worksheet in Attachment C of this General Permit.

3. Type 3 LUPs:

Type 3 LUPs are determined by the Combined Risk Matrix in Attachment A.1. Type 3 LUPs have the specified combination of risk:

a. High sediment risk, high receiving water risk, or

b. High sediment risk, medium receiving water risk, or

c. Medium sediment risk, high receiving water risk

Receiving water risk is either considered "Medium" for those areas of the project within a sensitive receiving watershed yet outside of the flood plain of a sensitive receiving water body, or "High" where the soil disturbance is within close proximity to a sensitive receiving water body. Project sediment risk is calculated based on the Risk Factor Worksheet in Attachment C.

J. LUP TYPE-SPECIFIC REQUIREMENTS

1. Effluent Standards

a. Narrative – LUP dischargers shall comply with the narrative effluent standards below.

i Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

ii LUP dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

b. Numeric – LUP Type 1 dischargers are not subject to a numeric effluent standard

c. Numeric –LUP Type 2 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

d. Numeric – LUP Type 3 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

2. Good Site Management "Housekeeping"

a. LUP dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, the good housekeeping measures shall consist of the following:

i Identify the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

ii Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

iii Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

iv Minimize exposure of construction materials to precipitation (not applicable to materials designed to be outdoors and exposed to the environment).

v Implement BMPs to control the off-site tracking of loose construction and landscape materials.

b. LUP dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

i Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

ii Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

iii Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

iv Cover waste disposal containers at the end of every business day and during a rain event.

v Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

vi Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

vii Implement procedures that effectively address hazardous and non-hazardous spills.

viii Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require that:

(1) Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly; and

(2) Appropriate spill response personnel are assigned and trained.

ix Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

c. LUP dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   i Prevent oil, grease, or fuel from leaking into the ground, storm drains or surface waters.

   ii Implement appropriate BMPs whenever equipment or vehicles are fueled, maintained or stored.

   iii Clean leaks immediately and disposing of leaked materials properly.

d. LUP dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   i Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   ii Contain fertilizers and other landscape materials when they are not actively being used.

   iii Discontinue the application of any erodible landscape material at least 2 days before a forecasted rain event[9] or during periods of precipitation.

   iv Applying erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   v Stacking erodible landscape material on pallets and covering or storing such materials when not being used or applied.

e. LUP dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, LUP dischargers shall do the following:

[9] 50% or greater chance of producing precipitation.

i Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

ii Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

iii Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

iv Ensure retention of sampling, visual observation, and inspection records.

v Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

f. LUP dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations.

3. Non-Storm Water Management

a. LUP dischargers shall implement measures to control all non-storm water discharges during construction.

b. LUP dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

c. LUP dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

4. Erosion Control

a. LUP dischargers shall implement effective wind erosion control.

b. LUP dischargers shall provide effective soil cover for inactive[10] areas and all finished slopes, and utility backfill.

[10] Areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days

c. LUP dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

5. Sediment Controls

a. LUP dischargers shall establish and maintain effective perimeter controls as needed, and implement effective BMPs for all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

b. On sites where sediment basins are to be used, LUP dischargers shall, at minimum, design sediment basins according to the guidance provided in CASQA's Construction BMP Handbook.

c. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[11] in accordance with Table 2 below.

Table 2 – Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

d. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent off-site tracking of sediment.

e. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

f. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall inspect all immediate access roads. At a minimum daily and prior to any rain event, the discharger shall remove any

[11] Sheet flow length is the length that shallow, low velocity flow travels across a site.

sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

g. **Additional LUP Type 3 Requirement:** The Regional Water Board may require LUP Type 3 dischargers to implement additional site-specific sediment control requirements if the implementation of the other requirements in this section are not adequately protecting the receiving waters.

6. Run-on and Run-off Controls

a. LUP dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site-shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this Attachment.

b. Run-on and runoff controls are not required for Type 1 LUPs unless the evaluation of quantity and quality of run-on and runoff deems them necessary or visual inspections show that the site requires such controls.

7. Inspection, Maintenance and Repair

a. All inspection, maintenance repair and sampling activities at the discharger's LUP location shall be performed or supervised by a QSP representing the discharger. The QSP may delegate any or all of these activities to an employee trained to do the task(s) appropriately, but shall ensure adequate deployment.

b. LUP dischargers shall conduct visual inspections and observations daily during working hours (not recorded). At least once each 24-hour period during extended storm events, **LUP Type 2 & 3 dischargers** shall conduct visual inspections to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

c. Upon identifying failures or other shortcomings, as directed by the QSP, LUP dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

d. For each pre- and post-rain event inspection required, LUP dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format that includes the information described below.

e. The LUP discharger shall ensure that the checklist remains on-site or with the SWPPP. At a minimum, an inspection checklist should include:

i Inspection date and date the inspection report was written.

ii Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

iii Site information, including stage of construction, activities completed, and approximate area of the site exposed.

iv A description of any BMPs evaluated and any deficiencies noted.

v If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

vi Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

vii Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

viii Photographs taken during the inspection, if any.

ix Inspector's name, title, and signature.

K. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) REQUIREMENTS

1. Objectives

SWPPPs for all LUPs shall be developed and amended or revised by a QSD. The SWPPP shall be designed to address the following objectives:

a. All pollutants and their sources, including sources of sediment, associated with construction activities associated with LUP activity are controlled;

b. All non-storm water discharges are identified and either eliminated, controlled, or treated;

c. BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from LUPs during construction; and

d. Stabilization BMPs installed to reduce or eliminate pollutants after construction is completed are effective and maintained.

2. SWPPP Implementation Schedule

a. LUPs for which PRDs have been submitted to the State Water Board shall develop a site/project location SWPPP prior to the start of land-disturbing activity in accordance with this Section and shall implement the SWPPP concurrently with commencement of soil-disturbing activities.

b. For an ongoing LUP involving a change in the LRP, the new LRP shall review the existing SWPPP and amend it, if necessary, or develop a new SWPPP within 15 calendar days to conform to the requirements set forth in this General Permit.

3. Availability

The SWPPP shall be available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone.

L. REGIONAL WATER BOARD AUTHORITIES

1. Regional Water Boards shall administer the provisions of this General Permit. Administration of this General Permit may include, but is not limited to, requesting the submittal of SWPPPs, reviewing SWPPPs, reviewing monitoring and sampling and analysis reports, conducting compliance inspections, gathering site information by any medium including sampling, photo and video documentation, and taking enforcement actions.

2. Regional Water Boards may terminate coverage under this General Permit for dischargers who fail to comply with its requirements or where they determine that an individual NPDES permit is appropriate.

3. Regional Water Boards may issue separate permits for discharges of storm water associated with construction activity to individual dischargers, categories of dischargers, or dischargers in a geographic area. Upon issuance of such permits by a Regional Water Board, dischargers subject to those permits shall no longer be regulated by this General Permit.

4. Regional Water Boards may direct the discharger to reevaluate the LUP Type(s) for the project (or elements/areas of the project) and impose the appropriate level of requirements.

5. Regional Water Boards may terminate coverage under this General Permit for dischargers who negligently or with willful intent incorrectly determine or report their LUP Type (e.g., they determine themselves to be a LUP Type 1 when they are actually a Type 2).

6. Regional Water Boards may review PRDs and reject or accept applications for permit coverage or may require dischargers to submit a Report of Waste Discharge / NPDES permit application for Regional Water Board consideration of individual requirements.

7. Regional Water Boards may impose additional requirements on dischargers to satisfy TMDL implementation requirements or to satisfy provisions in their Basin Plans.

8. Regional Water Boards may require additional Monitoring and Reporting Program Requirements, including sampling and analysis of discharges to sediment-impaired water bodies.

9. Regional Water Boards may require dischargers to retain records for more than the three years required by this General Permit.

10. Based on an LUP's threat to water quality and complexity, the Regional Water Board may determine on a case-by-case basis that an LUP, or a portion of an LUP, is not eligible for the linear project requirements contained in this Attachment, and require that the discharger comply with all standard requirements in this General Permit.

11. The Regional Water Board may require additional monitoring and reporting program requirements including sampling and analysis of discharges to CWA § 303(d)-listed water bodies. Additional requirements imposed by the Regional Water Board shall be consistent with the overall monitoring effort in the receiving waters.

M. MONITORING AND REPORTING REQUIREMENTS

Table 3. LUP Summary of Monitoring Requirements

LUP Type	Visual Inspections				Sample Collection		
	Daily Site BMP	Pre-storm Event / Baseline	Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water	Non-Visible (when applicable)
1	X						X
2	X	X	X	X	X		X
3	X	X	X	X	X	X	X

1. Objectives

LUP dischargers shall prepare a monitoring and reporting program (M&RP) prior to the start of construction and immediately implement the program at the start of construction for LUPs. The monitoring program must be implemented at the appropriate level to protect water quality at all times throughout the life of the project. The M&RP must be a part of the SWPPP, included as an appendix or separate SWPPP chapter.

2. M&RP Implementation Schedule

a. LUP dischargers shall implement the requirements of this Section at the time of commencement of construction activity. LUP dischargers are responsible for implementing these requirements until construction activity is complete and the site is stabilized.

b. LUP dischargers shall revise the M&RP when:

i Site conditions or construction activities change such that a change in monitoring is required to comply with the requirements and intent of this General Permit.

ii The Regional Water Board requires the discharger to revise its M&RP based on its review of the document. Revisions may include, but not be limited to, conducting additional site inspections, submitting reports, and certifications. Revisions shall be submitted via postal mail or electronic e-mail.

iii The Regional Water Board may require additional monitoring and reporting program requirements including sampling and analysis of discharges to CWA § 303(d)-listed water bodies. Additional requirements imposed by the Regional Water Board shall be consistent with the overall monitoring effort in the receiving waters.

3. LUP Type 1 Monitoring and Reporting Requirements

a. LUP Type 1 Inspection Requirements

i LUP Type 1 dischargers shall ensure that all inspections are conducted by trained personnel. The name(s) and contact number(s) of the assigned inspection personnel should be listed in the SWPPP.

ii LUP Type 1 dischargers shall ensure that all visual inspections are conducted daily during working hours and in conjunction with other daily activities in areas where active construction is occurring.

iii LUP Type 1 dischargers shall ensure that photographs of the site taken before, during, and after storm events are taken during inspections, and submitted through the State Water Board's SMARTS website once every three rain events.

iv LUP Type 1 dischargers shall conduct daily visual inspections to verify that:

(1) Appropriate BMPs for storm water and non-storm water are being implemented in areas where active construction is occurring (including staging areas);

(2) Project excavations are closed, with properly protected spoils, and that road surfaces are cleaned of excavated material and construction materials such as chemicals by either removing or storing the material in protective storage containers at the end of every construction day;

(3) Land areas disturbed during construction are returned to pre-construction conditions or an equivalent protection is used at the end of each workday to eliminate or minimize erosion and the possible discharge of sediment or other pollutants during a rain event.

v Inspections may be discontinued in non-active construction areas where soil-disturbing activities are completed and final soil stabilization is achieved (e.g., paving is completed, substructures

are installed, vegetation meets minimum cover requirements for final stabilization, or other stabilization requirements are met).

vi Inspection programs are required for LUP Type 1 projects where temporary and permanent stabilization BMPs are installed and are to be monitored after active construction is completed. Inspection activities shall continue until adequate permanent stabilization is established and, in areas where re-vegetation is chosen, until minimum vegetative coverage is established in accordance with Section C.1 of this Attachment.

b. LUP Type 1 Monitoring Requirements for Non-Visible Pollutants

LUP Type 1 dischargers shall implement sampling and analysis requirements to monitor non-visible pollutants associated with (1) construction sites; (2) activities producing pollutants that are not visually detectable in storm water discharges; and (3) activities which could cause or contribute to an exceedance of water quality objectives in the receiving waters.

i Sampling and analysis for non-visible pollutants is only required where the LUP Type 1 discharger believes pollutants associated with construction activities have the potential to be discharged with storm water runoff due to a spill or in the event there was a breach, malfunction, failure and/or leak of any BMP. Also, failure to implement BMPs may require sample collection.

(1) Visual observations made during the monitoring program described above will help the LUP Type 1 discharger determine when to collect samples.

(2) The LUP Type 1 discharger is not required to sample if one of the conditions described above (e.g., breach or spill) occurs and the site is cleaned of material and pollutants and/or BMPs are implemented prior to the next storm event.

ii LUP Type 1 dischargers shall collect samples down-gradient from all discharge locations where the visual observations were made triggering the monitoring, and which can be safely accessed. For sites where sampling and analysis is required, personnel trained in water quality sampling procedures shall collect storm water samples.

iii If sampling for non-visible pollutant parameters is required, LUP Type 1 dischargers shall ensure that samples be analyzed for parameters indicating the presence of pollutants identified in the pollutant source assessment required in Section J.2.a.i.

iv LUP Type 1 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

v LUP Type 1 dischargers shall ensure that a sufficiently large sample of storm water that has not come into contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample[12]) will be collected for comparison with the discharge sample. Samples shall be collected during the first two hours of discharge from rain events that occur during daylight hours and which generate runoff.

vi LUP Type 1 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis. Analyses may include, but are not limited to, indicator parameters such as: pH, specific conductance, dissolved oxygen, conductivity, salinity, and Total Dissolved Solids (TDS).

vii For laboratory analyses, all sampling, sample preservation, and other analyses must be conducted according to test procedures pursuant to 40 C.F.R. Part 136. LUP Type 1 dischargers shall ensure that field samples are collected and analyzed according to manufacturer specifications of the sampling devices employed. Portable meters shall be calibrated according to manufacturer's specification.

viii LUP Type 1 dischargers shall ensure that all field and/or analytical data are kept in the SWPPP document.

c. <u>LUP Type 1 Visual Observation Exceptions</u>

i LUP Type 1 dischargers shall be prepared to collect samples and conduct visual observation (inspections) to meet the minimum visual observation requirements of this Attachment. The Type 1 LUP discharger is not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

(1) During dangerous weather conditions such as flooding and electrical storms;

(2) Outside of scheduled site business hours.

(3) When access to the site is unsafe due to storm events.

[12] Sample collected at a location unaffected by contruction activities.

ii If the LUP Type 1 discharger does not collect the required samples or visual observation (inspections) due to these exceptions, an explanation why the sampling or visual observation (inspections) were not conducted shall be included in both the SWPPP and the Annual Report.

d. Particle Size Analysis for Risk Justification

LUP Type 1 dischargers utilizing justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

4. LUP Type 2 & 3 Monitoring and Reporting Requirements

a. LUP Type 2 & 3 Inspection Requirements

i LUP Type 2 & 3 dischargers shall ensure that all inspections are conducted by trained personnel. The name(s) and contact number(s) of the assigned inspection personnel should be listed in the SWPPP.

ii LUP Type 2 & 3 dischargers shall ensure that all visual inspections are conducted daily during working hours and in conjunction with other daily activities in areas where active construction is occurring.

iii LUP Type 2 & 3 dischargers shall ensure that photographs of the site taken before, during, and after storm events are taken during inspections, and submitted through the State Water Board's SMARTS website once every three rain events.

iv LUP Type 2 & 3 dischargers shall conduct daily visual inspections to verify that appropriate BMPs for storm water and non-storm water are being implemented and in place in areas where active construction is occurring (including staging areas).

v LUP Type 2 & 3 dischargers shall conduct inspections of the construction site prior to anticipated storm events, during extended storm events, and after actual storm events to identify areas contributing to a discharge of storm water associated with construction activity. Pre-storm inspections are to ensure that BMPs are properly installed and maintained; post-storm inspections are to assure that BMPs have functioned adequately. During

extended storm events, inspections shall be required during normal working hours for each 24-hour period.

vi Inspections may be discontinued in non-active construction areas where soil-disturbing activities are completed and final soil stabilization is achieved (e.g., paving is completed, substructures are installed, vegetation meets minimum cover requirements for final stabilization, or other stabilization requirements are met).

vii LUP Type 2 & 3 dischargers shall implement a monitoring program for inspecting projects that require temporary and permanent stabilization BMPs after active construction is complete. Inspections shall ensure that the BMPs are adequate and maintained. Inspection activities shall continue until adequate permanent stabilization is established and, in vegetated areas, until minimum vegetative coverage is established in accordance with Section C.1 of this Attachment.

viii If possible, LUP Type 2 & 3 dischargers shall install a rain gauge on-site at an accessible and secure location with readings made during all storm event inspections. When readings are unavailable, data from the closest rain gauge with publically available data may be used.

ix LUP Type 2 & 3 dischargers shall Include and maintain a log of the inspections conducted in the SWPPP. The log will provide the date and time of the inspection and who conducted the inspection.

b. LUP Type 2 & 3 Storm Water Effluent Monitoring Requirements

Table 4. LUP Type 2 & 3 Effluent Monitoring Requirements

LUP Type	Frequency	Effluent Monitoring
2	Minimum of 3 samples per day characterizing discharges associated with construction activity from the project active areas of construction.	Turbidity, pH, and non-visible pollutant parameters (if applicable)
3	Minimum of 3 samples per day characterizing discharges associated with construction activity from the project active areas of construction.	turbidity, pH, and non-visible pollutant parameters (if applicable)

i LUP Type 2 & 3 dischargers shall collect storm water grab samples from sampling locations characterizing discharges associated with activity from the LUP active areas of construction. At a minimum, 3 samples shall be collected per day of discharge.

ii LUP Type 2 & 3 dischargers shall collect samples of stored or contained storm water that is discharged subsequent to a storm event producing precipitation of ½ inch or more at the time of discharge.

iii LUP Type 2 & 3 dischargers shall ensure that storm water grab sample(s) obtained be representative of the flow and characteristics of the discharge.

iv LUP Type 2 & 3 dischargers shall analyze their effluent samples for:

(1) pH and turbidity
(2) Any additional parameter for which monitoring is required by the Regional Water Board.

c. LUP Type 2 & 3 Storm Water Effluent Sampling Locations

i LUP Type 2 & 3 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire disturbed project or area.

ii LUP Type 2 & 3 dischargers may monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to exceedance of NALs.

iii LUP Type 2 & 3 dischargers shall select analytical test methods from the list provided in Table 5 below.

iv LUP Type 2 & 3 dischargers shall ensure that all storm water sample collection preservation and handling shall be conducted in accordance with the “Storm Water Sample Collection and Handling Instructions” below.

d. LUP Type 3 Receiving Water Monitoring Requirements

i In the event that an LUP Type 3 discharger’s effluent exceeds the receiving water monitoring triggers of 500 NTU turbidity or pH range of 6.0-9.0, contained in this General Permit and has a direct discharge to receiving waters, the LUP discharger shall subsequently sample Receiving Waters (RWs) for turbidity, pH (if applicable) and SSC for the duration of coverage under this General Permit. In the event that an LUP Tupe 3 discharger utilizing ATS with direct discharges into receiving waters discharges effluent that exceeds the NELs in this permit, the discharger shall

subsequently sample RWs for turbidity, pH (if applicable), and SSC for the duration of coverage under this General Permit.

ii LUP Type 3 dischargers that meet the project criteria in Appendix 3 of this General Permit and have more than 30 acres of soil disturbance in the project area or project section area designated as Type 3, shall comply with the Bioassessment requirements prior to commencement of construction activity.

iii LUP Type 3 dischargers shall obtain RW samples in accordance with the requirements of the Receiving Water Sampling Locations section (Section M.4.c. of this Attachment).

e. LUP Type 3 Receiving Water Sampling Locations

i **Upstream/up-gradient RW samples**: LUP Type 3 dischargers shall obtain any required upstream/up-gradient receiving water samples from a representative and accessible location as close as possible to and upstream from the effluent discharge point.

ii **Downstream/down-gradient RW samples**: LUP Type 3 dischargers shall obtain any required downstream/down-gradient receiving water samples from a representative and accessible location as close as possible to and downstream from the effluent discharge point.

iii If two or more discharge locations discharge to the same receiving water, LUP Type 3 dischargers may sample the receiving water at a single upstream and downstream location.

f. LUP Type 2 & 3 Monitoring Requirements for Non-Visible Pollutants

LUP Type 2 & 3 dischargers shall implement sampling and analysis requirements to monitor non-visible pollutants associated with (1) construction sites; (2) activities producing pollutants that are not visually detectable in storm water discharges; and (3) activities which could cause or contribute to an exceedance of water quality objectives in the receiving waters.

i Sampling and analysis for non-visible pollutants is only required where LUP Type 2 & 3 dischargers believe pollutants associated with construction activities have the potential to be discharged with storm water runoff due to a spill or in the event there was a breach, malfunction, failure and/or leak of any BMP. Also, failure to implement BMPs may require sample collection.

(1) Visual observations made during the monitoring program described above will help LUP Type 2 & 3 dischargers determine when to collect samples.

(2) LUP Type 2 & 3 dischargers are not required to sample if one of the conditions described above (e.g., breach or spill) occurs and the site is cleaned of material and pollutants and/or BMPs are implemented prior to the next storm event.

ii LUP Type 2 & 3 dischargers shall collect samples down-gradient from the discharge locations where the visual observations were made triggering the monitoring and which can be safely accessed. For sites where sampling and analysis is required, personnel trained in water quality sampling procedures shall collect storm water samples.

iii If sampling for non-visible pollutant parameters is required, LUP Type 2 & 3 dischargers shall ensure that samples be analyzed for parameters indicating the presence of pollutants identified in the pollutant source assessment required in Section J.2.a.i.

iv LUP Type 2 & 3 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

v LUP Type 2 & 3 dischargers shall ensure that a sufficiently large sample of storm water that has not come into contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample[13]) will be collected for comparison with the discharge sample. Samples shall be collected during the first two hours of discharge from rain events that occur during daylight hours and which generate runoff.

vi LUP Type 2 & 3 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis. Analyses may include, but are not limited to, indicator parameters such as: pH, specific conductance, dissolved oxygen, conductivity, salinity, and Total Dissolved Solids (TDS).

vii For laboratory analyses, all sampling, sample preservation, and other analyses must be conducted according to test procedures pursuant to 40 C.F.R. Part 136. LUP Type 2 & 3 dischargers shall ensure that field samples are collected and analyzed according to manufacturer specifications of the sampling devices employed.

[13] Sample collected at a location unaffected by construction activities

Portable meters shall be calibrated according to manufacturer's specification.

viii LUP Type 2 & 3 dischargers shall ensure that all field and/or analytical data are kept in the SWPPP document.

g. LUP Type 2 & 3 Visual Observation and Sample Collection Exceptions

i LUP Type 2 & 3 dischargers shall be prepared to collect samples and conduct visual observation (inspections) to meet the minimum visual observation requirements of this Attachment. Type 2 & 3 LUP dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

(1) During dangerous weather conditions such as flooding and electrical storms;

(2) Outside of scheduled site business hours.

(3) When access to the site is unsafe due to storm events.

ii If the LUP Type 2 or 3 discharger does not collect the required samples or visual observation (inspections) due to these exceptions, an explanation why the sampling or visual observation (inspections) were not conducted shall be included in both the SWPPP and the Annual Report.

h. LUP Type 2 & 3 Storm Water Sample Collection and Handling Instructions

LUP Type 2 & 3 dischargers shall refer to Table 5 below for test Methods, detection Limits, and reporting Units. During storm water sample collection and handling, the LUP Type 2 & 3 discharger shall:

i Identify the parameters required for testing and the number of storm water discharge points that will be sampled. Request the laboratory to provide the appropriate number of sample containers, types of containers, sample container labels, blank chain of custody forms, and sample preservation instructions.

ii Determine how to ship the samples to the laboratory. The testing laboratory should receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory). The options are to either deliver the samples to the laboratory, arrange to have the laboratory pick them up, or ship them overnight to the laboratory.

iii Use only the sample containers provided by the laboratory to collect and store samples. Use of any other type of containers could contaminate your samples.

iv Prevent sample contamination, by not touching, or putting anything into the sample containers before collecting storm water samples.

v Not overfilling sample containers. Overfilling can change the analytical results.

vi Tightly screw the cap of each sample container without stripping the threads of the cap.

vii Complete and attach a label to each sample container. The label shall identify the date and time of sample collection, the person taking the sample, and the sample collection location or discharge point. The label should also identify any sample containers that have been preserved.

viii Carefully pack sample containers into an ice chest or refrigerator to prevent breakage and maintain temperature during shipment. Remember to place frozen ice packs into the shipping container. Samples should be kept as close to 4° C (39° F) as possible until arriving at the laboratory. Do not freeze samples.

ix Complete a Chain of Custody form for each set of samples. The Chain of Custody form shall include the discharger's name, address, and phone number, identification of each sample container and sample collection point, person collecting the samples, the date and time each sample container was filled, and the analysis that is required for each sample container.

x Upon shipping/delivering the sample containers, obtain both the signatures of the persons relinquishing and receiving the sample containers.

xi Designate and train personnel to collect, maintain, and ship samples in accordance with the above sample protocols and good laboratory practices.

xii Refer to the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP) for more

information on sampling collection and analysis. See http://www.waterboards.ca.gov/water_issues/programs/swamp/[14]

Table 5. Test Methods, Detection Limits, Reporting Units and Applicable NALs

Parameter	Test Method	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Levels	(LUP Type 3) Receiving Water Monitoring Trigger
pH	Field test with calibrated portable instrument	Type 2 & 3	0.2	pH units	Lower = 6.5 upper = 8.5	Lower = 6.0 upper = 9.0
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Type 2 & 3	1	NTU	250 NTU	500 NTU
SSC	ASTM Method D 3977-97[15]	Type 3 if Receiving Water Monitoring Trigger is exceeded	5	Mg/L	N/A	N/A
Bioassessment	(STE) Level I of (SAFIT),[16] fixed-count of 600 org/sample	Type 3 LUPs > 30 acres	N/A	N/A	N/A	N/A

i. LUP Type 2 & 3 Monitoring Methods

i The LUP Type 2 or 3 discharger's project M&RP shall include a description of the following items:

(1) Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

[14] Additional information regarding SWAMP's QAPrP can be found at: http://www.waterboards.ca.gov/water_issues/programs/swamp/.

[15] ASTM, 1999, Standard Test Method for Determining Sediment Concentration in Water Samples: American Society of Testing and Materials, D 3977-97, Vol. 11.02, pp. 389-394

[16] The current SAFIT STEs (28 November 2006) list requirements for both the Level I and Level II taxonomic effort, and are located at: http://www.swrcb.ca.gov/swamp/docs/safit/ste_list.pdf. When new editions are published by SAFIT, they will supersede all previous editions. All editions will be posted at the State Water Board's SWAMP website.

(2) Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program a copy of the Chain of Custody form used when handling and shipping samples.

(3) Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section M.4.f above.

ii LUP Type 2 & 3 dischargers shall ensure that all sampling and sample preservation be in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) shall be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. All laboratory analyses shall be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses shall be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services (SSC exception). The LUP discharger shall conduct its own field analysis of pH and may conduct its own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

j. LUP Type 2 & 3 Analytical Methods

LUP Type 2 & 3 dischargers shall refer to Table 5 above for test Methods, detection Limits, and reporting Units.

i **pH**: LUP Type 2 & 3 dischargers shall perform pH analysis on-site with a calibrated pH meter or pH test kit. The LUP discharger shall record pH monitoring results on paper and retain these records in accordance with Section M.4.o, below.

ii **Turbidity**: LUP Type 2 & 3 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results shall

be recorded in the site log book in Nephelometric Turbidity Units (NTU).

iii **Suspended sediment concentration (SSC)**: LUP Type 3 dischargers exceeding the turbidity Receiving Water Monitoring Trigger, shall perform SSC analysis using ASTM Method D3977-97.

iv **Bioassessment**: LUP Type 3 dischargers shall perform bioassessment sampling and analysis according to Appendix 3 of this General Permit.

k. Watershed Monitoring Option

If an LUP Type 2 or 3 discharger is part of a qualified regional watershed-based monitoring program the LUP Type 2 or 3 discharger may be eligible for relief from the monitoring requirements in this Attachment. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program if it determines that the watershed-based monitoring program will provide information to determine each discharger's compliance with the requirements of this General Permit.

l. Particle Size Analysis for Risk Justification

LUP Type 2 & 3 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

m. NAL Exceedance Report

i In the event that any effluent sample exceeds an applicable NAL, the Regional Water Boards may require LUP Type 2 & 3 dischargers to submit NAL Exceedance Reports.

ii LUP Type 2 & 3 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

iii LUP Type 2 & 3 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the exceedance report is filed.

iv LUP Type 2 & 3 dischargers shall include in the NAL Exceedance Report:

(1) the analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit"); and
(2) the date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.
(3) Description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

n. Monitoring Records

LUP Type 2 & 3 dischargers shall ensure that records of all storm water monitoring information and copies of all reports (including Annual Reports) required by this General Permit be retained for a period of at least three years. LUP Type 2 & 3 dischargers may retain records off-site and make them available upon request. These records shall include:

i The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation (rain gauge);

ii The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements;

iii The date and approximate time of analyses;

iv The individual(s) who performed the analyses;

v A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and all chain of custody forms;

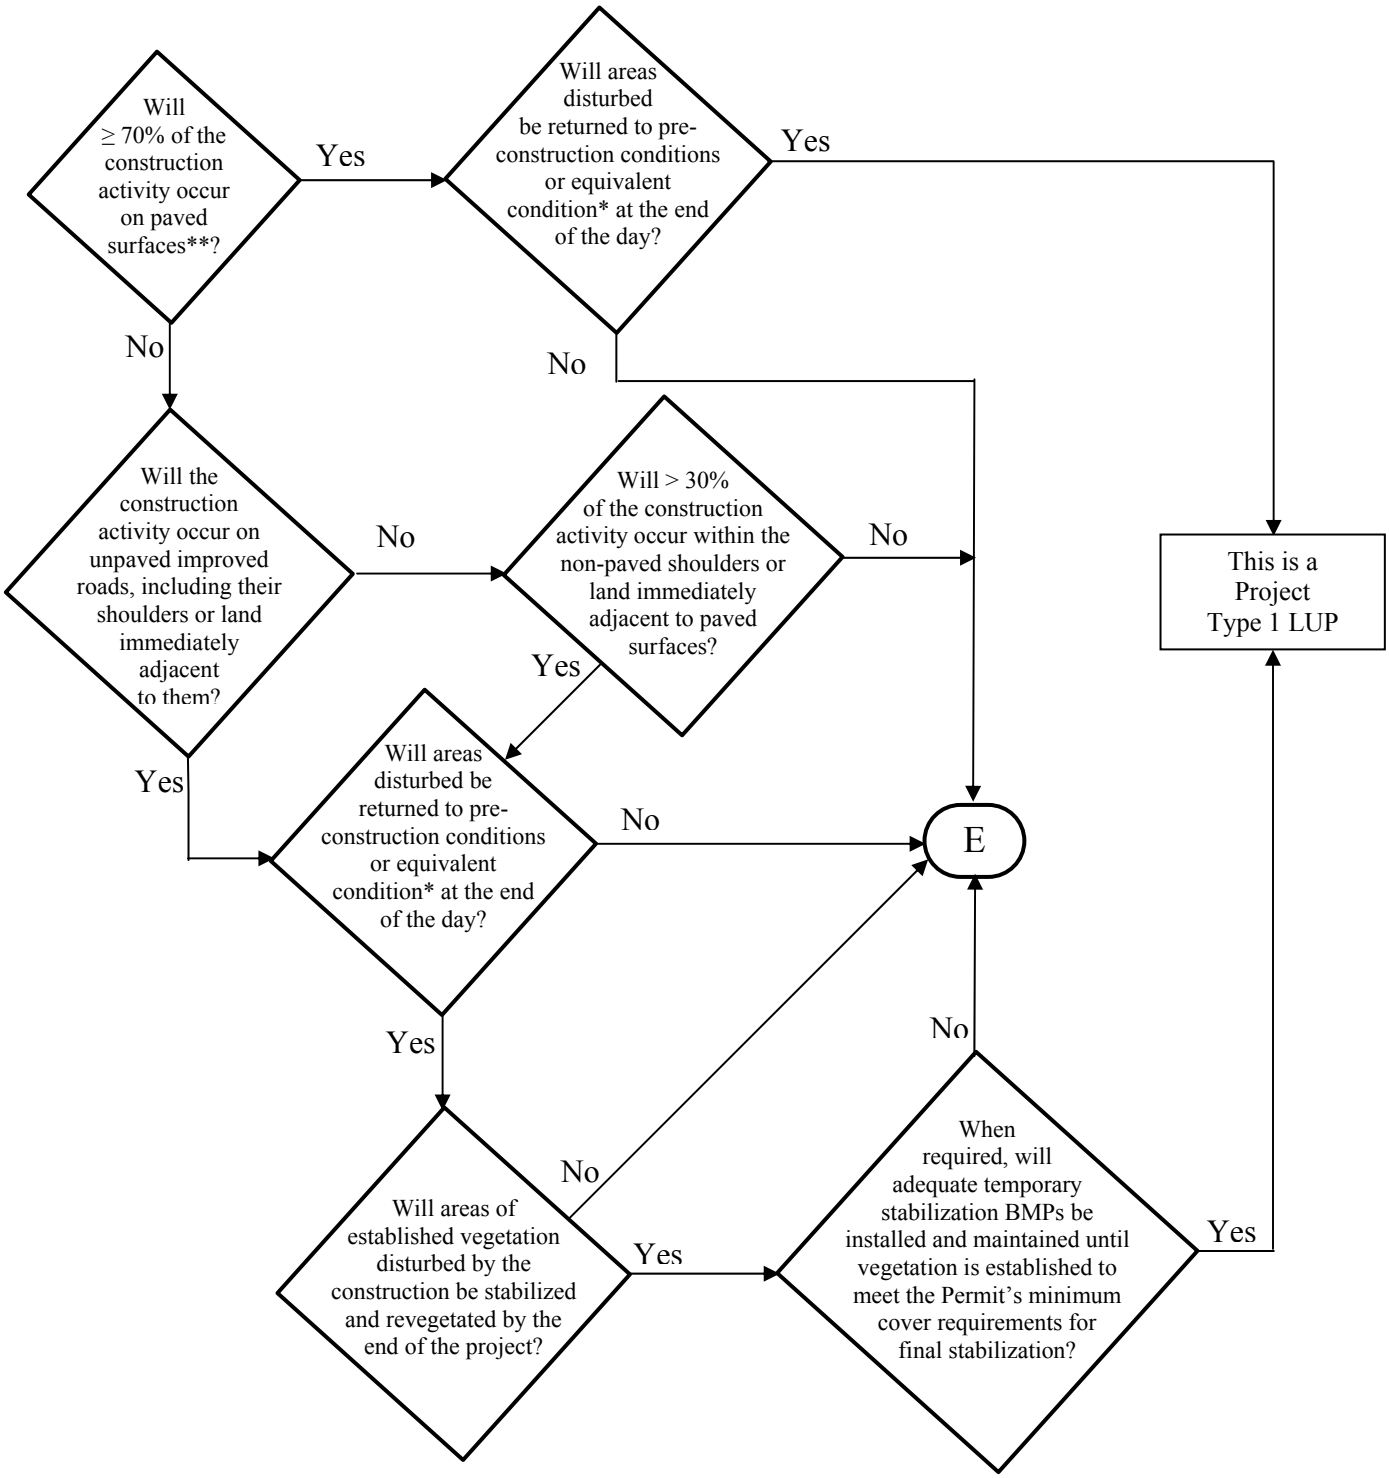
vi Quality assurance/quality control records and results;

vii Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Section M.4.a above);

viii Visual observation and sample collection exception records (see Section M.4.g above); and

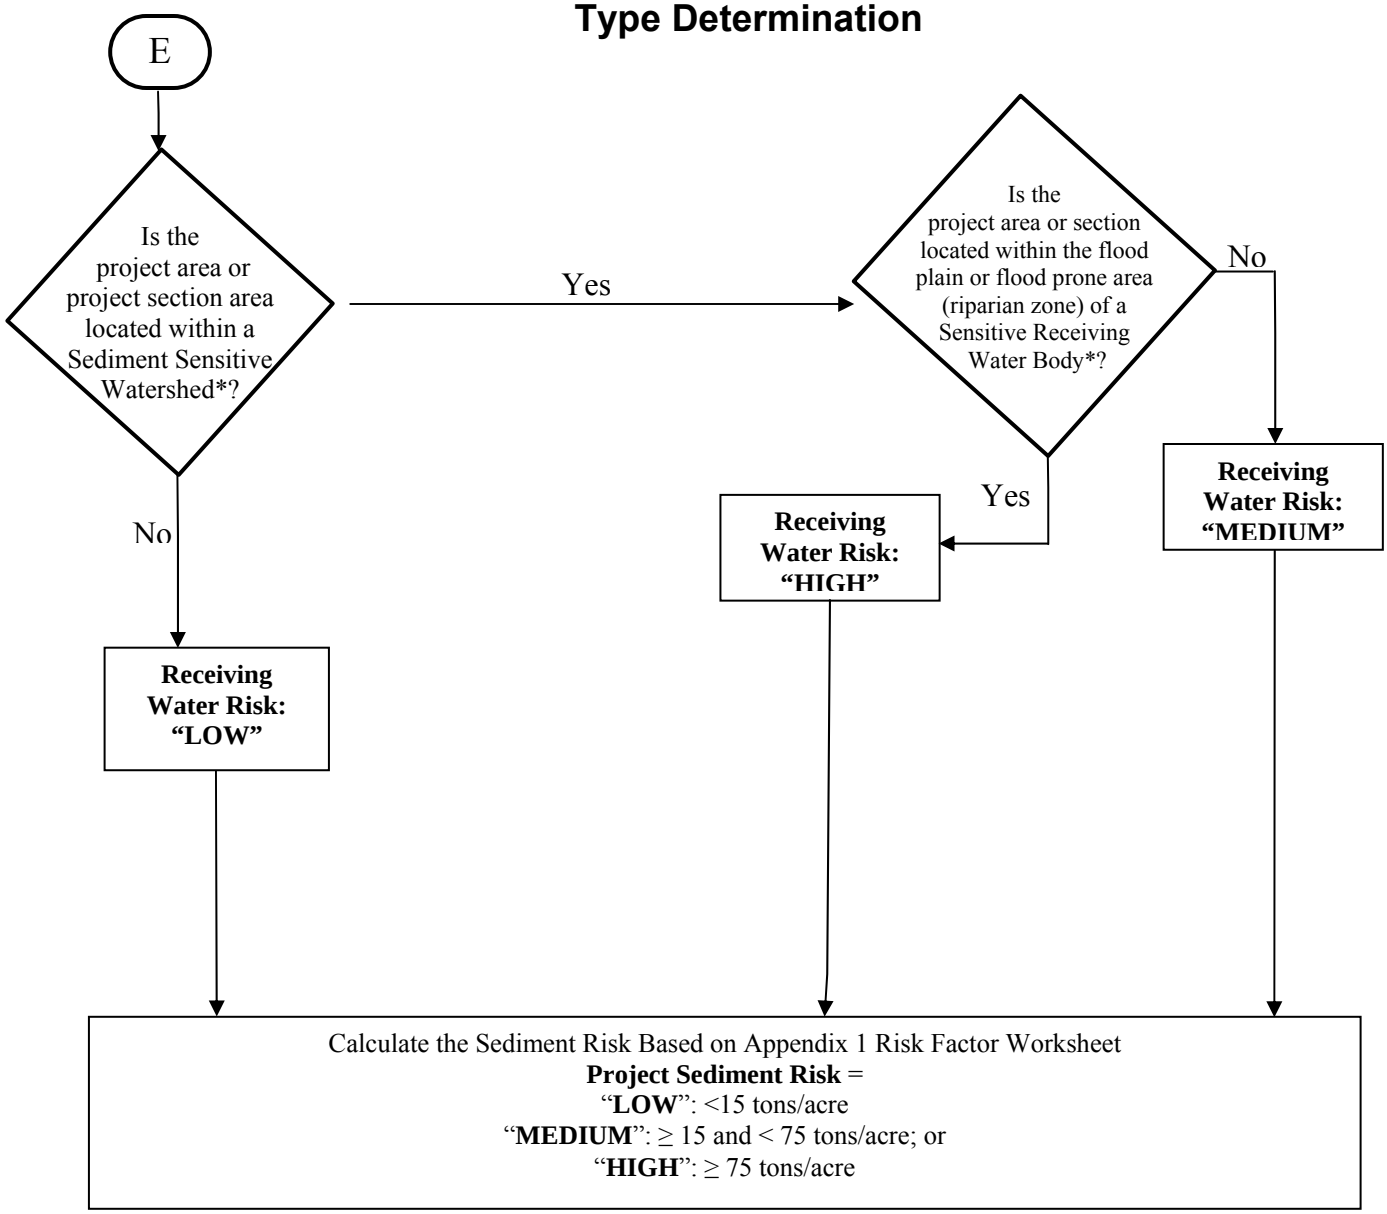
ix The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

ATTACHMENT A.1
LUP Project Area or Project Section Area Type Determination



*See Definition of Terms
** Or: "Will < 30% of the soil disturbance occur on unpaved surfaces?

ATTACHMENT A.1
LUP Project Area or Project Section Area Type Determination



* See Definition of Terms

RECEIVING WATER RISK	PROJECT SEDIMENT RISK		
	LOW	MEDIUM	HIGH
LOW	Type 1	Type 1	Type 2
MEDIUM	Type 1	Type 2	Type 3
HIGH	Type 2	Type 3	Type 3

ATTACHMENT A.1
Definition of Terms

1. **Equivalent Condition** – Means disturbed soils such as those from trench excavation are required to be hauled away, backfilled into the trench, and/or covered (e.g., metal plates, pavement, plastic covers over spoil piles) at the end of the construction day.
2. **Linear Construction Activity** – Linear construction activity consists of underground/ overhead facilities that typically include, but are not limited to, any conveyance, pipe or pipeline for the transportation of any gaseous, liquid (including water, wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g., telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/ tower pad and cable/ wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/ borrow locations.
3. **Sediment Sensitive Receiving Water Body –** Defined as a water body segment that is listed on EPA's approved CWA 303(d) list for sedimentation/siltation, turbidity, or is designated with beneficial uses of SPAWN, MIGRATORY, and COLD.
4. **Sediment Sensitive Watershed –** Defined as a watershed draining into a receiving water body listed on EPA's approved CWA 303(d) list for sedimentation/siltation, turbidity, or a water body designated with beneficial uses of SPAWN, MIGRATORY, and COLD.

ATTACHMENT A.2
PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS FOR LINEAR UNDERGROUND/OVERHEAD PROJECTS TO COMPLY WITH THE CONSTRUCTION GENERAL PERMIT

GENERAL INSTRUCTIONS

Who Must Submit

This permit is effective on July 1, 2010.

The Legally Responsible Person (LRP) for construction activities associated with linear underground/overhead project (LUP) must electronically apply for coverage under this General Permit on or after July 1, 2010. If it is determined that the LUP construction activities require an NPDES permit, the Legally Responsible Person[1] (LRP) shall submit PRDs for this General Permit in accordance with the following:

LUPs associated with Private or Municipal Development Projects

1. For LUPs associated with pre-development and pre-redevelopment construction activities:

   The LRP must obtain coverage[2] under this General Permit for its pre-development and pre-redevelopment construction activities where the total disturbed land area of these construction activities is greater than 1 acre.

2. For LUPs associated with new development and redevelopment construction projects:

   The LRP must obtain coverage under this General Permit for LUP construction activities associated with new development and redevelopment projects where the total disturbed land area of the LUP is greater than 1 acre. Coverage under this permit is not required where the same LUP construction activities are covered by another NPDES permit.

LUPs not associated with private or municipal new development or redevelopment projects:

The LRP must obtain coverage under this General Permit on or after July 1, 2010 for its LUP construction activities where the total disturbed land area is greater than 1 acre.

PRD Submittal Requirements

Prior to the start of construction activities a LRP must submit PRDs and fees to the State Water Board for each LUP.

New and Ongoing LUPs

Dischargers of new LUPs that commence construction activities after the adoption date of this General Permit shall file PRDs prior to the commencement of construction and implement the SWPPP upon the start of construction.

[1] person possessing the title of the land on which the construction activities will occur for the regulated site
[2] obtain coverage means filing PRDs for the project.

PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS (CONTINUED)

Dischargers of ongoing LUPs that are currently covered under State Water Board Order No. 2003-0007 (Small LUP General Permit) shall electronically file Permit Registration Documents no later than July 1, 2010. After July 1, 2010, all NOIs subject to State Water Board Order No. 2003-0007-DWQ will be terminated. All existing dischargers shall be exempt from the risk determination requirements in Attachment A. All existing dischargers are therefore subject to LUP Type 1 requirements regardless of their project's sediment and receiving water risks. However, a Regional Board retains the authority to require an existing discharger to comply with the risk determination requirements in Attachment A.

Where to Apply

The Permit Registration Documents (PRDs) can be found at www.waterboards.ca.gov/water_issues/programs/stormwater/

Fees

The annual fee for storm water permits are established through the State of California Code of Regulations.

When Permit Coverage Commences

To obtain coverage under the General Permit, the LRP must include the complete PRDs and the annual fee. All PRDs deemed incomplete will be rejected with an explanation as to what is required to complete submittal. Upon receipt of complete PRDs and associated fee, each discharger will be sent a waste discharger's identification (WDID) number.

Projects and Activities Not Defined As Construction Activity

1. LUP construction activity does not include routine maintenance projects to maintain original line and grade, hydraulic capacity, or original purpose of the facility. Routine maintenance projects are projects associated with operations and maintenance activities that are conducted on existing lines and facilities and within existing right-of-way, easements, franchise agreements or other legally binding agreements of the discharger. Routine maintenance projects include, but are not limited to projects that are conducted to:

    - Maintain the original purpose of the facility, or hydraulic capacity.
    - Update existing lines[3] and facilities to comply with applicable codes, standards and regulations regardless if such projects result in increased capacity.
    - Repairing leaks.

    Routine maintenance does not include construction of new[4] lines or facilities resulting from compliance with applicable codes, standards and regulations.

[3] Update existing lines includes replacing existing lines with new materials or pipes.
[4] New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS (CONTINUED)

Routine maintenance projects do not include those areas of maintenance projects that are outside of an existing right-of-way, franchise, easements, or agreements. When a project must acquire new areas, those areas may be subject to this General Permit based on the area of disturbed land outside the original right-of-way, easement, or agreement.

2. LUP construction activity does not include field activities associated with the planning and design of a project (e.g., activities associated with route selection).

3. Tie-ins conducted immediately adjacent to "energized" or "pressurized" facilities by the discharger are not considered small construction activities where all other LUP construction activities associated with the tie-in are covered by a NOI and SWPPP of a third party or municipal agency.

Calculating Land Disturbance Areas of LUPs

The total land area disturbed for LUPs is the sum of the:

- Surface areas of trenches, laterals and ancillary facilities, plus
- Area of the base of stockpiles on unpaved surfaces, plus
- Surface area of the borrow area, plus
- Areas of paved surfaces constructed for the project, plus
- Areas of new roads constructed or areas of major reconstruction to existing roads (e.g. improvements to two-track surfaces or road widening) for the sole purpose of accessing construction activities or as part of the final project, plus
- Equipment and material storage, staging, and preparation areas (laydown areas) not on paved surfaces, plus
- Soil areas outside the surface area of trenches, laterals and ancillary facilities that will be graded, and/or disturbed by the use of construction equipment, vehicles and machinery during construction activities.

Stockpiling Areas

Stockpiling areas, borrow areas and the removal of soils from a construction site may or may not be included when calculating the area of disturbed soil for a site depending on the following conditions:

- For stockpiling of soils onsite or immediately adjacent to a LUP site and the stockpile is not on a paved surface, the area of the base of the stockpile is to be included in the disturbed area calculation.

- The surface area of borrow areas that are onsite or immediately adjacent to a project site are to be included in the disturbed area calculation.

- For soil that is hauled offsite to a location owned or operated by the discharger that is not a paved surface, the area of the base of the stockpile is to be included in the disturbed area calculation except when the offsite location is already subject to a separate storm water permit.

PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS (CONTINUED)

- For soil that is brought to the project from an off-site location owned or operated by the discharger the surface area of the borrow pit is to be included in the disturbed area calculation except when the offsite location is already subject to a separate storm water permit.

- Trench spoils on a paved surface that are either returned to the trench or excavation or hauled away from the project daily for disposal or reuse will not be included in the disturbed area calculation.

If you have any questions concerning submittal of PRDs, please call the State Water Board at (866) 563-3107.

ATTACHMENT B
PERMIT REGISTRATION DOCUMENTS (PRDs) TO COMPLY WITH THE TERMS OF THE GENERAL PERMIT TO DISCHARGE STORM WATER ASSOCIATED WITH CONSTRUCTION ACTIVITY

GENERAL INSTRUCTIONS

A. All Linear Construction Projects shall comply with the PRD requirements in Attachment A.2 of this Order.

B. Who Must Submit

Discharges of storm water associated with construction that results in the disturbance of one acre or more of land must apply for coverage under the General Construction Storm Water Permit (General Permit). Any construction activity that is a part of a larger common plan of development or sale must also be permitted, regardless of size. (For example, if 0.5 acre of a 20-acre subdivision is disturbed by the construction activities of discharger A and the remaining 19.5 acres is to be developed by discharger B, discharger A must obtain a General Storm Water Permit for the 0.5 acre project).

Other discharges from construction activities that are covered under this General Permit can be found in the General Permit Section II.B.

It is the LRP's responsibility to obtain coverage under this General Permit by electronically submitting complete PRDs (Permit Registration Documents).

In all cases, the proper procedures for submitting the PRDs must be completed before construction can commence.

C. Construction Activity Not Covered By This General Permit

Discharges from construction that are not covered under this General Permit can be found in the General Permit Sections II.A &B..

D. Annual Fees and Fee Calculation

Annual fees are calculated based upon the total area of land to be disturbed not the total size of the acreage owned. However, the calculation includes all acres to be disturbed during the duration of the project. For example, if 10 acres are scheduled to be disturbed the first year and 10 in each subsequent year for 5 years, the annual fees would be based upon 50 acres of disturbance. The State Water Board will evaluate adding acreage to an existing Permit Waste Discharge Identification (WDID) number on a case-by-case basis. In general, any acreage to be considered must be contiguous to the permitted land area and the existing

SWPPP must be appropriate for the construction activity and topography of the acreage under consideration. As acreage is built out and stabilized or sold, the Change of Information (COI) form enables the applicant to remove those acres from inclusion in the annual fee calculation. Checks should be made payable to: State Water Board.

The Annual fees are established through regulations adopted by the State Water Board. The total annual fee is the current base fee plus applicable surcharges for all construction sites submitting an NOI, based on the total acreage to be disturbed during the life of the project. Annual fees are subject to change by regulation.

Dischargers that apply for and satisfy the Small Construction Erosivity Wavier requirements shall pay a fee of $200.00 plus an applicable surcharge, see the General Permit Section II.B.7.

E. When to Apply

LRP's proposing to conduct construction activities subject to this General Permit must submit their PRDs prior to the commencement of construction activity.

F. Requirements for Completing Permit Registration Documents (PRDs)

All dischargers required to comply with this General Permit shall electronically submit the required PRDs for their type of construction as defined below.

G. Standard PRD Requirements (All Dischargers)

1. Notice of Intent
2. Risk Assessment (Standard or Site-Specific)
3. Site Map
4. SWPPP
5. Annual Fee
6. Certification

H. Additional PRD Requirements Related to Construction Type

1. Discharger in unincorporated areas of the State (not covered under an adopted Phase I or II SUSMP requirements) and that are not a linear project shall also submit a completed:
   a. Post-Construction Water Balance Calculator (Appendix 2).

2. Dischargers who are proposing to implement ATS shall submit:
   a. Complete ATS Plan in accordance with Attachment F at least 14 days prior to the planned operation of the ATS and a paper copy shall be available onsite during ATS operation.

b. Certification proof that design done by a professional in accordance with Attachment F.

3. Dischargers who are proposing an alternate Risk Justification:
   a. Particle Size Analysis.

I. Exceptions to Standard PRD Requirements

Construction sites with an R value less than 5 as determined in the Risk Assessment are not required to submit a SWPPP.

J. Description of PRDs

1. Notice of Intent (NOI)

2. Site Map(s) Includes:
   a. The project's surrounding area (vicinity)
   b. Site layout
   c. Construction site boundaries
   d. Drainage areas
   e. Discharge locations
   f. Sampling locations
   g. Areas of soil disturbance (temporary or permanent)
   h. Active areas of soil disturbance (cut or fill)
   i. Locations of all runoff BMPs
   j. Locations of all erosion control BMPs
   k. Locations of all sediment control BMPs
   l. ATS location (if applicable)
   m. Locations of sensitive habitats, watercourses, or other features which are not to be disturbed
   n. Locations of all post-construction BMPs
   o. Locations of storage areas for waste, vehicles, service, loading/unloading of materials, access (entrance/exits) points to construction site, fueling, and water storage, water transfer for dust control and compaction practices

3. **SWPPPs**
   A site-specific SWPPP shall be developed by each discharger and shall be submitted with the PRDs.

4. **Risk Assessment**
   All dischargers shall use the Risk Assessment procedure as describe in the General Permit Appendix 1.

   a. The Standard Risk Assessment includes utilization of the following:
      i. Receiving water Risk Assessment interactive map

ii. EPA Rainfall Erosivity Factor Calculator Website
iii. Sediment Risk interactive map
iv. Sediment sensitive water bodies list

b. The Site-Specific Risk Assessment includes the completion of the hand calculated R value Risk Calculator

5. **Post-Construction Water Balance Calculator**
All dischargers subject to this requirement shall complete the Water Balance Calculator (in Appendix 2) in accordance with the instructions.

6. **ATS Design Document and Certification**
All dischargers using ATS must submit electronically their system design (as well as any supporting documentation) and proof that the system was designed by a qualified ATS design professional (See Attachment F).

To obtain coverage under the General Permit PRDs must be included and completed. If any of the required items are missing, the PRD submittal is considered incomplete and will be rejected. Upon receipt of a complete PRD submittal, the State Water Board will process the application package in the order received and assign a (WDID) number.

Questions?

If you have any questions on completing the PRDs please email stormwater@waterboards.ca.gov or call (866) 563-3107.

ATTACHMENT C
RISK LEVEL 1 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 1 dischargers shall comply with the narrative effluent standards listed below:

   a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

   b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric – Risk Level 1 dischargers are not subject to a numeric effluent standard.

B. Good Site Management "Housekeeping"

1. Risk Level 1 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 1 dischargers shall implement the following good housekeeping measures:

   a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

   b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 1 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require that:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly; and

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 1 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 1 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain fertilizers and other landscape materials when they are not actively being used.

   c. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 1 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 1 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 1 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

C. Non-Storm Water Management

1. Risk Level 1 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 1 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 1 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 1 dischargers shall implement effective wind erosion control.

2. Risk Level 1 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Risk Level 1 dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 1 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 1 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

F. Run-on and Runoff Controls

Risk Level 1 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 1 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee trained to do the task(s) appropriately, but shall ensure adequate deployment.

2. Risk Level 1 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.

storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 1 dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 1 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 1 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

   a. Inspection date and date the inspection report was written.

   b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

   c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

   d. A description of any BMPs evaluated and any deficiencies noted.

   e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

   f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

   g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

   h. Photographs taken during the inspection, if any.

   i. Inspector’s name, title, and signature.

H. Rain Event Action Plan

Not required for Risk Level 1 dischargers.

I. Risk Level 1 Monitoring and Reporting Requirements

Table 1- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
1	X	X		X	X		

1. **Construction Site Monitoring Program Requirements**

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Programs to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

   a. To demonstrate that the site is in compliance with the Discharge Prohibitions;

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives;

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges; and

d. To determine whether BMPs included in the SWPPP are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 1 - Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 1 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 1 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 1 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 1 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 1 dischargers shall visually observe (inspect):

i. All storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. All BMPs to identify whether they have been properly implemented in accordance with the SWPPP. If needed, the discharger shall implement appropriate corrective actions.

iii. Any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in e.i and e.iii above, Risk Level 1 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 1 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 1 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 1 – Visual Observation Exemptions**

a. Risk Level 1 dischargers shall be prepared to conduct visual observation (inspections) until the minimum requirements of Section I.3 above are completed. Risk Level 1 dischargers are not required to conduct visual observation (inspections) under the following conditions:

i. During dangerous weather conditions such as flooding and electrical storms.

ii. Outside of scheduled site business hours.

b. If no required visual observations (inspections) are collected due to these exceptions, Risk Level 1 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the visual observations (inspections) were not conducted.

5. **Risk Level 1 – Monitoring Methods**

Risk Level 1 dischargers shall include a description of the visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures in the CSMP.

6. **Risk Level 1 – Non-Storm Water Discharge Monitoring Requirements**

a. Visual Monitoring Requirements:

i. Risk Level 1 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

ii. Risk Level 1 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

iii. Risk Level 1 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 1 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

7. **Risk Level 1 – Non-Visible Pollutant Monitoring Requirements**

a. Risk Level 1 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

b. Risk Level 1 dischargers shall ensure that water samples are large enough to characterize the site conditions.

c. Risk Level 1 dischargers shall collect samples at all discharge locations that can be safely accessed.

d. Risk Level 1 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

e. Risk Level 1 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the

presence of pollutants identified in the pollutant source assessment required (Risk Level 1 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 1 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 1 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[2]

h. Risk Level 1 dischargers shall keep all field /or analytical data in the SWPPP document.

8. **Risk Level 1 – Particle Size Analysis for Project Risk Justification**

Risk Level 1 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

9. **Risk Level 1 – Records**

Risk Level 1 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 1 dischargers shall retain all records on-site while construction is ongoing. These records include:

a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

c. The date and approximate time of analyses.

d. The individual(s) who performed the analyses.

[2] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

e. A summary of all analytical results from the last three years, the method detection limits and reporting units, and the analytical techniques or methods used.

f. Rain gauge readings from site inspections.

g. Quality assurance/quality control records and results.

h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.6 above).

i. Visual observation and sample collection exception records (see Section I.4 above).

j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

ATTACHMENT D
RISK LEVEL 2 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 2 dischargers shall comply with the narrative effluent standards listed below:

    a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

    b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric – Risk level 2 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

B. Good Site Management "Housekeeping"

1. Risk Level 2 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 2 dischargers shall implement the following good housekeeping measures:

    a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

    b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 2 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly.

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 2 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 2 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain all fertilizers and other landscape materials when they are not actively being used.

   c. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 2 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 2 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 2 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

7. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall document all housekeeping BMPs in the SWPPP and REAP(s) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

C. Non-Storm Water Management

1. Risk Level 2 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 2 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 2 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 2 dischargers shall implement effective wind erosion control.

2. Risk Level 2 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Risk Level 2 dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 2 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 2 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

3. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

4. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 1.

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.
[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage.
[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

Table 1 - Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

5. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

6. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

7. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

F. Run-on and Run-off Controls

Risk Level 2 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 2 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

2. Risk Level 2 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 2 dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 2 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 2 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

   a. Inspection date and date the inspection report was written.

   b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

   c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

   d. A description of any BMPs evaluated and any deficiencies noted.

   e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

   f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

   g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

   h. Photographs taken during the inspection, if any.

   i. Inspector's name, title, and signature.

H. Rain Event Action Plan

1. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop a Rain Event Action Plan (REAP) 48 hours prior to any

likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The discharger shall ensure a QSP obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

2. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

3. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP ensure that the REAP include, at a minimum, the following site information:

    a. Site Address
    b. Calculated Risk Level (2 or 3)
    c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
    d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
    e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number

4. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP include in the REAP, at a minimum, the following project phase information:

    a. Activities associated with each construction phase
    b. Trades active on the construction site during each construction phase
    c. Trade contractor information
    d. Suggested actions for each project phase

5. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

    a. Site Address
    b. Calculated Risk Level (2 or 3)
    c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number

d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number
f. Trades active on site during Inactive Construction
g. Trade contractor information
h. Suggested actions for inactive construction sites

6. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP begin implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

7. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP maintain onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

I. Risk Level 2 Monitoring and Reporting Requirements

Table 2- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
2	X	X	X	X	X	X	

1. Construction Site Monitoring Program Requirements

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

   a. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs).

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

d. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 2 – Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 2 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 2 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 2 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 2 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 2 dischargers shall visually observe (inspect):

i. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP/REAP. If needed, the discharger shall implement appropriate corrective actions.

iii. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in c.i and c.iii above, Risk Level 2 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 2 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 2 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 2 – Water Quality Sampling and Analysis**

a. Risk Level 2 dischargers shall collect storm water grab samples from sampling locations, as defined in Section I.5. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

b. At minimum, Risk Level 2 dischargers shall collect 3 samples per day of the qualifying event.

c. Risk Level 2 dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

<u>Storm Water Effluent Monitoring Requirements</u>

d. Risk Level 2 dischargers shall analyze their effluent samples for:

i. pH and turbidity.

ii. Any additional parameters for which monitoring is required by the Regional Water Board.

5. **Risk Level 2 – Storm Water Discharge Water Quality Sampling Locations**

Effluent Sampling Locations

a. Risk Level 2 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

b. Risk Level 2 dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

c. Risk Level 2 dischargers shall ensure that storm water discharge collected and observed represent[4] the effluent in each drainage area based on visual observation of the water and upstream conditions.

d. Risk Level 2 dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

e. Risk Level 2 dischargers who deploy an ATS on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

f. Risk Level 2 dischargers shall select analytical test methods from the list provided in Table 3 below.

g. All storm water sample collection preservation and handling shall be conducted in accordance with Section I.7 “Storm Water Sample Collection and Handling Instructions” below.

6. **Risk Level 2 – Visual Observation and Sample Collection Exemptions**

a. Risk Level 2 dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Sections I.3 and I.4 above are completed. Risk Level 2 dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

[4] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment-laden water even if most water flowing through the fence is clear.

i. During dangerous weather conditions such as flooding and electrical storms.

ii. Outside of scheduled site business hours.

b. If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 2 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7. **Risk Level 2 – Storm Water Sample Collection and Handling Instructions**

a. Risk Level 2 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. Risk Level 2 dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

c. Risk Level 2 dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP).[5]

8. **Risk Level 2 – Monitoring Methods**

a. Risk Level 2 dischargers shall include a description of the following items in the CSMP:

i. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

ii. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program

[5] Additional information regarding SWAMP's QAPrP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/. QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf.

an example Chain of Custody form used when handling and shipping samples.

iii. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section I.4 above.

b. Risk Level 2 dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Risk Level 2 dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services. Risk Level 2 dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

9. **Risk Level 2 – Analytical Methods**

a. Risk Level 2 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. **pH**: Risk Level 2 dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 2 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section I.14, below.

c. **Turbidity**: Risk Level 2 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

10. **Risk Level 2 - Non-Storm Water Discharge Monitoring Requirements**

a. Visual Monitoring Requirements:

i. Risk Level 2 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

ii. Risk Level 2 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

iii. Risk Level 2 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 2 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

b. Effluent Sampling Locations:

i. Risk Level 2 dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

ii. Risk Level 2 dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

iii. Risk Level 2 dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

11. **Risk Level 2 – Non-Visible Pollutant Monitoring Requirements**

a. Risk Level 2 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual

inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

b. Risk Level 2 dischargers shall ensure that water samples are large enough to characterize the site conditions.

c. Risk Level 2 dischargers shall collect samples at all discharge locations that can be safely accessed.

d. Risk Level 2 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

e. Risk Level 2 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 2 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 2 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 2 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[6]

h. Risk Level 2 dischargers shall keep all field /or analytical data in the SWPPP document.

12. **Risk Level 2 – Watershed Monitoring Option**

Risk Level 2 dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in Sections I.5. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

[6] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

13. **Risk Level 2 – Particle Size Analysis for Project Risk Justification**

Risk Level 2 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

14. **Risk Level 2 – Records**

Risk Level 2 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 2 dischargers shall retain all records on-site while construction is ongoing. These records include:

a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

c. The date and approximate time of analyses.

d. The individual(s) who performed the analyses.

e. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

f. Rain gauge readings from site inspections;

g. Quality assurance/quality control records and results.

h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.10 above).

i. Visual observation and sample collection exception records (see Section I.6 above).

j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

15. **Risk Level 2 – NAL Exceedance Report**

a. In the event that any effluent sample exceeds an applicable NAL, Risk Level 2 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

b. Risk Level 2 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

c. Risk Level 2 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

d. Risk Level 2 dischargers shall include in the NAL Exceedance Report:

i. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”).

ii. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

iii. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

Table 3 – Risk Level 2 Test Methods, Detection Limits, Reporting Units and Applicable NALs/NELs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2 Discharges	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2 Discharges other than ATS	1	NTU	250 NTU
		For ATS discharges	1	NTU	N/A

ATTACHMENT E
RISK LEVEL 3 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 3 dischargers shall comply with the narrative effluent standards listed below:

   a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

   b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric –Risk Level 3 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

B. Good Site Management "Housekeeping"

1. Risk Level 3 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 3 dischargers shall implement the following good housekeeping measures:

   a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

   b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 3 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protecting stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require that:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly; and

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 3 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 3 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain fertilizers and other landscape materials when they are not actively being used.

   c. Discontinuing the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Applying erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stacking erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 3 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 3 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 3 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

7. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall document all housekeeping BMPs in the SWPPP and REAP(s) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

C. Non-Storm Water Management

1. Risk Level 3 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 3 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 3 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 3 dischargers shall implement effective wind erosion control.

2. Risk Level 3 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 3 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 3 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

3. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

4. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 1.

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.
[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage
[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

Table 1 - Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

5. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

6. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

7. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

8. **Additional Risk Level 3 Requirement:** The Regional Water Board may require Risk Level 3 dischargers to implement additional site-specific sediment control requirements if the implementation of the other requirements in this section are not adequately protecting the receiving waters.

F. Run-on and Run-off Controls

Risk Level 3 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 3 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

2. Risk Level 3 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 3 dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 3 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 3 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

    a. Inspection date and date the inspection report was written.

    b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

    c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

    d. A description of any BMPs evaluated and any deficiencies noted.

    e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

    f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

    g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

    h. Photographs taken during the inspection, if any.

i. Inspector's name, title, and signature.

H. Rain Event Action Plan

1. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP develop a Rain Event Action Plan (REAP) 48 hours prior to any likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The QSP shall obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

2. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP develop the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

3. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP ensure that the REAP include, at a minimum, the following site information:

   a. Site Address.
   b. Calculated Risk Level (2 or 3).
   c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number.
   d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number.
   e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number.

4. **Additional Risk Level 3 Requirement:** The QSP shall include in the REAP, at a minimum, the following project phase information:

   a. Activities associated with each construction phase.
   b. Trades active on the construction site during each construction phase.
   c. Trade contractor information.
   d. Suggested actions for each project phase.

5. **Additional Risk Level 3 Requirement:** The QSP shall develop additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

a. Site Address.
b. Calculated Risk Level (2 or 3).
c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number.
d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number.
e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number.
f. Trades active on site during Inactive Construction.
g. Trade contractor information.
h. Suggested actions for inactive construction sites.

6. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP begin implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

7. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP maintain onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

I. Risk Level 3 Monitoring and Reporting Requirements

Table 2- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
3	X	X	X	X	X	X	X[4]

1. Construction Site Monitoring Program Requirements

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Program in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

[4] When receiving water monitoring trigger is exceeded

a. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs) of this General Permit.

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

d. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 3 – Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 3 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 3 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 3 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 3 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 3 dischargers shall visually observe (inspect):

i. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP/REAP. If needed, the discharger shall implement appropriate corrective actions.

iii. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in c.i. and c.iii above, Risk Level 3 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 3 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 3 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 3 – Water Quality Sampling and Analysis**

a. Risk Level 3 dischargers shall collect storm water grab samples from sampling locations, as defined in Section I.5. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

b. At minimum, Risk Level 3 dischargers shall collect 3 samples per day of the qualifying event.

c. Risk Level 3 dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

<u>Storm Water Effluent Monitoring Requirements</u>

d. Risk Level 3 dischargers shall analyze their effluent samples for:

i. pH and turbidity.

ii. Any additional parameters for which monitoring is required by the Regional Water Board.

e. Risk 3 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event.

Receiving Water Monitoring Requirements

f. In the event that a Risk Level 3 discharger's effluent exceeds the daily average receiving water monitoring trigger of 500 NTU turbidity or the daily average pH range 6.0-9.0 contained in this General Permit and has a direct discharge into receiving waters, the Risk Level 3 discharger shall subsequently sample receiving waters (RWs) for turbidity, pH (if applicable), and SSC for the duration of coverage under this General Permit. If a Risk Level 3 discharger utilizing ATS with direct discharges into receiving waters discharges effluent that exceeds the NELs in this permit, the discharger shall subsequently sample RWs for turbidity, pH (if applicable), and SSC for the duration of coverage under this General Permit.

g. Risk Level 3 dischargers disturbing 30 acres or more of the landscape and with direct discharges into receiving waters shall conduct or participate in benthic macroinvertebrate bioassessment of RWs prior to commencement of construction activity (See Appendix 3).

h. Risk Level 3 dischargers shall obtain RW samples in accordance with the Receiving Water sampling location section (Section I.5), below.

5. **Risk Level 3 – Storm Water Discharge Water Quality Sampling Locations**

Effluent Sampling Locations

a. Risk Level 3 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

b. Risk Level 3 dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

c. Risk Level 3 dischargers shall ensure that storm water discharge collected and observed represent[5] the effluent in each drainage area based on visual observation of the water and upstream conditions.

d. Risk Level 3 dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

e. Risk Level 3 dischargers who deploy an ATS on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

f. Risk Level 3 dischargers shall select analytical test methods from the list provided in Table 3 below.

g. All storm water sample collection preservation and handling shall be conducted in accordance with Section I.7 "Storm Water Sample Collection and Handling Instructions" below.

Receiving Water Sampling Locations

h. **Upstream/up-gradient RW samples**: Risk Level 3 dischargers shall obtain any required upstream/up-gradient receiving water samples from a representative and accessible location as close as possible and upstream from the effluent discharge point.

i. **Downstream/down-gradient RW samples**: Risk Level 3 dischargers shall obtain any required downstream/down-gradient receiving water samples from a representative and accessible location as close as possible and downstream from the effluent discharge point.

j. If two or more discharge locations discharge to the same receiving water, Risk Level 3 dischargers may sample the receiving water at a single upstream and downstream location.

[5] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment-laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment laden water even if most water flowing through the fence is clear.

6. **Risk Level 3 – Visual Observation and Sample Collection Exemptions**

   a. Risk Level 3 dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Sections I.3 and I.4 above are completed. Risk Level 3 dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

      i. During dangerous weather conditions such as flooding and electrical storms.

      ii. Outside of scheduled site business hours.

   b. If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 3 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7. **Risk Level 3 – Storm Water Sample Collection and Handling Instructions**

   a. Risk Level 3 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

   b. Risk Level 3 dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

   c. Risk Level 3 dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP).[6]

[6] Additional information regarding SWAMP's QAPrP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/.
QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf

8. **Risk Level 3 – Monitoring Methods**

   a. Risk Level 3 dischargers shall include a description of the following items in the CSMP:

      i. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

      ii. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples.

      iii. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section I.4 above.

   b. Risk Level 3 dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Risk Level 3 dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services (SSC exception). Risk Level 3 dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

9. **Risk Level 3 – Analytical Methods**

   a. Risk Level 3 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. **pH**: Risk Level 3 dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 3 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section I.14, below.

c. **Turbidity**: Risk Level 3 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

d. **Suspended sediment concentration (SSC)**: Risk Level 3 dischargers that exceed the turbidity Receiving Water Monitoring Trigger shall perform SSC analysis using ASTM Method D3977-97.

e. **Bioassessment**: Risk Level 3 dischargers shall perform bioassessment sampling and analysis according to Appendix 3 of this General Permit.

10. **Risk Level 3 - Non-Storm Water Discharge Monitoring Requirements**

a. Visual Monitoring Requirements:

i. Risk Level 3 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

ii. Risk Level 3 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

iii. Risk Level 3 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 3 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to

reduce or prevent pollutants from contacting non-storm water discharges.

b. Effluent Sampling Locations:

i. Risk Level 3 dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

ii. Risk Level 3 dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

iii. Risk Level 3 dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

11. **Risk Level 3 – Non-Visible Pollutant Monitoring Requirements**

a. Risk Level 3 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

b. Risk Level 3 dischargers shall ensure that water samples are large enough to characterize the site conditions.

c. Risk Level 3 dischargers shall collect samples at all discharge locations that can be safely accessed.

d. Risk Level 3 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

e. Risk Level 3 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 3 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 3 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 3 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[7]

h. Risk Level 3 dischargers shall keep all field /or analytical data in the SWPPP document.

12. **Risk Level 3 – Watershed Monitoring Option**

Risk Level 3 dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in Sections I.5. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

13. **Risk Level 3 – Particle Size Analysis for Project Risk Justification**

Risk Level 3 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

14. **Risk Level 3 – Records**

Risk Level 3 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 3 dischargers shall retain all records on-site while construction is ongoing. These records include:

a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

c. The date and approximate time of analyses.

[7] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

d. The individual(s) who performed the analyses.

e. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

f. Rain gauge readings from site inspections.

g. Quality assurance/quality control records and results.

h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.10 above).

i. Visual observation and sample collection exception records (see Section I.6 above).

j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

15. **Risk Level 3 – NAL Exceedance Report**

a. Risk Level 3 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

b. Risk Level 3 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity In this General Permit.

c. Risk Level 3 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

d. Risk Level 3 dischargers shall include in the NAL Exceedance Report:

i. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”).

ii. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

iii. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

16. **Risk Level 3 – Bioassessment**

a. Risk Level 3 dischargers with a total project-related ground disturbance exceeding 30 acres shall:

i. Conduct bioassessment monitoring, as described in Appendix 3.

ii. Include the collection and reporting of specified in stream biological data and physical habitat.

iii. Use the bioassessment sample collection and Quality Assurance & Quality Control (QA/QC) protocols developed by the State of California's Surface Water Ambient Monitoring Program (SWAMP).[8]

b. Risk Level 3 dischargers qualifying for bioassessment, where construction commences out of an index period for the site location shall:

i. Receive Regional Board approval for the sampling exception.

ii. Conduct bioassessment monitoring, as described in Appendix 3.

iii. Include the collection and reporting of specified instream biological data and physical habitat.

iv. Use the bioassessment sample collection and Quality Assurance & Quality Control (QA/QC) protocols developed by the State of California's Surface Water Ambient Monitoring Program (SWAMP).

OR

v. Make a check payable to: Cal State Chico Foundation (SWAMP Bank Account) or San Jose State Foundation (SWAMP Bank Account) and include the WDID# on the check for the amount calculated for the exempted project.

[8] http://www.waterboards.ca.gov/water_issues/programs/swamp/.

vi. Send a copy of the check to the Regional Water Board office for the site's region.

vii. Invest $**7,500.00 X The number of samples required** into the SWAMP program as compensation (upon regional board approval).

Table 3 – Risk Level 3 Test Methods, Detection Limits, Reporting Units and Applicable NALs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level	Numeric Effluent Limitation	Receiving Water Monitoring Trigger
pH	Field test with calibrated portable instrument	Risk Level 3 Discharges	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5	N/A	lower limit = 6.0 upper limit = 9.0
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 3 Discharges other than ATS	1	NTU	250 NTU	N/A	500 NTU
		For ATS discharges	1	NTU	N/A	10 NTU for Daily Weighted Average & 20 NTU for Any Single Sample	10 NTU for Daily Weighted Average & 20 NTU for Any Single Sample
SSC	ASTM Method D 3977-97[9]	Risk Level 3 (if Receiving Water Monitoring Trigger exceeded)	5	mg/L	N/A	N/A	N/A
Bioassessment	(STE) Level I of (SAFIT),[10] fixed-count of 600 org/sample	Risk Level 3 projects> 30 acres	N/A	N/A	N/A	N/A	N/A

[9] ASTM, 1999, Standard Test Method for Determining Sediment Concentration in Water Samples: American Society of Testing and Materials, D 3977-97, Vol. 11.02, pp. 389-394.

[10] The current SAFIT STEs (28 November 2006) list requirements for both the Level I and Level II taxonomic effort, and are located at: http://www.swrcb.ca.gov/swamp/docs/safit/ste_list.pdf. When new editions are published by SAFIT, they will supersede all previous editions. All editions will be posted at the State Water Board's SWAMP website.

ATTACHMENT F:
Active Treatment System (ATS) Requirements

Table 1 – Numeric Effluent Limitations, Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level	Numeric Effluent Limitation
Turbidity	EPA 0180.1 and/or field test with a calibrated portable instrument	For ATS discharges	1	NTU	N/A	10 NTU for Daily Flow-Weighted Average & 20 NTU for Any Single Sample

A. Dischargers choosing to implement an Active Treatment System (ATS) on their site shall comply with all of the requirements in this Attachment.

B. The discharger shall maintain a paper copy of each ATS specification onsite in compliance with the record retention requirements in the Special Provisions of this General Permit.

C. ATS Design, Operation and Submittals

1. The ATS shall be designed and approved by a Certified Professional in Erosion and Sediment Control (CPESC), a Certified Professional in Storm Water Quality (CPSWQ); a California registered civil engineer; or any other California registered engineer.

2. The discharger shall ensure that the ATS is designed in a manner to preclude the accidental discharge of settled floc[1] during floc pumping or related operations.

3. The discharger shall design outlets to dissipate energy from concentrated flows.

4. The discharger shall install and operate an ATS by assigning a lead person (or project manager) who has either a minimum of five years construction storm

[1] Floc is defined as a clump of solids formed by the chemical action in ATS systems.

water experience or who is a licensed contractors specifically holding a California Class A Contractors license.[2]

5. The discharger shall prepare an ATS Plan that combines the site-specific data and treatment system information required to safely and efficiently operate an ATS. The ATS Plan shall be electronically submitted to the State Water Board at least 14 days prior to the planned operation of the ATS and a paper copy shall be available onsite during ATS operation. At a minimum, the ATS Plan shall include:

   a. ATS Operation and Maintenance Manual for All Equipment.

   b. ATS Monitoring, Sampling & Reporting Plan, including Quality Assurance/Quality Control (QA/QC).

   c. ATS Health and Safety Plan.

   d. ATS Spill Prevention Plan.

6. The ATS shall be designed to capture and treat (within a 72-hour period) a volume equivalent to the runoff from a 10-year, 24-hour storm event using a watershed runoff coefficient of 1.0.

D. Treatment – Chemical Coagulation/Flocculation

1. Jar tests shall be conducted using water samples selected to represent typical site conditions and in accordance with ASTM D2035-08 (2003).

2. The discharger shall conduct, at minimum, six site-specific jar tests (per polymer with one test serving as a control) for each project to determine the proper polymer and dosage levels for their ATS.

3. Single field jar tests may also be conducted during a project if conditions warrant, for example if construction activities disturb changing types of soils, which consequently cause change in storm water and runoff characteristics.

E. Residual Chemical and Toxicity Requirements

1. The discharger shall utilize a residual chemical test method that has a method detection limit (MDL) of 10% or less than the maximum allowable threshold

[2] Business and Professions Code Division 3, Chapter 9, Article 4, Class A Contractor: A general engineering contractor is a contractor whose principal contracting business is in connection with fixed works requiring specialized engineering knowledge and skill. [http://www.cslb.ca.gov/General-Information/library/licensing-classifications.asp].

concentration[3] (MATC) for the specific coagulant in use and for the most sensitive species of the chemical used.

2. The discharger shall utilize a residual chemical test method that produces a result within one hour of sampling.

3. The discharger shall have a California State certified laboratory validate the selected residual chemical test. Specifically the lab will review the test protocol, test parameters, and the detection limit of the coagulant. The discharger shall electronically submit this documentation as part of the ATS Plan.

4. If the discharger cannot utilize a residual chemical test method that meets the requirements above, the discharger shall operate the ATS in Batch Treatment[4] mode.

5. A discharger planning to operate in Batch Treatment mode shall perform toxicity testing in accordance with the following:

   a. The discharger shall initiate acute toxicity testing on effluent samples representing effluent from each batch prior to discharge[5]. All bioassays shall be sent to a laboratory certified by the Department of Health Services (DHS) Environmental Laboratory Accreditation Program (ELAP). The required field of testing number for Whole Effluent Toxicity (WET) testing is E113.[6]

   b. Acute toxicity tests shall be conducted with the following species and protocols. The methods to be used in the acute toxicity testing shall be those outlined for a 96-hour acute test in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms, USEPA-841-R-02-012" for Fathead minnow, *Pimephales promelas* (fathead minnow). Acute toxicity for *Oncorhynchus mykiss* (Rainbow Trout) may be used as a substitute for testing fathead minnows.

   c. All toxicity tests shall meet quality assurance criteria and test acceptability criteria in the most recent versions of the EPA test method for WET testing.

   d. The discharger shall electronically report all acute toxicity testing.

[3] The Maximum Allowable Threshold Concentration (MATC) is the allowable concentration of residual, or dissolved, coagulant/flocculant in effluent. The MATC shall be coagulant/flocculant-specific, and based on toxicity testing conducted by an independent, third-party laboratory. A typical MATC would be:
The MATC is equal to the geometric mean of the NOEC (No Observed Effect Concentration) and LOEC (Lowest Observed Effect Concentration) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant. The most sensitive species test shall be used to determine the MATC.

[4] Batch Treatment mode is defined as holding or recirculating the treated water in a holding basin or tank(s) until treatment is complete or the basin or storage tank(s) is full.

[5] This requirement only requires that the test be initiated prior to discharge.

[6] http://www.dhs.ca.gov/ps/ls/elap/pdf/FOT_Desc.pdf.

F. Filtration

1. The ATS shall include a filtration step between the coagulant treatment train and the effluent discharge. This is commonly provided by sand, bag, or cartridge filters, which are sized to capture suspended material that might pass through the clarifier tanks.

2. Differential pressure measurements shall be taken to monitor filter loading and confirm that the final filter stage is functioning properly.

G. Residuals Management

1. Sediment shall be removed from the storage or treatment cells as necessary to ensure that the cells maintain their required water storage (i.e., volume) capability.

2. Handling and disposal of all solids generated during ATS operations shall be done in accordance with all local, state, and federal laws and regulations.

H. ATS Instrumentation

1. The ATS shall be equipped with instrumentation that automatically measures and records effluent water quality data and flow rate.

2. The minimum data recorded shall be consistent with the Monitoring and Reporting requirements below, and shall include:

    a. Influent Turbidity

    b. Effluent Turbidity

    c. Influent pH

    d. Effluent pH

    e. Residual Chemical

    f. Effluent Flow rate

    g. Effluent Flow volume

3. Systems shall be equipped with a data recording system, such as data loggers or webserver-based systems, which records each measurement on a frequency no longer than once every 15 minutes.

4. Cumulative flow volume shall be recorded daily. The data recording system shall have the capacity to record a minimum of seven days continuous data.

5. Instrumentation systems shall be interfaced with system control to provide auto shutoff or recirculation in the event that effluent measurements exceed turbidity or pH.

6. The system shall also assure that upon system upset, power failure, or other catastrophic event, the ATS will default to a recirculation mode or safe shut down.

7. Instrumentation (flow meters, probes, valves, streaming current detectors, controlling computers, etc.) shall be installed and maintained per manufacturer's recommendations, which shall be included in the QA/QC plan.

8. The QA/QC plan shall also specify calibration procedures and frequencies, instrument method detection limit or sensitivity verification, laboratory duplicate procedures, and other pertinent procedures.

9. The instrumentation system shall include a method for controlling coagulant dose, to prevent potential overdosing. Available technologies include flow/turbidity proportional metering, periodic jar testing and metering pump adjustment, and ionic charge measurement controlling the metering pump.

I. ATS Effluent Discharge

1. ATS effluent shall comply with all provisions and prohibitions in this General Permit, specifically the NELs.

2. NELs for discharges from an ATS:

   a. Turbidity of all ATS discharges shall be less than 10 NTU for daily flow-weighted average of all samples and 20 NTU for any single sample.

   b. Residual Chemical shall be < 10% of MATC[7] for the most sensitive species of the chemical used.

[7] The Maximum Allowable Threshold Concentration (MATC) is the allowable concentration of residual, or dissolved, coagulant/flocculant in effluent. The MATC shall be coagulant/flocculant-specific, and based on toxicity testing conducted by an independent, third-party laboratory. The MATC is equal to the geometric mean of the NOEC (No Observed Effect Concentration) and LOEC (Lowest Observed Effect Concentration) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant. The most sensitive species test shall be used to determine the MATC.

3. If an analytical effluent sampling result exceeds the turbidity NEL (as listed in Table 1), the discharger is in violation of this General Permit and shall electronically file the results in violation within 24-hours of obtaining the results.

4. If ATS effluent is authorized to discharge into a sanitary sewer system, the discharger shall comply with any pre-treatment requirements applicable for that system. The discharger shall include any specific criteria required by the municipality in the ATS Plan.

5. Compliance Storm Event:

   Discharges of storm water from ATS shall comply with applicable NELs (above) unless the storm event causing the discharges is determined after the fact to be equal to or larger than the Compliance Storm Event (expressed in inches of rainfall). The Compliance Storm Event for ATS discharges is the 10 year, 24 hour storm, as determined using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca10y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca10y24.gif

   This exemption is dependent on the submission of rain gauge data verifying the storm event is equal to or larger than the Compliance Storm.

J. Operation and Maintenance Plan

1. Each Project shall have a site-specific Operation and Maintenance (O&M) Manual covering the procedures required to install, operate and maintain the ATS.[8]

2. The O&M Manual shall only be used in conjunction with appropriate project-specific design specifications that describe the system configuration and operating parameters.

3. The O&M Manual shall have operating manuals for specific pumps, generators, control systems,and other equipment.

K. Sampling and Reporting Quality Assurance/ Quality Check (QA/QC) Plan

4. A project-specific QA/QC Plan shall be developed for each project. The QA/QC Plan shall include at a minimum:

   a. Calibration – Calibration methods and frequencies for all system and field instruments shall be specified.

[8] The manual is typically in a modular format covering generalized procedures for each component that is utilized in a particular system.

b. Method Detection Limits (MDLs) – The methods for determining MDLs shall be specified for each residual coagulant measurement method. Acceptable minimum MDLs for each method, specific to individual coagulants, shall be specified.

c. Laboratory Duplicates – Requirements for monthly laboratory duplicates for residual coagulant analysis shall be specified.

L. Personnel Training

1. Operators shall have training specific to using an ATS and liquid coagulants for storm water discharges in California.

2. The training shall be in the form of a formal class with a certificate and requirements for testing and certificate renewal.

3. Training shall include a minimum of eight hours classroom and 32 hours field training. The course shall cover the following topics:

   a. Coagulation Basics –Chemistry and physical processes

   b. ATS System Design and Operating Principles

   c. ATS Control Systems

   d. Coagulant Selection – Jar testing, dose determination, etc.

   e. Aquatic Safety/Toxicity of Coagulants, proper handling and safety

   f. Monitoring, Sampling, and Analysis

   g. Reporting and Recordkeeping

   h. Emergency Response

M. Active Treatment System (ATS) Monitoring Requirements

Any discharger who deploys an ATS on their site shall conduct the following:

1. Visual Monitoring

   a. A designated responsible person shall be on site daily at all times during treatment operations.

b. Daily on-site visual monitoring of the system for proper performance shall be conducted and recorded in the project data log.

   i. The log shall include the name and phone number of the person responsible for system operation and monitoring.

   ii. The log shall include documentation of the responsible person's training.

2. Operational and Compliance Monitoring

   a. Flow shall be continuously monitored and recorded at not greater than 15-minute intervals for total volume treated and discharged.

   b. Influent and effluent pH must be continuously monitored and recorded at not greater than 15-minute intervals.

   c. Influent and effluent turbidity (expressed in NTU) must be continuously monitored and recorded at not greater than 15-minute intervals.

   d. The type and amount of chemical used for pH adjustment, if any, shall be monitored and recorded.

   e. Dose rate of chemical used in the ATS system (expressed in mg/L) shall be monitored and reported 15-minutes after startup and every 8 hours of operation.

   f. Laboratory duplicates – monthly laboratory duplicates for residual coagulant analysis must be performed and records shall be maintained onsite.

   g. Effluent shall be monitored and recorded for residual chemical/additive levels.

   h. If a residual chemical/additive test does not exist and the ATS is operating in a batch treatment mode of operation refer to the toxicity monitoring requirements below.

3. Toxicity Monitoring

   A discharger operating in batch treatment mode shall perform toxicity testing in accordance with the following:

   a. The discharger shall initiate acute toxicity testing on effluent samples representing effluent from each batch prior to discharge.[9] All bioassays shall be sent to a laboratory certified by the Department of Health Services (DHS)

[9] This requirement only requires that the test be initiated prior to discharge.

Environmental Laboratory Accreditation Program (ELAP). The required field of testing number for Whole Effluent Toxicity (WET) testing is E113.[10]

b. Acute toxicity tests shall be conducted with the following species and protocols. The methods to be used in the acute toxicity testing shall be those outlined for a 96-hour acute test in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms, USEPA-841-R-02-012" for Fathead minnow, *Pimephales promelas or* Rainbow trout *Oncorhynchus mykiss* may be used as a substitute for fathead minnow.

c. All toxicity tests shall meet quality assurance criteria and test acceptability criteria in the most recent versions of the EPA test method for WET testing.[11]

4. Reporting and Recordkeeping

At a minimum, every 30 days a LRP representing the discharger shall access the State Water Boards Storm Water Mulit-Application and Report Tracking system (SMARTS) and electronically upload field data from the ATS. Records must be kept for three years after the project is completed .

5. Non-compliance Reporting

a. Any indications of toxicity or other violations of water quality objectives shall be reported to the appropriate regulatory agency as required by this General Permit.

b. Upon any measurements that exceed water quality standards, the system operator shall immediately notify his supervisor or other responsible parties, who shall notify the Regional Water Board.

c. If any monitoring data exceeds any applicable NEL in this General Permit, the discharger shall electronically submit a NEL Violation Report to the State Water Board within 24 hours after the NEL exceedance has been identified.

i. ATS dischargers shall certify each NEL Violation Report in accordance with the Special Provisions for Construction Activity in this General Permit.

ii. ATS dischargers shall retain an electronic or paper copy of each NEL Violation Report for a minimum of three years after the date the annual report is filed.

iii. ATS dischargers shall include in the NEL Violation Report:

[10] http://www.dhs.ca.gov/ps/ls/elap/pdf/FOT_Desc.pdf.
[11] http://www.epa.gov/waterscience/methods/wet/.

(1) The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”);

(2) The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation; and

(3) A description of the current onsite BMPs, and the proposed corrective actions taken to manage the NEL exceedance.

iv. Compliance Storm Exemption - In the event that an applicable NEL has been exceeded during a storm event equal to or larger than the Compliance Storm Event, ATS dischargers shall report the on-site rain gauge reading and nearby governmental rain gauge readings for verification.

	A	B	C
1	**Sediment Risk Factor Worksheet**		**Entry**
2	**A) R Factor**		
3	Analyses of data indicated that when factors other than rainfall are held constant, soil loss is directly proportional to a rainfall factor composed of total storm kinetic energy (E) times the maximum 30-min intensity (I30) (Wischmeier and Smith, 1958). The numerical value of R is the average annual sum of EI30 for storm events during a rainfall record of at least 22 years. "Isoerodent" maps were developed based on R values calculated for more than 1000 locations in the Western U.S. Refer to the link below to determine the R factor for the project site.		
4	http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm		
5	**R Factor Value**		0
6	**B) K Factor (weighted average, by area, for all site soils)**		
7	The soil-erodibility factor K represents: (1) susceptibility of soil or surface material to erosion, (2) transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff even though these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high rates and large volumes of runoff. Use Site-specific data must be submitted.		
8	Site-specific K factor guidance		
9	**K Factor Value**		0
10	**C) LS Factor (weighted average, by area, for all slopes)**		
11	The effect of topography on erosion is accounted for by the LS factor, which combines the effects of a hillslope-length factor, L, and a hillslope-gradient factor, S. Generally speaking, as hillslope length and/or hillslope gradient increase, soil loss increases. As hillslope length increases, total soil loss and soil loss per unit area increase due to the progressive accumulation of runoff in the downslope direction. As the hillslope gradient increases, the velocity and erosivity of runoff increases. Use the LS table located in separate tab of this spreadsheet to determine LS factors. Estimate the weighted LS for the site prior to construction.		
12	LS Table		
13	**LS Factor Value**		0

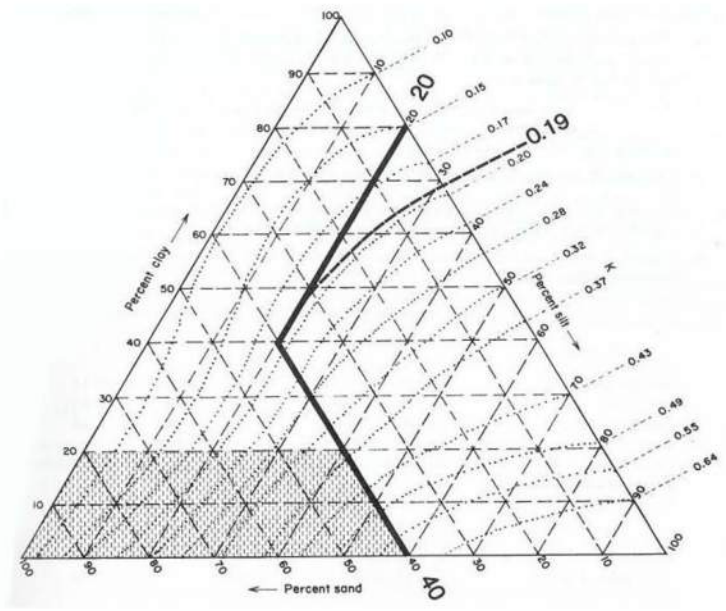
Soil Erodibility Factor (K)

The K factor can be determined by using the nomograph method, which requires that a particle size analysis (ASTM D-422) be done to determine the percentages of sand, very fine sand, silt and clay. Use the figure below to determine appropriate K value.



Erickson triangular nomograph used to estimate soil erodibility (K) factor.
The figure above is the USDA nomograph used to determine the K factor for a soil, based on its texture (% silt plus very fine sand, % sand, % organic matter, soil structure, and permeability). *Nomograph from Erickson 1977 as referenced in Goldman et. al., 1986.*

LS Factors for Construction Sites. *Table from Renard et. al., 1997.*

APPENDIX 2:
Post-Construction Water Balance Performance Standard Spreadsheet

The discharger shall submit with their Notice of Intent (NOI) the following information to demonstrate compliance with the New and Re-Development Water Balance Performance Standard.

Map Instructions

The discharger must submit a small-scale topographic map of the site to show the existing contour elevations, pre- and post-construction drainage divides, and the total length of stream in each watershed area. Recommended scales include 1 in. = 20 ft., 1 in. = 30 ft., 1 in. = 40 ft., or 1 in = 50 ft. The suggested contour interval is usually 1 to 5 feet, depending upon the slope of the terrain. The contour interval may be increased on steep slopes. Other contour intervals and scales may be appropriate given the magnitude of land disturbance.

Spreadsheet Instructions

The intent of the spreadsheet is to help dischargers calculate the project-related increase in runoff volume and select impervious area and runoff reduction credits to reduce the project-related increase in runoff volume to pre-project levels.

The discharger has the option of using the spreadsheet (**Appendix 2.1)** or a more sophisticated, watershed process-based model (e.g. Storm Water Management Model, Hydrological Simulation Program Fortran) to determine the project-related increase in runoff volume.

In* Appendix 4.1**, ***you must complete the worksheet for each land use/soil type combination for each project sub-watershed.

Steps 1 through 9 pertain specifically to the Runoff Volume Calculator:

Step 1: Enter the county where the project is located in cell H3.

Step 2: Enter the soil type in cell H6.

Step 3: Enter the existing pervious (dominant) land use type in cell H7.

Step 4: Enter the proposed pervious (dominant) land use type in cell H8.

Step 5: Enter the total project site area in cell H11 or J11.

Step 6: Enter the sub-watershed area in cell H12 or J12.

Step 7: Enter the existing rooftop area in cell H17 or J17, the existing non-rooftop impervious area in cell H18 or J18, the proposed rooftop area in cell H19 or J19, and the proposed non-rooftop impervious area in cell H20 or J20

Step 8: Work through each of the impervious area reduction credits and claim credits where applicable. Volume that cannot be addressed using non-structural practices must be captured in structural practices and approved by the Regional Water Board.

Step 9: Work through each of the impervious volume reduction credits and claim credits where applicable. Volume that cannot be addressed using non-structural practices must be captured in structural practices and approved by the Regional Water Board.

Porous Pavement Credit Worksheet

Please fill out a porous pavement credit worksheet for each project sub-watershed.

For the PROPOSED Development:

Proposed Porous Pavement	Runoff Reduction*	Fill in either Acres or SqFt		Equivalent Acres
		In SqFt.	In Acres	
Area of **Brick without Grout** on less than 12 inches of base with at least 20% void space over soil	0.45			0.00
Area of **Brick without Grout** on more than 12 inches of base with at least 20% void space over soil	0.90			0.00
Area of **Cobbles** less than 12 inches deep and over soil	0.30			0.00
Area of **Cobbles** less than 12 inches deep and over soil	0.60			0.00
Area of **Reinforced Grass Pavement** on less than 12 inches of base with at least 20% void space over soil	0.45			0.00
Area of **Reinforced Grass Pavement** on at least 12 inches of base with at least 20% void space over soil	0.90			0.00
Area of **Porous Gravel Pavement** on less than 12 inches of base with at least 20% void space over soil	0.38			0.00
Area of **Porous Gravel Pavement** on at least 12 inches of base with at least 20% void space over soil	0.75			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with less than 4 inches of gravel base (washed stone)	0.40			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with 4 to 8 inches of gravel base (washed stone)	0.60			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with 8 to 12 inches of gravel base (washed stone)	0.80			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with 12 or more inches of gravel base (washed stone)	1.00			0.00

Tree Planting Credit Worksheet

Please fill out a tree canopy credit worksheet for each project sub-watershed.

Tree Canopy Credit Criteria	Number of Trees Planted	Credit (acres)
Number of proposed evergreen trees to be planted (credit = number of trees x 0.005)*	0	0.00
Number of proposed deciduous trees to be planted (credit = number of trees x 0.0025)*		0.00
	Square feet Under Canopy	
Square feet under an existing tree canopy, that will remain on the property, with an average diameter at 4.5 ft above grade (i.e., diameter at breast height or DBH) is LESS than 12 in diameter.		0.00
Square feet under an existing tree canopy that will remain on the property, with an average diameter at 4.5 ft above grade (i.e., diameter at breast height or DBH) is 12 in diameter or GREATER.		0.00
Please describe below how the project will ensure that these trees will be maintained.

* credit amount based on credits from Stormwater Quality Design Manual for the Sacramento and South Placer Regions

Downspout Disconnection Credit Worksheet

Please fill out a downspout disconnection credit worksheet for each project subwatershed. If you answer yes to all questions, all rooftop area draining to each downspout will be subtracted from your proposed rooftop impervious coverage.

Downspout Disconnection Credit Criteria		
Do downspouts and any extensions extend at least six feet from a basement and two feet from a crawl space or concrete slab?	○ Yes	◉ No
Is the area of rooftop connecting to each disconnected downspout 600 square feet or less?	○ Yes	◉ No
Is the roof runoff from the design storm event fully contained in a raised bed or planter box or does it drain as sheet flow to a landscaped area large enough to contain the roof runoff from the design storm event?	○ Yes	◉ No
The Stream Buffer and/or Vegetated Swale credits **will not** be taken in this sub-watershed area?	○ Yes	◉ No

Percentage of existing	0.00	Acres	of rooftop surface has disconnected downspouts	
Percentage of the proposed	0.00	Acres	of rooftop surface has disconnected downspouts	50

Return to Calculator

Impervious Area Disconnection Credit Worksheet

Please fill out an impervious area disconnection credit worksheet for each project sub-watershed. If you answer yes to all questions, all non-rooftop impervious surface area will be subtracted from your proposed non-rooftop impervious coverage.

Non-Rooftop Disconnection Credit Criteria	Response
Is the maximum contributing impervious flow path length less than 75 feet or, if equal or greater than 75 feet, is a storage device (e.g. French drain, bioretention area, gravel trench) implemented to achieve the required disconnection length?	◉ Yes ○ No
Is the impervious area to any one discharge location less than 5,000 square feet?	◉ Yes ○ No
The Stream Buffer credit **will not** be taken in this sub-watershed area?	◉ Yes ○ No

Percentage of existing	0.00	Acres non-rooftop surface area disconnected	
Percentage of the proposed	0.00	Acres non-rooftop surface area disconnected	70

Return to Calculator

Green Roof Credit Worksheet

Please fill out a greenroof credit worksheet for each project sub-watershed. If you answer yes to all questions, 70% of the greenroof area will be subtracted from your proposed rooftop impervious coverage.

Green Roof Credit Criteria				Response
Is the roof slope less than 15% or does it have a grid to hold the substrate in place until it forms a thick vegetation mat?				◉ Yes ○ No
Has a professional engineer assessed the necessary load reserves and designed a roof structure to meet state and local codes?				◉ Yes ○ No
Is the irrigation needed for plant establishment and/or to sustain the green roof during extended dry periods, is the source from stored, recycled, reclaimed, or reused water?				◉ Yes ○ No
Percentage of existing	0.00	Acres	rooftop surface area in greenroof	
Percentage of the proposed	0.00	Acres	rooftop surface area in greenroof	

Return to Calculator

Stream Buffer Credit Worksheet

Please fill out a stream buffer credit worksheet for each project sub-watershed. If you answer yes to all questions, you may subtract all impervious surface draining to each stream buffer that has not been addressed using the Downspout and/or Impervious Area Disconnection credits.

Stream Buffer Credit Criteria				Response
Does runoff enter the floodprone width* or within 500 feet (whichever is larger) of a stream channel as sheet flow**?				○ Yes ◉ No
Is the contributing overland slope 5% or less, or if greater than 5%, is a level spreader used?				○ Yes ◉ No
Is the buffer area protected from vehicle or other traffic barriers to reduce compaction?				○ Yes ◉ No
Will the stream buffer be maintained in an ungraded and uncompacted condition and will the vegetation be maintained in a natural condition?				○ Yes ◉ No
Percentage of existing	0.00	Acres	impervious surface area draining into a stream buffer:	
Percentage of the proposed	0.00	Acres	impervious surface area that will drain into a stream buffer:	
Please describe below how the project will ensure that the buffer areas will remain in ungraded and uncompacted condition and that the vegetation will be maintained in a natural condition.				

Return to Calculator

* floodprone width is the width at twice the bankfull depth.
** the maximum contributing length shall be 75 feet for impervious area

Vegetated Swale Credit Worksheet

Please fill out a vegetated swale worksheet for each project subwatershed. If you answer yes to all questions, you may subtract all impervious surface draining to each stream buffer that has not been addressed using the Downspout Disconnection credit.

Vegetated Swale Credit Criteria

Have all vegetated swales been designed in accordance with Treatment Control BMP 30 (TC-30 - Vegetated Swale) from the California Stormwater BMP Handbook, New Development and Redevelopment (available at www.cabmphandbooks.com)?	○ Yes ◉ No
Is the maximum flow velocity for runoff from the design storm event less than or equal to 1.0 foot per second?	○ Yes ◉ No

Percentage of existing	0.00	Acres of impervious area draining to a vegetated swale	
Percentage of the proposed	0.00	Acres of impervious area draining to a vegetated swale	

Return to Calculator

Rain Barrel/Cistern Credit Worksheet

Please fill out a rain barrel/cistern worksheet for each project sub-watershed.

Rain Barrel/Cistern Credit Criteria	Response
Total number of rain barrel(s)/cisterns	
Average capacity of rain barrel(s)/cistern(s) (in gallons)	
Total capacity rain barrel(s)/cistern(s) (in cu ft) [1]	0

[1] accounts for 10% loss

Return to Calculator

Please fill out a soil quality worksheet for each project sub-watershed.

	Response
Will the landscaped area be lined with an impervious membrane?	
Will the soils used for landscaping meet the ideal bulk densities listed in Table 1 below? [1]	○ Yes ◉ No
If you answered yes to the question above, and you know the area-weighted bulk density within the top 12 inches for soils used for landscaping (in g/cm^3)* , fill in the cell to the right and skip to cell G11. If not select from the drop-down menu in G10.	1.3
If you answered yes to the question above, but you do not know the exact bulk density, which of the soil types in the drop down menu to the right best describes the top 12 inches for soils used for landscaping (in g/cm^3).	Sandy loams, loams
What is the average depth of your landscaped soil media meeting the above criteria (inches)?	12
What is the total area of the landscaped areas meeting the above criteria (in acres)?	2.97

Return to Calculator

Table 1

Sands, loamy sands	<1.6
Sandy loams, loams	<1.4
Sandy clay loams, loams, clay loams	<1.4
Silts, silt loams	<1.3
Silt loams, silty clay loams	<1.1
Sandy clays, silty clays, some clay loams (35-45% clay)	<1.1
Clays (>45% clay)	<1.1

Porosity (%) 50.94%

Mineral grains in many soils are mainly quartz and feldspar, so 2.65 a good average for particle density. To determine percent porosity, use the formula: Porosity (%) = (1-Bulk Density/2.65) X 100

[1] USDA NRCS. "Soil Quality Urban Technical Note No.2-Urban Soil Compaction". March 2000. http://soils.usda.gov/sqi/management/files/sq_utn_2.pdf

* To determine how to calculate density see: http://www.globe.gov/tctg/bulkden.pdf?sectionID=94

APPENDIX 3
Bioassessment Monitoring Guidelines

Bioassessment monitoring is required for projects that meet all of the following criteria:

1. The project is rated Risk Level 3 or LUP Type 3
2. The project directly discharges runoff to a freshwater wadeable stream (or streams) that is either: (a) listed by the State Water Board or USEPA as impaired due to sediment, and/or (b) tributary to any downstream water body that is listed for sediment; and/or have the beneficial use SPAWN & COLD & MIGRATORY
3. Total project-related ground disturbance exceeds 30 acres.

For all such projects, the discharger shall conduct bioassessment monitoring, as described in this section, to assess the effect of the project on the biological integrity of receiving waters.
Bioassessment shall include:

1. The collection and reporting of specified instream biological data
2. The collection and reporting of specified instream physical habitat data

<u>Bioassessment Exception</u>
If a site qualifies for bioassessment, but construction commences out of an index period for the site location, the discharger shall:

1. Receive Regional Water Board approval for the sampling exception
2. Make a check payable to: Cal State Chico Foundation (SWAMP Bank Account) or San Jose State Foundation (SWAMP Bank Account) and include the WDID# on the check for the amount calculated for the exempted project.
3. Send a copy of the check to the Regional Water Board office for the site's region
4. Invest **7,500.00 X The number of samples required** into the SWAMP program as compensation (upon Regional Water Board approval).
5. Conduct bioassessment monitoring, as described in Appendix 4
6. Include the collection and reporting of specified instream biological data and physical habitat
7. Use the bioassessment sample collection and Quality Assurance & Quality Control (QA/QC) protocols developed by the State of California's Surface Water Ambient Monitoring Program (SWAMP)

<u>Site Locations and Frequency</u>
Macroinvertebrate samples shall be collected both before ground disturbance is initiated and after the project is completed. The "after" sample(s) shall be collected after at least one winter season resulting in surface runoff has transpired after project-related ground disturbance has ceased. "Before" and "after" samples shall be collected both upstream and downstream of the project's

discharge. Upstream samples should be taken immediately before the sites outfall and downstream samples should be taken immediately after the outfall (when safe to collect the samples). Samples should be collected for each freshwater wadeable stream that is listed as impaired due to sediment, or tributary to a water body that is listed for sediment. Habitat assessment data shall be collected concurrently with all required macroinvertebrate samples.

Index Period (Timing of Sample Collection)
Macroinvertebrate sampling shall be conducted during the time of year (i.e., the "index period") most appropriate for bioassessment sampling, depending on ecoregion. This map is posted on the State Water Board's Website: http://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.shtml

Field Methods for Macroinvertebrate Collections
In collecting macroinvertebrate samples, the discharger shall use the "Reachwide Benthos (Multi-habitat) Procedure" specified in *Standard Operating Procedures for Collecting Benthic Macroinvertebrate Samples and Associated Physical and Chemical Data for Ambient Bioassessments in California* (Ode 2007).[1]

Physical - Habitat Assessment Methods
The discharger shall conduct, concurrently with all required macroinvertebrate collections, the "Full" suite of physical habitat characterization measurements as specified in *Standard Operating Procedures for Collecting Benthic Macroinvertebrate Samples and Associated Physical and Chemical Data for Ambient Bioassessments in California* (Ode 2007), and as summarized in the Surface Water Ambient Monitoring Program's *Stream Habitat Characterization Form — Full Version*.

Laboratory Methods
Macroinvertebrates shall be identified and classified according to the Standard Taxonomic Effort (STE) Level I of the Southwestern Association of Freshwater Invertebrate Taxonomists (SAFIT),[2] and using a fixed-count of 600 organisms per sample.

Quality Assurance
The discharger or its consultant(s) shall have and follow a quality assurance (QA) plan that covers the required bioassessment monitoring. The QA plan shall include, or be supplemented to include, a specific requirement for external QA checks (i.e., verification of taxonomic identifications and correction of data where

[1] This document is available on the Internet at: ~~http://www.swrcb.ca.gov/swamp/docs/phab_sopr6.pdf~~. http://swamp.mpsl.mlml.calstate.edu/wp-content/uploads/2009/04/swamp_sop_bioassessment_collection_020107.pdf.

[2] The current SAFIT STEs (28 November 2006) list requirements for both the Level I and Level II taxonomic effort, and are located at: ~~http://www.swrcb.ca.gov/swamp/docs/safit/ste_list.pdf~~ http://www.safit.org/Docs/ste_list.pdf. When new editions are published by SAFIT, they will supersede all previous editions. All editions will be posted at the State Water Board's SWAMP website.

errors are identified). External QA checks shall be performed on one of the discharger's macroinvertebrate samples collected per calendar year, or ten percent of the samples per year (whichever is greater). QA samples shall be randomly selected. The external QA checks shall be paid for by the discharger, and performed by the California Department of Fish and Game's Aquatic Bioassessment Laboratory. An alternate laboratory with equivalent or better expertise and performance may be used if approved in writing by State Water Board staff.

Sample Preservation and Archiving

The original sample material shall be stored in 70 percent ethanol and retained by the discharger until: 1) all QA analyses specified herein and in the relevant QA plan are completed; and 2) any data corrections and/or re-analyses recommended by the external QA laboratory have been implemented. The remaining subsampled material shall be stored in 70 percent ethanol and retained until completeness checks have been performed according to the relevant QA plan. The identified organisms shall be stored in 70 percent ethanol, in separate glass vials for each final ID taxon. (For example, a sample with 45 identified taxa would be archived in a minimum of 45 vials, each containing all individuals of the identified taxon.) Each of the vials containing identified organisms shall be labeled with taxonomic information (i.e., taxon name, organism count) and collection information (i.e., site name/site code, waterbody name, date collected, method of collection). The identified organisms shall be archived (i.e., retained) by the discharger for a period of not less than three years from the date that all QA steps are completed, and shall be checked at least once per year and "topped off" with ethanol to prevent desiccation. The identified organisms shall be relinquished to the State Water Board upon request by any State Water Board staff.

Data Submittal

The macroinvertebrate results (i.e., taxonomic identifications consistent with the specified SAFIT STEs, and number of organisms within each taxa) shall be submitted to the State Water Board in electronic format. The State Water Board's Surface Water Ambient Monitoring Program (SWAMP) is currently developing standardized formats for reporting bioassessment data. All bioassessment data collected after those formats become available shall be submitted using the SWAMP formats. Until those formats are available, the biological data shall be submitted in MS-Excel (or equivalent) format.[3]

The physical/habitat data shall be reported using the standard format titled *SWAMP Stream Habitat Characterization Form — Full Version*.[4]

[3] Any version of Excel, 2000 or later, may be used.
[4] Available at: http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf

Invasive Species Prevention

In conducting the required bioassessment monitoring, the discharger and its consultants shall take precautions to prevent the introduction or spread of aquatic invasive species. At minimum, the discharger and its consultants shall follow the recommendations of the California Department of Fish and Game to minimize the introduction or spread of the New Zealand mudsnail.[5]

[5] Instructions for controlling the spread of NZ mudsnails, including decontamination methods, can be found at: http://www.dfg.ca.gov/invasives/mudsnail/

General Construction Storm Water Permits:

Waste load allocations will be incorporated into the State Board general permit upon renewal or into a watershed-specific general permit developed by the Regional Board.

- Dry-weather Implementation Non-storm water flows authorized by the General Permit for Storm Water Discharges Associated with Construction Activity (Water Quality Order No. 99-08 DWQ), or any successor order, are exempt from the dry-weather waste load allocation equal to zero as long as they comply with the provisions of sections C.3 and A.9 of the Order No. 99-08 DWQ, which state that these authorized non-storm discharges shall be:
  (1) infeasible to eliminate
  (2) comply with BMPs as described in the Storm Water Pollution Prevention Plan prepared by the permittee, and
  (3) not cause or contribute to a violation of water quality standards, or comparable provisions in any successor order.
  Unauthorized non-storm water flows are already prohibited by Order No. 99-08 DWQ.
- Wet-weather Implementation Within seven years of the effective date of the TMDL, the construction industry will submit the results of BMP effectiveness studies to determine BMPs that will achieve compliance with the final waste load allocations assigned to construction storm water permittees.
- Regional Board staff will bring the recommended BMPs before the Regional Board for consideration within eight years of the effective date of the TMDL.
- General construction storm water permittees will be considered in compliance with final waste load allocations if they implement these Regional Board approved BMPs. All permittees must implement the approved BMPs within nine years of the effective date of the TMDL. If no effectiveness studies are conducted and no BMPs are approved by the Regional Board within eight years of the effective date of the TMDL, each general construction storm water permit holder will be subject to site-specific BMPs and monitoring requirements to demonstrate compliance with final waste load allocations.

Pleasant Valley (Revolon)	230.0	1720.0	1289.0	1.3

- General Construction permittees are assigned a dry weather wasteload allocation equal to the average dry weather critical condition flow rate multiplied by the numeric target for each constituent. Waste load allocations apply in the receiving water at the base of each subwatershed. Dry weather allocations apply when instream flow rates are below the 86th percentile flow and there has been no measurable precipitation in the previous 24 hours.
- Because wet weather flows transport a large mass of salts at low concentrations, these dischargers meet water quality objectives during wet weather.
- Interim limits are assigned for dry weather discharges from areas covered by NPDES stormwater permits to allow time to implement appropriate actions. The interim limits are assigned as concentration based receiving water limits set to the 95th percentile of the discharger data as a monthly average limit except for chloride. The 95th percentile for chloride was 267 mg/L which is higher than the recommended criteria set forth in the Basin Plan for protection of sensitive beneficial uses including aquatic life. Therefore, the interim limit for chloride for Permitted Stormwater Dischargers is set equal to 230 mg/L to ensure protection of sensitive beneficial uses in the Calleguas Creek watershed.

Region 4 San Gabriel River and Tributaries-Metals and Selenium

Region 4 San Gabriel River and Tributaries Source: Construction Stormwater Dischargers TMDL Completion Date: 3 2007 TMDL Type: Creek	**Pollutant Stressor**	**Wet weather Allocations**	**Dry Weather Allocations**	**% of Watershed**

San Gabriel Reach 2	Lead (Pb)	0.7% * 166 µg/l * Daily Storm Vol	N/A	0.7%
San Gabriel Reach 2	Lead (Pb) Mass based	0.8 kg/d	N/A	0.7%
Coyote Creek	Copper (Cu)	0.285 kg/d	0	5.0%
Coyote Creek	Lead (Pb)	1.70 kg/d	N/A	5.0%
Coyote Creek	Zinc (Zn)	2.4 kg/d	N/A	5.0%
San Jose Creek Reach 1 and 2	Selenium	5 µg/L	5 µg/L	5.0%

Wet-weather allocations for lead in San Gabriel River Reach 2. Concentration-based allocations apply to non-stormwater NPDES discharges. Stormwater allocations are expressed as a percent of load duration curve. Mass-based values presented in table are based on a flow of 260 cfs (daily storm volume = 6.4 $x10^{8}$ liters).

There are 1555 acres of water in the entire watershed, 37.4 acres of water in the Reach 1 subwatershed (2.4%), and 269 acres in the Coyote Creek subwatershed (17%).

General Construction Storm Water Permits

Waste load allocations for the general construction storm water permits may be incorporated into the State Board general permit upon renewal or into a watershed-specific general permit developed by the Regional Board. An estimate of direct atmospheric deposition is developed based on the percent area of surface water in the watershed. Approximately 0.4% of the watershed area draining to San Gabriel River Reach 2 is comprised of water and approximately 0.2% of the watershed area draining to Coyote Creek is comprised of water.

Region 4 The Harbor Beaches of Ventura County-Bacteria

The TMDL has a multi-part numeric target based on the bacteriological water quality objectives for marine water to protect the water contact recreation use. These targets are the most appropriate indicators of public health risk in recreational waters. Bacteriological objectives are set forth in Chapter 3 of the Basin Plan. The objectives are based on four bacteria indicators and include both geometric mean limits and single sample limits. The Basin Plan objectives that serve as the numeric targets for this TMDL are:

The General NPDES Construction permit is seen as a minor contributor and is given no allocation

General NPDES permits, individual NPDES permits, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, and WDR permittees in the Channel Islands Harbor subwatershed are assigned WLAs of zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean. Any future enrollees under a general NPDES permit, individual NPDES permit, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, and WDR will also be subject to a WLA of zero (0) days of allowable exceedances.

Region 4 Resolution No. 03-009 Los Angeles River and Tributaries-Nutrients

Minor Point Sources
Waste loads are allocated to minor point sources enrolled under NPDES or WDR permits including but not limited to Tapia WRP, Whittier Narrows WRP, Los Angeles Zoo WRP, industrial and construction stormwater, and municipal storm water and urban runoff from municipal separate storm sewer systems (MS4s)

Region 4 Minor Point Sources for NPDES/WDR Permits TMDL Completion Date: 7 10 2003 TMDL Type: River	Pollutant Stressor/WLA				
	Total Ammonia (NH_3)		**Nitrate-nitrogen (NO_3-N)**	**Nitrite-nitrogen (NO_2-N)**	**NO_3-N + NO_3-N**

LA River Above Los Angeles-Glendale WRP (LAG)	4.7	1.6	8.0	1.0	8.0
LA River Below LAG	8.7	2.4	8.0	1.0	8.0
Los Angeles Tributaries	10.1	2.3	8.0	1.0	8.0

Malibu Creek Attachment A to Resolution No. 2004-019R-Bacteria

12 13 2004 The WLAs for permittees under the NPDES General Stormwater Construction Permit are zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean.

Region 4 Marina del Rey Harbor, Mothers' Beach and Back Basins

Attachment A to Resolution No. 2003-012-Bacteria

8 7 2003 As discussed in "Source Analysis", discharges from general NPDES permits, general industrial storm water permits and general construction storm water permits are not expected to be a significant source of bacteria. Therefore, the WLAs for these discharges are zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean. Any future enrollees under a general NPDES permit, general industrial storm water permit or general construction storm water permit within the MdR Watershed will also be subject to a WLA of zero days of allowable exceedances.

Region 4 San Gabriel River and Tributaries-Metals and Selenium

Dry Weather Selenium WLA
A zero WLA is assigned to the industrial and construction stormwater permits during dry weather. Non-storm water discharges are already prohibited or restricted by existing general permits.

Region 4 General Construction Permittees TMDL Completion Date: 7 13 2006 TMDL Type: River	**Total Recoverable Metals (kg/day)**		
	Copper (Cu) Kg/day	**Lead (Pb) Kg/day**	**Zinc (Zn) Kg/day**
San Gabriel River Reach 2 and upstream reaches/tributaries	**XXXX**	Daily storm volume x 1.24 µg/L	**XXXX**
Coyote Creek and Tributaries	Daily storm volume x 0.7 µg/L	Daily storm volume x 4.3 µg/L	Daily storm volume x 6.2 µg/L

Each enrollee under the general construction stormwater permit receives a WLA on a per acre basis

Region 4 General Construction Permittees TMDL Completion Date: 7 13 2006 TMDL Type: River	**Total Recoverable Metals (kg/day/acre)**		
	Copper (Cu) Kg/acre/day	**Lead (Pb) Kg/acre/day**	**Zinc (Zn) Kg/acre/day**
San Gabriel River Reach 2 and upstream reaches/tributaries	**XXXX**	Daily storm volume x 0.56 µg/L	**XXXX**

Coyote Creek and Tributaries	Daily storm volume x 0.12 µg/L	Daily storm volume x 0.70 µg/L	Daily storm volume x 1.01 µg/L

For the general industrial and construction storm water permits, the daily storm volume is measured at USGS station 11085000 for discharges to Reach 2 and above and at LACDPW flow gauge station F354-R for discharges to Coyote Creek.

General construction storm water permits
WLAs will be incorporated into the State Board general permit upon renewal or into a watershed-specific general permit developed by the Regional Board.

Dry-weather implementation
Non-storm water flows authorized by the General Permit for Storm Water Discharges Associated with Construction Activity (NPDES Permit No. CAS000002), or any successor permit, are exempt from the dry-weather WLA equal to zero as long as they comply with the provisions of sections C.3.and A.9 of the Order No. 99-08 DWQ, which state that these authorized non-storm discharges shall be (1) infeasible to eliminate (2) comply with BMPs as described in the Storm Water Pollution Prevention Plan prepared by the permittee, and (3) not cause or contribute to a violation of water quality standards, or comparable provisions in any successor order. Unauthorized non-storm water flows are already prohibited by Permit No. CAS000002.

Upon permit issuance, renewal, or re-opener
Non-storm water flows not authorized by Order No. 99-08 DWQ, or any successor order, shall achieve dry-weather WLAs. WLAs shall be expressed as NPDES water quality-based effluent limitations specified in accordance with federal regulations and state policy on water quality control. Effluent limitations may be expressed as permit conditions, such as the installation, maintenance, and monitoring of Regional Board-approved BMPs.

Six years from the effective date of the TMDL
The construction industry will submit the results of wet-weather BMP effectiveness studies to the Los Angeles Regional Board for consideration. In the event that no effectiveness studies are conducted and no BMPs are approved, permittees shall be subject to site-specific BMPs and monitoring to demonstrate BMP effectiveness.

Seven years from the effective date of the TMDL
The Los Angeles Regional Board will consider results of the wet weather BMP effectiveness studies and consider approval of BMPs.

Eight years from the effective date of the TMDL
All general construction storm water permittees shall implement Regional Board-approved BMPs.

Total Maximum Daily Loads (TMDLs) for San Diego Creek,

Organochlorine Compounds TMDLs Implementation Tasks and Schedule

Regional Board staff shall develop a SWPPP Improvement Program that identifies the Regional Board's expectations with respect to the content of SWPPPs, including documentation regarding the selection and implementation of BMPs, and a sampling and analysis plan. The Improvement Program shall include specific guidance regarding the development and implementation of monitoring plans, including the constituents to be monitored, sampling frequency and analytical protocols. The SWPPP Improvement Program shall be completed by (*the date of OAL approval of this BPA*). ***No later than two months*** from completion of the Improvement Program, Board staff shall assure that the requirements of the Program are communicated to interested parties, including dischargers with existing authorizations under the General Construction Permit. Existing, authorized dischargers shall revise their project SWPPPs as needed to address the Program requirements as soon as possible but ***no later than (three months of completion of the SWPPP Improvement Program)***. Applicable SWPPPs that do not adequately address the Program requirements shall be considered inadequate and enforcement by the Regional Board shall proceed accordingly. The Caltrans and Orange County MS4 permits shall be revised as needed to assure that the permittees communicate the Regional Board's SWPPP expectations, based on the SWPPP Improvement Program, with the Standard Conditions of Approval.

Appendix 4 Sediment TMDLs

Implemented Sediment TMDLs in California. Construction was listed as a source in all fo these TMDLs in relation to road construction. Although construction was mentioned as a source, it was not given a specific allocation amount. The closest allocation amount would be for the road activity management WLA. **Implementation Phase** – Adoption process by the Regional Board, the State Water Resources Control Board, the Office of Administrative Law, and the US Environmental Protection Agency completed and TMDL being implemented.

APPENDIX 5:
Glossary

Active Areas of Construction
All areas subject to land surface disturbance activities related to the project including, but not limited to, project staging areas, immediate access areas and storage areas. All previously active areas are still considered active areas until final stabilization is complete. [The construction activity Phases used in this General Permit are the Preliminary Phase, Grading and Land Development Phase, Streets and Utilities Phase, and the Vertical Construction Phase.]

Active Treatment System (ATS)
A treatment system that employs chemical coagulation, chemical flocculation, or electrocoagulation to aid in the reduction of turbidity caused by fine suspended sediment.

Acute Toxicity Test
A chemical stimulus severe enough to rapidly induce a negative effect; in aquatic toxicity tests, an effect observed within 96 hours or less is considered acute.

Air Deposition
Airborne particulates from construction activities.

Approved Signatory
A person who has been authorized by the Legally Responsible Person to sign, certify, and electronically submit Permit Registration Documents, Notices of Termination, and any other documents, reports, or information required by the General Permit, the State or Regional Water Board, or U.S. EPA. The Approved Signatory must be one of the following:

1. For a corporation or limited liability company: a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (a) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation or limited liability company; or (b) the manager of the facility if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

2. For a partnership or sole proprietorship: a general partner or the proprietor, respectively;

3. For a municipality, State, Federal, or other public agency: a principal executive officer, ranking elected official, city manager, council president, or any other authorized public employee with managerial responsibility over the

construction or land disturbance project (including, but not limited to, project manager, project superintendent, or resident engineer);

4. For the military: any military officer or Department of Defense civilian, acting in an equivalent capacity to a military officer, who has been designated;

5. For a public university: an authorized university official;

6. For an individual: the individual, because the individual acts as both the Legally Responsible Person and the Approved Signatory; or

7. For any type of entity not listed above (e.g. trusts, estates, receivers): an authorized person with managerial authority over the construction or land disturbance project.

Beneficial Uses
As defined in the California Water Code, beneficial uses of the waters of the state that may be protected against quality degradation include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

Best Available Technology Economically Achievable (BAT)
As defined by USEPA, BAT is a technology-based standard established by the Clean Water Act (CWA) as the most appropriate means available on a national basis for controlling the direct discharge of toxic and nonconventional pollutants to navigable waters. The BAT effluent limitations guidelines, in general, represent the best existing performance of treatment technologies that are economically achievable within an industrial point source category or subcategory.

Best Conventional Pollutant Control Technology (BCT)
As defined by USEPA, BCT is a technology-based standard for the discharge from existing industrial point sources of conventional pollutants including biochemical oxygen demand (BOD), total suspended sediment (TSS), fecal coliform, pH, oil and grease.

Best Professional Judgment (BPJ)
The method used by permit writers to develop technology-based NPDES permit conditions on a case-by-case basis using all reasonably available and relevant data.

Best Management Practices (BMPs)
BMPs are scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants. BMPs also include treatment requirements, operating procedures,

and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Chain of Custody (COC)
Form used to track sample handling as samples progress from sample collection to the analytical laboratory. The COC is then used to track the resulting analytical data from the laboratory to the client. COC forms can be obtained from an analytical laboratory upon request.

Coagulation
The clumping of particles in a discharge to settle out impurities, often induced by chemicals such as lime, alum, and iron salts.

Common Plan of Development
Generally a contiguous area where multiple, distinct construction activities may be taking place at different times under one plan. A plan is generally defined as any piece of documentation or physical demarcation that indicates that construction activities may occur on a common plot. Such documentation could consist of a tract map, parcel map, demolition plans, grading plans or contract documents. Any of these documents could delineate the boundaries of a common plan area. However, broad planning documents, such as land use master plans, conceptual master plans, or broad-based CEQA or NEPA documents that identify potential projects for an agency or facility are not considered common plans of development.

Daily Average Discharge
The discharge of a pollutant measured during any 24-hour period that reasonably represents a calendar day for purposes of sampling. For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged during the day. For pollutants with limitations expressed in other units of measurement (e.g., concentration) the daily discharge is calculated as the average measurement of the pollutant throughout the day (40 CFR 122.2). In the case of pH, the pH must first be converted from a log scale.

Debris
Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

Direct Discharge
A discharge that is routed directly to waters of the United States by means of a pipe, channel, or ditch (including a municipal storm sewer system), or through surface runoff.

Discharger
The Legally Responsible Person (see definition) or entity subject to this General Permit.

Dose Rate (for ATS)
In exposure assessment, dose (e.g. of a chemical) per time unit (e.g. mg/day), sometimes also called dosage.

Drainage Area
The area of land that drains water, sediment, pollutants, and dissolved materials to a common outlet.

Effluent
Any discharge of water by a discharger either to the receiving water or beyond the property boundary controlled by the discharger.

Effluent Limitation
Any numeric or narrative restriction imposed on quantities, discharge rates, and concentrations of pollutants which are discharged from point sources into waters of the United States, the waters of the contiguous zone, or the ocean.

Erosion
The process, by which soil particles are detached and transported by the actions of wind, water, or gravity.

Erosion Control BMPs
Vegetation, such as grasses and wildflowers, and other materials, such as straw, fiber, stabilizing emulsion, protective blankets, etc., placed to stabilize areas of disturbed soils, reduce loss of soil due to the action of water or wind, and prevent water pollution.

Field Measurements
Testing procedures performed in the field with portable field-testing kits or meters.

Final Stabilization
All soil disturbing activities at each individual parcel within the site have been completed in a manner consistent with the requirements in this General Permit.

First Order Stream
Stream with no tributaries.

Flocculants
Substances that interact with suspended particles and bind them together to form flocs.

Good Housekeeping BMPs
BMPs designed to reduce or eliminate the addition of pollutants to construction site runoff through analysis of pollutant sources, implementation of proper handling/disposal practices, employee education, and other actions.

Grading Phase (part of the Grading and Land Development Phase)
Includes reconfiguring the topography and slope including; alluvium removals; canyon cleanouts; rock undercuts; keyway excavations; land form grading; and stockpiling of select material for capping operations.

Hydromodification
Hydromodification is the alteration of the hydrologic characteristics of coastal and non-coastal waters, which in turn could cause degradation of water resources. Hydromodification can cause excessive erosion and/or sedimentation rates, causing excessive turbidity, channel aggradation and/or degradation.

Identified Organisms
Organisms within a sub-sample that is specifically identified and counted.

Inactive Areas of Construction
Areas of construction activity that are not active and those that have been active and are not scheduled to be re-disturbed for at least 14 days.

Index Period
The period of time during which bioassessment samples must be collected to produce results suitable for assessing the biological integrity of streams and rivers. Instream communities naturally vary over the course of a year,and sampling during the index period ensures that samples are collected during a time frame when communities are stable so that year-to-year consistency is obtained. The index period approach provides a cost-effective alternative to year-round sampling. Furthermore, sampling within the appropriate index period will yield results that are comparable to the assessment thresholds or criteria for a given region, which are established for the same index period. Because index periods differ for different parts of the state, it is essential to know the index period for your area.

K Factor
The soil erodibility factor used in the Revised Universal Soil Loss Equation (RUSLE). It represents the combination of detachability of the soil, runoff potential of the soil, and the transportability of the sediment eroded from the soil.

Legally Responsible Person
The Legally Responsible Person (LRP) will typically be the project proponent. The categories of persons or entities that are eligible to serve as the LRP are set forth below. For any construction or land disturbance project where multiple persons or entities are eligible to serve as the LRP, those persons or entities

shall select a single LRP. In exceptional circumstances, a person or entity that qualifies as the LRP may provide written authorization to another person or entity to serve as the LRP. In such a circumstance, the person or entity that provides the authorization retains all responsibility for compliance with the General Permit. Except as provided in category 2(d), a contractor who does not satisfy the requirements of any of the categories below is not qualified to be an LRP.

The following persons or entities may serve as an LRP:

1. A person, company, agency, or other entity that possesses a real property interest (including, but not limited to, fee simple ownership, easement, leasehold, or other rights of way) in the land upon which the construction or land disturbance activities will occur for the regulated site.

2. In addition to the above, the following persons or entities may also serve as an LRP:

    a. For linear underground/overhead projects, the utility company, municipality, or other public or private company or agency that owns or operates the LUP;

    b. For land controlled by an estate or similar entity, the person who has day-to-day control over the land (including, but not limited to, a bankruptcy trustee, receiver, or conservator);

    c. For pollution investigation and remediation projects, any potentially responsible party that has received permission to conduct the project from the holder of a real property interest in the land; or

    d. For U.S. Army Corp of Engineers projects, the U.S. Army Corps of Engineers may provide written authorization to its bonded contractor to serve as the LRP, provided, however, that the U.S. Army Corps of Engineers is also responsible for compliance with the general permit, as authorized by the Clean Water Act or the Federal Facilities Compliance Act.

Likely Precipitation Event
Any weather pattern that is forecasted to have a 50% or greater chance of producing precipitation in the project area. The discharger shall obtain likely precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

Maximum Allowable Threshold Concentration (MATC)
The allowable concentration of residual, or dissolved, coagulant/flocculant in effluent. The MATC shall be coagulant/flocculant-specific, and based on toxicity

testing conducted by an independent, third-party laboratory. A typical MATC would be:

The MATC is equal to the geometric mean of the NOEC (No Observed Effect Concentration) and LOEC (Lowest Observed Effect Concentration) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant. The most sensitive species test shall be used to determine the MATC.

Natural Channel Evolution
The physical trend in channel adjustments following a disturbance that causes the river to have more energy and degrade or aggrade more sediment. Channels have been observed to pass through 5 to 9 evolution types. Once they pass though the suite of evolution stages, they will rest in a new state of equilibrium.

Non-Storm Water Discharges
Discharges are discharges that do not originate from precipitation events. They can include, but are not limited to, discharges of process water, air conditioner condensate, non-contact cooling water, vehicle wash water, sanitary wastes, concrete washout water, paint wash water, irrigation water, or pipe testing water.

Non-Visible Pollutants
Pollutants associated with a specific site or activity that can have a negative impact on water quality, but cannot be seen though observation (ex: chlorine). Such pollutants being discharged are not authorized.

Numeric Action Level (NAL)
Level is used as a warning to evaluate if best management practices are effective and take necessary corrective actions. Not an effluent limit.

Original Sample Material
The material (i.e., macroinvertebrates, organic material, gravel, etc.) remaining after the subsample has been removed for identification.

pH
Unit universally used to express the intensity of the acid or alkaline condition of a water sample. The pH of natural waters tends to range between 6 and 9, with neutral being 7. Extremes of pH can have deleterious effects on aquatic systems.

Post-Construction BMPs
Structural and non-structural controls which detain, retain, or filter the release of pollutants to receiving waters after final stabilization is attained.

Preliminary Phase (Pre-Construction Phase - Part of the Grading and Land Development Phase)
Construction stage including rough grading and/or disking, clearing and grubbing operations, or any soil disturbance prior to mass grading.

Project

Qualified SWPPP Developer
Individual who is authorized to develop and revise SWPPPs.

Qualified SWPPP Practitioner
Individual assigned responsibility for non-storm water and storm water visual observations, sampling and analysis, and responsibility to ensure full compliance with the permit and implementation of all elements of the SWPPP, including the preparation of the annual compliance evaluation and the elimination of all unauthorized discharges.

Qualifying Rain Event
Any event that produces 0.5 inches or more precipitation with a 48 hour or greater period between rain events.

R Factor
Erosivity factor used in the Revised Universal Soil Loss Equation (RUSLE). The R factor represents the erosivity of the climate at a particular location. An average annual value of R is determined from historical weather records using erosivity values determined for individual storms. The erosivity of an individual storm is computed as the product of the storm's total energy, which is closely related to storm amount, and the storm's maximum 30-minute intensity.

Rain Event Action Plan (REAP)
Written document, specific for each rain event, that when implemented is designed to protect all exposed portions of the site within 48 hours of any likely precipitation event.

Remaining Sub sampled Material
The material (e.g., organic material, gravel, etc.) that remains after the organisms to be identified have been removed from the subsample for identification. (Generally, no macroinvertebrates are present in the remaining subsampled material, but the sample needs to be checked and verified using a complete Quality Assurance (QA) plan)

Routine Maintenance
Activities intended to maintain the original line and grade, hydraulic capacity, or original purpose of a facility.

Runoff Control BMPs
Measures used to divert runon from offsite and runoff within the site.

Run-on
Discharges that originate offsite and flow onto the property of a separate project site.

Revised Universal Soil Loss Equation (RUSLE)
Empirical model that calculates average annual soil loss as a function of rainfall and runoff erosivity, soil erodibility, topography, erosion controls, and sediment controls.

Sampling and Analysis Plan
Document that describes how the samples will be collected, under what conditions, where and when the samples will be collected, what the sample will be tested for, what test methods and detection limits will be used, and what methods/procedures will be maintained to ensure the integrity of the sample during collection, storage, shipping and testing (i.e., quality assurance/quality control protocols).

Sediment
Solid particulate matter, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

Sedimentation
Process of deposition of suspended matter carried by water, wastewater, or other liquids, by gravity. It is usually accomplished by reducing the velocity of the liquid below the point at which it can transport the suspended material.

Sediment Control BMPs
Practices that trap soil particles after they have been eroded by rain, flowing water, or wind. They include those practices that intercept and slow or detain the flow of storm water to allow sediment to settle and be trapped (e.g., silt fence, sediment basin, fiber rolls, etc.).

Settleable Solids (SS)
Solid material that can be settled within a water column during a specified time frame. It is typically tested by placing a water sample into an Imhoff settling cone and then allowing the solids to settle by gravity for a given length of time. Results are reported either as a volume (mL/L) or a mass (mg/L) concentration.

Sheet Flow
Flow of water that occurs overland in areas where there are no defined channels where the water spreads out over a large area at a uniform depth.

Site

Soil Amendment
Any material that is added to the soil to change its chemical properties, engineering properties, or erosion resistance that could become mobilized by storm water.

Streets and Utilities Phase
Construction stage including excavation and street paving, lot grading, curbs, gutters and sidewalks, public utilities, public water facilities including fire hydrants, public sanitary sewer systems, storm sewer system and/or other drainage improvements.

Structural Controls
Any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution

Suspended Sediment Concentration (SSC)
The measure of the concentration of suspended solid material in a water sample by measuring the dry weight of all of the solid material from a known volume of a collected water sample. Results are reported in mg/L.

Total Suspended Solids (TSS)
The measure of the suspended solids in a water sample includes inorganic substances, such as soil particles and organic substances, such as algae, aquatic plant/animal waste, particles related to industrial/sewage waste, etc. The TSS test measures the concentration of suspended solids in water by measuring the dry weight of a solid material contained in a known volume of a sub-sample of a collected water sample. Results are reported in mg/L.

Toxicity
The adverse response(s) of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies.

Turbidity
The cloudiness of water quantified by the degree to which light traveling through a water column is scattered by the suspended organic and inorganic particles it contains. The turbidity test is reported in Nephelometric Turbidity Units (NTU) or Jackson Turbidity Units (JTU).

Vertical Construction Phase
The Build out of structures from foundations to roofing, including rough landscaping.

Waters of the United States
Generally refers to surface waters, as defined by the federal Environmental Protection Agency in 40 C.F.R. § 122.2.[1]

Water Quality Objectives (WQO)
Water quality objectives are defined in the California Water Code as limits or levels of water quality constituents or characteristics, which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.

[1] The application of the definition of "waters of the United States" may be difficult to determine; there are currently several judicial decisions that create some confusion. If a landowner is unsure whether the discharge must be covered by this General Permit, the landowner may wish to seek legal advice.

APPENDIX 6:
Acronym List

ASBS	Areas of Special Biological Significance
ASTM	American Society of Testing and Materials; Standard Test Method for Particle-Size Analysis of Soils
ATS	Active Treatment System
BASMAA	Bay Area Storm water Management Agencies Association
BAT	Best Available Technology Economically Achievable
BCT	Best Conventional Pollutant Control Technology
BMP	Best Management Practices
BOD	Biochemical Oxygen Demand
BPJ	Best Professional Judgment
CAFO	Confined Animal Feeding Operation
CCR	California Code of Regulations
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CGP	NPDES General Permit for Storm Water Discharges Associated with Construction Activities
CIWQS	California Integrated Water Quality System
CKD	Cement Kiln Dust
COC	Chain of Custody
CPESC	Certified Professional in Erosion and Sediment Control
CPSWQ	Certified Professional in Storm Water Quality
CSMP	Construction Site Monitoring Program
CTB	Cement Treated Base
CTR	California Toxics Rule
CWA	Clean Water Act
CWC	California Water Code
CWP	Center for Watershed Protection
DADMAC	Diallyldimethyl-ammonium chloride
DDNR	Delaware Department of Natural Resources
DFG	Department of Fish and Game
DHS	Department of Health Services
DWQ	Division of Water Quality
EC	Electrical Conductivity
ELAP	Environmental Laboratory Accreditation Program
EPA	Environmental Protection Agency
ESA	Environmentally Sensitive Area
ESC	Erosion and Sediment Control
HSPF	Hydrologic Simulation Program Fortran
JTU	Jackson Turbidity Units
LID	Low Impact Development
LOEC	Lowest Observed Effect Concentration
LRP	Legally Responsible Person
LUP	Linear Underground/Overhead Projects

MATC	Maximum Allowable Threshold Concentration
MDL	Method Detection Limits
MRR	Monitoring and Reporting Requirements
MS4	Municipal Separate Storm Sewer System
MUSLE	Modified Universal Soil Loss Equation
NAL	Numeric Action Level
NEL	Numeric Effluent Limitation
NICET	National Institute for Certification in Engineering Technologies
NOAA	National Oceanic and Atmospheric Administration
NOEC	No Observed Effect Concentration
NOI	Notice of Intent
NOT	Notice of Termination
NPDES	National Pollutant Discharge Elimination System
NRCS	Natural Resources Conservation Service
NTR	National Toxics Rule
NTU	Nephelometric Turbidity Units
O&M	Operation and Maintenance
PAC	Polyaluminum chloride
PAM	Polyacrylamide
PASS	Polyaluminum chloride Silica/sulfate
POC	Pollutants of Concern
PoP	Probability of Precipitation
POTW	Publicly Owned Treatment Works
PRDs	Permit Registration Documents
PWS	Planning Watershed
QAMP	Quality Assurance Management Plan
QA/QC	Quality Assurance/Quality Control
REAP	Rain Event Action Plan
Regional Board	Regional Water Quality Control Board
ROWD	Report of Waste Discharge
RUSLE	Revised Universal Soil Loss Equation
RW	Receiving Water
SMARTS	Storm water Multi Application Reporting and Tracking System
SS	Settleable Solids
SSC	Suspended Sediment Concentration
SUSMP	Standard Urban Storm Water Mitigation Plan
SW	Storm Water
SWARM	Storm Water Annual Report Module
SWAMP	Surface Water Ambient Monitoring Program
SWMM	Storm Water Management Model
SWMP	Storm Water Management Program
SWPPP	Storm Water Pollution Prevention Plan
TC	Treatment Control
TDS	Total Dissolved Solids

TMDL	Total Maximum Daily Load
TSS	Total Suspended Solids
USACOE	U.S. Army Corps of Engineers
USC	United States Code
USEPA	United States Environmental Protection Agency
USGS	United States Geological Survey
WDID	Waste Discharge Identification Number
WDR	Waste Discharge Requirements
WLA	Waste Load Allocation
WET	Whole Effluent Toxicity
WRCC	Western Regional Climate Center
WQBEL	Water Quality Based Effluent Limitation
WQO	Water Quality Objective
WQS	Water Quality Standard

SECTION 3
Comment Letters

The City of Los Angeles Department of Water and Power (LADWP), Department of Public Works Bureau of Engineering (BOE) and Bureau of Sanitation (LASAN), and Department of Recreation and Parks (RAP), are collectively referred to herein as the "City." LADWP acting as Lead Agency circulated the Draft Initial Study/Mitigated Negative Declaration (Draft IS/MND) for the Stormwater Capture Parks Program (Program) for public review for 30 days (January 7, 2021 through February 7, 2021) in accordance with the requirements of the California Environmental Quality Act (CEQA) Guidelines Section 15072(a). BOE, LASAN, and RAP will act as Responsible Agencies. The City received a total of eight comment letters during the public review period, which are listed in **Table 3-1** and are included within this chapter. The letters have been marked with brackets that delineate comments pertaining to environmental issues and the information and analysis contained in the Draft IS/MND. Responses to such comments are provided in Section 4.

TABLE 3-1
COMMENT LETTERS RECEIVED

Comment Letter No.	Commenter	Date of Comment
1	California Department of Transportation	January 13, 2021
2	Luis Suarez	January 15, 2021
3	Marie Gordon	January 22, 2021
4	Brenda Dalusong	February 2, 2021
5	California Department of Fish and Wildlife	February 5, 2021
6	Diana Nicole, Sunshine Hills Residents Association	February 8, 2021
7	County of Los Angeles Fire Department	February 9, 2021
8	Joanne D'Antonio	February 8, 2021

SECTION 4
Response to Comments

4.1 Comments on the Draft IS/MND and Response to Comments

The responses to comments included in this section correspond to each comment letter outlined in Section 3.

Letter 1: Miya Edmonson (California Department of Transportation)

Comment 1-A

The commenter summarizes the project description.

Response 1-A

The comment is noted and will be included in the project record.

Comment 1-B

The commenter states that an encroachment permit would likely be required for any project work, including road closures, done on or near California Department of Transportation's (Caltrans) right of way.

Response 1-B

As noted on page 33 of the Draft IS/MND, the City and/or its contractors will coordinate with Caltrans and will obtain all necessary permits prior to construction activities. In addition, Caltrans is an active partner in the Program, providing some funding and assisting with project level designs.

Comment 1-C

The commenter states that a Caltrans transportation permit is required for transporting any heavy construction equipment and/or materials with oversized-transport vehicles on State Highways.

Response 1-C

The City and/or its contractors will coordinate with Caltrans and will obtain all necessary permits prior to construction activities.

Comment 1-D

The commenter recommends that project construction traffic is limited to off-peak periods to minimize potential impacts on State facilities.

Response 1-D

As outlined in Mitigation Measure TR-1, the City and/or its contractors will coordinate with Los Angeles Department of Transportation (LADOT) in order to prepare a construction traffic management plan (CTMP) for the Program which will include time of day restrictions, and time limitations for construction traffic.

Comment 1-E

The commenter requests submission of a construction traffic management plan to Caltrans for review if State facilities are expected to have delays. The commenter request that the traffic management plan includes details on any traffic delays that would occur on State facilities during construction, and alternate bicycle and pedestrian routes for any routes that would be affected during construction.

Response 1-E

The City will submit the CTMP to Caltrans for review if delays are expected on State facilities.

Comment 1-F

The commenter expresses support for Transportation Demand Management (TDM) strategies which the City has incorporated into the Program and recommends additional options to further reduce Vehicle Miles Traveled (VMT) and greenhouse gas emissions impacts.

Response 1-F

The Draft IS/MND concluded that Program impacts to VMT and greenhouse gas emissions would occur at levels that are below CEQA significance thresholds, without implementation of any mitigation measures.

Letter 2: Luis Suarez

Comment 2-A

The commenter requests more information regarding the environmental impacts that would occur on homes surrounding Fernangeles Park.

Response 2-A

Residents in the vicinity of Program sites may experience temporary impacts related to construction. The City and its construction contractors are required to implement mitigation measures to ensure that nearby residents are notified of tentative construction schedules and that Program impacts remain below the specific impact thresholds identified in Appendix G of the

CEQA Guidelines. For a detailed discussion of anticipated environmental impacts, please refer to the Draft IS/MND. With respect to neighborhood impacts, the IS/MND describes effects to aesthetics on page 46, air quality on page 51, biological resources on page 72, noise on page 122, recreational resources on page 138, and traffic on page 140.

Comment 2-B

The commenter expresses concern regarding the potential for groundwater saturation in surrounding neighborhoods as a result of the proposed infiltration galleries at Fernangeles Park.

Response 2-B

The Program would include construction of underground infiltration galleries, which would capture surface flow and divert stormwater runoff from the Caltrans pump discharge to recharge the San Fernando Groundwater Basin. The infiltration galleries will be constructed of concrete and are designed to retain flows for percolation into the San Fernando Groundwater Basin. The ground surface surrounding the park would be restored to support recreational uses similar to current conditions. The Draft IS/MND evaluates the potential for groundwater mounding to occur that could affect surface infrastructure. A technical analysis prepared by Todd Groundwater Consultants is included as Appendix E. As noted in Table 1 of Appendix E, the infiltration galleries would range from 16 to 29 feet below ground surface and the groundwater levels in the area range from 105 to 335 feet below the ground surface. Mitigation measure GEO-1 has been included to monitor groundwater levels and reduce flow diversions when groundwater is within 50 feet of the surface. With mitigation implemented, the Draft IS/MND concludes that the potential for elevated groundwater levels would be minimized.

Letter 3: Marie Gordon

Comment 3-A

The commenter requests information regarding start and end dates for Program construction activities that would occur near two senior citizen apartment buildings located along Vanowen Street, between Whitsett Avenue and Rhodes Avenue, just south of Whitsett Fields Park North.

Response 3-A

As noted in Table 1-6 on page 40 of the Draft IS/MND, construction activities at Whitsett Fields Park North are expected to take approximately 18 months, starting in June 2025 and ending in November 2026. Construction at Valley Plaza Park North, located east of I-170 on Vanowen Street, is expected to take approximately 17 months, starting in November 2023 and ending in March 2025. Construction work hours would generally be restricted to times between 7 A.M. and 7 P.M., Monday through Friday.

Comment 3-B

The commenter expresses concern regarding construction mitigation measures and their potential to minimize environmental impacts on senior citizens living in nearby apartments. The commenter states that the environmental impacts of prior projects were not effectively mitigated.

Response 3-B

Residents in the vicinity of Program sites may experience temporary impacts related to construction. The City and its construction contractors are required to implement mitigation measures to ensure that nearby residents are notified of tentative construction schedules, and that Program impact levels remain below the specific thresholds identified in Appendix G of the CEQA Guidelines. For a detailed discussion of anticipated environmental impacts, please refer to the Draft IS/MND. With respect to neighborhood impacts, the IS/MND describes effects to aesthetics on page 46, air quality on page 51, biological resources on page 72, noise on page 122, recreational resources on page 138, and traffic on page 140.

Comment 3-C

Commenter states that the Notice of Intent (NOI) for the Program is dated January 7, 2021 but was not received until January 20, 2021.

Response 3-C

The comment is noted and will be included in the project record. The public review period for the Draft IS/MND was from January 7, 2021, to February 7, 2021. The commenter received the NOI within the public review period of the Draft IS/MND in compliance with CEQA.

Letter 4: Brenda Dalusong

Comment 4-A

The commenter requests that the City consider construction of sidewalks around the perimeter of Fernangeles Park as part of the Program's proposed recreational facilities enhancements. The commenter states concern for pedestrian/motor vehicle safety around the park due to the lack of sidewalks available for pedestrian use.

Response 4-A

Figures 1-4 through 1-12 provide architectural drawings for each of the proposed parks that include public access and pedestrian circulation to support existing recreational uses.

Letter 5: Erinn Wilson-Olgin (California Department of Fish and Wildlife)

Comment 5-A

The comment acknowledges that California Department of Fish and Wildlife (CDFW) received the Draft IS/MND for review and to provide comments.

Response 5-A

Comment noted.

Comment 5-B

CDFW disagrees with the City's impact analysis, which finds that the Project's diversion of water would not impact biological resources

The Project would divert dry season flow and stormwater totaling 3,010 acre-feet per year (AFY). The water would otherwise proceed downstream via concrete channels to the Los Angeles River. The Draft IS/MND concluded that "no beneficial uses would be impacted." However, flow reduction could have a significant impact on downstream biological resources, especially during the dry season proceeding after a below-average water year.

Response 5-B

The Draft IS/MND on pages 74 and 77 describes that the Program would reduce dry season flows from the Tujunga Central Branch channel that would reduce water in the Los Angeles River. In response to the comment the sentence on page 77 of the Draft IS/MND has been revised as follows:

> The Los Angeles River currently discharges an average of over 100 cubic feet per second (cfs) to the ocean during dry weather (City of Los Angeles 2018). The volume of water diverted during dry weather flow by the proposed Program would be a small percentage of the current downstream flows (1.4 percent of total annual flow or approximately 4 percent of dry weather flow), and as a result no beneficial uses, including biological resources, would be significantly impacted.

As noted in the comment, the reduction of dry weather flows is itself an impact. Therefore, the changes to the text provided above as requested in the comment are appropriate. The Draft IS/MND identifies the reduced flow impact on page 74, but concludes that no riparian or aquatic habitat would be removed or adversely affected within the downstream reaches of the Los Angeles River. Therefore, since no habitat would be lost or stressed, the flow reduction would be a less than significant impact. The analysis relies on a de minimis impact conclusion. That is, the reduction of 1.4 percent of total flow and approximately 4 percent of dry weather flow in the river would not result in loss of habitat or result in reduced habitat quality. Rather, diverting dry-weather urban runoff would benefit water quality. The Draft IS/MND describes on pages 74 and 77 how beneficial uses are well supported by the remaining dry season flows. This evidence is outlined further below.

The Draft IS/MND describes in Section 1.5 that six of the nine Program sites (see table below) would require insertion of diversion structures within underground storm drain pipes. No habitat values exist within the buried storm drain pipes. The remaining four Program sites would require installation of diversion structures within existing Tujunga Central Branch concrete box channel or reinforced concrete box culvert. The watershed drained by this Tujunga Central Branch

channel is a small portion of the San Fernando Valley adjacent to but outside of the Tujunga Wash drainage area, representing 1.7 percent of the total Los Angeles River watershed.

Infiltration Gallery Location	Diversion Structure Installation
David M. Gonzales Recreation Center	Underground Storm Drain Pipe
FernAngeles Park	Underground Storm Drain Pipe
Whitsett Fields Park North	Underground Storm Drain Pipe
Strathern Park North	Underground Storm Drain Pipe
Valley Plaza Park North	Underground Reinforced Concrete Box Culvert
Valley Plaza Park South	Concrete Channel
Alexandria Park	Concrete Channel
North Hollywood Park	Concrete Channel
Valley Village Park	Underground Storm Drain Pipe

The Draft IS/MND describes on page 74 that the Tujunga Central Branch channel is concrete-lined with no ecological value. As a result, direct impacts to habitat values from installing diversion structures would not adversely affect biological resources. Furthermore, the Draft IS/MND concludes on pages 74 and 77 that the proposed diversions would result in a small reduction of the flow in the Los Angeles River compared to the current flow, including in the dry season, and would not result in measurable effects to biological resources. The Draft IS/MND references the hydrological analysis conducted by the City for the One Water LA Program and cites that currently an average of 100 cubic feet per second (cfs) reaches the ocean in the concrete channel of the Los Angeles River during dry weather (City of Los Angeles 2018). The Program diversions represent an annual average flow of approximately 4 cfs or 4 percent of the dry weather flows to the ocean. The Draft IS/MND concludes on page 77 that the reduction caused by the project would represent 1.4 percent of the total flow in the river on an annual average. Since the river discharges substantial flow to the ocean in the dry season (>100 cfs), the Draft IS/MND concludes that the proposed project's 1.4 percent diversion of total flows and 4 percent of dry season flows would not result in significant impacts to biological resources.

The Draft IS/MND also concludes on page 153 that the flow reductions would not result in a cumulatively significant reduction, including in the dry season. This conclusion is consistent with the One Water LA Study, which provides an overview of stormwater flows in Chapter 3and the Los Angeles River in Chapter 4. (City of Los Angeles 2018).

In addition to the published One Water LA study, the City has been participating in the Los Angeles River Flows Project, a comprehensive new hydrologic study of the river led by the Southern California Coastal Watershed Research Project (SCCWRP) in partnership with the State Water Resources Control Board (SWRCB). This new study is called the Los Angeles River Flows Project and is sponsored by the City of Los Angeles (by and through LADWP and LASAN), Los Angeles Regional Water Quality Control Board (LARWQCB), and the Los Angeles County Sanitation Districts (LACSD). SCCWRP is a quasi-public agency established to

support Southern California governmental agencies with third-party, science-based analysis. The Los Angeles River Flows Project was initiated in 2019 expressly to evaluate potential effects of cumulative flow reductions in the Los Angeles River, including reductions in WRP discharges and future stormwater capture projects such as the proposed Project. CDFW has been actively participating in the Project as a member of the Technical Advisory Committee (TAC).

In May 2021, SCCWRP published a report titled Process and Decision Support Tools for Evaluating Flow Management Targets to Support Aquatic Life and Recreational Beneficial Uses of the Los Angeles River as part of the Los Angeles River Flows Project (LA River Flows Project Final Report) (SCCWRP, 2021b). This new Final report, included by reference with this Final IS/MND, characterizes the environmental attributes of the river channel and evaluates flows that support those attributes, providing flow-ecology relationships helpful in understanding dry season flow reduction impacts on ecological values. The report develops a set of tools to evaluate future flow management scenarios. One of the three objectives noted in the report is to:

> "Produce tools and approaches to help evaluate how potential modified flow regimes in the LA River may affect the likelihood of supporting aquatic life and recreational beneficial uses" (SCCWRP, 2021b)

The results of this study directly confirm the conclusions outlined in the IS/MND, including an evaluation of the effects to focal species of reduced storm flows during the dry season. See response to comment 5-I for more discussion on the new study and the conclusions regarding impacts to ecological values from reduced dry weather flow.

Comment 5-C

The Draft IS/MND does not provide sufficient analysis of the Project's potential biological impacts to allow CDFW to determine the Project's significance or need for mitigation.

Data Source: The Draft IS/MND uses data from the 2015 *Los Angeles River Ecosystem Restoration Integrated Feasibility Report* (USACE 2015). The U.S. Army Corp of Engineers (USACE) report analyzes the feasibility of restoring an 11-mile stretch of the Los Angeles River from Pollywog Park to Downtown Los Angeles, referred to in the report as the ARBOR reach (Area with Restoration Benefits and Opportunities for Revitalization) (USACE 2015). Citing the USACE report, page 77 of the Draft IS/MND states, "USACE estimated that existing water sources provide 211,348 AFY of flow within the Los Angeles River watershed on an annual basis. The proposed diversion would be approximately 1.4 percent of the existing water source […]. The volume of water diverted during dry weather flow by the proposed Program would be a small percentage of the current downstream flows (1.4 percent), and no beneficial uses would be impacted.

The Draft IS/MND may have underestimated the percentage of water diverted from the Los Angeles River in using 211,348 AFY as the basis for deriving 1.4 percent. After factoring in water demand (e.g., infiltration, evaporation, evapotranspiration), the USACE estimated that flow would be reduced from 211,348 AFY to 143,793 AFY annually and 29,166 AFY in the summer

(April through September) (USACE 2015). Based on reduced volumes, the Project's proposed diversion would be approximately 2.2 percent annually, an increase from 1.4 percent. During the summer, diversion would be approximately 10.3 percent. Based on the above, the Draft IS/MND's impact analysis may not have accurately estimated the proportion of water the Project would divert from the Los Angeles River.

Response 5-C

The calculation in the comment asserting a 10.3 percent reduction is inaccurate in that it assumes the entire diversion estimate of the proposed Program (3,010 AFY) will occur between April and September. It would be more appropriate when calculating the six-month dry season percentage from the 29,166 AFY flow assumption to compare half the annual anticipated diversion, which would be 1,505 AFY, calculated as 5.14 percent of the total dry season flow. A different way of calculating the contribution of flows attributed to the Tujunga Central Branch channel is to compare the project's diversion estimates with flow estimates at the ocean. The One Water LA Report (City of Los Angeles 2018) estimates that the river discharges 100 cfs to the ocean during summer months. The Program's proposed diversion of 3,010 AFY would constitute approximately 4 percent of the existing flow to the ocean during the summer months. This would be a conservative assumption since it does not attribute any stormwater capture to the proposed Program. The Draft IS/MND concludes that the contribution of flow to the Los Angeles River from the Tujunga Central Branch channel during the dry season is small (1.4 percent of the total volume and 4 percent of dry weather flow) compared to other sources. Furthermore, the watershed represents only 1.7 percent of the total watershed feeding stormwater to the Los Angeles River. Based on these flow estimates, the Draft IS/MND concludes that the proposed project would not significantly affect the ecology of the river.

The City, including LADWP, is participating in the Los Angeles River Flows Project in partnership with the SWRCB, and in close coordination with CDFW. The Los Angeles River Flows Project has been initiated by SWRCB to better understand the water demands of beneficial uses in the river, and to support future flow management priorities with science-based demand characterizations. See response to comment 5-I for more discussion on the new study.

Comment 5-D

Seasonality: The Draft IS/MND does not thoroughly analyze the potential significance of water diversion depending on the season. During the dry season, typically April through September in southern California, the Los Angeles River is largely maintained by urban runoff and discharge from WRPs. Diverting water could be significant during the dry season and could either significantly reduce water flow or result in complete loss of water flow from the Tujunga Central Branch channel to the Los Angeles River.

Response 5-D

The Draft IS/MND does evaluate the seasonality of the potential effects of the Program on page 74. The assessment describes the effects of the proposed Program on both dry weather flows and

wet weather flows. The Draft IS/MND notes on pages 74 and 77 that dry weather flows would be reduced slightly but would not result in loss of habitat. This is substantiated by the fact that 100 cfs currently discharges to the ocean in dry weather indicating a surplus of flow. Furthermore, the Draft IS/MND also points out that the ecological values of the river would be enhanced with the reduction of pollutant daily loads conveyed in dry weather flow. The water quality benefits of stormwater capture on downstream habitat values are described further in One Water LA, Chapter 4 Los Angeles River Study (City of Los Angeles 2018), as a fundamental benefit of the City's Program, and supports the water quality objectives of the regional Municipal Separate Storm Sewer System (MS4) stormwater NPDES permit of which the City is a participating permittee. See response to comments 5-C and 5-G.

Comment 5-E

Drought: The Draft IS/MND does not analyze the potential significance of water diversion during a below-normal water year. Since 2000, the longest duration of drought in California lasted between 2011 and 2019 (USGS 2021) and in southern California, between 2012 through 2016 (Los Angeles Almanac 2021). The 2017-2018 rainfall season was below normal and the driest for Los Angeles since 2006-2007 (Los Angeles Almanac 2021). Diverting water during a below normal rainfall year may significantly reduce water flow or result in complete loss of water flow.

Response 5-E

Annual rainfall amounts vary in the Los Angeles River watershed, with multi-year droughts likely becoming more common. The City's Stormwater Capture Master Plan states that "although the average annual precipitation in downtown Los Angeles is 15.3 inches, it ranges from a low of 4.69 inches (2007) to a high of 30.6 (1998). The mountains that surround the coastal plain, and are tributary to the City, experience considerably more rainfall than downtown Los Angeles. For example, in Big Tujunga Canyon, annual rainfall ranged from 9.62 inches in 1989 to 53.93 in 1998." (LADWP Stormwater Capture Master Plan, 2015; p. 3) The watershed represents only 1.7 percent of the total LA River watershed. The reduction would not significantly reduce dry season flows. The comment does not provide any additional information not already considered in the Draft IS/MND. See response to comment 5-I.

Comment 5-F

Beneficial Uses: The concrete lined portions of the Los Angeles River support wildlife. These portions of the Los Angeles River are regionally significant, especially in a dense urban environment with substantial loss or alteration of the natural hydrologic regime and river ecosystems. A reduction of flow, especially dry season flow, could directly or indirectly impact biological resources through habitat modifications. Where the Los Angeles River overtops the concrete-lined channel, the resulting sheet flows allow phytoplankton (algae and cyanobacteria), microorganisms, and herbaceous vegetation to establish. The algae provide habitat and a food source for benthic invertebrates, a vital food source for wading birds. The Los Angeles River provides habitat for hundreds of bird species, making these areas birding hotspots. The least Bell's vireo (*Vireo bellii pusillus*), an Endangered Species Act and CESA-listed endangered

species, has been documented within the Glendale Narrows area. Least Bell's vireo depends on willow (*Salix* genus) riparian habitat. The ARBOR reach examined in the USACE report contains soft-bottom channels that support herbaceous and woody vegetation. Dominant species include black willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and arroyo willow (*Salix laevigata*) (USACE 2015). The middle reach of the Los Angeles River, specifically Glendale Narrows, supports anadromous fish that includes the Pacific lamprey (*Entosphenus tridentatus*), a California Species of Special Concern.

The Draft IS/MND concludes that "no beneficial uses would be impacted." The Draft IS/MND does not offer a quantitative analysis as to how it determined no impacts would occur. Moreover, the Draft IS/MND does not define what it considered to be "beneficial uses." Diverting water during the dry season could reduce the availability and extent of shallow water sheet flow downstream. This could potentially impact algae, benthic invertebrates, and birds. Willow riparian habitat may be impacted if reduction in flow leads to receding shoreline or lower water depth. Preliminary work of the Los Angeles River Flows Project show that black willow (*Salix gooddingii*) seedling mortality increases as water depth decreases (SWRCB 2019). Loss of suitable habitat may impact sensitive species such as least Bell's vireo. Anadromous fish have specific habitat requirements including water depth, velocity, and vegetation.

Response 5-F

The Draft IS/MND on pages 74-78 describes the valuable biological resources existing in the Los Angeles River that are supported by consistent surface flow. The Draft IS/MND cites the One Water LA Program to substantiate the values found in the river, including all the species described in the comment. The 4 percent reduction of the current 100 cfs in the lower river channel would not reduce habitat from sheet flow in the lower reaches of the river since the flows would continue to be greater than the low flow channel and would continue to overflow and maintain the sheetflow condition. Phytoplankton and herbaceous vegetation would continue to provide a food source for benthic invertebrates, and for wading birds, as noted in the comment. The Draft IS/MND does provide a quantitative assessment of the potential effect of the proposed Program by estimating a 1.4 percent flow reduction. This small average flow reduction would not result in measurable effects to habitat values in the concrete-lined Los Angeles River either in the Arbor Reach or in the concrete-lined portion of the lower river. Furthermore, the Draft IS/MND cites the One Water LA Study that states that far more water exits the Arbor Reach under current conditions than is proposed to be diverted by the proposed Program. That is to say, since more water exits the system than is contributed by stormwater, there would be sufficient quantity of flow to meet the existing ecological demand. The Draft IS/MND concludes that the calculated flow reductions would not impact beneficial uses.

The comment cites information from a report published for the Los Angeles River Flows Project in January 2021 that provides a habitat suitability assessment for species known to occur in the Los Angeles River. The citation notes that black willow seedling mortality increases with water depth reduction. This information is extracted from a life stage suitability curve provided in the report. The Assessment Report does not provide a conclusion on the optimal water flow depth in

the Los Angeles River. Rather, the Habitat Assessment Report (SCCWRP 2021a) provides suitability curves that show a relationship with water depth and different life cycle stages for various species.

The figure below taken from that report shows that willow seedling mortality is more complex than stated in the comment: mortality is at a minimum at mean depths of around 5 cm and then increases with both reductions and increases in flow depth. In other words, germination occurs within a specific range of flow depth.

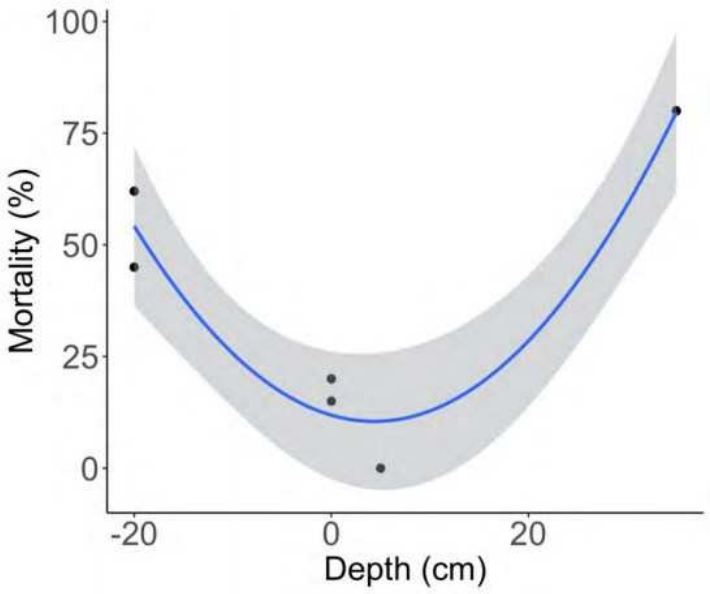

Figure 35. Habitat suitability curve of seedling mortality as a function of inundation/depth from water surface of Salix Gooddingii calculated through quadratic linear regression. Depth is defined as depth from surface i.e., -20 cm = 20 cm below surface, 20 cm = 20 cm above surface. Mean = 5 cm, p = 0.002, n=5.

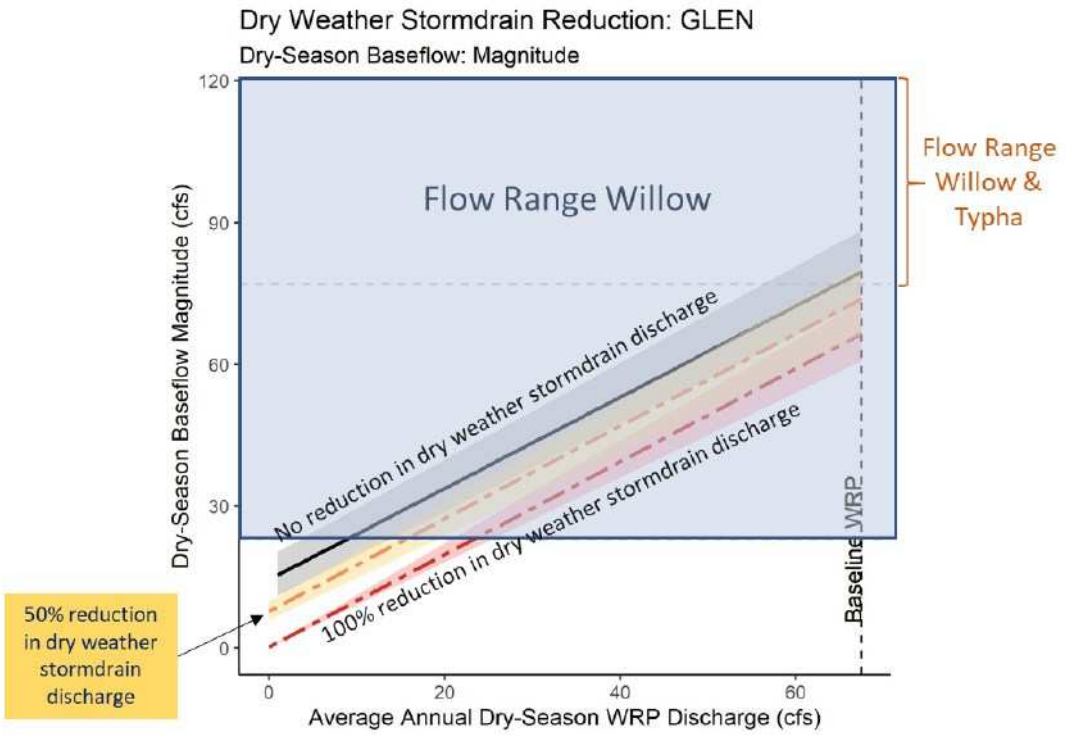
The second figure, taken from the recently published SCCWRP flow study (SCCWRP 2021b) shows that willow in the Glendale Narrows area of the Los Angeles River can sustain a wide range of flow conditions. The graph shown below from the study shows that WRP discharges could be reduced by 80 percent and still support the existing willow. The WRP flow reduction of 80 percent illustrated, from 75 cfs to 15 cfs, is an order of magnitude greater than the proposed flow reduction from the proposed Program. The graph also shows that if all urban baseflows were captured, WRP discharges could be reduced by up to 68 percent and the existing willow habitat would be maintained. That is to say, a 100 percent reduction in urban baseflow across the Los Angeles River watershed (of which the proposed Program watershed comprises 1.7 percent by area) would still allow for a 68 percent reduction in WRP flow and continue to support willow habitat. This substantiates the conclusion that the proposed Program dry weather flow reductions would not affect downstream beneficial uses significantly, and that it would be unreasonable to assume otherwise.



The effect of stormwater diversion would reduce Los Angeles River flows less than 4 cfs in the dry season, compared to the current dry season average of 75 cfs in the Arbor Reach and 100 cfs where the Los Angeles River confluences with the Pacific Ocean. The remaining flow would provide for the needs of willow and other riparian vegetation. The conclusions illustrated in the SCCWRP study for black willow show that surface water depth is not a driving factor in the suitability of black willow habitat in the Los Angeles River. The comment does not identify any other citation supporting water needs for the riparian habitats See response to comment 5-I.

Comment 5-G

Cumulative Flow Reductions: The Draft IS/MND does not analyze whether the Program would result in significant impacts when considered with other existing or proposed water diversion projects in the Los Angeles River watershed. The cities of Burbank, Glendale, and Los Angeles plan to recycle more wastewater and reduce their discharges to the Los Angeles River for this purpose (SWRCB 2019).

Response 5-G

The Draft IS/MND concludes on page 153 that the proposed Program would not result in cumulatively significant effects to the environment. This conclusion is based on the quantitative analysis that 4 percent of dry weather flow (1.4 percent of total annual flow) is too small an amount to result in an appreciable, or measurable change in the habitat values currently exhibited in the Los Angeles River. Furthermore, the City has acknowledged that cumulative flow reductions in the future may include potential reductions in WRP discharges to support regional

recycled water program objectives. To evaluate the effects of cumulative reductions in future flows that may include future diversions of WRP discharges, the SWRCB has conducted the Los Angeles River Flows Project. The study published by SCCWRP through the Los Angeles River Flows Project (SCCWRP 2021b) provides tools to all the river stakeholders to best manage the resource's beneficial uses. Future projects that may propose further diversions in dry weather flow may rely on this study to assess potential direct and cumulative effects of WRP discharge diversions. These future WRP diversions will be subject to Water Code Section 1211 Petitions, approved by the SWRCB.

In January 2021, SCCWRP published a report titled the Assessment of Aquatic Life Use Needs for the Los Angeles River Report (Assessment of Aquatic Life Report) (SCCWRP 2021a). This report characterizes habitat values in the river, and evaluates water demands of riparian and aquatic species known to occur in the river system. Habitat suitability curves have been developed for certain focal species based on the assessment. Habitat suitability curves were developed as part of a technical tool to assist the SWRCB in assessing potential WRP flow reductions in the Los Angeles River, but are not themselves flow recommendations.

The Assessment of Aquatic Life Report outlines habitat suitability criteria for three species: black willow, cattails (*Typha sp.*), and algae (*Cladophora sp.*). The study provides an overview of the cumulative effects of stormwater diversions to the overall flow in the Los Angeles River. The graphic provided in response to comment 5-F above summarizing the relationship between flow in the river and ecological water demands of willow substantiates the conclusion that the proposed Program dry weather flow reductions would not affect downstream beneficial uses significantly, and that it would be unreasonable to assume otherwise.

The City, including LADWP, is committed to maintaining a supportive role in the Los Angeles River Flows Project. See response to comment 5-I.

Comment 5-H

Diverting water from the Los Angeles River may impact biological resources downstream, especially during the dry season proceeding after a below-average water year. Impacts to any sensitive or special status species should be considered significant under CEQA unless they are clearly mitigated below a level of significance. Inadequate avoidance, minimization, and mitigation measures for impacts to sensitive or special status species will result in the Project continuing to have a substantial adverse direct, indirect, and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species by CDFW or U.S. Fish and Wildlife Service.

Response 5-H

See responses to comments 5-G and 5-I.

Comment 5-I

Mitigation Measure #1: CDFW recommends LADWP provide additional analysis and evaluation of potential impacts on biological resources as part of the final environmental document. At a minimum, an additional analysis and report should provide the following:

Study Reach

1. CDFW recommends LADWP define the study area as a 15-mile reach of the Los Angeles River, bounded by the Los Angeles River's confluence with the Tujunga Wash tributary and proceeding downstream to the river's confluence with the Arroyo Seco tributary. LADWP should identify all sources of flow input within the study area to estimate the total annual and dry season flow. LADWP should assess potential Project related impacts on biological resources within this study reach.

Changes to Hydrology and Hydraulics

1. Under pre-Project (i.e., baseline) conditions, the volume of water flow from the Tujunga Central Branch channel into the 15-mile study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). LADWP should clearly define what it would consider to be above-average or below-average rainfall year.

2. Under proposed Project conditions, the percent reduction in flow from 1) the Tujunga Central Branch channel tributary and 2) 15-mile study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.

3. An analysis of potential Project-related changes to river hydraulics in both concrete and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change). CDFW requests a map modeling potential changes to channel hydraulics overlain on a map of plant communities and habitat for sensitive wildlife species and birds.

4. A quantitative analysis comparing the flow from the Tujunga Wash, Burbank Wastewater Reclamation Plant (WRP), Tillman WRP, Verdugo Wash, and Glendale WRP, and their relative contribution to the hydrograph of the 15-mile study reach.

Biological Resources Impact Assessment

5. A map of plant communities and important bird foraging and nesting habitat occurring in the 15-mile study reach. Plant communities should be mapped at the alliance/association level using the Manual of California Vegetation, second edition (Sawyer et al. 2009). Also, CDFW recommends an updated and thorough floristic-based assessment of plant communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

6. A comprehensive list of sensitive and special status plant and wildlife species, and sensitive plant communities, occurring in the 15-mile study reach. CDFW recommends a nine-quad

search of the California Natural Diversity Database (CNDDB) for sensitive and special status biological resources that could occur downstream. For each biological resource, provide:

a. A summary of species-specific habitat requirements;

b. A discussion as to how the species or plant community may be significantly impacted directly or indirectly through habitat modification, as result of changes to hydrology (reduced flow) and hydraulics (water depth, wetted perimeter, velocity); and,

c. A quantitative analysis and/or adequate discussion to evaluate whether the Project would result in those significant impacts.

7. A discussion of whether diversion devices such as rubber dams would have direct and/or indirect impact on biological resources.

8. An adequate discussion to address how the Project may potentially affect on-going habitat recovery and restoration efforts.

9. An adequate discussion of Project-related impacts on biological resources in relation to cumulative flow reductions.

Response 5-I

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel, and that it would be unreasonable to assume otherwise. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required. However, in response to the comment and request for mitigation, the Los Angeles River Flows Project Final report (LA River Flows Project Final Report), published after the Draft IS/MND was published is incorporated by reference into this Final IS/MND. This robust hydrological, hydraulic, and ecological study of the Los Angeles River conducted by SCCWRP for SWRCB is designed to develop a set of tools and approaches to help evaluate future flow management scenarios. The Project applies the California Environmental Flow Framework (CEFF) approach to evaluating ecological flow relationships in California streams. The City is participating in the Los Angeles River Flows Project to assess how future flow diversions from WRPs may be best managed to support beneficial uses and management priorities in the river.

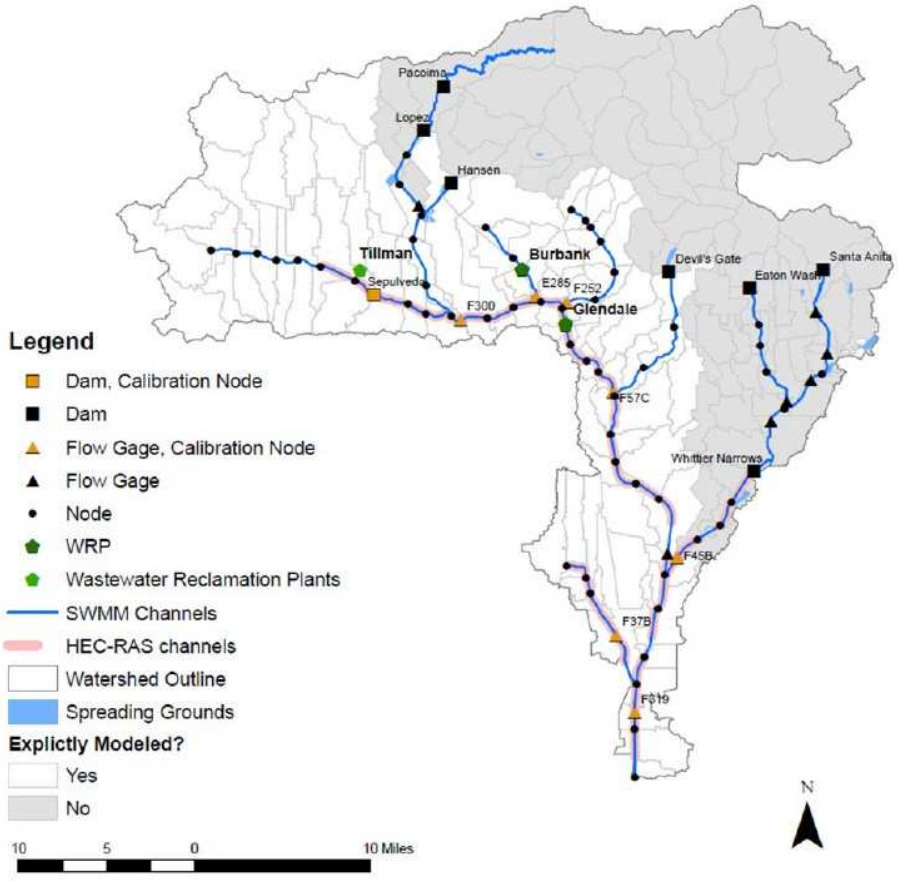
The LA River Flows Project Final Report is presented in this Final IS/MND to respond to this detailed comment. The Report was conducted over a two-year period, including input from numerous stakeholders including both LADWP and CDFW. The Report assists in evaluating the potential significance of the impacts of stormwater capture projects, such as the proposed Project, and includes all of the elements proposed in the comment and recommended mitigation measure. The following responses address each point in the comment:

Comment 5-Ia: Study Reach

1. CDFW recommends LADWP define the study area as a 15-mile reach of the Los Angeles River, bounded by the Los Angeles River's confluence with the Tujunga Wash tributary and proceeding downstream to the river's confluence with the Arroyo Seco tributary. LADWP should identify all sources of flow input within the study area to estimate the total annual and dry season flow. LADWP should assess potential Project related impacts on biological resources within this study reach.

Response to Comment 5-Ia

With respect to the Study Reach, the Los Angeles River Flows Project includes assessments of habitat values in the entire Los Angeles River from the Sepulveda Dam to the Pacific Ocean. This study area is larger than requested in the comment. The model domain included as Figure 5 in the study is included below. The Tujunga Central Branch channel confluences with the Los Angeles River at approximately node F300 shown in in the figure.

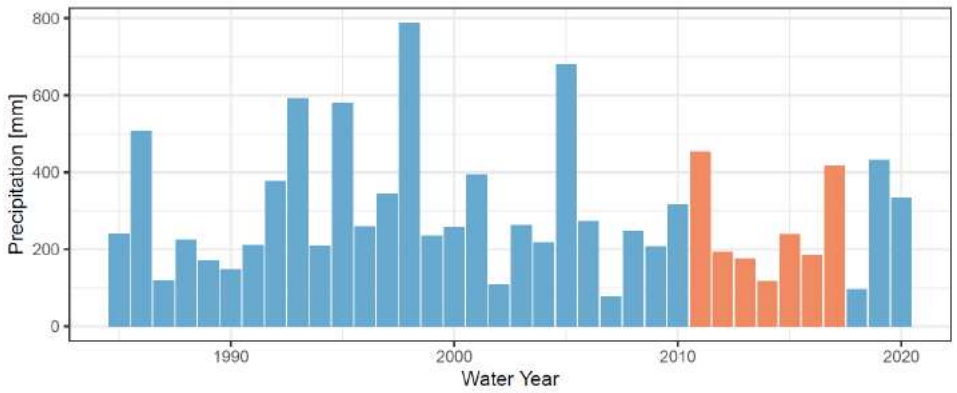


Comment 5-Ib: Hydrology and Hydraulics

2. Under pre-Project (i.e., baseline) conditions, the volume of water flow from the Tujunga Central Branch channel into the 15-mile study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). LADWP should clearly define what it would consider to be above-average or below-average rainfall year.

Response to Comment 5-Ib

With respect to Changes to Hydrology and Hydraulics, the Los Angeles River Flows Project includes results from a comprehensive modelling effort that meets all the parameters in the comment. As noted on pages 7 through 9 of the study, estimated flow conditions were modeled using a coupled hydrologic-hydraulic model created in EPA's Storm Water Management Model (SWMM) and the Hydrology Engineering Center's River Analysis System (HEC-RAS). The hydrologic model simulates discharge on the mainstem of the LA River, Compton Creek, and Rio Hondo at an hourly time step from WY 2011 through 2017. The model includes wet season and dry season discharges and uses a dry period to represent conservative flow estimates as shown in the figure below taken from Figure 3 of the study.



The one-dimensional hydraulic model was created by combining existing HEC-RAS models for the LA River and updating channel geometry and Manning's roughness based on field observations and calibration. The hydraulic model was run under steady-state conditions, which were used to develop rating curves to apply to the simulated hydrographs, producing time series hydraulic data for velocity, maximum channel depth, and shear stress.

Some excerpts from the SCCWRP 2021 report that describes the Flows Project are included here:

> *"We estimated current flow condition in the study area using a coupled hydrologic-hydraulic model created in EPA SWMM and HEC-RAS (ES-2). Current hydrologic conditions are defined as the flows and operations that occurred during water year (WY) 2011 to 2017." (SCCWRP, 2021; p ii)*

"Calculated ranges for the wet season and dry season baseflow metrics increase downstream of the three water reclamation plants, illustrating the contributions of discharges from the water reclamation plants…. The wet season metrics, baseflows from the start of the storm season to the start of the dry season, and dry season metrics, base flows from the start of the dry season to the start of the following wet season, are calculated on an annual basis. Typically, the start of the wet season is between November to January and the start of the dry season is between May to July depending on the climatic conditions for a given water year. The broader ranges and higher values of wet season baseflow metrics reflects the contribution of residual stormdrain discharge following storm events. Rio Hondo and Compton Creek both have the lowest wet season and dry season baseflow magnitudes compared to all other reporting nodes on the mainstem." (SCCWRP, 2021; p iv.)

Comment 5-Ic: Hydrology and Hydraulics

3. Under proposed Project conditions, the percent reduction in flow from 1) the Tujunga Central Branch channel tributary and 2) 15-mile study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.

Response to Comment 5-Ic

As noted Figure ES-5 of the LA River Flows Project Final Report and excerpted below, dry weather storm flow contributions are a key consideration in the study. The graph illustrates average baseline flows with the black line accompanied by a grey band that indicates the 10 percent and 90 percent percentiles. This grey shading following the black line accounts for extremely dry years. In other words, the analysis represented by this graph takes dry year and wet year flows into consideration.

The graph compares potential future combined flow reductions of both dry weather runoff and WRP reductions with habitat value impacts. The large grey box represents habitat suitability for black willow habitat. The graph shows that a small percentage decline in dry weather storm channel flows (even in very dry years) would not reduce flows in the river below suitability thresholds for willow habitat, resulting in no reductions in habitat acreage or habitat quality. (The flow range for typha [cattails] is also included in the graph to show flow requirements for typha across the entire channel width. The flow rate is needed due to the wide channel width. Less flow could support typha within a narrower side channel such as shown in the HEC-RAS cross section provided in response to comment 5-!d below)As a result, the impact would be less than significant from a direct, indirect and cumulative perspective.

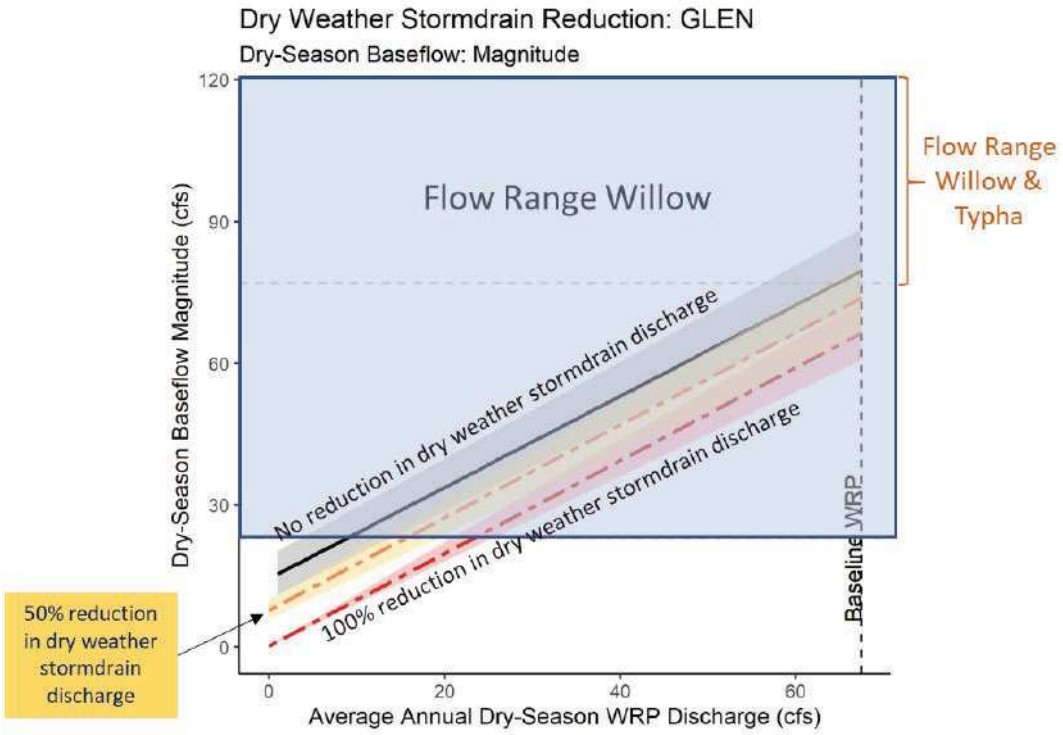


Figure ES-5. Flow-based sensitivity curves illustrating the combined effects of change in WRP discharge and 50% (yellow) and 100% reduction (red) in dry weather stormdrain discharge at GLEN reporting node. Solid and dashed lines represent median values; bounds of the gray and colored bands are the 10th and 90th percentile dry-season instream flows across the modeled period. Optimal flow range in this example is based on a 50% (medium) probability of occurrence of Willow and Typha.

Comment 5-Id: Hydrology and Hydraulics

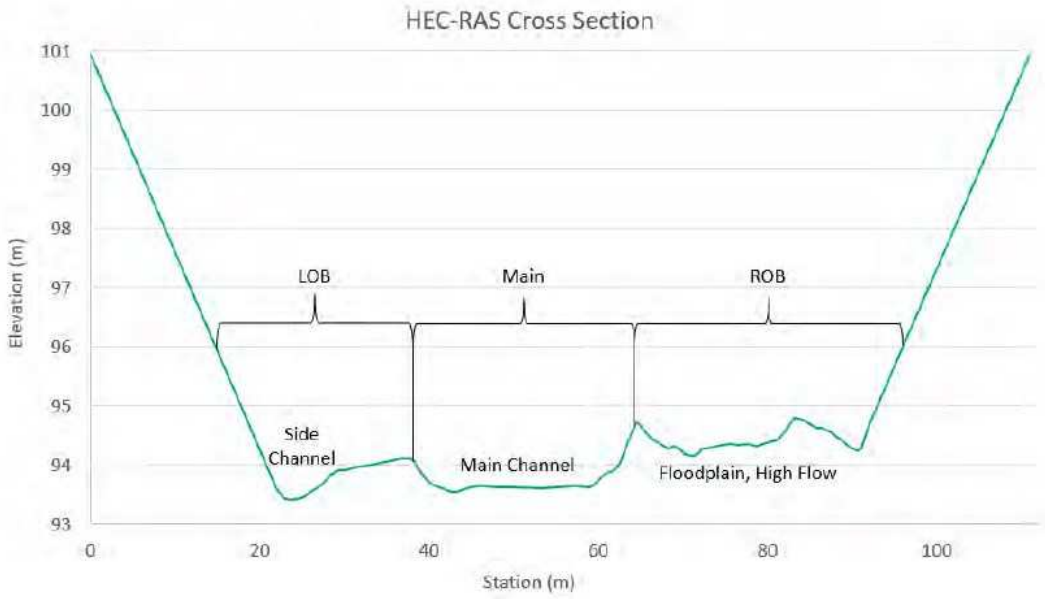
4. An analysis of potential Project-related changes to river hydraulics in both concrete and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change). CDFW requests a map modeling potential changes to channel hydraulics overlain on a map of plant communities and habitat for sensitive wildlife species and birds.

Response to Comment 5-Id

The Los Angeles River Flows Project published the "Assessment of Aquatic Life Use Needs for the Los Angeles River" (Assessment of Aquatic Life Report) in February 2021 (Stein, 2021). This document provides a detailed summary of hydraulic HEC-RAS modeling done to support the overall program objectives. Over 1,000 cross sections were generated by the HEC-RAS model in the river that show impacts of flow reductions to depth and wetted perimeter (as requested in the comment). Since the roughness of the Los Angeles river changes over time and greatly influences depth and wetted perimeter in specific locations, the model characterized typical channel dimensions and roughnesses to provide meaningful ecological-flow relationships. An excerpt from page 15 of this study is included below:

> *"Channel hydraulics (i.e., maximum channel depth, velocity, and shear stress) can vastly differ across different sections of the channel at a single site. For every soft-bottom output node in the HEC-RAS model, three output locations were selected at the three most significant morphological zones to capture the variability in hydraulics for each node and were designated as left overbank (LOB), center channel (Main), and right overbank (ROB)"*

The figure below provided on page 15 of the Assessment of Aquatic Life Report shows how channel characteristics were accommodated in the ecological-flow relationship analysis provided in the report. Habitat suitability curves were developed to reflect water depth and velocity requirements of existing habitat within these three different parts of the channel: side channel, main channel, and high floodplain. Although the Assessment of Aquatic Life Report does not provide a map of the habitat within the Los Angeles River associated with each of these cross sections, it does inventory the species and habitat values that occur within the soft-bottom portion of the river (the 15-mile segment highlighted in the comment) and presents a detailed HEC-RAS model that provides depth and width impacts associated with flow reductions at specific cross section locations that were also measured in the field for model calibration purposes. The evaluation of habitat suitability within this segment of the river (see graph provided in response to comment 5-F) is then expressed in cubic feet per second (cfs) impacts rather than depth and width in order to provide a meaningful model for the total 15 miles of the soft-bottom segment.



Comment 5-Ie: Hydrology and Hydraulics

5. A quantitative analysis comparing the flow from the Tujunga Wash, Burbank Wastewater Reclamation Plant (WRP), Tillman WRP, Verdugo Wash, and Glendale WRP, and their relative contribution to the hydrograph of the 15-mile study reach.

Response to Comment 5-Ie

As described in responses above, the Assessment of Aquatic Life Report as well as the LA River Flows Project Final Report provide a comprehensive assessment of flow in the Los Angeles River including each of the flow sources noted in the comment. The Assessment of Aquatic Life Report describes average dry season river flows in each segment of the river accounting for contributions from WRPs, groundwater, and storm drain channel inputs.

Comment 5-If: Biological Resources Impact Assessment

1. A map of plant communities and important bird foraging and nesting habitat occurring in the 15-mile study reach. Plant communities should be mapped at the alliance/association level using the Manual of California Vegetation, second edition (Sawyer et al. 2009). Also, CDFW recommends an updated and thorough floristic-based assessment of plant communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

Response to Comment 5-If

The Assessment of Aquatic Life Report provides an inventory of habitat and species occurrences within the 15-mile segment mentioned in the comment. Figure 34 of the Assessment of Aquatic Life Report reproduced below illustrates which reaches exhibit aquatic and riparian habitat values. Habitat mapping was not conducted as part of the study. Rather, flow ranges supporting habitat suitability for all aquatic values were developed, assuming that the entire 15-mile river segment may exhibit habitat values.

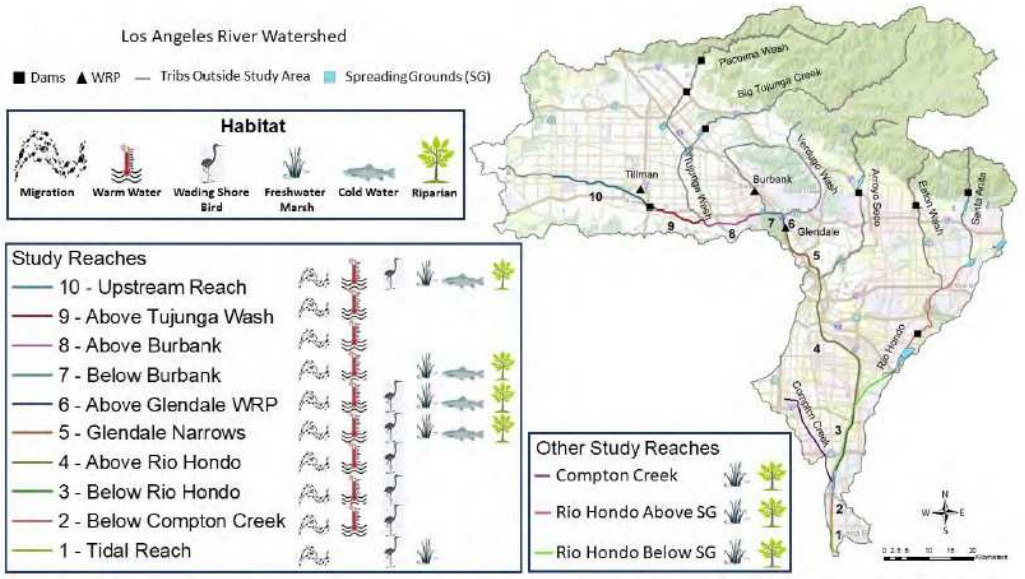


Figure 34. Map of study reaches with identified habitats that could potentially be supported in each reach.

Comment 5-Ig: Biological Resources Impact Assessment

2. A comprehensive list of sensitive and special status plant and wildlife species, and sensitive plant communities, occurring in the 15-mile study reach. CDFW recommends a nine-quad search of the California Natural Diversity Database (CNDDB) for sensitive and special status biological resources that could occur downstream. For each biological resource, provide:

    d. A summary of species-specific habitat requirements;

    e. A discussion as to how the species or plant community may be significantly impacted directly or indirectly through habitat modification, as result of changes to hydrology (reduced flow) and hydraulics (water depth, wetted perimeter, velocity); and,

    f. A quantitative analysis and/or adequate discussion to evaluate whether the Project would result in those significant impacts.

Response to Comment 5-Ig

The Los Angeles River Flows Project Final Report includes a comprehensive inventory and assessment of biological habitat values in the Los Angeles River:

> *"The overarching goal of this project is to consider potential effects of reduced WRP discharge and increased stormwater capture on existing and potential future beneficial uses. Therefore, our analysis included characterizing species and habitats that current occur and those that could reasonably occur in the future (based on a comparison to similar southern California watersheds). "(SCCWRP, 2021; p vii)*
>
> *"The aquatic life use assessment began with a compilation of observational data from the LA River and surrounding watersheds which was used to identify priority focal habitats and endmember species that represent a range of tolerances for each habitat. We then determined the flow conditions necessary to support the life history needs of each species and used those to create "flow-ecology" curves or models relating key hydrologic, hydraulic, and temperature conditions to the probability of occurrence for each focal species, or the probably of being able to complete specific life-history requirements." (SCCWRP, 2021; p vii)*

The Assessment of Aquatic Life Report provides the CNDDB listed species of concern in a concise map excerpted below. Beginning on page 38, the Assessment of Aquatic Life Report provides a summary of "life history needs" for key species within the habitat types. Habitat suitability curves are prepared based on the target vegetation's needs for water as measured by flow in the river (ie., cfs). This analysis defines future water flow reductions as the impact, and provides suitability curves to evaluate significance of the impact. The graph included in response to comment 5-F summarizes the relationship of flow in the river with habitat suitability for willow habitat. Since willow habitat (the key indicator species for riparian values in Southern California) is sustained with substantially less flow than currently exists or is projected to exist with future flow reductions, the contribution of 4 percent flow reduction resulting from the proposed project is considered cumulatively less than significant. That is to say, the scientific analysis contained in the LA Rivers Flows Project Final Report and companion study Assessment of Aquatic Life Report provide the information requested in this comment and support the conclusions of the IS/MND.

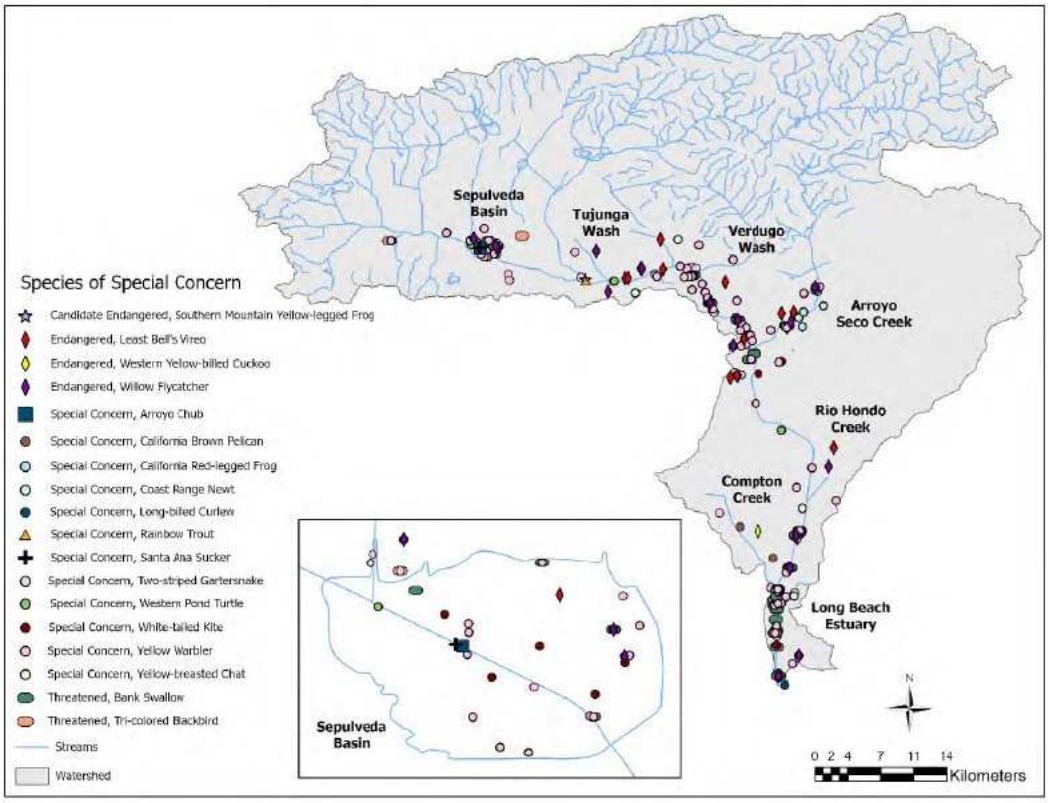

Figure 33. Species observations along the mainstem of the LA River and tributaries included in this study.

Comment 5-Ii: Biological Resources Impact Assessment

3. A discussion of whether diversion devices such as rubber dams would have direct and/or indirect impact on biological resources.

Response to Comment 5-Ii

As described on page 74 of the IS/MND, the proposed diversion structures would not impact any biological resources since they would be installed within either underground storm drain pipes or concrete box channels. The only effect to biological resources that could occur would result from reduced flow to downstream resources. No habitat would be removed as a result of the Project. As described in detail in this response to comment 5-I those effects are determined to be less than significant.

Comment 5-Ij: Biological Resources Impact Assessment

4. An adequate discussion to address how the Project may potentially affect on-going habitat recovery and restoration efforts.

Response to Comment 5-Ij

As described in this response to comment 5-I, the proposed Project would not significantly affect the habitat values within the Los Angeles River. No restoration projects are currently occurring within the river channel that would be adversely affected by the proposed Project.

Comment 5-Ik: Biological Resources Impact Assessment

5. An adequate discussion of Project-related impacts on biological resources in relation to cumulative flow reductions.

Response to Comment 5-Ik

As described in responses to comments 5-F and 5-I, the proposed Project would not significantly affect the habitat values within the Los Angeles River. The LA Flows Project Final Report provides ecology-flow relationship analysis for cumulative reductions including incremental storm flow and WRP reductions. The Project would not contribute to a cumulative reduction in habitat acreage or quality.

Comment 5-J

Mitigation Measure #2: CDFW recommends LADWP develop a discharge operation plan that would always allow sufficient water to pass downstream. CDFW also recommends LADWP develop an Adaptive Management Plan that would direct LADWP to reduce or suspend water diversion if at any point the Project may impact biological resources downstream exceeding a defined threshold/trigger.

Response 5-J

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel. Downstream ecological values would not be measurably affected by the Project. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required.

LADWP recognizes that the placement of diversion structures within streams and drainages must comply with Fish and Game Code Section 5901 which prohibits installing "any device or contrivance that prevents, impedes, or tends to prevent or impede, the passing of fish up and down stream." Fish and Game Code 5937 requires that operators of dams "allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam." Currently, no fish exist within the underground urban storm collection system or concrete box channel. The Tujunga Central Branch channel does not lead to natural stream resources at higher elevation. As a result, the channel would not provide a migratory route for steelhead spawning grounds now or in the future. The entire watershed area is urbanized, mostly within underground storm drain pipes with no ecological values. Future fish migration in the channel is highly unlikely. Furthermore, the instream diversion structures have been designed and operated to allow for storm flows to bypass the diversion mechanism. Each of the diversion structures would include a slide gate. If fish re-colonized the channel in the future these slide gates would be able to allow bypass flows. Therefore, based on the ability to allow for storm flows, the diversion structures would also be able to accommodate fish passage during periods of receding flow when migration opportunities exist, if fish were present. The project would not prevent future habitat restoration or fish occupation in the drainage. The proposed designs would

be compliant with California Fish and Game Code 5901 and 5937. Since no fish are currently in the concrete channel and dry weather flow depths do not accommodate ponding sufficient for fish to survive, there is no reason to prepare a discharge operation plan or adaptive management plan at this time.

See responses to comments 5-G and 5-I.

Comment 5-K

Mitigation Measure #3: CDFW recommends LADWP provide compensatory mitigation at no less than 3:1 for permanent impacts to the concrete-lined Tujunga Central Branch channel due to the installation of diversion structures including (but not limited to) rubber dams and channel drop inlets. CDFW also recommends LADWP provide compensatory mitigation commensurate with the permanent diversion of discharge from Los Angeles River.

Response 5-K

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required.

The purpose of compensatory mitigation for impacts to waters of the State is to ensure that habitat values and hydrologic functions are maintained at least at the level of the system prior to the initiation of the project. The current concrete channel into which the diversion structures will be placed currently provides no habitat value. Six of the diversion structures will be placed in underground reinforced concrete pipe. The City does not believe that compensation is required for placing diversion structures in underground concrete pipes or concrete channels. As noted on page 74 of the Draft IS/MND, the City will be required to obtain a Lake and Streambed Alteration Agreement (LSAA) from CDFW for the three park projects that will place diversion structures within concrete channels. See response to comment 5-N.

Comment 5-L

Recommendation #1: CDFW recommends the following data and information sources:

- Stream gage data available from Los Angeles County Public Works (LADPW 2021);
- Los Angeles River Master Plan (Geosyntec et al. 2020); and,
- Los Angeles River Flows Project (SWRCB 2019).

Response 5-L

The IS/MND (on page 74) includes annual flow estimates for the Los Angeles River provided by USACE. The data provided in the Draft IS/MND regarding flows is consistent with the river flow data provided in the references cited in the comment. The City is participating in the Los

Angeles River Flows Project which has compiled hydrologic and hydraulic data for the river. The data mentioned in the comment from the County are continuously collected and are indicative of the flow data used by the USACE to ensure flood protection for the City of Los Angeles. The recently published Los Angeles River Master Plan compiles historic river flow data consistent with the USACE and County data. All of this data is consistent with the annual flow totals cited in the IS/MND that document the percentage of flow from the Tujunga Central Branch channel. See response to comments 5-C and 5-G.

Comment 5-M

Recommendation #2: Based on the inadequacy of the Draft IS/MND as elaborated in our preceding comments, CDFW recommends that LADWP revise and recirculate the Draft IS/MND so CDFW may provide more appropriate comments on avoidance, minimization, and mitigation measures (CEQA Guidelines, § 15073.5).

Response 5-M

The comment provides no new information supporting the inadequacy of the analysis in the Draft IS/MND. Re-circulation of the Draft IS/MND is not necessary since existing evidence supports a conclusion that impacts would be less than significant, and that it would be unreasonable to assume otherwise. Furthermore, the study recently published by SCCWRP (SCCWRP 2021b) provides all of the hydrology and hydraulics data and analysis requested in the comment. The study substantiates the conclusions made in the Draft IS/MND, and satisfies CDFW's request for additional information.

Comment 5-N

The Project would potentially alter streams. The Project would divert dry season flow and stormwater. In addition, the Project proposes to install devices within and adjacent to a stream to facilitate water diversion.

The Project would divert water from the Tujunga Central Branch channel and Los Angeles River. The Project proposes to install water diversion structures within or adjacent to the Tujunga Central Branch channel. This includes inflatable rubber dams. Accordingly, the Project may obstruct water flow and change the bed and channel of a stream (confinement).

Fish and Game Code section 1602 requires any person, state or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following:

- Divert or obstruct the natural flow of any river, stream, or lake;
- Change the bed, channel, or bank of any river, stream, or lake;
- Use material from any river, stream, or lake; or,
- Deposit or dispose of material into any river, stream, or lake.

Response 5-N

The Draft IS/MND states on page 74 that the City would be required to obtain a Streambed Alteration Agreement pursuant to the California Fish and Game Code section 1602. The City will consult with CDFW to obtain a 1602 LSAA for the Program sites that include construction of diversions structures at the Tujunga Central Branch channel. Installation of diversion structures into underground storm drain pipes may require notification, but would not likely result in the need for a full LSAA. The table below identifies LADWP's assumptions of which Program sites may require a LSAA LADWP understands that CDFW will ultimately determine which of these sites will require a LSAA based on information in the initial notification.

Infiltration Gallery Location	Diversion Structure Installation	LSAA Required?
David M. Gonzales Recreation Center	Underground Storm Drain Pipe	No
FernAngeles Park	Underground Storm Drain Pipe	No
Whitsett Fields Park North	Underground Storm Drain Pipe	No
Strathern Park North	Underground Storm Drain Pipe	No
Valley Plaza Park North	Underground Reinforced Concrete Box Culvert	No
Valley Plaza Park South	Concrete Channel	Yes
Alexandria Park	Concrete Channel	Yes
North Hollywood Park	Concrete Channel	Yes
Valley Village Park	Underground Storm Drain Pipe	No

Comment 5-O

Mitigation Measure #1: CDFW has concluded that the [Program] may result in the alteration of streams. As such, the applicant (or "entity") must provide notification to CDFW pursuant to Fish and Game Code, section 1600 *et seq*. Based on this notification and other information, CDFW determines whether an LSAA with the applicant is required prior to conducting the proposed activities. Please visit CDFW's Lake and Streambed Alteration Program webpage to for information about LSAA Notification and online submittal through the Environmental Permit Information Management System Permitting Portal (CDFW 2021a).

Response 5-O

The Draft IS/MND states on page 74 that the City would be required to obtain a LSAA pursuant to the California Fish and Game Code section 1602. A new mitigation measure requiring compliance with regulations is not needed. The City will consult with CDFW to obtain a 1602 LSAA for the Program sites that include construction of diversions structures at the Tujunga Central Branch channel (see table in response 5-N).

Comment 5-P

Mitigation Measure #2: CDFW recommends the LSAA Notification include a hydrological evaluation of the 200, 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions.

Recommendation: CDFW's issuance of an LSAA for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from LADWP for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 *et seq*. and/or under CEQA, the CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSAA. As such, CDFW recommends LADWP consider CDFW's comments and revise the Draft IS/MND. To compensate for any on- and off-site impacts to aquatic and riparian resources, additional mitigation conditioned in any LSAA may include the following: erosion and pollution control measures, avoidance of resources, protective measures for downstream resources, on and/or off-site habitat creation, enhancement or restoration, and/or protection, and management of mitigation lands in perpetuity.

Response 5-P

The Draft IS/MND states on page 74 that the City would be required to obtain a LSAA pursuant to the California Fish and Game Code section 1602(See response to comment 5-N). Hydrologic assessments have been conducted for each of these park projects to determine the capacity of the infiltration galleries and the quantity of feasible wet weather diversions. The rubber dam diversion structures would be lowered when flow rates exceeded the diversion capacity, allowing most of the storm flows in larger storms (including the 2, 5, 10, 25, 50, 100, and 200 year storms) to bypass the diversions. Additional modeling is not necessary to make this conclusion.

Comment 5-Q

CDFW is concerned that the Program may result in significant impacts to bats, including hoary bat (*Lasiurus cinereus*) and silver haired bat (*Lasionycteris Octavian's*).

The Program may result in direct and indirect impacts to bats. Direct impacts include removal of trees and that may provide roosting habitat. Indirect impacts to bats and roosts could result from increased human activity, noise disturbances, dust, vegetation clearing, ground-disturbing activities (e.g., staging, mobilizing, excavating, and grading), and vibrations caused by heavy equipment.

Native and non-native ornamental trees at each park could provide potential roosting habitat for bats. Bats can fit into very small seams, as small as a ¼ inch. Therefore, crevices in buildings and other man-made structures within and adjacent to each park could provide roosting habitat for bats. Despite the availability of potential roosting habitat, the Program concludes that there would not be significant impacts to bats.

Page 60 of Appendix B concludes that while bats "may use western sycamore trees to roost, special-status bat species including hoary bat and silver-haired bat have low potential to occur within all of the project locations, since they are situated in an urban environment with constant ambient nighttime lighting (e.g., street lights, baseball field lights)." The presence of constant ambient lighting may be insufficient to conclude that bats do not occur. Bat response to artificial lighting could vary between species and not all bat species are repelled by light (Longcore and Rich 2004; Opéra et al. 2009). Faster-flying species of bats are attracted to insects that congregate around light sources (Longcore and Rich 2004). Foraging is still possible in the presence of ambient lighting, although forging may be reduced. Also, based on Program site photos in Appendix B, it appears that not all areas within certain parks are illuminated, for instance Valley Plaza North and Valley Plaza South. Based on the above, the probability of bats occurring within each park could be higher than previously concluded.

Accordingly, if bats are present, extra noise, vibration, or the reconfiguration of large objects can lead to the disturbance of roosting bats. Human disturbance can also lead to a change in humidity, temperatures, or the approach to a roost that could force the animals to change their mode of egress and/or ingress to a roost. Modifications to roost sites can have significant impacts on the bats' usability of the roost and can impact the bats' fitness and survivability (Johnston et al. 2004). Although temporary, such disturbances can lead to the abandonment of a maternity roost (Johnston et al. 2004).

Response 5-Q

The Draft IS/MND identifies on page 73 that removal of trees may affect wildlife commonly found in the parks, including bat species, although the Draft IS/MND concludes that the potential for encountering bat roosts in the affected trees is low. Nonetheless, in response to this comment, Mitigation Measure BIO-1 has been modified to require that bat surveys be conducted at each of the Program sites to ascertain whether bats are utilizing the trees to be removed by the Program. With this modification to the BIO-1 mitigation measure, impacts to bats would remain less than significant.

The following text is added to Mitigation Measure BIO-1:

- Prior to removal of trees in any of the Program sites, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the Program sites. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

Comment 5-R

Bats are considered non-game mammals and are afforded protection by State law from take and/or harassment (Fish & G. Code, § 4150; Cal. Code of Regs, § 251.1). Additionally, several bat species are considered Species of Special Concern and meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). Take of SSC could require a mandatory finding of significance by the Lead Agency (CEQA Guidelines, § 15065).

Response 5-R

See response to comment 5-Q.

Comment 5-S

Mitigation Measure #1: Where Program-related implementation, construction, and activities would occur near potential roosting habitat for bats, CDFW recommends a qualified bat specialist conduct bat surveys within these areas (plus a 100-foot buffer as access allows) in order to identify potential habitat that could provide daytime and/or nighttime roost sites, and any maternity roosts. CDFW recommends using acoustic recognition technology to maximize detection of bats. A discussion of survey results, including negative findings should be provided to LADWP. Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the LADWP prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats.

Response 5-S

Mitigation Measure BIO-1 has been modified to accommodate CDFW suggested mitigation requirements. See response to comment 5-Q.

Comment 5-T

Mitigation Measure #2: If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed down using heavy machinery rather than felling with a chainsaw. To ensure the optimum warning for any roosting bats that may still be present, trees should be pushed lightly two or three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. The tree should then be pushed to the ground slowly and remain in place until it is inspected by a bat specialist. Trees that are known to be bat roosts should not be bucked or mulched immediately. A period of at least 24 hours, and preferable 48 hours, should elapse prior to such operations to allow bats to escape.

Response 5-T

Mitigation Measure BIO-1 provides for bat surveys to confirm that bats are not using the trees. If bats are encountered the City will consult with CDFW to ensure an effective bat removal effort in compliance with the California Fish and Game Code. Bats will not be removed from the Program sites without prior CDFW approval. No additional tree removal techniques would be required. No new mitigation is required.

Comment 5-U

Mitigation Measure #3: If maternity roosts are found, to the extent feasible, work should be scheduled between October 1 and February 28, outside of the maternity roosting season when young bats are present but are yet ready to fly out of the roost (March 1 to September 30).

Response 5-U

Mitigation measure BIO-1 has been modified to require approval from CDFW if bats are found to be using the affected trees. As part of any bat removal effort that may be necessary, seasonality of the removal will be a consideration. No additional mitigation measure is required.

Comment 5-V

Mitigation Measure #4: If maternity roosts are found and LADWP determines that impacts are unavoidable, a qualified bat specialist should conduct a preconstruction survey to identify those trees proposed for disturbance that could provide hibernacula or nursery colony roosting habitat. Acoustic recognition technology should be used to maximize the detection of bats. Each tree identified as potentially supporting an active maternity roost should be closely inspected by the bat specialist no more than 7 days prior to tree disturbance to determine the presence or absence of roost bats more precisely. If maternity roosts are detected, trees determined to be maternity roosts should be left in place until the end of the maternity season. Work should not occur within 100 feet of or directly under or adjacent to an active roost. Work should also not occur between 30 minutes before subset and 30 minutes after sunrise.

Response 5-V

As noted in response to comment 5-Q, mitigation measure BIO-1 has been modified to include bat presence surveys. If bats are found, the mitigation measure would require that the City implement a bat removal program in consultation with CDFW.

Comment 5-W

Devices Impeding Fish. The Program includes installation of rubber dams in the stream channel. Per California Fish and Game Code section 5901, it is unlawful to construct or maintain in any stream any device or contrivance the prevents, impedes, or tends to prevent or impeded, the passing of fish up and downstream. Accordingly, LADWP should coordinate with CDFW prior to commencing the Program to ensure that the Program would comply with Fish and Game Code section 5901.

Response 5-W

The concrete pipeline and channel do not support fish species. The Program would not install any devices that would impede fish migration since fish do not occur in the concrete channel and underground pipeline associated with the Tujunga Central Branch channel. The primary impediment for migrating fish under existing conditions is the velocity of the fast-moving storm water in confined pipelines and channels and the lack of refugia habitat at the channel edges. Nonetheless, the in-channel devices for four of the Program sites will require an LSAA from CDFW. The City will consult with CDFW to ensure diversion structures are compliant with Fish and Game Code section 5901.

Comment 5-X

Southern California Black Walnut Tree (*Juglans californica*). According to page 73 in the Draft IS/MND, one Southern California black walnut tree may be removed at North Hollywood Park. Southern California black walnut is a California Rare Plant Rank 4.2 species. If removal of Southern California black walnut is required, CDFW recommends LADWP replace each tree at no less than 3:1 in consideration of the species rarity, temporal loss of black walnut tree canopy and structure while the tree grows, and potential attrition associated with transplanting. Southern California black walnut trees should be replaced with trees of the same species.

Response 5-X

As noted on pages 78-80 of the Draft IS/MND, any protected tree required to be removed would be replaced with 24-inch box size specimens of the same tree species at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and the RAP's Tree Preservation Policy.

Comment 5-Y

Tree Replacement. In the greater Los Angeles, urban forests and street trees, both native and some non-native species, provide habitat for a high diversity of birds (Wood and Esaian 2020). Some species of raptors have adapted to and exploited urban areas for breeding and nesting (Cooper et al. 2020). For example, raptors (Accipitridae, Falconidae) such as red-tailed hawks (*Buteo jamaicensis*) and Cooper's hawks (*Accipiter cooperii*) can nest successfully in urban sites. Red-tailed hawks commonly nest in ornamental vegetation such as eucalyptus (Cooper et al. 2020). CDFW recommends planting native tree species preferred by birds. This includes coast live oak (*Quercus agrifolia*) and California sycamore (*Platanus racemosa*) (Wood and Esaian 2020). CDFW recommends Audubon Society's Plants for Birds for more information (Audubon Society 2020).

Response 5-Y

The proposed Program would require the removal of existing trees; however, the removal of trees would be replaced on a trunk caliper size basis, 1-inch replaced to 1-inch removed. As noted on pages 78-80 of the Draft IS/MND, any protected tree required to be removed would be replaced

with 24-inch box size specimens at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and RAP's Tree Preservation Policy. The replacement trees would be planted near the original tree's location, but if there is not adequate space, the City would coordinate with RAP to identify the closest appropriate locations for new plantings. Mitigation Measure BIO-1 is included in the Draft IS/MND to ensure construction activities do not disturb nesting birds. The requirement to replace mature trees would encourage future nesting opportunities for raptors.

Comment 5-Z

Landscaping. CDFW strongly recommends avoiding non-native, invasive plants. CDFW recommends LADWP restrict use of any species, particularly 'Moderate' or 'High' listed by the California Invasive Plant Council (Cal-IPC 2020a). CDFW recommends LADWP use native species found in naturally occurring vegetation communities within or adjacent to the Program sites. Information on alternatives for invasive, non-native, or landscaping plants may be found on the California Invasive Plant Council's, Don't Plant a Pest webpage for southern California (CalIPC 2020b). The California Native Plant Society's Gardening and Xerces Society's PollinatorFriendly Native Plant Lists webpage has information on native plant species that invite insects and pollinators (CNPS 2020; Xerces Society 2020).

Response 5-Z

As noted in the project description, each of the Program sites will be re-landscaped following the installation of the stormwater capture infrastructure. The landscaping plans will use primarily native species to the extent feasible, per RAP landscaping guidelines.

Comment 5-AA

Move Out of Harm's Way. The proposed Program is anticipated to result in clearing of habitats that support wildlife species common in developed areas. CDFW recommends a qualified biological monitor be on site during initial ground disturbing activities and vegetation removal. The qualified biological monitor should move wildlife of low mobility out of harm's way to avoid wildlife injury or mortality.

Response 5-AA

Mitigation Measure BIO-1 would ensure that impacts to any avian species currently utilizing the Program sites would be avoided. As required in mitigation measure BIO-1, contractors will be encouraged to remove vegetation outside of the affected avian or bat nesting seasons. If nesting season cannot be avoided, the mitigation measure provides for measures to ensure impacts to nesting birds is avoided, including delaying activities if necessary. Since the Program sites do not support any native habitat values, a biological monitor is not recommended other than for nesting birds as required in mitigation measure BIO-1.

Comment 5-AB

Data. CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database (i.e., California Natural Diversity Database) which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDB Field Survey Forms (CDFW 2020b). LADWP should ensure the data has been properly submitted, with all data fields applicable filled out, prior to finalizing/adopting the environmental document. LADWP should provide CDFW with confirmation of data submittal.

Response 5-AB

The City acknowledges that survey data identifying special status species should be provided to the CDFW. Appendix B of the Draft IS/MND includes a Biological Technical Report prepared for the Program.

Comment 5-AC

Mitigation and Monitoring Reporting Plan. CDFW recommends LADWP update the Program's proposed Biological Resources Mitigation Measures and condition the environmental document to include mitigation measures recommended in this letter. CDFW provides comments to assist LADWP in developing mitigation measures that are specific, detailed (i.e., responsible party, timing, specific actions, location), and clear in order for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (CEQA Guidelines, § 15097; Pub. Resources Code, § 21081.6). LADWP is welcome to coordinate with CDFW to further review and refine the Program's mitigation measures. Per Public Resources Code section 21081.6(a)(1), CDFW has provided LADWP with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A).

Response 5-AC

The City will adopt the MMRP when approving the Final IS/MND that will include implementation of Mitigation Measure BIO-1.

Comment 5-AD

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by LADWP and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required for the underlying Project approval to be operative, vested, and final (Cal. Code Regs., tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

Response 5-AD

The City recognizes that the CDFW filing fee for this IS/MND is applicable and the appropriate funds will be included with the Notice of Determination (NOD) when filed with the County Clerk as required by the CEQA Guidelines Section 15094.

Comment 5-AE

The comment includes a table with all of the CDFW proposed Mitigation Measures outlined in the letter.

Response 5-AE

As discussed in the responses to comments 5-A through 5-AE, no new mitigation measures are needed to ensure less than significant effects to biological resources. The MMRP will include the modified Mitigation Measure BIO-1 that reflects CDFW's comments on bat species.

Letter 6: Diana Nicole (Sunshine Hills Residents Association)

Comment 6-A

The commenter expresses concern regarding the diversion of City plans, codes, and funds from parks and tree-oriented initiatives toward green infrastructure.

Response 6-A

The comment does not state a specific concern about the adequacy of the Draft IS/MND or otherwise comment on the contents of the Draft IS/MND analysis. The comment is noted and will be included in the Program record, but a response is not required pursuant to CEQA.

Comment 6-B

The commenter expresses concern regarding the depletion of existing trees/urban forest resources as a result of the Program.

Response 6-B

Once the stormwater capture infiltration galleries are installed, the Program sites will be returned to preconstruction condition with park improvements. The park improvements will include but are not limited to, the addition of green infrastructure elements such as landscape areas with California native drought-tolerant plant material, new irrigation system, shade trees, new lighting. The proposed Program would require the removal of existing trees; however, the removal of trees would be replaced on a trunk caliper size basis, 1-inch replaced to 1-inch removed. Any protected tree required to be removed would be replaced with 24-inch box trees at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and the RAP's Tree Preservation Policy. The replacement trees would be planted near the original tree's location, but if there is not adequate space, the City would coordinate with RAP to identify the closest appropriate locations for new plantings.

Comment 6-C

The commenter states that the City's protected trees, groves, and related habitat should be subject to higher conservation standards than those that are provided in the Draft IS/MND.

Response 6-C

The City would comply with the existing tree ordinance. See response to 6-B above.

Letter 7: County of Los Angeles Fire Department

Comment 7-A

The commenter provides introduction of the County of Los Angeles Fire Department.

Response 7-A

The comment is noted and will be included in the Program record.

Comment 7-B

The commenter states that since the Program is within the City, the Program would not impact the County of Los Angeles Fire Department.

Response 7-B

The comment is noted and will be included in the Program record.

Comment 7-C

The commenter states that the Program would not have an impact on the County Fire Department Land Development Unit.

Response 7-C

The comment is noted and will be included in the Program record.

Comment 7-D

The comment states that under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the Oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured 4 1/2 feet above mean natural grade.

Response 7-D

The Draft IS/MND describes the Oak Tree Ordinance in detail on pages 78-81. The Draft IS/MND concludes that compliance with the ordinance and RAP's Tree Preservation Policy would ensure that impacts to mature trees would not result in significant impacts.

Comment 7-E

The commenter states that the Program would not impact the Health Hazardous Materials Division.

Response 7-E

The comment is noted and will be included in the project record.

Letter 8: Joanne D'Antonio

Comment 8-A

The commenter raises objection to the proposed removal of any mature and healthy trees, most notably the eucalyptus grove at North Hollywood Park. The commenter states that this park has experienced great tree loss during the drought and that all parks are important for the physical and psychological health of residents. They provide much needed shade in the heat-island-effect-plagued San Fernando Valley. The commenters asks where the wildlife will go during construction and how disruptive construction noise may be.

Commenter would like to see the project redesigned to not remove any trees and references several reports on biodiversity and the loss of trees and tree canopy by the City of Los Angeles and Tree People.

Response 8-A

All nine project sites are currently located within developed City parks containing active recreational facilities or open disturbed areas. All nine park project sites will undergo some enhancements and improvements to the park aesthetic and recreational facilities after the installation of the projects. As stated in the IS/MND page 7, park enhancements and improvements are being designed with input from RAP and the community. The City has been coordinating the design effort with RAP and has engaged the local community through several community meetings to solicit input. Conceptual design drawings were included in the IS/MND as Figures 1-4 through 1-12 to depict the current preliminary design associated with each park project site. The stormwater capture facilities are mainly being placed beneath existing ball fields, where feasible, to minimize impacts to landscaped areas within the park. The designs for each park attempt to minimize tree removal where feasible, but as stated in section 2.4, Biological Resources, some trees will be removed in compliance with the City of Los Angeles Tree Protection Ordinance and the RAP Tree Preservation Policy for protection of native and non-native trees. The City has been in coordination with the RAP Forestry Division and none of the parks' mature or healthy trees will be removed without their approval. Revisions to the park designs are being made in coordination with RAP in order to preserve mature trees and any other trees deemed sacred by RAP. RAP has identified two eucalyptus trees at North Hollywood Park that have died and have requested these be removed as part of the project. Tree surveys will be conducted at each part project site prior to tree removal to determine which trees are protected and which trees would need replacement under the RAP Tree Preservation Policy. Further, Mitigation Measure BIO-1was included to protect wildlife species from impacts during

construction. This mitigation measure will require construction activities to occur outside of the nesting bird season or to avoid or minimize impacts to nesting birds and raptors by requiring preconstruction surveys and nest avoidance and/or monitoring during construction.

The City acknowledges that the City of Los Angeles is considered a biodiversity hotspot. As stated in the 2020 Biodiversity Report prepared by the City of Los Angeles and referenced by the commenter, the Program area would fall primarily within Ecotope 20: Los Angeles River Alluvial Plain. As shown in Appendix B, page 428 of the report, only 0.5 percent of the natural vegetation remains across the ecotope, mostly within the Sepulveda Basin. Riparian vegetation is the dominant remaining type of vegetation and provides nesting habitat for the federally endangered least Bell's vireo (*Vireo bellii pusillus*) and potentially the southwestern willow flycatcher (*Empidonax traillii extimus*). The Program site does not include riparian vegetation and is located in an area that is surrounded by a vegetation alliance characterized by urban/developed, and falls mostly within areas characterized by non-native alliances. In addition, the program site is not located within an area characterized as a natural area by the study, and it is located within areas with higher pollution and population percentiles and a lower habitat quality score due to the urban nature of its location. (City of Los Angeles 2020, pages 436 through 442) As such, although the City of Los Angeles is rich in biodiversity, construction within the Program area would not add to the decline of biodiversity in the area.

Comment 8-B

The commenter requests that all trees in the vicinity of construction be protected with orange fencing and no construction material placed under the drip line.

Response 8-B

The construction impact areas will be clearly delineated and trees to be retained will be clearly marked to avoid any impacts to them. As stated in Response 8-A, the City will comply with the City of Los Angeles Tree Protection Ordinance and the RAP Tree Preservation Policy for protection of native and non-native trees that are being retained onsite and/or are being removed.

The RAP Tree Preservation Policy is the primary regulatory tool that gives direction for orderly protection of specified trees, maintains their value, and avoids significant negative effects to the ecosystem. By assuring preservation and protection through regulation and standards of care, these resources will remain significant contributions to the environment and landscape, and continue to add to the unique character of Los Angeles City Parks. (RAP 2004).

As outlined in the Policies for the Installation and Preservation of Landscaping Trees on Public Property of Recreation and Parks Department, included as Appendix M of the City of Los Angeles RAP Urban Forest Program (RAP 2004), "whenever trees are removed, the existing trees' aggregate diameter, measured at breast height (DBH [diameter at breast height], or 4.5-feet above the ground; multi-trunk trees are to be measured immediately below the lowest trunk) shall be replaced at an equal or greater rate of caliper of new trees. Each one-inch DBH of existing tree shall be replaced with a minimum one-inch caliper new tree." For example, if an existing tree with a DBH of 24 inches is removed, the City would need to replace that tree with a newly

planted trees with a total DBH of 24 inches. The replacement tree can have a DBH of 24 inches or if smaller trees are planted, with a DBH of 2 inches, then 12 trees would be planted, or any combination that equates to the 24-inch DBH being replaced.

Comment 8-C

The commenter is concerned about imported soil and improper soil being substituted for naturally occurring soil which create the best environment for replanting. The commenter asks if there is a plan for replanting at the parks to be done with viable new trees. The commenter states that ideally construction projects such as these would not be happening in our parks.

Response 8-C

As stated on page 38 of the IS/MND, once installation of the stormwater system is complete, soils excavated from the site that are stockpiled on-site would be used to backfill the impact areas. Additional imported soils would be used to regrade as needed to return the project impact areas to pre-project conditions. The City will ensure that the soil to backfill the impacted areas would be suitable for the required design elements as shown on preliminary Figures 1-4 through 1-12 of the IS/MND including landscape planting. The City is coordinating with RAP to ensure compliance with park requirements.

Comment 8-D

The commenter states that a one-month comment period is too short to get input from neighborhood councils.

Response 8-D

The comment is noted and will be included in the project record. The CEQA Guidelines require that MNDs be circulated for a total of 30 days per Section 15105(b).

4.2 Changes Made to the Draft IS/MND

The City has made the following changes to the Draft IS/MND and has incorporated them into the Final IS/MND. These modifications clarify, amplify, or make minor changes to the Draft IS/MND. Revisions to the Draft IS/MND have not resulted in new significant impacts or increased the severity of an impact.

Where the responses indicate additions or deletions to the text of the Draft IS/MND, additions are included as <u>underlined text</u>, deletions as ~~stricken text~~. The changes are listed by section and page number.

4.2.1 Changes Made in Response to Comments

Clarification/Revision

The following modifications have been made to page 75 of the Draft IS/MND to augment Mitigation Measure BIO-1 for the inclusion of bat surveys.

Section 2.4, Biological Resources – Page 75

Mitigation Measure

BIO-1: Special-Status Wildlife Species. Construction activities at any of the nine park project sites could result in impacts to the Cooper's hawk (*Accipiter cooperii*), a California Species of Special Concern, where mature trees are present. Similarly, construction activities may also impact other nesting bird species that may nest in a variety of vegetation as well as man-made structures. Construction activities should occur outside of the avian nesting season. If the avian nesting season cannot be avoided and construction or vegetation removal occurs from February 1 to September 1, the City ~~project~~ shall implement the following to avoid and minimize impacts to nesting birds and raptors:

- During the avian breeding season, a qualified biologist shall conduct a preconstruction avian nesting survey no more than 7 days prior to vegetation disturbance or ground-disturbing activities. If construction begins in the non-breeding season and proceeds continuously into the avian nesting season, no surveys are required. However, if there is a break of 7 days or more in construction activities during the nesting season, a new nesting bird survey shall be conducted before construction begins again.
- The preconstruction survey shall cover all reasonably potential nesting locations on and within 100 feet of the construction areas. A 300-foot radius shall be surveyed in areas containing suitable habitat for nesting raptors, such as trees and utility poles.
- If an active nest is found during the preconstruction avian nesting survey, a qualified biologist shall designate a suitable buffer for all passerine birds and raptor species. The nest site area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the project. Buffer areas may be increased upon recommendation of a qualified biologist if any endangered, threatened, California Fully Protected, or California Species of Special Concern are identified during preconstruction surveys.
- If the nest(s) are found in an area where ground disturbance is scheduled to occur, the City or its contractor shall avoid the area by delaying ground disturbance in the area until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.
- Prior to removal of trees in any of the Program sites, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the Program sites. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

4.2.2 Changes Made by the Lead Agency

Clarification/Revision

The following modifications have been made to page 1 of the Draft IS/MND to include The Metropolitan Water District of Southern California (Metropolitan) as a Responsible Agency of the Program.

Section 1.0, Project Description – Page 1

1.1 Introduction

The City of Los Angeles Department of Water and Power (LADWP), Department of Public Works (Bureau of Engineering [BOE]), Los Angeles Sanitation and Environment (LASAN), and City of Los Angeles Department of Recreation and Parks (RAP), collectively referred to herein as the City, propose to implement the Stormwater Capture Parks Program (Program). The Program would include construction of stormwater capture facilities at nine City-owned parks to help capture surface flow and divert stormwater runoff from the Tujunga Wash Central Branch storm drain to recharge the San Fernando Groundwater Basin. All nine parks are located in the east San Fernando Valley along State Route (SR) 170 (**Figure 1-1**); these parks include: David M. Gonzales Recreation Center; Fernangeles Park; Strathern Park North; Whitsett Fields Park North; Valley Plaza Park North; Valley Plaza Park South; Alexandria Park; North Hollywood Park; and Valley Village Park (**Figure 1-2**).

The City is proposing to obtain financial assistance for the park projects through the Stormwater for Recharge Pilot Program (Recharge Pilot) that is administered by The Metropolitan Water District of Southern California (Metropolitan). The Recharge Pilot encourages development and monitoring of new and existing stormwater recharge projects by providing financial incentives for construction and/or monitoring equipment installation of project and supplemental reporting costs.

Metropolitan offers different incentive amounts for the Recharge Pilot based on project type (New Construction or Monitoring Equipment Installation):

<table>
<tr><td>PROJECT TYPE</td><td colspan="2">FUNDING COMPONENTS</td></tr>
<tr><td></td><td>Construction/Installation</td><td>Monitoring & Reporting</td></tr>
<tr><td rowspan="2">Monitoring Equipment Installation</td><td>Up to $350,000 reimbursement for eligible costs</td><td>$50,000/report</td></tr>
<tr><td colspan="2">Maximum of $500,000</td></tr>
<tr><td rowspan="2">New Construction</td><td>Up to 50% reimbursement of eligible costs, max of $850,000</td><td>$50,000/report</td></tr>
<tr><td colspan="2">Maximum of $1 million</td></tr>
</table>

The City has chosen the New Construction Project Type.

As a Responsible Agency, Metropolitan's Board of Directors will review and consider the proposal and environmental documentation prepared by the City in determining whether or not to approve financial assistance for the Program within the Recharge Pilot administrative process.

The Program would be consistent with Metropolitan's commitment to develop Recharge Pilot activities that would provide a better understanding of the connection between captured stormwater and water supply yield.

Clarification/Revision

The following modifications have been made to pages 82 and 83 of the Draft IS/MND to update the name of the library.

Section 2.5, Cultural Resources – Pages 82 and 83

Page 82

Less than Significant Impact with Mitigation. The cultural resources assessment identified three historic architectural resources within the Program area. These resources include: the David M. Gonzales Recreation Center featuring a clubhouse building dating to the park's period of significance of 1950 located approximately 65 feet from the Program construction footprint; North Hollywood Park featuring a maintenance building and pool house (65 feet and 100 feet from the Program construction footprint, respectively) and the North Hollywood Amelia Earhart Regional ~~Branch~~ Library (located 100 feet from the Program construction footprint) dating to the park's period of significance of 1928–1931; and the 170 Freeway Pedestrian Overpass connecting Valley Plaza Park North and Whitsett Fields Park North located approximately 90 feet from a proposed diversion structure in Valley Plaza Park North. The North Hollywood Amelia Earhart Regional ~~Branch~~ Library is National Register of Historic Places (NRHP)-listed and, therefore qualifies as a historical resource.

Page 83

Mitigation Measures

CUL-1: In the event Program designs are further refined and individual Program site components change to encroach more closely than 50 feet to the North Hollywood Amelia Earhart Regional ~~Branch~~ Library (P-19-167303), the pool house and maintenance building associated with North Hollywood Park, the clubhouse associated with the David M. Gonzales Recreation Center, and/or the 170 Freeway Pedestrian Overpass, the City shall retain a qualified architectural historian meeting the Secretary of the Interior's Standards for Architectural History to review design plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards). Should potential Program redesign not conform to the Standards, the City shall work with the qualified architectural historian to mitigate impacts to these resources. Should Program redesign place Program components within 50 feet of these resources, the qualified architectural historian shall also assess potential construction-related impacts resulting from ground-borne vibration. Should ground-borne vibrations have the potential to impact the historical resources, the City and the qualified architectural historian shall develop a plan to monitor ground-borne vibration during construction to ensure it does not exceed thresholds that could damage, or otherwise alter the historical resources.

SECTION 5
Mitigation Monitoring and Reporting Program

The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Program has been prepared in accordance with Public Resources Code section 21081.6 and State CEQA Guidelines section 15091(d). The City will use this MMRP to track compliance with the Program mitigation measures. The City will consider the MMRP during the certification hearing for the Final IS/MND. The MMRP will incorporate all mitigation measures adopted for the proposed Program.

This MMRP summarizes potentially significant impacts and mitigation commitments identified in the Stormwater Capture Parks Program IS/MND. Table 5-1 provides the MMRP which includes all mitigation measures, monitoring/reporting action, monitoring timing, and responsible person(s) for implementation. Impacts and mitigation measures are presented in the same order as in the IS/MND. The columns in the table provide the following information:

- **Mitigation Measures:** The action(s) that will be taken to reduce the impact to a less-than-significant level.
- **Monitoring /Reporting Action:** This column outlines the appropriate steps to implement and verify compliance with the mitigation measures.
- **Monitoring Timing:** This column indicates the general schedule for conducting each monitoring task, either prior to construction, during construction, and/or after construction.
- **Responsible Person(s):** This column lists the agency responsible for ensuring implementation of the mitigation measure.

TABLE 5-1
MITIGATION MONITORING AND REPORTING PROGRAM - STORMWATER CAPTURE PARKS PROGRAM

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
Air Quality			
AQ-1: Construction of the Program shall incorporate the following conditions: a. For all Program sites: The Program shall use off-road diesel-powered construction equipment that meets or exceeds the CARB and USEPA Tier 4 off-road emissions standards for equipment rated at 50 horsepower or greater and not identified under b or c. below. Such equipment will be outfitted with Best Available Control Technology (BACT) devices, including a CARB-certified Level 3 Diesel Particulate Filter or equivalent. These requirements shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. b. All dumpers/tenders used on-site shall either be certified Tier 3 with a CARB-certified Level 3 Diesel Particulate Filter or equivalent; certified Tier 4 with a CARB-certified Level 3 Diesel Particulate Filter or equivalent, or alternatively fueled (e.g., gasoline, electric, CNG). c. At a minimum, the following equipment shall be electric: air compressors, cement and mortar mixers, concrete saws, forklifts, pumps. Diesel generators shall be replaced with electricity from the grid either permanent or temporary, or replaced with alternative (non-diesel) fuels. d. Equipment requirements identified under a, b, and c above shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. A copy of each unit's certified tier specification or model year specification and CARB or SCAQMD operating permit (if applicable) shall be available upon request at the time of mobilization of each applicable unit of equipment. e. During the site clearing and preparation, grading and excavation, and soil filling, revegetation, and park improvement phases, watering must be conducted a minimum of 4 times per day during dry weather. f. For Valley Plaza Park North only 2 dozers are allowed to operate on any portion of the site at one time. g. The City shall ensure: i. On-road haul trucks including delivery and those conveying excavated material do not exceed the following daily truck limits: 1. 185 trucks when 2 parks are concurrently under construction; 2. 180 trucks when 3 parks are currently under construction; 3. 170 trucks when 4 parks are concurrently under construction; 4. 160 trucks when 5 parks are concurrently under construction; 5. 150 trucks when 6 parks are concurrently under construction; 6. 140 trucks when 7 parks are concurrently under construction. Or;	Site Monitoring	Prior to Construction During Construction	The City Construction Contractor

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
ii. If the fleet is composed of a mix of 2014 or newer trucks, the City shall ensure that on-road haul trucks including delivery and those conveying excavated material do not exceed the following daily truck limits: 1. 240 trucks when 2 parks are concurrently under construction; 2. 230 trucks when 3 parks are concurrently under construction; 3. 220 trucks when 4 parks are concurrently under construction; 4. 210 trucks when 5 parks are concurrently under construction; 5. 200 trucks when 6 parks are concurrently under construction; 6. 190 trucks when 7 parks are concurrently under construction.			
Biological Resources			
BIO-1: Special-Status Wildlife Species. Construction activities at any of the nine park project sites could result in impacts to the Cooper's hawk (*Accipiter cooperii*), a California Species of Special Concern, where mature trees are present. Similarly, construction activities may also impact other nesting bird species that may nest in a variety of vegetation as well as man-made structures. Construction activities should occur outside of the avian nesting season. If the avian nesting season cannot be avoided and construction or vegetation removal occurs from February 1 to September 1, the City shall implement the following to avoid and minimize impacts to nesting birds and raptors: ● During the avian breeding season, a qualified biologist shall conduct a preconstruction avian nesting survey no more than 7 days prior to vegetation disturbance or ground-disturbing activities. If construction begins in the non-breeding season and proceeds continuously into the avian nesting season, no surveys are required. However, if there is a break of 7 days or more in construction activities during the nesting season, a new nesting bird survey shall be conducted before construction begins again. ● The preconstruction survey shall cover all reasonably potential nesting locations on and within 100 feet of the construction areas. A 300-foot radius shall be surveyed in areas containing suitable habitat for nesting raptors, such as trees and utility poles. ● If an active nest is found during the preconstruction avian nesting survey, a qualified biologist shall designate a suitable buffer for all passerine birds and raptor species. The nest site area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the Program. Buffer areas may be increased upon recommendation of a qualified biologist if any endangered, threatened, California Fully Protected, or California Species of Special Concern are identified during preconstruction surveys. ● If the nest(s) are found in an area where ground disturbance is scheduled to occur, the City or its contractor shall avoid the area by delaying ground disturbance in the area until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival. ● Prior to removal of trees in any of the parks, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The	Site Survey by a Qualified Biologist	Prior to Construction During Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
surveys should encompass a minimum buffer area of 100 feet around the parks. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.			
Cultural Resources			
CUL-1: In the event Program designs are further refined and individual park project components change to encroach more closely than 50 feet to the North Hollywood Amelia Earhart Regional Library (P-19-167303), the pool house and maintenance building associated with North Hollywood Park, the clubhouse associated with the David M. Gonzales Recreation Center, and/or the 170 Freeway Pedestrian Overpass, the City shall retain a qualified architectural historian meeting the Secretary of the Interior's Standards for Architectural History to review design plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards). Should potential Program redesign not conform to the Standards, the City shall work with the qualified architectural historian to mitigate impacts to these resources. Should Program redesign place Program components within 50 feet of these resources, the qualified architectural historian shall also assess potential construction-related impacts resulting from ground-borne vibration. Should ground-borne vibrations have the potential to impact the historical resources, the City and the qualified architectural historian shall develop a plan to monitor ground-borne vibration during construction to ensure it does not exceed thresholds that could damage, or otherwise alter the historical resources.	Plan Preparation Site Monitoring by a Qualified Archeologist Historian	Prior to Construction During Construction	The City
CUL-2: Prior to the start of ground-disturbing activities, the City shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (U.S. Department of the Interior, 2008) to carry out the following cultural resources mitigation measures.	Site Monitoring by a Qualified Archeologist	Prior to Construction During Construction	The City
CUL-3: Prior to start of ground-disturbing activities, the qualified archaeologist shall prepare a cultural resources sensitivity training module to be used as part of the City's Worker Environmental Awareness Program (WEAP) training. All construction personnel shall receive sensitivity training prior to beginning work onsite. Construction personnel should be informed of the types of archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. The City should ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.	Personnel Training by a Qualified Archeologist	Prior to Construction During Construction	The City Construction Contractor
CUL-4: Prior to the start of any project-related ground-disturbing activities, the qualified archaeologist shall prepare a Cultural Resources Monitoring Plan (CRMP) in consultation with Tribes that requested consultation under AB52. The CRMP shall stipulate the location and timing of archaeological and Native American monitoring, which shall include all ground-disturbing activities in each of the nine parks that exceed the depths of undocumented fill as documented by geotechnical testing. The qualified archaeologist shall review engineering plans for each of the nine parks to determine where ground-disturbing activities will exceed the depths of undocumented fill at each park to determine the timing and locations of monitoring to be included in the CRMP. The CRMP shall include monitoring protocols to be carried out during Program-related construction. The CRMP shall stipulate that Native	Plan Preparation Site Monitoring by a Qualified Archeologist	Prior to Construction During Construction Post Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
American monitors associated with any of the Tribes that have been consulted with under AB52 be retained to monitor Program-related ground disturbance stipulated in the CRMP. The CRMP shall contain an allowance that the Qualified Archaeologist, based on observations of subsurface soil stratigraphy or other factors during initial grading, and in coordination with the Native American monitor(s) and the City, may reduce or discontinue monitoring as warranted if it is determined that the possibility of encountering archaeological deposits is low. The CRMP shall outline the appropriate measures to be followed in the event of unanticipated discovery of cultural resources during Program implementation, including that all ground disturbance within 100 feet of an unanticipated discovery shall cease until a treatment plan is developed by the qualified archaeologist in coordination with the City and the Native American monitor(s) and which will consider the resources archaeological and tribal value. The CRMP shall identify avoidance as the preferred manner of mitigating impacts to cultural resources. The CRMP shall establish the criteria utilized to evaluate the significance (per CEQA) of the discoveries, methods of avoidance consistent with CEQA Guidelines Section 15126.4(b)(3), as well as identify the appropriate treatment to mitigate the effect of the Program if avoidance of a significant resource is determined to be infeasible. The CRMP will also include provisions for the treatment of archaeological sites that qualify as unique archaeological resources pursuant to Public Resources Code Section 21083.2, which places limits on the costs of mitigation for unique archaeological resources. The plan shall also require the preparation of a monitoring report following the completion. The monitoring report will be submitted to the City for review and comment and a final copy will be filed at the SCCIC. The CRMP shall be submitted to the City and the appropriate Native American representatives who have been consulted with under AB52 for review prior to the start of Program-related ground disturbance.			
CUL-5: In the event of the unanticipated discovery of archaeological materials during Program implementation, all work shall immediately cease in the area (within approximately 100 feet) of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has conferred with the City and the Native American monitors on the significance of the resource. If it is determined that the discovered archaeological resource constitutes a significant resource, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the City and Native American monitors that provides for the adequate recovery of the scientifically consequential information contained in the archaeological resource. The City shall consult the appropriate Native American representatives in determining treatment and disposition for prehistoric or Native American resources to ensure cultural values ascribed to the resource beyond those that are scientifically important are considered.	Site Monitoring by a Qualified Archeologist	During Construction	The City Construction Contractor
CUL-6: If human remains are encountered, all work shall halt in the vicinity (within 100 feet) of the find and the Los Angeles County Coroner shall be contacted in accordance with PRC Section 5097.98 and Health and Safety Code Section 7050.5. If the County Coroner determines that the remains are Native American, the NAHC will be notified in accordance with Health and Safety Code Section 7050.5, subdivision (c), and PRC Section 5097.98 (as amended by Assembly Bill 2641). The NAHC will designate a Most Likely Descendent (MLD) for the remains per PRC Section 5097.98. Until the landowner has conferred with the MLD, the City shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity, is adequately protected according to generally	Site Inspection	During Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
accepted cultural or archaeological standards or practices, and that further activities take into account the possibility of multiple burials.			
Geology and Soils			
GEO-1: The City shall implement the recommendations provided in the geotechnical investigations for each of the park project sites. In the event that the depth to groundwater rises to less than 50 feet bgs as measured in nearby wells, the stormwater infiltration process shall be stopped and the stormwater routed to the surface storm drain system until groundwater depths decrease to below 50 bgs.	Site Monitoring	During Construction Post Construction	The City
GEO-2: Prior to the start of construction activities, the City shall retain a Qualified Paleontologist that meets the standards of the Society of Vertebrate Paleontology (2010) to carry out all mitigation measures related to paleontological resources.	Site Monitoring	Prior to Construction During Construction	The City
GEO-3: Prior to start of any ground-disturbing activities, the Qualified Paleontologist shall contribute to any construction worker cultural resources sensitivity WEAP training materials outlined in Mitigation Measure CUL-2, either in person or via a training module provided to the Qualified Archaeologist. This training shall include information on what types of paleontological resources could be encountered during excavations, what to do in case an unanticipated discovery is made by a worker, and laws protecting paleontological resources. All construction personnel shall be informed of the possibility of encountering fossils and instructed to immediately inform the construction foreman or supervisor if any fossils are unexpectedly unearthed in an area where a paleontological monitor is not present. The City shall ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.	Personnel Training by a Qualified Paleontologist	Prior to Construction During Construction	The City
GEO-4: The Qualified Paleontologist shall supervise a paleontological monitor meeting the Society for Vertebrate Paleontology standards (2010) who shall be present during all excavations exceeding 15 feet. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. Monitoring can be reduced to part-time inspections or ceased entirely if determined adequate by the Qualified Paleontologist in consultation with the City. Monitoring activities shall be documented in a Paleontological Resources Monitoring Report to be prepared by the Qualified Paleontologist at the completion of construction and shall be provided to the City and filed with the Natural History Museum of Los Angeles County within 6 months of Program completion.	Site Monitoring by a Qualified Paleontologist	During Construction	The City
GEO-5: If a unique geologic feature or paleontological resource is discovered during construction, the paleontological monitor shall be empowered to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation of the discovery. An appropriate buffer area shall be established by the Qualified Paleontologist around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the Qualified Paleontologist's discretion and to reduce any construction delay, the grading and excavation contractor shall assist in removing rock samples for initial processing and evaluation of the find. All significant fossils shall be collected by the paleontological monitor and/or the Qualified Paleontologist. Collected fossils shall be prepared to the point of identification and catalogued before they are submitted to their final repository. Any fossils collected shall be curated at a public, non-profit institution with a research interest in the materials, such as the Los Angeles County Natural History	Site Monitoring by a Qualified Paleontologist	During Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
Museum, if such an institution agrees to accept the fossils. If no institution accepts the fossil collection, they shall be donated to a local school in the area for educational purposes. Accompanying notes, maps, and photographs shall also be filed at the repository and/or school.			
Hazards and Hazardous Materials			
HAZ-1: The City or its construction contractor shall ensure that fueling of vehicles or storage of fuel or other chemicals would occur at the furthest extent possible from an existing school site.	Site Monitoring	During Construction	The City Construction Contractor
HAZ-2: For all schools located adjacent to a proposed work area, the City shall coordinate school safety routes, which should include, but not be limited to: ● Maintaining in place all crosswalks along the safe routes to and from the school (for Pacoima Charter School these would include Norris Avenue, Van Nuys Boulevard, Pierce Street, and Herrick Avenue). ● Designating a safe location for school buses and parents to drop off and pick up students. ● Designating a safe parking area for parents to wait for/pick up school children. ● Maintaining sidewalks open to pedestrian traffic during construction. ● Additional safety measures must be adopted during construction to protect the students and the public, including k-railing, secured fencing with screen, clear signing, temporary striping, and a flagger for trucks entering and existing the construction zone. Flaggers should also be considered at crosswalks while students are present. ● Close coordination with the impacted school and the Los Angeles Unified School District for input on the school safety route design and frequent communication during construction. ● Extensive outreach program for the school and the community describing safety measures and construction schedules. ● Restrict construction times to avoid before and after school timeframes while children may be walking to and from school, and while school is in session, as feasible.	Safety Planning Notification Site Monitoring	During Construction	The City Construction Contractor
HAZ-3: The City and its contractor shall conduct further investigation of the nature and extent of landfill materials and contaminated soil at the Strathern Park North site, under the oversight of the City of Los Angeles Local Enforcement Agency (LEA). Undocumented waste shall be delineated and sampled for chemicals of concern related to waste materials. The project shall avoid construction within the delineated waste mass, as feasible. If avoidance of the waste mass is not feasible, the City shall submit a work plan to the LEA that documents the results of the waste delineation, details the specifics of the construction project and how it relates to the onsite waste, describes the procedures for dealing with the waste, and outlines the environmental monitoring procedures that would be implemented during construction. Upon approval of the work plan, the City and its contractor shall remove the landfill materials and any soil with chemical concentrations above regulatory action levels to the satisfaction of the LEA and properly dispose of it at a permitted facility. An as-built report shall be submitted to the LEA after completion of the project.	Site Survey Plan Preparation	Prior to Construction During Construction Post Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
Noise			
NOI-1: For construction activities adjacent to noise-sensitive receptors (e.g., residences and schools), the contractor shall ensure that all construction equipment, fixed or mobile, are equipped with properly operating and maintained noise shielding and muffling devices, consistent with manufacturers' standards. The contractor shall use muffler systems (e.g., absorptive mufflers) that provide a minimum reduction of 5 dBA compared to the same equipment without an installed muffler system, reducing maximum construction noise levels. The contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturers' specifications. The contractor shall also keep documentation on-site verifying compliance with this measure.	Site Monitoring	During Construction	The City Construction Contractor
NOI-2: For construction activities adjacent to noise-sensitive receptors (e.g., residences and schools), where physically and technically feasible, the contractor shall provide an 8-foot-tall to 20-foot-tall temporary fence or other barrier placed between the project construction area and the sensitive receptor with a performance standard of achieving a 15 dBA noise level reduction at the sensitive receptors. The temporary fence or barrier shall be used during peak noise-generating construction phases when the use of heavy equipment is prevalent. A noise barrier is not required if it would pose a safety risk or unreasonably prevent access to the construction area as deemed by the on-site construction manager, such as in areas that have limited equipment maneuvering space or access.	Temporary Fence/Barrier Site Monitoring	During Construction	The City Construction Contractor
NOI-3: Limit engine idling of construction equipment (e.g., haul trucks, loaders) to a minimum of 200 feet from any boundary of the nearest sensitive receptors.	Site Monitoring	During Construction	The City Construction Contractor
NOI-4: Prior to commencement of construction activities, the City shall notify in writing adjacent residents, schools and businesses near the various park project sites, of proposed construction activities and the tentative schedule. The notices shall also provide a contact person and hotline where local residents, schools, or business owners can call during active construction with questions or comments. The City shall respond to inquiries regarding construction noise and vibration. Notices and construction signs will include a website address which will be updated quarterly and will include Program-related information.	Notification	Prior to Construction	The City
NOI-5: The operation of construction equipment that generates high levels of vibration, such as large bulldozers and loaded trucks, shall be prohibited within 45 feet of the property lines of existing residential and school uses adjacent to the various park project sites. Instead, rubber-tired equipment not exceeding 247 horsepower shall be used in these areas during construction within 45 feet from the sensitive receptor locations.	Site Monitoring	During Construction	The City Construction Contractor
Transportation			
TR-1: For parks where construction would occur outside of park facilities or that may impact roadways surrounding park areas, a CTMP shall be developed by the City or its contractor and approved by LADOT prior to the start of construction. The CTMP may include, but is not limited to the following:	Plan Preparation Site Survey Notification	Prior to Construction During Construction	The City Construction Contractor

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
• Work area traffic control plans for all in-street construction sites to the satisfaction of LADOT, as appropriate prior to the start of any construction work. The plans shall include such elements as the location of any lane closures, restricted hours during which lane closures would not be allowed, local traffic detours, protective devices and traffic controls (such as pavement markings, barricades, cones, flagmen, lights, warning beacons, temporary traffic signals, turning movement restrictions, warning signs), access to abutting properties, and provisions to maintain emergency access through construction work areas. • The dates and locations where in-street and off-street construction activities are planned. • If any street segments will be limited to one-way traffic, prepare detour plans over parallel routes. • Require signage indicated alternative routes where construction will occur. • Identify and consolidate staging areas for equipment and materials, as feasible. • Consolidate truck trips, such that multiple worksites can be served, as feasible. • Promote carpooling among workers. • Contact emergency service providers in the project vicinity to notify of the location, hours, and duration of in-street construction. Provide advance notice of any lane closures and changes to local access and identity alternative routes where appropriate.

Senior Assistant General Manager Water System

MARTIN L. ADAMS
General Manager and Chief Engineer

DATE: August 2, 2021

SUBJECT: Adoption of the Stormwater Capture Parks Program Mitigated Negative Declaration in Accordance with the California Environmental Quality Act

SUMMARY

This Resolution is to fulfill LADWP's responsibilities under the California Environmental Quality Act (CEQA) prior to implementation of the proposed Stormwater Capture Parks Program (Program).

The purpose of the Program is to help meet the City's established goals related to increasing local water supplies, improving water quality, and alleviating localized flooding. The Program would include the construction of underground stormwater capture facilities within nine City-owned parks located along State Route 170, between the Pacoima and Valley Village neighborhoods in the San Fernando Valley. These facilities are designed to divert flows from the Tujunga Central Branch Channel, remove pollutants from the runoff, and recharge the local groundwater basin. In addition, the Program would also include park improvements, enhanced recreational opportunities, and environmental education opportunities to local residents and students.

City Council approval is not required.

RECOMMENDATION

It is recommended that the Board of Water and Power Commissioners adopt the attached Resolution authorizing adoption of the Initial Study/Mitigated Negative Declaration (IS/MND) and approve the Program.

ALTERNATIVES CONSIDERED

Under the no action alternative, the proposed Project would not be implemented, and LADWP would not be meeting its goals for stormwater capture as a critical component in increasing local water supplies, addressing future water demands, and decreasing reliance on purchased imported water.

FINANCIAL INFORMATION

The Program is estimated to cost approximately $342 million for associated construction activities, materials, and engineering support. Funding is budgeted in the Water Fund. Additional funding will also come from state or local grants, as well as funding partnerships.

BACKGROUND

LADWP, in partnership with the City of Los Angeles, Bureau of Engineering, Los Angeles Sanitation and Environment, and Department of Recreation and Parks propose to implement the Program. The Program would include construction of stormwater capture facilities at nine City-owned parks to help capture surface flow and divert stormwater runoff from the Tujunga Central Branch Channel to recharge the San Fernando Groundwater Basin and assist the City in complying with its Municipal Separate Storm Sewer System National Pollutant Discharge Elimination System Permit requirements. All nine parks are located in the east San Fernando Valley along State Route 170. These parks include: David M. Gonzales Recreation Center; Fernangeles Park; Strathern Park North; Whitsett Fields Park North; Valley Plaza Park North; Valley Plaza Park South; Alexandria Park; North Hollywood Park; and Valley Village Park. The stormwater capture facilities would consist of underground infiltration structures, stormwater pre-treatment devices, diversion structures, conveyance pipes, and pump stations, where needed. The impact areas within each park would be fully restored to maintain their recreational uses following construction.

The Program is necessary to meet the City's water resiliency, reliability, and sustainability goals, as established in LADWP's Stormwater Capture Master Plan and Urban Water Management Plan, the Upper Los Angeles River Enhanced Watershed Management Plan, and Mayor Eric Garcetti's City of Los Angeles Green New Deal.

Public Review

In accordance with CEQA, an IS/MND was prepared and circulated for public review.

- The Notice of Intent (NOI) to Adopt a Mitigated Negative Declaration was mailed to agencies, organizations, and individuals believed to have an interest in the Project, and a list of California Native American Tribes (CNAT) provided by the Native American Heritage Commission (NAHC).
- The NOI was published as a legal notice in the Los Angeles Daily Journal on January 7, 2021.
- The IS/MND was made available for public review from January 7, 2021 to February 8, 2021. Copies of the IS/MND were made available for review at LADWP Environmental Affairs Division and on LADWP's webpage (http://www.ladwp.com/envnotices).
- During the public review period, eight comment letters were received.

Public Comments

Eight written comment letters were received on the IS/MND during the formal public review period and are listed in the table below:

Comment Letter No.	Commenter	Date of Comment
1	California Department of Transportation	January 13, 2021
2	Luis Suarez	January 15, 2021
3	Marie Gordon	January 22, 2021
4	Brenda Dalusong	February 2, 2021
5	California Department of Fish and Wildlife	February 5, 2021
6	Diana Nicole, Sunshine Hills Residents Association	February 8, 2021
7	County of Los Angeles Fire Department	February 9, 2021
8	Joanne D'Antonio	February 8, 2021

While written Responses to Comments (RTC) on a proposed IS/MND are not required by CEQA, the RTC document is provided to demonstrate LADWP's careful consideration of the comments received. These responses provide LADWP's good faith and reasoned analysis on the major environmental issues raised in the comments. Commenters were directly responded to in writing. Comment letters and the RTC are included as an attachment.

ENVIRONMENTAL DETERMINATION

Determine item is in compliance with CEQA Guidelines Sections 15070 – 15075. In accordance with CEQA, a Mitigated Negative Declaration was prepared to analyze the impacts associated with the completion of the Program. Adoption of the Resolution will result in the adoption of the IS/MND and adoption of the Mitigation Monitoring and Reporting Program for the Project.

TRIBAL CONSULTATION

Consultation invitation letters were sent to all CNAT provided on the NAHC list. LADWP received responses from two tribes, including the Chairman of the Gabrieleño Band of Mission Indians - Kizh Nation on March 16, 2020 and the Fernandeño Tataviam Band of Mission Indians on March 26, 2020. In response, LADWP consulted with each tribe, shared relevant Program information, and listened to their concerns. Subsequently, LADWP developed and incorporated Cultural Resources mitigation measures in the IS/MND that were based in part on the input received from both tribes.

CITY ATTORNEY

The Office of the City Attorney reviewed and approved the Resolution as to form and legality.

ATTACHMENTS

- Resolution
- Notice of Intent
- Final IS/MND
- Mitigation Monitoring and Reporting Program
- Comment Letter and Response

Resolution No. _____

WHEREAS, the Los Angeles Department of Water and Power (LADWP) is committed to increasing opportunities for stormwater capture in the City of Los Angeles (City) as part of its effort to increase the local water supply; and

WHEREAS, LADWP is partnering with the City of Los Angeles, Bureau of Engineering, Los Angeles Sanitation and Environment, and Department of Recreation and Parks to implement the Stormwater Capture Parks Program (Program); and

WHEREAS, the Program is needed to help meet the established goals for improving the City's water reliability and sustainability, as identified in the LADWP's Stormwater Capture Master Plan, 2020 Urban Water Management Plan, Upper Los Angeles River Enhancement Watershed Management Program, and Mayor Eric Garcetti's City of Los Angeles Green New Deal; and

WHEREAS, nine City-owned parks located in the east San Fernando Valley were identified as key project sites for inclusion in the Program, including David M. Gonzales Recreation Center; Fernangeles Park; Strathern Park North; Whitsett Fields Park North; Valley Plaza Park North; Valley Plaza Park South; Alexandria Park; North Hollywood Park; and Valley Village Park; and

WHEREAS, the Program proposes to construct stormwater capture facilities at the nine parks to help capture surface flow and divert stormwater runoff from the Tujunga Wash Central Branch storm drain to recharge the San Fernando Groundwater Basin and meet water quality objectives; and

WHEREAS, the stormwater capture facilities at each park include underground infiltration structures, stormwater pre-treatment devices, diversion structures, conveyance pipes, and pump stations; and

WHEREAS, the Program also includes park improvements, enhanced recreational opportunities, and environmental education opportunities to local residents and students.

NOW, THEREFORE, BE IT RESOLVED that the Water and Power Board of Commissioners (Board) recognizes that a study was conducted of the potential environmental effects of the proposed Program. This study is embodied in the Initial Study/Mitigated Negative Declaration (IS/MND) on file with the Secretary of this Board and is incorporated in this Resolution, and made a part hereof.

BE IT FURTHER RESOLVED that this Board makes the following further findings and determinations with respect to the proposed Program:

- LADWP is the lead agency under the California Environmental Quality Act (CEQA) and has prepared an IS/MND in compliance with CEQA.

- An IS/MND was prepared, which analyzed the potential environmental impacts associated with the Project. The IS/MND was made available for public review from January 7, 2021 to February 8, 2021. Copies of the IS/MND were made available for review at LADWP Environmental Affairs Division and on LADWP's webpage (http://www.ladwp.com/envnotices).

- A Notice of Intent to Adopt a Mitigated Negative Declaration was prepared and mailed to agencies, organizations, and individuals believed to have an interest in the Project. A public legal notice was published in the Los Angeles Daily Journal on January 7, 2021.

- Eight written comment letters were received on the IS/MND released for public review.

BE IT FURTHER RESOLVED that the Mitigation Monitoring and Reporting Program (MMRP) has been developed to ensure the implementation of the mitigation measures outlined in the IS/MND. The MMRP is on file with the Secretary of the Board as an attachment to the Board Letter. These mitigation measures, over which LADWP will maintain oversight and act as a monitoring agent, are as follows:

Air Quality	
AQ-1: Construction of the Program shall incorporate the following conditions: a. For all Program sites: The Program shall use off-road diesel-powered construction equipment that meets or exceeds the CARB and USEPA Tier 4 off-road emissions standards for equipment rated at 50 horsepower or greater and not identified under b or c. below. Such equipment will be outfitted with Best Available Control Technology devices, including a CARB-certified Level 3 Diesel Particulate Filter or equivalent. These requirements shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. b. All dumpers/tenders used on-site shall either be certified Tier 3 with a CARB-certified Level 3 Diesel Particulate Filter or equivalent; certified Tier 4 with a CARB-certified Level 3 Diesel Particulate Filter or equivalent, or alternatively fueled (e.g., gasoline, electric, CNG). c. At a minimum, the following equipment shall be electric: air compressors, cement and mortar mixers, concrete saws, forklifts, pumps. Diesel generators shall be replaced with electricity from the grid either permanent or temporary, or replaced with alternative (non-diesel) fuels. d. Equipment requirements identified under a, b, and c above shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. A copy of each unit's certified tier specification or model year specification and CARB or SCAQMD operating permit (if applicable) shall be available upon request at the time of mobilization of each applicable unit of equipment. e. During the site clearing and preparation, grading and excavation, and soil	

filling, revegetation, and park improvement phases, watering must be conducted a minimum of four times per day during dry weather.

f. For Valley Plaza Park North only two dozers are allowed to operate on any portion of the site at one time.

g. The City shall ensure:

   i. On-road haul trucks including delivery and those conveying excavated material do not exceed the following daily truck limits:
      1. 185 trucks when two parks are concurrently under construction;
      2. 180 trucks when three parks are currently under construction;
      3. 170 trucks when four parks are concurrently under construction;
      4. 160 trucks when five parks are concurrently under construction;
      5. 150 trucks when six parks are concurrently under construction;
      6. 140 trucks when seven parks are concurrently under construction. Or;

   ii. If the fleet is composed of a mix of 2014 or newer trucks, the City shall ensure that on-road haul trucks including delivery and those conveying excavated material do not exceed the following daily truck limits:
      1. 240 trucks when two parks are concurrently under construction;
      2. 230 trucks when three parks are concurrently under construction;
      3. 220 trucks when four parks are concurrently under construction;
      4. 210 trucks when five parks are concurrently under construction;
      5. 200 trucks when six parks are concurrently under construction;
      6. 190 trucks when seven parks are concurrently under construction.

Biological Resources

BIO-1: Special-Status Wildlife Species. Construction activities at any of the nine park project sites could result in impacts to the Cooper's hawk (*Accipiter cooperii*), a California Species of Special Concern, where mature trees are present. Similarly, construction activities may also impact other nesting bird species that may nest in a variety of vegetation as well as man-made structures. Construction activities should occur outside of the avian nesting season. If the avian nesting season cannot be avoided and construction or vegetation removal occurs from February 1 to September 1, the City shall implement the following to avoid and minimize impacts to nesting birds and raptors:

- During the avian breeding season, a qualified biologist shall conduct a preconstruction avian nesting survey no more than seven days prior to vegetation disturbance or ground-disturbing activities. If construction begins in the non-breeding season and proceeds continuously into the avian nesting season, no surveys are required. However, if there is a break of seven days or more in construction activities during the nesting season, a new nesting bird survey shall be conducted before construction begins again.
- The preconstruction survey shall cover all reasonably potential nesting locations on and within 100 feet of the construction areas. A 300-foot radius shall be surveyed in areas containing suitable habitat for nesting raptors, such as trees and utility poles.
- If an active nest is found during the preconstruction avian nesting survey, a qualified biologist shall designate a suitable buffer for all passerine birds and raptor species. The nest site area shall not be disturbed until the nest becomes

inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the Program. Buffer areas may be increased upon recommendation of a qualified biologist if any endangered, threatened, California Fully Protected, or California Species of Special Concern are identified during preconstruction surveys.

- If the nest(s) are found in an area where ground disturbance is scheduled to occur, the City or its contractor shall avoid the area by delaying ground disturbance in the area until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.
- Prior to removal of trees in any of the parks, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the parks. The results of the surveys will be provided to California Department of Fish and Wildlife (CDFW). In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

Cultural Resources

CUL-1: In the event Program designs are further refined and individual park project components change to encroach more closely than 50 feet to the North Hollywood Branch Library (P-19-167303), the pool house and maintenance building associated with North Hollywood Park, the clubhouse associated with the David M. Gonzales Recreation Center, and/or the 170 Freeway Pedestrian Overpass, the City shall retain a qualified architectural historian meeting the Secretary of the Interior's Standards for Architectural History to review design plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards). Should potential Program redesign not conform to the Standards, the City shall work with the qualified architectural historian to mitigate impacts to these resources. Should Program redesign place Program components within 50 feet of these resources, the qualified architectural historian shall also assess potential construction-related impacts resulting from ground-borne vibration. Should ground-borne vibrations have the potential to impact the historical resources, the City and the qualified architectural historian shall develop a plan to monitor ground-borne vibration during construction to ensure it does not exceed thresholds that could damage, or otherwise alter the historical resources.

CUL-2: Prior to the start of ground-disturbing activities, the City shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (U.S. Department of the Interior, 2008) to carry out the following cultural resources mitigation measures.

CUL-3: Prior to start of ground-disturbing activities, the qualified archaeologist shall prepare a cultural resources sensitivity training module to be used as part of the City's Worker Environmental Awareness Program (WEAP) training. All construction

personnel shall receive sensitivity training prior to beginning work onsite. Construction personnel should be informed of the types of archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. The City should ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.
CUL-4: Prior to the start of any project-related ground-disturbing activities, the qualified archaeologist shall prepare a Cultural Resources Monitoring Plan (CRMP) in consultation with Tribes that requested consultation under Assembly Bill 52 (AB52). The CRMP shall stipulate the location and timing of archaeological and Native American monitoring, which shall include all ground-disturbing activities in each of the nine parks that exceed the depths of undocumented fill as documented by geotechnical testing. The qualified archaeologist shall review engineering plans for each of the nine parks to determine where ground-disturbing activities will exceed the depths of undocumented fill at each park to determine the timing and locations of monitoring to be included in the CRMP. The CRMP shall include monitoring protocols to be carried out during Program-related construction. The CRMP shall stipulate that Native American monitors associated with any of the Tribes that have been consulted with under AB52 be retained to monitor Program-related ground disturbance stipulated in the CRMP. The CRMP shall contain an allowance that the Qualified Archaeologist, based on observations of subsurface soil stratigraphy or other factors during initial grading, and in coordination with the Native American monitor(s) and the City, may reduce or discontinue monitoring as warranted if it is determined that the possibility of encountering archaeological deposits is low. The CRMP shall outline the appropriate measures to be followed in the event of unanticipated discovery of cultural resources during Program implementation, including that all ground disturbance within 100 feet of an unanticipated discovery shall cease until a treatment plan is developed by the qualified archaeologist in coordination with the City and the Native American monitor(s) and which will consider the resources archaeological and tribal value. The CRMP shall identify avoidance as the preferred manner of mitigating impacts to cultural resources. The CRMP shall establish the criteria utilized to evaluate the significance per CEQA of the discoveries, methods of avoidance consistent with CEQA Guidelines Section 15126.4(b)(3), as well as identify the appropriate treatment to mitigate the effect of the Program if avoidance of a significant resource is determined to be infeasible. The CRMP will also include provisions for the treatment of archaeological sites that qualify as unique archaeological resources pursuant to Public Resources Code Section 21083.2, which places limits on the costs of mitigation for unique archaeological resources. The plan shall also require the preparation of a monitoring report following the completion. The monitoring report will be submitted to the City for review and comment and a final copy will be filed at the South Central Coastal Information Center. The CRMP shall be submitted to the City and the appropriate Native American representatives who have been consulted with under AB52 for review prior to the start of Program-related ground disturbance.
CUL-5: In the event of the unanticipated discovery of archaeological materials during Program implementation, all work shall immediately cease in the area (within

approximately 100 feet) of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has conferred with the City and the Native American monitors on the significance of the resource. If it is determined that the discovered archaeological resource constitutes a significant resource, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the City and Native American monitors that provides for the adequate recovery of the scientifically consequential information contained in the archaeological resource. The City shall consult the appropriate Native American representatives in determining treatment and disposition for prehistoric or Native American resources to ensure cultural values ascribed to the resource beyond those that are scientifically important are considered.
CUL-6: If human remains are encountered, all work shall halt in the vicinity (within 100 feet) of the find and the Los Angeles County Coroner shall be contacted in accordance with Public Resources Code (PRC) Section 5097.98 and Health and Safety Code Section 7050.5. If the County Coroner determines that the remains are Native American, the Native American Heritage Commission (NAHC) will be notified in accordance with Health and Safety Code Section 7050.5, subdivision (c), and PRC Section 5097.98 (as amended by Assembly Bill 2641). The NAHC will designate a Most Likely Descendent (MLD) for the remains per PRC Section 5097.98. Until the landowner has conferred with the MLD, the City shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity, is adequately protected according to generally accepted cultural or archaeological standards or practices, and that further activities take into account the possibility of multiple burials.
Geology and Soils
GEO-1: The City shall implement the recommendations provided in the geotechnical investigations for each of the park Project sites. In the event that the depth to groundwater rises to less than 50 feet bgs as measured in nearby wells, the stormwater infiltration process shall be stopped and the stormwater routed to the surface storm drain system until groundwater depths decrease to below 50 bgs.
GEO-2: Prior to the start of construction activities, the City shall retain a Qualified Paleontologist that meets the standards of the Society of Vertebrate Paleontology (2010) to carry out all mitigation measures related to paleontological resources.
GEO-3: Prior to start of any ground-disturbing activities, the Qualified Paleontologist shall contribute to any construction worker cultural resources sensitivity WEAP training materials outlined in Mitigation Measure CUL-2, either in person or via a training module provided to the Qualified Archaeologist. This training shall include information on what types of paleontological resources could be encountered during excavations, what to do in case an unanticipated discovery is made by a worker, and laws protecting paleontological resources. All construction personnel shall be informed of the possibility of encountering fossils and instructed to immediately inform the

construction foreman or supervisor if any fossils are unexpectedly unearthed in an area where a paleontological monitor is not present. The City shall ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.
GEO-4: The Qualified Paleontologist shall supervise a paleontological monitor meeting the Society for Vertebrate Paleontology standards (2010) who shall be present during all excavations exceeding 15 feet. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. Monitoring can be reduced to part-time inspections or ceased entirely if determined adequate by the Qualified Paleontologist in consultation with the City. Monitoring activities shall be documented in a Paleontological Resources Monitoring Report to be prepared by the Qualified Paleontologist at the completion of construction and shall be provided to the City and filed with the Natural History Museum of Los Angeles County within six months of Program completion.
GEO-5: If a unique geologic feature or paleontological resource is discovered during construction, the paleontological monitor shall be empowered to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation of the discovery. An appropriate buffer area shall be established by the Qualified Paleontologist around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the Qualified Paleontologist's discretion and to reduce any construction delay, the grading and excavation contractor shall assist in removing rock samples for initial processing and evaluation of the find. All significant fossils shall be collected by the paleontological monitor and/or the Qualified Paleontologist. Collected fossils shall be prepared to the point of identification and catalogued before they are submitted to their final repository. Any fossils collected shall be curated at a public, non-profit institution with a research interest in the materials, such as the Los Angeles County Natural History Museum, if such an institution agrees to accept the fossils. If no institution accepts the fossil collection, they shall be donated to a local school in the area for educational purposes. Accompanying notes, maps, and photographs shall also be filed at the repository and/or school.
Hazards and Hazardous Materials
HAZ-1: The City or its construction contractor shall ensure that fueling of vehicles or storage of fuel or other chemicals would occur at the furthest extent possible from an existing school site.
HAZ-2: For all schools located adjacent to a proposed work area, the City shall coordinate school safety routes, which should include, but not be limited to: • Maintaining in place all crosswalks along the safe routes to and from the school (for Pacoima Charter School these would include Norris Avenue, Van Nuys Boulevard, Pierce Street, and Herrick Avenue). • Designating a safe location for school buses and parents to drop off and pick up students. • Designating a safe parking area for parents to wait for/pick up school children. • Maintaining sidewalks open to pedestrian traffic during construction. • Additional safety measures must be adopted during construction to protect the

students and the public, including k-railing, secured fencing with screen, clear signing, temporary striping, and a flagger for trucks entering and existing the construction zone. Flaggers should also be considered at crosswalks while students are present.

- Close coordination with the impacted school and the Los Angeles Unified School District for input on the school safety route design and frequent communication during construction.
- Extensive outreach program for the school and the community describing safety measures and construction schedules.
- Restrict construction times to avoid before and after school timeframes while children may be walking to and from school, and while school is in session, as feasible.

HAZ-3: The City and its contractor shall conduct further investigation of the nature and extent of landfill materials and contaminated soil at the Strathern Park North site, under the oversight of the City of Los Angeles Local Enforcement Agency (LEA). Undocumented waste shall be delineated and sampled for chemicals of concern related to waste materials. The Project shall avoid construction within the delineated waste mass, as feasible. If avoidance of the waste mass is not feasible, the City shall submit a work plan to the LEA that documents the results of the waste delineation, details the specifics of the construction Project and how it relates to the onsite waste, describes the procedures for dealing with the waste, and outlines the environmental monitoring procedures that would be implemented during construction. Upon approval of the work plan, the City and its contractor shall remove the landfill materials and any soil with chemical concentrations above regulatory action levels to the satisfaction of the LEA and properly dispose of it at a permitted facility. An as-built report shall be submitted to the LEA after completion of the Project.

Noise

NOI-1: For construction activities adjacent to noise-sensitive receptors (e.g., residences and schools), the contractor shall ensure that all construction equipment, fixed or mobile, are equipped with properly operating and maintained noise shielding and muffling devices, consistent with manufacturers' standards. The contractor shall use muffler systems (e.g., absorptive mufflers) that provide a minimum reduction of 5 dBA compared to the same equipment without an installed muffler system, reducing maximum construction noise levels. The contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturers' specifications. The contractor shall also keep documentation on-site verifying compliance with this measure.

NOI-2: For construction activities adjacent to noise-sensitive receptors (e.g., residences and schools), where physically and technically feasible, the contractor shall provide an 8-foot-tall to 20-foot-tall temporary fence or other barrier placed between the Project construction area and the sensitive receptor with a performance standard of achieving a 15 dBA noise level reduction at the sensitive receptors. The temporary fence or barrier shall be used during peak noise-generating construction phases when the use of heavy equipment is prevalent. A noise barrier is not required if it would pose a safety risk or unreasonably prevent access to the construction area as deemed by the on-site construction manager, such as in areas that have limited equipment

maneuvering space or access.
NOI-3: Limit engine idling of construction equipment (e.g., haul trucks, loaders) to a minimum of 200 feet from any boundary of the nearest sensitive receptors.
NOI-4: Prior to commencement of construction activities, the City shall notify in writing adjacent residents, schools and businesses near the various park Project sites, of proposed construction activities and the tentative schedule. The notices shall also provide a contact person and hotline where local residents, schools, or business owners can call during active construction with questions or comments. The City shall respond to inquiries regarding construction noise and vibration. Notices and construction signs will include a website address which will be updated quarterly and will include Program-related information.
NOI-5: The operation of construction equipment that generates high levels of vibration, such as large bulldozers and loaded trucks, shall be prohibited within 45 feet of the property lines of existing residential and school uses adjacent to the various park Project sites. Instead, rubber-tired equipment not exceeding 247 horsepower shall be used in these areas during construction within 45 feet from the sensitive receptor locations.
Transportation
TR-1: For parks where construction would occur outside of park facilities or that may impact roadways surrounding park areas, a CTMP shall be developed by the City or its contractor and approved by LADOT prior to the start of construction. The CTMP may include, but is not limited to the following: • Work area traffic control plans for all in-street construction sites to the satisfaction of LADOT, as appropriate prior to the start of any construction work. The plans shall include such elements as the location of any lane closures, restricted hours during which lane closures would not be allowed, local traffic detours, protective devices and traffic controls (such as pavement markings, barricades, cones, flagmen, lights, warning beacons, temporary traffic signals, turning movement restrictions, warning signs), access to abutting properties, and provisions to maintain emergency access through construction work areas. • The dates and locations where in-street and off-street construction activities are planned. • If any street segments will be limited to one-way traffic, prepare detour plans over parallel routes. • Require signage indicated alternative routes where construction will occur. • Identify and consolidate staging areas for equipment and materials, as feasible. • Consolidate truck trips, such that multiple worksites can be served, as feasible. • Promote carpooling among workers. • Contact emergency service providers in the Project vicinity to notify of the location, hours, and duration of in-street construction. Provide advance notice of any lane closures and changes to local access and identity alternative routes where appropriate.

BE IT FURTHER RESOLVED that this Board finds that the implementation of these mitigation measures will lessen the environmental impacts of the proposed Project to a level of less than significant.

BE IT FURTHER RESOLVED that this Board concludes that the IS/MND has been prepared in compliance with CEQA and constitutes a complete, accurate, adequate, and good faith effort at full disclosure under CEQA.

BE IT FURTHER RESOLVED that this Board has reviewed and considered the information contained in the IS/MND, and that the IS/MND reflects the independent judgment and analysis of this Board.

BE IT FURTHER RESOLVED that this Board finds on the basis of the whole record before it, including the IS/MND, that there is no substantial evidence that the proposed Project, with mitigation incorporated, will have a significant effect on the environment.

BE IT FURTHER RESOLVED that the IS/MND is on file with the Secretary of the Board and is incorporated in the Resolution, and made a part hereof.

BE IT FURTHER RESOLVED that this Board adopts the IS/MND, requires incorporation of the mitigation measures, adopts the MMRP, approves the Project, authorizes its construction, and approves the payment for permit, mitigation, and tribal support costs associated with the Project.

BE IT FURTHER RESOLVED that the Chief Accounting Employee of the LADWP, upon approval of the Manager of Environmental Planning and Assessment, is authorized and directed to draw demands on the Water Revenue Fund in payment of the obligations arising under this Board Resolution.

BE IT FURTHER RESOLVED that LADWP shall file a Notice of Determination with the Los Angeles County Clerk within five working days after deciding to approve the Project.

BE IT FURTHER RESOLVED that the Environmental Affairs Division will be the custodian of the record of proceedings for the Project.

I HEREBY CERTIFY that the foregoing is a full, true, and correct copy of the Resolution adopted by the Board of Water and Power Commissioners of the City at its meeting held

Project Title: Stormwater Capture Parks Program

Project Applicant: Los Angeles Department of Water and Power

Project Location (include county): various locations, San Fernando Valley, Los Angeles County

Project Description:

The City of Los Angeles, including LADWP, Recreation and Parks, and the Bureau of Engineering, proposes to construct stormwater capture facilities at nine City-owned parks in the San Fernando Valley. The main goal of the Program is to capture stormwater and recharge the San Fernando Groundwater Basin, helping to increase the local water supply, improve water quality, and reduce flood risk.

This is to advise that the Los Angeles Department of Water and Power (☒ Lead Agency or ☐ Responsible Agency) has approved the above

described project on 09/14/2021 (date) and has made the following determinations regarding the above described project.

1. The project [☐ will ☒ will not] have a significant effect on the environment.
2. ☐ An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA.
   ☒ A Negative Declaration was prepared for this project pursuant to the provisions of CEQA.
3. Mitigation measures [☒ were ☐ were not] made a condition of the approval of the project.
4. A mitigation reporting or monitoring plan [☒ was ☐ was not] adopted for this project.
5. A statement of Overriding Considerations [☐ was ☒ was not] adopted for this project.
6. Findings [☒ were ☐ were not] made pursuant to the provisions of CEQA.

This is to certify that the final EIR with comments and responses and record of project approval, or the negative Declaration, is available to the General Public at:
111 N. Hope Street, Room 1044, Los Angeles, CA 90012 www.ladwp.com/envnotices

NOTICE OF INTENT TO ADOPT A MITIGATED NEGATIVE DECLARATION FOR THE STORMWATER CAPTURE PARKS PROGRAM

Date: January 7, 2021

To: Agencies, Organizations, and Interested Parties

Subject: Notice of Intent to Adopt a Mitigated Negative Declaration for the Stormwater Capture Parks Program

An Initial Study/Mitigated Negative Declaration (IS/MND) has been prepared by the Los Angeles Department of Water and Power (LADWP), Department of Public Works Bureau of Engineering, Los Angeles Sanitation and Environment, and City of Los Angeles Department of Recreation and Parks (RAP), collectively referred to herein as the City, for the Stormwater Capture Parks Program (Program). Pursuant to the California Environmental Quality Act, LADWP is the Lead Agency and is responsible for the preparation of this document.

PROJECT LOCATION

The proposed Program components would be constructed within nine parks located within the upper Tujunga Wash Watershed, which lies above the San Fernando Valley Groundwater Basin. All nine parks are located along State Route (SR) 170 between the Pacoima and Valley Village neighborhoods of the City of Los Angeles: David M. Gonzales Recreation Center (10943 Herrick Avenue, Pacoima, CA), Fernangeles Park (8851 Laurel Canyon Boulevard, Sun Valley, CA), Strathern Park North (8045 Whitsett Avenue, North Hollywood, CA), Whitsett Fields Park North (7100 Whitsett Avenue, North Hollywood, CA), Valley Plaza Park North and Valley Plaza Park South (12240 Archwood Street, North Hollywood, CA), Alexandria Park (north of SR 170 and west of North Laurel Canyon Boulevard), North Hollywood Park (11430 Chandler Boulevard, North Hollywood, CA), and Valley Village Park (5000 Westpark Drive, North Hollywood, CA).

PROJECT DESCRIPTION

The goals of the Program are to increase local water supply, alleviate localized flooding in the area, and improve water quality of stormwater runoff. The proposed Program would capture stormwater surface flows in the Program area within the City, diverting the runoff from the Central Branch Tujunga Wash to recharge the San Fernando Groundwater Basin. Underground infiltration galleries would be constructed within open space portions of each of the nine parks, and other appurtenances would be installed to connect to and manage flow from existing storm drains. Additional improvements to park amenities would also be implemented as part of the Program.

At each park project site, an underground infiltration gallery and/or dry wells would be constructed. These would be approximately 12 feet high with 11 feet of storage. Additional facilities at each park project site would include a hydrodynamic separator unit, maintenance holes for access, flow-measuring devices, diversion and equalization pipes, pump station, and rubber dams, where

needed. Diversion pipes may travel along city streets surrounding the park project sites. Educational signage would be installed at each park project site to provide for community engagement. In addition, each park would be graded and revegetated with grass, or other park improvements would be made to enhance recreational use and would be determined with input from RAP and the community.

ENVIRONMENTAL EFFECTS
The IS/MND describes potentially significant impacts to air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, noise, transportation, and wildfire. Mitigation measures have been defined to reduce impacts to less than significant levels. Effects found to be less than significant are also described in the IS/MND.

PUBLIC COMMENT PERIOD
The public comment period for the IS/MND will commence on January 7, 2021 and conclude on February 8, 2021 at 5:00 pm. The IS/MND is available for review on the LADWP website at http://www.ladwp.com/envnotices.

Please submit comments in writing to the address provided below. Comment letters must be received by **5:00 p.m. on February 8, 2021**.

Los Angeles Department of Water and Power
111 North Hope Street, Room 1044
Los Angeles, CA 90012
Attention: Mr. Christopher Lopez
Email: Christopher.Lopez@ladwp.com

All comments received related to issues discussed in the IS/MND will be included in the final package that is provided to the City of Los Angeles Board of Water and Power Commissioners for final consideration and approval at a future date. Once determined, the Board hearing date and time will be posted on the LADWP website at http://www.ladwp.com/envnotices. The hearing will be in the LADWP Board Room at 111 North Hope Street, 15th Floor, Los Angeles, CA 90012. Please check the Board agenda within 72 hours of the scheduled time and date to confirm. You may access the Board agenda on the LADWP website at http://www.ladwp.com/AboutLADWP or contact the commission office at (213) 367-1356.

PLEASE NOTE: LADWP's practice is to make the entirety of comments received a part of the public record. Therefore, names, home addresses, home phone numbers, and email addresses of commenters, if included in the response, will be made part of the record and available for public review. Individual commenters may request that LADWP withhold their name and/or home addresses, etc., but if you wish LADWP to consider withholding this information you must state this prominently at the beginning of your comments. In the absence of this written request, this information will be made part of the record for public review. LADWP will always make submissions from organizations or businesses, and from individuals identifying themselves as a representative of representatives of, or officials of, organizations or businesses, available for public inspection in their entirety.

For any questions regarding the review of the IS/MND, please contact Mr. Christopher Lopez at Christopher.Lopez@ladwp.com or (213) 367-3509.

CITY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
BUREAU OF ENGINEERING

Date: October 26, 2021

The Department of Public Works is scheduling the following improvements:

Project Title: **David M. Gonzales Recreation Center Stormwater Capture Project**
Work Order No.: **EW40078D** **Job ID:** **1453**

Work to Be Performed: The Project consists of installing a 2.6-acre underground infiltration gallery to capture and infiltrate stormwater. Construction of the underground infiltration gallery will include installation of a storm drain diversion structure, storm pipe, pretreatment device, desilting basin, flow measuring device, level sensors, and education signage. Runoff will be collected from approximately a 759-acre tributary area and diverted into the infiltration gallery. The galleries shall be sized to store approximately 1,596,000 cf.

The project will include restoration of existing park components as well as new improvements. Park improvements include park improvements such as two (2) improved baseball fields with the following amenities: backstops, dugouts, player benches, batting cage, bullpens, sports lighting, and bleachers. Other improvements include new exercise equipment, a multi-purpose field/open space, hydration stations, permeable pavement parking lot, landscaping, and an improved irrigation system.

Please fill out the following and return one copy to the Utility Coordination Group by **November 26, 2021**.
PLEASE UPLOAD A COPY OF YOUR AS-BUILT PLANS, IN THE LINK PROVIDED IN THE EMAIL, SHOWING THE LOCATION OF YOUR FACILITIES (IN OR AROUND THE PROJECT AREA).

Your replies will be transmitted to prospective bidders and used in coordinating this project. Please note proper location of any facilities, live or abandoned, that are not shown or are shown incorrectly on the attached plans. The City will not be responsible for any damage to facilities that are not shown or are shown incorrectly on the plans. Failure to reply may deprive you of the protection provided for in the Standard Specifications. Construction delays and/or expenses due to failure in providing accurate information shall result in an assessment of costs to you, per Los Angeles Municipal Code (LAMC) 62.01 or your Franchise Agreement with the City.

Upon receipt and review of your response(s), the City will contact you to formalize your utility relocation (or protect-in-place) plan, with a utility relocation agreement if necessary.

For questions, please contact the **Project Manager Bryan Powell** at (213) 485-5908 or **bryan.powell**@lacity.org.

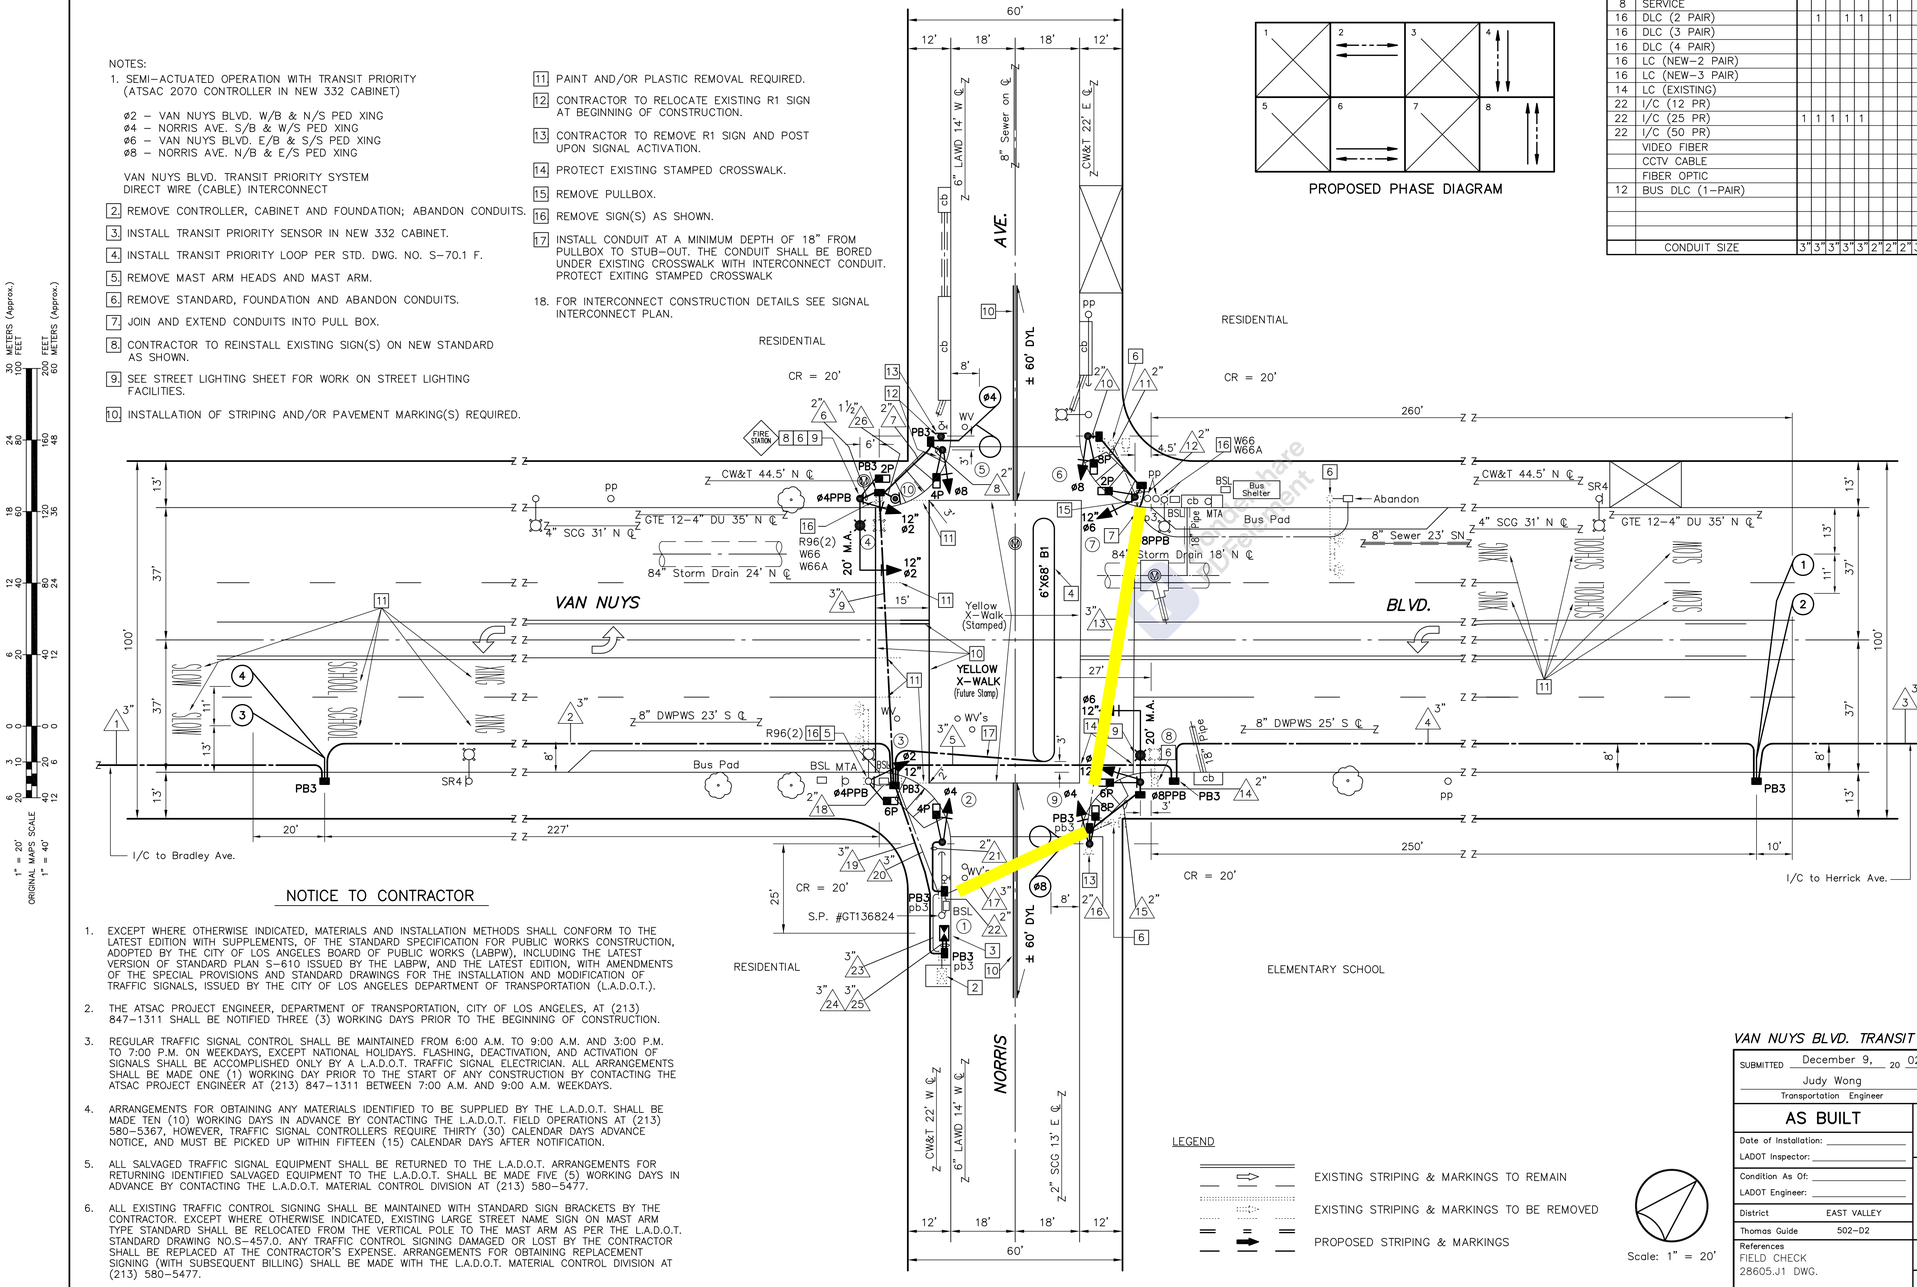
PROPOSED PHASE DIAGRAM



NOTICE TO CONTRACTOR

1. EXCEPT WHERE OTHERWISE INDICATED, MATERIALS AND INSTALLATION METHODS SHALL CONFORM TO THE LATEST EDITION WITH SUPPLEMENTS, OF THE STANDARD SPECIFICATION FOR PUBLIC WORKS CONSTRUCTION, ADOPTED BY THE CITY OF LOS ANGELES BOARD OF PUBLIC WORKS (LABPW), INCLUDING THE LATEST VERSION OF STANDARD PLAN S-610 ISSUED BY THE LABPW, AND THE LATEST EDITION, WITH AMENDMENTS OF THE SPECIAL PROVISIONS AND STANDARD DRAWINGS FOR THE INSTALLATION AND MODIFICATION OF TRAFFIC SIGNALS, ISSUED BY THE CITY OF LOS ANGELES DEPARTMENT OF TRANSPORTATION (L.A.D.O.T.).
2. THE ATSAC PROJECT ENGINEER, DEPARTMENT OF TRANSPORTATION, CITY OF LOS ANGELES, AT (213) 847-1311 SHALL BE NOTIFIED THREE (3) WORKING DAYS PRIOR TO THE BEGINNING OF CONSTRUCTION.
3. REGULAR TRAFFIC SIGNAL CONTROL SHALL BE MAINTAINED FROM 6:00 A.M. TO 9:00 A.M. AND 3:00 P.M. TO 7:00 P.M. ON WEEKDAYS, EXCEPT NATIONAL HOLIDAYS. FLASHING, DEACTIVATION, AND ACTIVATION OF SIGNALS SHALL BE ACCOMPLISHED ONLY BY A L.A.D.O.T. TRAFFIC SIGNAL ELECTRICIAN. ALL ARRANGEMENTS SHALL BE MADE ONE (1) WORKING DAY PRIOR TO THE START OF ANY CONSTRUCTION BY CONTACTING THE ATSAC PROJECT ENGINEER AT (213) 847-1311 BETWEEN 7:00 A.M. AND 9:00 A.M. WEEKDAYS.
4. ARRANGEMENTS FOR OBTAINING ANY MATERIALS IDENTIFIED TO BE SUPPLIED BY THE L.A.D.O.T. SHALL BE MADE TEN (10) WORKING DAYS IN ADVANCE BY CONTACTING THE L.A.D.O.T. FIELD OPERATIONS AT (213) 580-5367, HOWEVER, TRAFFIC SIGNAL CONTROLLERS REQUIRE THIRTY (30) CALENDAR DAYS ADVANCE NOTICE, AND MUST BE PICKED UP WITHIN FIFTEEN (15) CALENDAR DAYS AFTER NOTIFICATION.
5. ALL SALVAGED TRAFFIC SIGNAL EQUIPMENT SHALL BE RETURNED TO THE L.A.D.O.T. ARRANGEMENTS FOR RETURNING IDENTIFIED SALVAGED EQUIPMENT TO THE L.A.D.O.T. SHALL BE MADE FIVE (5) WORKING DAYS IN ADVANCE BY CONTACTING THE L.A.D.O.T. MATERIAL CONTROL DIVISION AT (213) 580-5477.
6. ALL EXISTING TRAFFIC CONTROL SIGNING SHALL BE MAINTAINED WITH STANDARD SIGN BRACKETS BY THE CONTRACTOR. EXCEPT WHERE OTHERWISE INDICATED, EXISTING LARGE STREET NAME SIGN ON MAST ARM TYPE STANDARD SHALL BE RELOCATED FROM THE VERTICAL POLE TO THE MAST ARM AS PER THE L.A.D.O.T. STANDARD DRAWING NO.S-457.0. ANY TRAFFIC CONTROL SIGNING DAMAGED OR LOST BY THE CONTRACTOR SHALL BE REPLACED AT THE CONTRACTOR'S EXPENSE. ARRANGEMENTS FOR OBTAINING REPLACEMENT SIGNING (WITH SUBSEQUENT BILLING) SHALL BE MADE WITH THE L.A.D.O.T. MATERIAL CONTROL DIVISION AT (213) 580-5477.

NOTICE OF PROPOSED PROJECT **FIRST NOTICE**

CITY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
BUREAU OF ENGINEERING

Date: October 26, 2021

The Department of Public Works is scheduling the following improvements:

Project Title: **David M. Gonzales Recreation Center Stormwater Capture Project**
Work Order No.: **EW40078D** **Job ID:** **1453**

Work to Be Performed: The Project consists of installing a 2.6-acre underground infiltration gallery to capture and infiltrate stormwater. Construction of the underground infiltration gallery will include installation of a storm drain diversion structure, storm pipe, pretreatment device, desilting basin, flow measuring device, level sensors, and education signage. Runoff will be collected from approximately a 759-acre tributary area and diverted into the infiltration gallery. The galleries shall be sized to store approximately 1,596,000 cf.

The project will include restoration of existing park components as well as new improvements. Park improvements include park improvements such as two (2) improved baseball fields with the following amenities: backstops, dugouts, player benches, batting cage, bullpens, sports lighting, and bleachers. Other improvements include new exercise equipment, a multi-purpose field/open space, hydration stations, permeable pavement parking lot, landscaping, and an improved irrigation system.

Please fill out the following and return one copy to the Utility Coordination Group by **November 26, 2021**.
PLEASE UPLOAD A COPY OF YOUR AS-BUILT PLANS, IN THE LINK PROVIDED IN THE EMAIL, SHOWING THE LOCATION OF YOUR FACILITIES (IN OR AROUND THE PROJECT AREA).

Your replies will be transmitted to prospective bidders and used in coordinating this project. Please note proper location of any facilities, live or abandoned, that are not shown or are shown incorrectly on the attached plans. The City will not be responsible for any damage to facilities that are not shown or are shown incorrectly on the plans. Failure to reply may deprive you of the protection provided for in the Standard Specifications. Construction delays and/or expenses due to failure in providing accurate information shall result in an assessment of costs to you, per Los Angeles Municipal Code (LAMC) 62.01 or your Franchise Agreement with the City.

Upon receipt and review of your response(s), the City will contact you to formalize your utility relocation (or protect-in-place) plan, with a utility relocation agreement if necessary.

For questions, please contact the **Project Manager Bryan Powell** at (213) 485-5908 or **bryan.powell@lacity.org**.

Work to Be Performed: The Project consists of installing a 2.6-acre underground infiltration gallery to capture and infiltrate stormwater. Construction of the underground infiltration gallery will include installation of a storm drain diversion structure, storm pipe, pretreatment device, desilting basin, flow measuring device, level sensors, and education signage. Runoff will be collected from approximately a 759-acre tributary area and diverted into the infiltration gallery. The galleries shall be sized to store approximately 1,596,000 cf.

The project will include restoration of existing park components as well as new improvements. Park improvements include park improvements such as two (2) improved baseball fields with the following amenities: backstops, dugouts, player benches, batting cage, bullpens, sports lighting, and bleachers. Other improvements include new exercise equipment, a multi-purpose field/open space, hydration stations, permeable pavement parking lot, landscaping, and an improved irrigation system.

Please fill out the following and return one copy to the Utility Coordination Group by **November 26, 2021**.
PLEASE UPLOAD A COPY OF YOUR AS-BUILT PLANS, IN THE LINK PROVIDED IN THE EMAIL, SHOWING THE LOCATION OF YOUR FACILITIES (IN OR AROUND THE PROJECT AREA).

Your replies will be transmitted to prospective bidders and used in coordinating this project. Please note proper location of any facilities, live or abandoned, that are not shown or are shown incorrectly on the attached plans. The City will not be responsible for any damage to facilities that are not shown or are shown incorrectly on the plans. Failure to reply may deprive you of the protection provided for in the Standard Specifications. Construction delays and/or expenses due to failure in providing accurate information shall result in an assessment of costs to you, per Los Angeles Municipal Code (LAMC) 62.01 or your Franchise Agreement with the City.

Upon receipt and review of your response(s), the City will contact you to formalize your utility relocation (or protect-in-place) plan, with a utility relocation agreement if necessary.

For questions, please contact the **Project Manager Bryan Powell** at (213) 485-5908 or **bryan.powell**@lacity.org.

Memorandum of Agreement
By and Among the Los Angeles Department of Water and Power,
the Los Angeles Department of Public Works Bureau of Engineering,
and the Los Angeles Department of Recreation and Parks
for the Implementation of the Stormwater Capture Parks Program

AGREEMENT

This Memorandum of Agreement (Agreement) is made and entered into by and among the Los Angeles Department of Water and Power (LADWP), Los Angeles Department of Public Works Bureau of Engineering (BOE), and Los Angeles Department of Recreation and Parks (RAP) (collectively referred to as "Parties" or individually as "Party"), for the implementation of the Stormwater Capture Parks Program (Program).

WITNESSETH

WHEREAS, the City of Los Angeles (City) is home to approximately four (4) million residents who depend on reliable sources of water; and

WHEREAS, local water supply is a key resource that LADWP has historically utilized, and currently makes up about ten percent (10%) of the City's total water supply; and

WHEREAS, capturing additional stormwater for groundwater recharge is vital to sustain the long-term reliability of the City's local groundwater supply; and

WHEREAS, the City holds water rights in several local groundwater basins, with the San Fernando Groundwater Basin (SFB) groundwater rights being the most significant; and

WHEREAS, the City's groundwater rights in the SFB, as well as its pueblo rights to the surface waters of the Los Angeles River, were recognized and adjudicated by the California Supreme Court in *The City of Los Angeles v. City of San Fernando*, 14 Cal. 3d 199 (1975), and the subsequent judgment in *The City of Los Angeles v. City of San Fernando*, Los Angeles Superior Court Case No. 650079 (January 26, 1979); and

WHEREAS, LADWP is a municipally owned utility responsible for delivering water and power to the residents of the City; and

WHEREAS, BOE is responsible for the design and construction of capital improvement projects within the City's rights-of-way; and

WHEREAS, RAP is responsible for managing, operating, and maintaining parkland, public recreation facilities, and programs in the City to enhance the safety and enjoyment of park patrons, and holds property rights to certain properties in the City dedicated to such uses, which may be modified to allow capture of additional stormwater for groundwater recharge while still allowing for ongoing operation of parkland and public recreation facilities and programs; and

WHEREAS, the Parties are committed to the Program to pursue integrated opportunities to enhance recreational space; provide social, economic, and environmental benefits; increase stormwater capture for water supply reliability; and improve water quality; and

WHEREAS, LADWP and BOE entered into a prior agreement (Resolution No. 019075) to complete the Program design, under which LADWP agreed to finance the Program design costs, up to a maximum of nineteen million, one hundred thousand dollars ($19,100,000) and BOE agreed to facilitate project management, planning, and design efforts of the Program; and

WHEREAS, LADWP intends to pay the Program implementation costs through a combination of LADWP's funds, grant funds, and funding partnerships up to a maximum of two hundred and ninety-eight million dollars ($298,000,000); and

WHEREAS, LADWP has been awarded seventy-five million dollars ($75,000,000) by the Los Angeles County's Safe Clean Water Regional Program (SCWP), one million, eight hundred thousand dollars ($1,800,000) by the Integrated Regional Water Management Proposition 1 Rounds 1 and 2, and three million dollars ($3,000,000) by Storm Water Grant Program Proposition 1; and

WHEREAS, LADWP will continue to pursue other eligible grants and cost-sharing partnerships to help fund the remaining Program's costs with assistance from BOE and RAP, as appropriate; and

WHEREAS, LADWP agrees to own, operate, and maintain all stormwater capture infrastructure associated with the Program for the life of the Program; and

WHEREAS, LADWP's agreement to own, operate, and maintain all stormwater capture infrastructure associated with the Program extends to its agreement to be responsible, at its sole cost, for any and all impacts and damages to RAP properties and facilities resulting from its activities related to ownership, operation or maintenance of that stormwater capture infrastructure; and to restore the RAP properties and facilities to conditions as shown in the 100% design plan sets; and

WHEREAS, LADWP agrees that, at the end of the useful life of the stormwater capture infrastructure at each RAP property, LADWP shall be responsible, at its sole cost, to remove all such infrastructure. Subject to reaching an agreement with RAP at the end of the useful life of each project, LADWP may refurbish the Program to extend the useful life of each project, abandon-in-place, or a combination of the above, in lieu of removal. Any impacts or damages to RAP properties and facilities shall be restored to pre-existing conditions within eighteen (18) months; and

WHEREAS, BOE agrees to facilitate project management and delivery of the Program; and

WHEREAS, the Board of Recreation and Park Commissioners for the City of Los Angeles, by resolution dated _____, 2024, has agreed to DWP's use, in coordination with BOE and RAP, of RAP properties for these integrated opportunities to enhance recreational space, provide social, economic, and environmental benefits, increase stormwater capture for water supply reliability, and improve water quality, all as more fully described herein; and

WHEREAS, RAP agrees to the implementation of the Program at RAP properties; and

WHEREAS, subject to reaching agreement with LADWP, RAP agrees to maintain all new park improvements, including landscaping and recreational improvements, and access roads, at its cost, upon completion of each project within the Program.

NOW, THEREFORE, in consideration of the mutual benefits to be derived by the Parties, it is hereby agreed as follows:

1. PROGRAM INFORMATION

   a. Background

      The Program is a partnership among LADWP, BOE, and RAP. The Program consists of seven (7) projects to divert and capture approximately one thousand, eight hundred (1,800) acre-feet per year (AFY) of stormwater and urban runoff from a combined three thousand, four hundred (3,400) acre drainage area for infiltration at seven (7) City parks to replenish the underlying SFB.

      The proposed stormwater capture infrastructure will consist of infiltration galleries, hydrodynamic separators, pumps, permeable pavements, bioswales, catch basins, storm drains, and other green street elements. Underground galleries have been strategically sized and placed within the parks to maximize above-ground uses. In addition, the Program is intended to help to alleviate localized flooding; improve downstream water quality; and provide recreational, social, economic, and environmental benefits for underserved communities.

      LADWP and BOE entered into a prior agreement (Resolution No. 019075) to complete the Program design, under which LADWP agreed to finance the Program design costs, up to a maximum of nineteen million, one hundred thousand dollars ($19,100,000) and BOE agreed to facilitate project management, planning, and design efforts of the Program. This subsequent Agreement is a continuing partnership for the bid and award, construction, and post-construction phases of the Program.

b. Location

The Program's projects are located at parks in the eastern San Fernando Valley in Council Districts 2, 6, and 7. See **Attachment 1, Program Map**. The Program's seven projects include:

i. David M. Gonzales Recreation Center Stormwater Capture Project (David Gonzales Park);
ii. Fernangeles Park Stormwater Capture Project (Fernangeles Park);
iii. Strathern Park North Stormwater Capture Project (Strathern Park);
iv. Whitsett Fields Park North Stormwater Capture Project (Whitsett Park);
v. Valley Plaza Park North Stormwater Capture Project (Valley Plaza Park North);
vi. Valley Plaza Park South Stormwater Capture Project (Valley Plaza Park South); and
vii. Valley Village Park Stormwater Capture Project (Valley Village Park).

c. Scope

This Agreement governs the Program's bid and award, construction, and post-construction phases, which include, but are not limited to, the preparation and approval of bid documents, advertisement and award of construction contracts, outreach, design support during bid and award, design support during construction, securing outstanding permits for phases 1 and 2 construction projects, construction, construction management, and post-construction tasks including, but not limited to, as-built plans, contract close-out, and project acceptance by the Board of Public Works, Board of Recreation and Parks, and Board of Water and Power Commissioners.

Under the Program, the Parties intend to divert and capture stormwater for infiltration at various City parks to increase replenishment of the SFB. The proposed stormwater capture infrastructure consists of infiltration galleries, hydrodynamic separators, pumps, permeable pavements, catch basins, storm drains, and other green street elements, as shown in **Attachment 4**.

d. Budget and Funding

The Program's estimated cost for bid and award, construction, construction management, and post-construction phases, as well as RAP's additional staff to perform tasks related to the Program and lost permit revenue, is approximately two hundred and ninety-eight million dollars ($298,000,000). LADWP secured seventy-nine million, and eight hundred thousand dollars

($79,800,000) through Measure W Safe Clean Water Program, Prop 1 Integrated Regional Water Management Rounds 1 and 2, and Prop 1 Stormwater Grant Program Round 2. LADWP continues to seek additional state and federal funds.

Each project within the Program will be evaluated individually and only proceed with implementation once LADWP determines the project has secured full funding. Any project bids exceeding the project costs provided in this Agreement shall require a written amendment to this Agreement signed by all Parties. If LADWP deems, in its sole discretion, that a project is no longer feasible to award a construction contract, LADWP will provide BOE and RAP with written notification to terminate work on the project. BOE shall only invoice LADWP for costs incurred subsequent to execution of this Agreement and prior to the Agreement termination date consistent with Section 6.a. If terminated, provisions in Section 6.l shall apply on an individual project basis.

The following tables show the total estimated Program costs:

Project	Estimated Project Cost[1]
Fernangeles Park	$42,900,000
Strathern Park	$41,900,000
Valley Village Park	$20,200,000
David Gonzales Park	$65,200,000
Valley Plaza Park North	$62,700,000
Valley Plaza Park South	$32,300,000
Whitsett Park	$32,500,000
Total:	**$297,700,000**

[1] Design cost not included

RAP	Estimated Cost[2]
Additional RAP staffing cost	$238,913
Lost permit revenue	$38,462
Storage bins	$22,625
Total:	**$300,000**

[2] RAP compensation amount per project is provided in **Attachment 2**

e. Schedule

Attachment 3 shows the anticipated construction schedule for each project within the Program. Bid and award and post-construction are not accounted for in the table below. The Program is separated into two (2) construction phases

to comply with California Environmental Quality Act (CEQA) mitigation measures and to minimize impacts to stakeholders and the community during construction. The Parties agree that this construction schedule shall be updated at least annually, by June 30th of each year, to reflect the actual current schedule for these activities.

2. LADWP AGREES TO:

   a. Provide written authorization to BOE to commence work related to bid preparation and advertisement of the specified project(s) within the Program after this Agreement becomes effective and upon identifying and securing full project funding. LADWP will provide a subsequent written authorization to BOE to either award a construction contract or terminate the specified project(s) within the Program.

   b. Provide funding for the Program implementation costs, which includes the Program bid and award, construction, and post-construction phases, up to a maximum of two hundred and ninety-seven million, seven hundred thousand dollars ($297,700,000), through a combination of LADWP's funds, grant funds, and funding partnerships, solely for service costs in accordance with Section 5.

   c. Reimburse RAP up to three hundred thousand dollars ($300,000) for additional staff costs related to the Program and lost permit revenue during construction. Any increase in reimbursement to RAP shall be agreed upon by LADWP and RAP through an amendment.

   d. In accordance with Section 5 of this Agreement, reimburse BOE, and BOE's suppliers and contractors, up to two hundred and ninety-seven million, seven hundred thousand dollars ($297,700,000) for all eligible costs related to the Program, including the application of the appropriate full Cost Allocation Plan overhead rates.

   e. Authorize BOE to represent LADWP in all negotiations including, but not limited to, permit acquisition in accordance with Section 3.c, relocation of non-LADWP utilities, construction, bid and award, and construction contract administration. LADWP shall have the right to make final decisions and approve all work related to the Program.

   f. Participate in Program meetings, make decisions, provide technical assistance, and provide direction to BOE regarding the Program in a timely manner.

   g. Lead community outreach on updates and milestones involving the Program.

h. Provide BOE, at LADWP's sole discretion, a temporary right-of-way, license, right-of-entry or other access across property owned or controlled by LADWP, as necessary for the Program's construction.

i. If necessary, collaborate with RAP after construction of the Program and enter into a separate contract to identify locations and complete any unfulfilled tree mitigation requirements at LADWP's cost, as set by RAP.

j. Advise BOE and RAP regarding grant agreements and requirements from State of California Proposition 1 and County of Los Angeles SCWP.

k. Acknowledge BOE and RAP as Program partners in all LADWP approved materials, publications, press releases, signage, and communications related to the Program.

l. Own, operate, and maintain all stormwater capture infrastructure associated with the Program, as shown in **Attachment 4**, for the life of the Program, which includes, but is not limited to: diversion structures, catch basins, conveyance pipes, hydrodynamic separators, permeable pavements, pumps, baffle boxes, sedimentation basins, underground infiltration galleries, Supervisory Control and Data Acquisition systems or other instrumentation and control systems to the extent applicable, control panels, flow meters, levels, and prefabricated utility structures. Costs associated with operation and maintenance of LADWP's stormwater capture infrastructure shall be LADWP's responsibility; costs associated with operation and maintenance of RAP's facilities shall be RAP's responsibility.

m. Accept sole and full responsibility for management, regulatory compliance, permitting, maintenance, and operation of the stormwater capture infrastructure upon completion.

n. Be responsible, at its sole cost, for any and all impacts and damages to RAP properties and facilities resulting from its activities related to ownership, operation, or maintenance of that stormwater capture infrastructure, including in the event that LADWP's stormwater capture infrastructure is cancelled or is only partially completed, and to restore the RAP properties and facilities to pre-existing conditions within eighteen (18) months of RAP providing LADWP written notice of such impacts or damages.

o. Be responsible, at its sole cost, at the end of the useful life of the stormwater capture infrastructure at each RAP property, to remove all such infrastructure. Subject to reaching an agreement with RAP at the end of the useful life of each project, in lieu of removal, LADWP may refurbish the stormwater capture infrastructure to extend the useful life of each project, abandon-in-place, or a combination of the above for all such infrastructure. RAP properties and facilities shall be restored to pre-existing conditions within eighteen (18) months thereafter.

p. Finalize all operation and maintenance (O&M) agreements related to stormwater capture infrastructure prior to the completion of construction for each project, either with LADWP's workforces or through a third-party contractor or agency.

q. Provide RAP advance notice, as indicated in the O&M Manual created pursuant to Section 3.n, to coordinate O&M of the stormwater capture facilities. Advance notice will be provided by LADWP to enter the Program sites to perform maintenance of the facilities. Notice must include the date, location, and duration of the maintenance and will be subject to RAP approval, which shall not be unreasonably denied. Maintenance conducted by LADWP shall not impede or interfere with any recreational activities or programming.

r. The O&M related provisions in Section 2, including Sections 2.k. though 2.p., shall survive termination of this Agreement and remain in effect until the end of the useful life of the project.

s. In the event that LADWP finds significant contamination or other site conditions that make a project infeasible, LADWP may decide to cancel that project. LADWP shall be responsible for all costs associated with any actions it undertook up to the point of its decision to cancel, including removal and disposal of any excavated soil found to be contaminated. In the event that LADWP decides to proceed with the stormwater capture infrastructure project notwithstanding the contamination or other condition, LADWP shall be responsible for all costs associated with removal of any contaminated soil.

3. BOE AGREES TO:

a. Commence work only upon issuance of written authorizations as stated in Section 2.a of the specified project(s) within the Program from LADWP.

b. Advertise the Program for construction bids, award and administer the construction contract(s), and cause the Program to be constructed in accordance with the said plans, specifications, scope, budget and schedule. Construction contracts will be awarded by the Board of Public Works.

c. Use LADWP funds solely for costs of services rendered for work performed in accordance with this Agreement. These funds shall be used to acquire or renew necessary permits, prepare bid documents, advertise and award construction contracts, provide design support during bid and award, provide design support during construction, construct the Program, and perform post-construction tasks including, but not limited to, as-built plans, contract close-out, and project acceptance by the Board of Public Works, Board of Recreation and Parks, and Board of Water and Power Commissioners.

d. Instruct and require BOE's suppliers and contractors to copy LADWP on all invoices submitted to Los Angeles Department of Public Works, Bureau of Contract Administration (BCA) for payment in accordance with the terms of the contracts awarded by BOE pursuant to Section 3.b. of this Agreement. Prior to the awarding of bid packages, BOE shall instruct and require all suppliers and contractors to submit a Supplier/Contractor Data Form, as shown in **Attachment 6**, directly to LADWP to create vendor codes for same.

e. BOE, and BOE's suppliers and contractors, shall only invoice LADWP for costs incurred during the term of this Agreement and prior to the Program termination date; LADWP is not responsible for costs incurred by BOE or BOE's suppliers and contractors outside that term.

f. Propose changes or modifications to the plans and specifications of the Program, including as may be necessitated by unforeseen, or unforeseeable, conditions encountered during construction, and consult with LADWP and RAP on any fundamental design changes. Subject to its consideration of RAP's right to provide input as to impacts on RAP's recreational facilities, LADWP shall have the right to make final decisions on all fundamental design changes for the Program and each individual project therein.

g. Develop Program milestones and report at each milestone consistent with BOE's and LADWP's project delivery processes.

h. Provide a minimum seven (7) day notice to LADWP and RAP to participate in meetings.

i. Upon full execution of this Agreement, prepare and send, and instruct its suppliers and contractors to send invoice(s) to LADWP in accordance with Section 5.

j. Use Generally Accepted Accounting Principles and comply with any and all other requirements of the City Controller to account for, transfer, and receive reimbursement funds for the Program.

k. Keep LADWP and RAP apprised of information, of which BOE becomes aware, pertaining to the status of the Program.

l. Provide construction documents and specifications to LADWP and RAP staff for review upon request.

m. Perform repairs and adjustments for all projects identified by LADWP prior to issuance of Statement of Completion.

n. Prepare and provide O&M plans and manuals and trainings to the satisfaction and requirements of LADWP.

o. Turn each project over to LADWP after witness testing, signoff of operational tests to confirm functionality of facility as designed, and final acceptance and turnover checklists per operator procedures.

p. Participate in community outreach on updates and milestones involving the Program.

q. Obtain approval from the Board of Recreation and Parks of the final plans and specifications for all portions of each project within the Program to be constructed on RAP property prior to the advertisement and award of a project by the Board of Public Works.

r. Support LADWP in grant applications and all grant-related documentation, including, but not limited to, providing labor hours, cost, schedule, and Program expenses, as needed for grant applications or reporting.

s. For Program projects awarded grant funds, such as from the State of California's Proposition 1 and County of Los Angeles SCWP, adhere to all grant requirements specified in the project's grant agreement, including incorporating grant requirements in all contracts BOE awards pursuant to this Agreement. Grant requirements include but are not limited to: retention of records, audits, and reports (minimum of thirty-six (36) years); insurance; contractor responsibility ordinance; project access; bonding; labor compliance; and signage.

t. Acknowledge LADWP and RAP as Program partners in all LADWP-approved material, publications, press releases, signage, and communications related to the Program.

u. Acknowledge LADWP's Power System Transmission Vegetation Management Group Contractor is currently occupying the Transmission Line Right of Way (TLRW) easement at Strathern Park. BOE shall allow the Contractor to continue with the occupancy and unfettered access of the LADWP TLRW through the construction of the project at Strathern Park. BOE shall coordinate these efforts with Mr. Juan Pelayo (Juan.Pelayo@ladwp.com).

4. RAP AGREES TO:

a. Participate in Program meetings and community outreach on updates and milestones involving the Program.

b. Grant BOE and LADWP, at no cost, any temporary rights-of-way, easements, right-of-entry, or grant of right for any real property that RAP owns, or has easements for, that are necessary for the Program's construction and that are consistent with the Charter of the City of Los Angeles.

c. Support LADWP in grant applications and all grant-related documentation, including, but not limited to, providing labor hours, cost, schedule, and Program expenses, as needed for grant applications and reporting.

d. RAP will have sole and full responsibility for overall park management, regulatory compliance, permitting, maintenance, and operation.

e. Finalize all O&M agreements related to RAP facilities prior to the completion of construction for each project, either with RAP's workforces or through a third-party contractor or agency.

f. Following RAP acceptance of each individual project, issue right-of-entry permits upon request for the post-construction phase and long-term post-construction O&M to identify repairs and adjustments to all civil, architectural, structural, mechanical, electrical, and instrumentation stormwater capture infrastructure installed as part of the Program, which includes, but is not limited to: diversion structures, catch basins, conveyance pipes, hydrodynamic separators, pumps, baffle boxes, sedimentation basins, underground infiltration galleries, Supervisory Control and Data Acquisition or other instrumentation and control systems as applicable, control panels, flow meters, levels, and prefabricated utility structures. The template form of the right of entry that RAP will provide to LADWP and its contractors to perform these activities is attached hereto as **Attachment 5**.

g. Subject to agreement with LADWP, perform the O&M of the Program's landscaping and irrigation components as to those elements for which LADWP is not responsible for O&M pursuant to Section 2 above.

h. Maintain the park trails, access roads, fencing, signage, trash receptacles, sports lighting, related electrical control panels, any electric vehicle station infrastructures, and recreational features of for each Program project.

i. Collaborate with LADWP to reach agreement to resolve situations where LADWP's activities related to ownership, operation or maintenance of its stormwater capture infrastructure result in impacts and damages to RAP properties and facilities.

j. Collaborate with LADWP to reach agreement to resolve the refurbishment, abandon-in-place, or removal and remediation of the stormwater capture infrastructure at each RAP property at the end of its useful life.

k. Continue to have sole and full responsibility for overall park management, permitting, maintenance, and operation. LADWP will have sole and full responsibility for management, regulatory compliance, permitting, maintenance, and operation of the stormwater capture infrastructure. Costs

associated with operation and maintenance of LADWP's stormwater capture infrastructure shall be LADWP's responsibility; costs associated with operation and maintenance of RAP's facilities shall be RAP's responsibility.

l. Acknowledge BOE and LADWP as Program partners in all LADWP approved material, publications, press releases, signage, and communications related to the Program.

5. INVOICES AND REIMBURSEMENT

a. BOE shall invoice LADWP for costs it incurs related to the Program, including BOE labor and BOE non-labor costs. LADWP shall pay BOE's approved invoices directly to BOE Accounting within thirty (30) calendar days of receipt of those invoices.

b. BOE's suppliers and contractors shall submit their invoices to the Los Angeles Department of Public Works Bureau of Contract Administration (BCA), BOE and LADWP simultaneously. Upon subsequent receipt of reviewed and undisputed invoices approved by BCA, BOE shall provide supplier and contractor invoice approval notices to LADWP within five (5) days of receipt. Concurrently, upon receipt of reviewed and undisputed invoices approved by BCA, LADWP shall have thirty (30) days to review, approve, and pay the invoices directly to BOE's suppliers and contractors. LADWP will not unreasonably withhold payment of the invoices to BOE's suppliers and contractors in order to comply with the City's vendor payment policy.

c. RAP shall invoice LADWP for Program costs associated with additional staff and lost permit revenues up to three hundred thousand dollars ($300,000) upon the issuance of the applicable Statement of Completion for each site. Any increase in reimbursement to RAP shall be agreed upon by LADWP and RAP through an amendment.

d. Invoice documentation shall state such services as were performed under this Agreement and comply with all City invoicing policies.

e. Subject to LADWP approval of contractor change order request, payment of construction change orders shall be included in regular invoices for payment. The total compensation by LADWP to BOE, and BOE's suppliers and contractors, including change orders for complete and satisfactory performance of services under this Agreement shall not exceed two hundred and ninety-seven million, seven hundred thousand dollars ($297,700,000) per Section 1.d. All construction change order requests are subject to consultation with and payment approval by LADWP.

f. Of the total amount of compensation included in Section 1.d above, LADWP shall only pay BOE, and BOE's suppliers and contractors, for services

performed, tasks implemented, and deliverables provided as specified in the Agreement. LADWP shall not be liable for monetary payments unless there is a document outlining performed services, completed tasks, and provided deliverables that are approved by LADWP's authorized representative(s) identified in this Agreement.

g. LADWP shall not be obligated to pay for work performed by BOE, and BOE's suppliers and contractors, for any such changes made in violation of this Agreement.

h. BOE shall provide quarterly progress reports throughout the term of this Agreement that will include schedule, budget, and work completed during the previous quarter and an estimate of the percentage completed. Progress reports shall be submitted to LADWP and RAP within forty-five (45) calendar days of the end of each respective quarter. Quarters shall be defined as the periods from January 1 to March 31, April 1 to June 30, July 1 to September 30, and October 1 to December 31.

6. IT IS MUTUALLY UNDERSTOOD AND AGREED:

a. This Agreement shall become effective upon execution by all Parties and terminate fifty-four (54) months thereafter. All work described in Section 1 shall be completed within the term of this Agreement. Any Party may terminate this Agreement for any reason by giving the other Parties thirty (30) calendar days written notice. In the event of termination by any Party prior to the date of completion of all of the projects in the Program: (i) the Parties agree to take all reasonable measures to prevent further costs under Agreement; (ii) LADWP will provide payment for any outstanding invoices for work performed up to the termination date, and will have no further financial obligations beyond the date of termination; (iii) BOE shall provide LADWP a final progress report that summarizes the total expenditure incurred under this Agreement with a copy of any completed or work-in-progress documents stated in Section
1.c and shall have no further obligation or liability to LADWP or City in regard to the performance of this Agreement; and (iv) any unspent funds will be transferred from BOE and/ or RAP to LADWP.

b. Subject to LADWP's obligations under this Agreement, including its O & M-related obligations under Section 2 (e.g., Section 2.k. through 2.p.), RAP and BOE recognize and agree that LADWP may reduce the scope and cost of the Program if LADWP determines, in its sole discretion, that any portion of the Program scope is technically infeasible to construct within the available budget.

c. The project management for the Program will be performed in accordance with the latest BOE standards and practices.

d. Each Party shall have no financial obligation to the other Parties under this Agreement, except as herein expressly provided.

e. No amendment or waiver of any provision of this Agreement, nor consent to any departure, shall be effective unless in writing and signed by each Party, and then such waiver or consent shall be effective only in the specific instances and for the specific purpose given.

f. This Agreement shall be governed, interpreted under, construed, and enforced in accordance with the laws of the State of California.

g. LADWP shall have the opportunity to participate, provide input, and approve the work mentioned in Section 1.c that is to be performed by the other Parties.

h. The Parties shall be required to make staff reasonably available, if requested, to participate and provide input at scheduled meetings, community meetings, workshops so as to not impact the Program schedule.

i. Notwithstanding any other provision of this Agreement, LADWP may determine not to implement the Program, or any portion thereof, if its environmental review pursuant to the CEQA discloses that the Program, or portion thereof, will have significant environmental impacts. In the event LADWP determines not to implement the Program, and so communicates to the Parties in writing, this Agreement shall be deemed terminated and the Parties shall have no further obligations to each other under this Agreement. In the event LADWP, determines not to implement a portion of the Program, and so communicates to the Parties in writing, this Agreement shall be deemed terminated as to that portion of the Program only, and the Parties shall have no further obligations to each other under this Agreement as to that portion of the Program.

j. To make all reasonable efforts to keep costs within the budgeted amounts, no Party shall be obligated to provide additional funding toward the completion of work called for by this Agreement, unless otherwise mutually agreed to by the Parties and reflected in a written amendment to this Agreement.

k. Cost performance shall be evaluated at regular intervals to ensure the cost-effectiveness of the Program is maintained.

l. In the event that performance on the part of any Party hereto is delayed or suspended as a result of circumstances beyond the reasonable control and without the fault and negligence of said Party, none of the Parties shall incur any liability to the other Parties as a result of such delay or suspension. Circumstances deemed to be beyond the control of the Parties hereunder include, but are not limited to, acts of God or of the public enemy; insurrection; acts of the federal government or any unit of state or local government in either sovereign or contractual capacity; fires; floods; earthquakes; epidemics;

pandemics; quarantine restrictions; strikes; freight embargoes or delays in transportation, to the extent that they are not caused by the Parties willful or negligent acts or omission.

m. As it relates to the management and oversight of all of the services associated with a Party's obligations under this Agreement, each Party shall retain all liability for its contractors, agents or invitees and each of the contractor's officers, agents, employees, or subcontractors of any tier. With respect to any liability or damage incurred on RAP property, except to the extent attributable to the sole or active negligence or willful misconduct of RAP, LADWP undertakes and agrees to promptly pay, reimburse, cover, and/or otherwise be financially responsible to RAP for, any and all costs arising in any manner by reason of, or incidental to, the actions of LADWP and/or their contractor or subcontractor of any tier in connection with this Agreement ("Costs"). Such Costs shall include, without limitation, all costs of litigation, claims, losses, demands, expenses, damage or liability of any nature whatsoever (including for death or injury to any person, including LADWP's employees, contractors and agents), or damage or destruction of any property.

7. RIGHT TO AUDIT

BOE shall maintain, and shall cause BOE's consultants and suppliers to maintain, all records pertaining to this Agreement, and related subcontracts, in their original form, including but not limited to, reports, documents, deliverables, employee time sheets, accounting procedures and practices, records of financial transactions, and other evidence, regardless of form (e.g., machine readable media such as disk, tape, etc.) or type (e.g., databases, applications software, database management software, utilities, etc.), sufficient to properly reflect all costs claimed to have been incurred and services performed pursuant to Agreement. If BOE or its contractors, consultants, or suppliers are required to submit cost or pricing data in connection with Agreement, BOE shall maintain all records and documents necessary to permit adequate evaluation of the cost or pricing data submitted, along with the computations and projections used. All records shall be retained, and shall be subject to examination and audit by LADWP personnel or by LADWP's agents (herein after referred to as Authorized Auditors), for a period of not less than thirty-six (36) years following payment made by LADWP hereunder or the expiration date of Agreement, whichever is later. BOE shall make said records or to the extent accepted by the Authorized Auditors, photographs, microphotographs, etc. or other authentic reproductions thereof, available to the Authorized Auditors at BOE's offices at all reasonable times and without charge. Authorized Auditors will have the right to reproduce, photocopy, download, transcribe, and the like any such records. Any information provided by BOE on machine-readable media shall be provided in a format accessible and readable by the Authorized Auditors. BOE shall not, however, be required to furnish the Authorized Auditors with commonly available software.

BOE and its contractors, consultants, and suppliers, as applicable to the services provided under Agreement, shall be subject at any time within sixty (60) calendar days, prior written notice to audits or examinations by Authorized Auditors, relating to all billings and to verify compliance with all Agreement requirements relative to practices, methods, procedures, performance, compensation, and documentation.

Examinations and audits will be performed using generally accepted auditing practices and principles and applicable City, County, State and Federal government audit standards. For consultants, subconsultants, and suppliers that utilize or are subject to Federal Acquisition Regulation (FAR), Parts 30 and 31, et seq. accounting procedures, or a portion thereof, examinations and audits will utilize

To the extent that the Authorized Auditor's examination or audit reveals inaccurate, incomplete, or noncurrent records, or records are unavailable, the records shall be considered defective.

Consistent with standard auditing procedures, BOE will be provided sixty (60) calendar days to review the Authorized Auditor's examination results or audit and respond to LADWP prior to the examination's or audit's finalization and public release.

If the Authorized Auditors' examination or audit indicates BOE, or BOE's suppliers and contractors, have been overpaid under a previous payment application, the identified overpayment amount shall be paid by BOE, or BOE's suppliers and contractors, to LADWP within ninety (90) calendar days of notice to BOE.

If applicable, having received written notice by LADWP in advance of contract bid and award, BOE shall contractually require all contractors, consultants and suppliers performing services under Agreement to comply with the provisions of this section by inserting this provision GC-18 in each contractor's contract and by contractually requiring each subcontractor to insert this provision GC-18 in any of its subcontractor contracts related to services under Agreement. In addition, BOE, their contractors, consultants, and/or suppliers, shall also include the following language in each contract:

> The Los Angeles Department of Water and Power (LADWP) is a third-party beneficiary of the foregoing audit provision. The benefits of the audit provision shall inure solely for the benefit of LADWP. The designation of LADWP as a third-party beneficiary of the audit provision shall not confer any rights or privileges on BOE, BOE's contractors, suppliers, or consultants, or any other person or entity.

If an examination or audit undertaken pursuant to the Retention of Records, Audit, and Reports provision of the General Conditions GC-18 for LADWP Professional Service Contracts reveals that LADWP overpayment to the consultant is more than five percent (5%) of the billings reviewed, the consultant shall pay all expenses and costs incurred by the Authorized Auditors arising out of or related to the examination or audit. Such examination or audit expenses and costs shall be paid by the consultant to LADWP within ninety (90) calendar days of notice to the consultant of the costs and expenses.

The provisions of this section shall survive expiration or termination of Agreement.

8. NOTICES

All notices provided under this Agreement must be in writing and, unless otherwise provided herein, shall be deemed validly given on the date either: (1) personally delivered to the address indicated below; or (2) on the third business day following deposit, postage prepaid, using certified mail, return receipt requested, in any United States Postal mailbox or at any United States Post Office. All notices, demands, or requests shall be addressed to the following:

LADWP: Mr. David R. Pettijohn
Director of Water Resources
Los Angeles Department of Water and Power
111 North Hope Street, Room 1460
Los Angeles, California 90012
Phone: (213) 367-0899

and

Mr. Art Castro
Manager of Watershed Management
Los Angeles Department of Water and Power
111 North Hope Street, Room 308
Los Angeles, California 90012
Phone: (213) 367-2966

RAP: Ms. Cathie Santo Domingo
Assistant General Manager
Los Angeles Department of Recreation and Parks
221 N. Figueroa St 3rd Floor
Los Angeles, California 90012
Phone: (213) 202-2633

BOE: Mr. Alfred Mata
Deputy City Engineer
Los Angeles Department of Public Works
Bureau of Engineering
1149 South Broadway Street, 7th Floor
Los Angeles, California 90015
Phone: (213) 485-4920

9. AMENDMENTS AND WAIVER

No amendment or waiver of any provision of this Agreement, nor consent to any departure, shall be effective unless in writing and signed by each Party, and then such waiver or consent shall be effective only in the specific instances and for the specific purpose given.

10. NO THIRD-PARTY BENEFICIARIES

There are no third-party beneficiaries of this Agreement and nothing in this Agreement, express or implied, is intended to confer on any person other than the Parties hereto any rights, remedies, obligations or liabilities.

11. COMPLETE AGREEMENT

This Agreement supersedes any prior agreement, oral or written and contains the entire agreement of the Parties on the subject matter hereof. No subsequent agreement, representation, or promise made by a Party, or its officers, employees, agents, or representatives, shall be of any effect unless it is in writing and executed by the Party to be bound.

12. EXECUTION IN COUNTERPARTS

This Agreement may be executed in one or more counterparts, and by the Parties in separate counterparts, each of when so executed shall be deemed an original and all of which taken together shall constitute one and the same agreement. The Parties further agree that facsimile signatures or signatures scanned into .pdf and sent by e-mail shall be deemed original signatures.

IN WITNESS WHEREOF, each Party hereto has caused this Agreement to be executed by its duly authorized representatives.

_____ PARK – 12345 _____ STREET, _____, CA ZIP CODE: MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY (MOU-ROE) AUTHORIZING LOS ANGELES DEPARTMENT OF WATER AND POWER (LADWP) TO _____– MOU-ROE NO. _____

Dear Name

The City of Los Angeles, Department of Recreation and Parks (hereinafter referred to as **RAP**) hereby issues revocable MOU-ROE No. _____, to LADWP and its contractors (hereinafter referred to as **PERMITTEE**) for temporary access to _____ Park. This MOU-ROE is granted between **RAP** and **PERMITTEE**. Said MOU-ROE will not become effective until proof of insurance is provided and MOU-ROE is properly executed and returned to **RAP** as noted.

MOU-ROE No. _____, is issued subject to the following conditions:

1. **MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY AREA DEFINED**

   The area covered under this MOU-ROE is **RAP** property known as _____ Park. The property is located at _____ Street, _____ CA ZIP. Please see attached maps for reference of permitted areas.

2. **PERMISSION GRANTED**

   Permission is granted to the **PERMITTEE** and/or its contractor(s) to enter the permit area (see attached maps) to conduct at the permit area the following scope of work and other project related work as approved by **RAP** staff: [DESCRIBE SCOPE]

3. **TERM**

   The term of this MOU-ROE shall be from DATE to DATE. A request to extend the term or conditions of this MOU-ROE shall be made in writing to the person named in Condition No. 8 below and coordinated with Region staff.

This MOU-ROE can be terminated by **RAP** as listed in Condition No. 12.

4. HOURS OF OPERATION

In accordance with this MOU-ROE, the approved operating hours for the permitted work by **PERMITTEE** should be in accordance with scheduled hours of operation as designated and approved by Region staff. Any change or request regarding hours of operation must be requested per Condition No. 8 and approved by **RAP** staff.

5. DEPARTMENT AUTHORITY

PERMITTEE shall at all times abide by the rules and regulations heretofore adopted or that may hereafter be adopted by **RAP** and cooperate fully with **RAP** employees in the performance of their duties.

NAME Pr. Grounds Maintenance Supervisor II, or his designee is the **RAP** ### Region Maintenance representative for the permitted activities at the subject property.

NAME may be reached at: PHONE, email: _____. **PERMITTEE** shall coordinate all work with Mr. Calloway or his designee upon receipt of this MOU-ROE.

NAME Pr. Recreation Supervisor I, or his designee is the **RAP** ### Region Recreation representative for the permitted activities at the subject property.

NAME may be reached at: PHONE, email: _____. **PERMITTEE** shall coordinate all work with NAME or his designee upon receipt of this MOU-ROE.

6. RIGHT OF INSPECTION

Authorized representatives, agents, and employees of **RAP** shall have the right to enter the premises at any time in case of emergency, and upon reasonable notice for purposes of property inspection.

7. MAINTENANCE OF PROPERTY

A. **PERMITTEE** will be responsible for any damages or repairs caused during the permitted period.

B. Upon completion of the work, it is understood that the **PERMITTEE** agrees to notify **RAP** of such work. Notification shall be made to the **RAP** representative designated in Condition No. 5.

C. The **PERMITTEE** shall maintain the permitted premises in an orderly condition during the work period or term of agreement, including the protection of those existing facilities at the park that will not be impacted by this project.

D. Work will not be permitted until **RAP** staff is present at the indicated hours of operation.

E. Contractor shall take all necessary steps to ensure safety and abide by any/all Federal, State and/or Local regulations governing the use and operation of equipment, in the

performance of approved work and ensure the protection and warning of any park user that could be in the area.

8. MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY NOTIFICATIONS

Should the **PERMITTEE** desire modifications to this MOU-ROE, time extensions of the MOU-ROE, or additional work to be performed, etc., request for said modifications and/or additions shall be submitted, in writing, to:

Attention: Rick Tonthat, Sr. Management Analyst II
City of Los Angeles, Department of Recreation and Parks
Planning Maintenance & Construction Branch
221 N. Figueroa Street, Suite 400
Los Angeles, CA 90012

Telephone: (213) 202-2608
Fax: (213) 202-2612

Or via email to: rick.tonthat@lacity.org

9. RESTORATION AND FINAL INSPECTION

PERMITTEE shall restore all **RAP** property that is damaged, moved or altered as a result of the permitted work at the permitted area to its original condition. Said restoration shall take place immediately upon the conclusion of said work and shall be performed to the satisfaction of **RAP**. Upon completion of the permitted work, **PERMITTEE** shall contact the **RAP** coordinator in Condition No. 5 to arrange a final **RAP** inspection of the completed project.

10. PERMITTEE CONTACT

PERMITTEE contact will be:

Name: Name of Permittee, Position
Phone No.: (###) ###_####
Cell No.: (###) ###-####
Email:

11. FINANCIAL RESPONSIBILITY AND INSURANCE

It is hereby understood that **PERMITTEE** is self-insured concerning any claims that may arise as a result of the approved work and use of the permitted area. **PERMITTEE** and its contractors shall insure that any of its contractors obtain and keep in force during the term of this MOU-ROE, insurance coverages from insurers acceptable to **RAP**.

Except to the extent attributable to the active negligence or willful misconduct of **RAP**, **PERMITTEE** undertakes and agrees to promptly pay, reimburse, cover, and/or otherwise be financially responsible to **RAP** for, any and all costs arising in any manner by reason of, or incidental to, the performance or this MOU-ROE on part of **PERMITTEE** and/or their contractor or subcontractor of any tier ("Costs"). Such Costs shall include, without limitation, all costs of litigation, claims, losses, demands, expenses, damage or liability of any nature whatsoever

(including for death or injury to any person, including **PERMITTEE'S** employees, contractors and agents), or damage or destruction of any property of either party hereto or of third parties.

PERMITTEE shall maintain, during the term of this MOU-ROE, evidence of insurance acceptable to CAO, Risk Management prior to **PERMITTEE'S** occupancy of the premises.

12. REVOCATION OF MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY

RAP may revoke this MOU-ROE at any time or if **PERMITTEE** does not comply with the conditions contained herein. Upon receipt of the written notice of revocation, **PERMITTEE** shall return the property to its original condition and discontinue all work permitted under this MOU-ROE.

13. ACCEPTANCE

Please indicate your acceptance of the foregoing in the signature block of this letter, and return the signed original copy to the **RAP** office noted in the letterhead.

Sincerely,

JIMMY KIM
